MyLab Math for *Calculus, 3e*

(access code required)

Used by over 3 million students a year, MyLab™ Math is the world's leading online program for teaching and learning mathematics. MyLab Math for *Calculus, 3e* delivers text-specific assessment, tutorials, and multimedia resources that provide engaging and personalized experiences, so learning can happen in any environment and course format.

eBook with Interactive Figures

This groundbreaking eBook includes approximately 700 figures that can be manipulated to provide a deeper geometric understanding of key concepts. Plus, all-new **Enhanced Interactive Figures** incorporate functionality from several standard Interactive Figures, making each one mathematically richer and ideal for in-class demonstrations.

Compute the volume of the solid bounded by the planes below.

$$x=0, x=7, z=y-2, z=-4y-2, z=0, z=2$$

Find the double integral needed to determine the volume of the solid.

$$\int_0^7 \int_0^2 (z+2) \, dz \, dx$$

The volume of the solid is $\frac{105}{2}$ cubic units. (Simplify your answer.)

Questions that Deepen Understanding

MyLab Math includes a variety of question types designed to help students succeed in the course. In **Setup & Solve** questions, students show how they set up a problem as well as the solution, better mirroring what is required on tests. **Additional Conceptual Questions** were written by faculty at Cornell University to support deeper, theoretical understanding of the key concepts in calculus.

ALL NEW! Instructional Videos

For each section of the text, there is a newly recorded full-lecture video. Many videos make use of Interactive Figures to enhance understanding of concepts. To make them easier to navigate, each lecture video is segmented into parts (Introduction, Example, or Summary). The videos are assignable within MyLab Math, and a Guide to Video-Based Assignments shows which MyLab Math exercises correspond to each video.

ALGEBRA

Exponents and Radicals

$$x^a x^b = x^{a+b} \quad \frac{x^a}{x^b} = x^{a-b} \quad x^{-a} = \frac{1}{x^a} \quad (x^a)^b = x^{ab} \quad \left(\frac{x}{y}\right)^a = \frac{x^a}{y^a}$$

$$x^{1/n} = \sqrt[n]{x} \quad x^{m/n} = \sqrt[n]{x^m} = (\sqrt[n]{x})^m \quad \sqrt[n]{xy} = \sqrt[n]{x} \sqrt[n]{y} \quad \sqrt[n]{x/y} = \sqrt[n]{x} / \sqrt[n]{y}$$

Factoring Formulas

$$a^2 - b^2 = (a - b)(a + b) \quad a^2 + b^2 \text{ does not factor over real numbers.}$$

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2) \quad a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

$$a^n - b^n = (a - b)(a^{n-1} + a^{n-2}b + a^{n-3}b^2 + \cdots + ab^{n-2} + b^{n-1})$$

Binomials

$$(a \pm b)^2 = a^2 \pm 2ab + b^2$$

$$(a \pm b)^3 = a^3 \pm 3a^2b + 3ab^2 \pm b^3$$

Binomial Theorem

$$(a + b)^n = a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n-1}ab^{n-1} + b^n,$$

where $\binom{n}{k} = \frac{n(n-1)(n-2) \cdots (n-k+1)}{k(k-1)(k-2) \cdots 3 \cdot 2 \cdot 1} = \frac{n!}{k!(n-k)!}$

Quadratic Formula

The solutions of $ax^2 + bx + c = 0$ are

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

GEOMETRY

Parallelogram

$$A = bh$$

Triangle

$$A = \frac{1}{2}bh$$

Trapezoid

$$A = \frac{1}{2}(a + b)h$$

Circle

$$A = \pi r^2$$

$$C = 2\pi r$$

Sector

$$A = \frac{1}{2}r^2\theta$$

$$s = r\theta \text{ (}\theta \text{ in radians)}$$

Cylinder

$$V = \pi r^2 h$$

$$S = 2\pi r h$$

(lateral surface area)

Cone

$$V = \frac{1}{3}\pi r^2 h$$

$$S = \pi r \ell$$

(lateral surface area)

Sphere

$$V = \frac{4}{3}\pi r^3$$

$$S = 4\pi r^2$$

Equations of Lines and Circles

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

slope of line through (x_1, y_1) and (x_2, y_2)

$$y - y_1 = m(x - x_1)$$

point-slope form of line through (x_1, y_1) with slope m

$$y = mx + b$$

slope-intercept form of line with slope m and y-intercept $(0, b)$

$$(x - h)^2 + (y - k)^2 = r^2$$

circle of radius r with center (h, k)

$$(x - h)^2 + (y - k)^2 = r^2$$

TRIGONOMETRY

$$\cos \theta = \frac{\text{adj}}{\text{hyp}} \quad \sin \theta = \frac{\text{opp}}{\text{hyp}} \quad \tan \theta = \frac{\text{opp}}{\text{adj}}$$

$$\sec \theta = \frac{\text{hyp}}{\text{adj}} \quad \csc \theta = \frac{\text{hyp}}{\text{opp}} \quad \cot \theta = \frac{\text{adj}}{\text{opp}}$$

$$\cos \theta = \frac{x}{r} \quad \sec \theta = \frac{r}{x}$$

$$\sin \theta = \frac{y}{r} \quad \csc \theta = \frac{r}{y}$$

$$\tan \theta = \frac{y}{x} \quad \cot \theta = \frac{x}{y}$$

(Continued)

Reciprocal Identities

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{\cos \theta}{\sin \theta} \quad \sec \theta = \frac{1}{\cos \theta} \quad \csc \theta = \frac{1}{\sin \theta}$$

Pythagorean Identities

$$\sin^2 \theta + \cos^2 \theta = 1 \quad \tan^2 \theta + 1 = \sec^2 \theta \quad 1 + \cot^2 \theta = \csc^2 \theta$$

Sign Identities

$$\begin{aligned} \sin(-\theta) &= -\sin \theta & \cos(-\theta) &= \cos \theta & \tan(-\theta) &= -\tan \theta \\ \csc(-\theta) &= -\csc \theta & \sec(-\theta) &= \sec \theta & \cot(-\theta) &= -\cot \theta \end{aligned}$$

Double-Angle Identities

$$\begin{aligned} \sin 2\theta &= 2 \sin \theta \cos \theta & \cos 2\theta &= \cos^2 \theta - \sin^2 \theta \\ & & &= 2 \cos^2 \theta - 1 \\ \tan 2\theta &= \frac{2 \tan \theta}{1 - \tan^2 \theta} & &= 1 - 2 \sin^2 \theta \end{aligned}$$

Half-Angle Identities

$$\cos^2 \theta = \frac{1 + \cos 2\theta}{2} \quad \sin^2 \theta = \frac{1 - \cos 2\theta}{2}$$

Addition Formulas

$$\begin{aligned} \sin(\alpha + \beta) &= \sin \alpha \cos \beta + \cos \alpha \sin \beta & \sin(\alpha - \beta) &= \sin \alpha \cos \beta - \cos \alpha \sin \beta \\ \cos(\alpha + \beta) &= \cos \alpha \cos \beta - \sin \alpha \sin \beta & \cos(\alpha - \beta) &= \cos \alpha \cos \beta + \sin \alpha \sin \beta \\ \tan(\alpha + \beta) &= \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} & \tan(\alpha - \beta) &= \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta} \end{aligned}$$

Law of Sines

$$\frac{\sin \alpha}{a} = \frac{\sin \beta}{b} = \frac{\sin \gamma}{c}$$

Law of Cosines

$$a^2 = b^2 + c^2 - 2bc \cos \alpha$$

Preface

The third edition of *Calculus* supports a three-semester or four-quarter calculus sequence typically taken by students studying mathematics, engineering, the natural sciences, or economics. The third edition has the same goals as the first edition:

- to motivate the essential ideas of calculus with a lively narrative, demonstrating the utility of calculus with applications in diverse fields;
- to introduce new topics through concrete examples, applications, and analogies, appealing to students' intuition and geometric instincts to make calculus natural and believable; and
- once this intuitive foundation is established, to present generalizations and abstractions and to treat theoretical matters in a rigorous way.

The third edition both builds on the success of the previous two editions and addresses the feedback we have received. We have listened to and learned from the instructors who used the text. They have given us wise guidance about how to make the third edition an even more effective learning tool for students and a more powerful resource for instructors. Users of the text continue to tell us that it mirrors the course they teach—and, more important, that students actually read it! Of course, the third edition also benefits from our own experiences using the text, as well as from our experiences teaching mathematics at diverse institutions over the past 30 years.

New to the Third Edition

Exercises

The exercise sets are a major focus of the revision. In response to reviewer and instructor feedback, we've made some significant changes to the exercise sets by rearranging and relabeling exercises, modifying some exercises, and adding many new ones. Of the approximately 10,400 exercises appearing in this edition, 18% are new, and many of the exercises from the second edition were revised for this edition. We analyzed aggregated student usage and performance data from MyLab™ Math for the previous edition of this text. The results of this analysis helped us improve the quality and quantity of exercises that matter the most to instructors and students. We have also simplified the structure of the exercise sets from five parts to the following three:

1. **Getting Started** contains some of the former Review Questions but goes beyond those to include more conceptual exercises, along with new basic skills and short-answer exercises. Our goal in this section is to provide an excellent overall assessment of understanding of the key ideas of a section.
2. **Practice Exercises** consist primarily of exercises from the former Basic Skills, but they also include intermediate-level exercises from the former Further Explorations and Applications sections. Unlike previous editions, these exercises are not necessarily organized into groups corresponding to specific examples. For instance, instead of separating out Product Rule exercises from Quotient Rule exercises in Section 3.4, we

have merged these problems into one larger group of exercises. Consequently, specific instructions such as “Use the Product Rule to find the derivative of the following functions” and “Use the Quotient Rule to find the derivative of the given functions” have been replaced with the general instruction “Find the derivative of the following functions.” With Product Rule and Quotient Rule exercises mixed together, students must first choose the correct method for evaluating derivatives before solving the problems.

3. Explorations and Challenges consist of more challenging problems and those that extend the content of the section.

We no longer have a section of the exercises called “Applications,” but (somewhat ironically) in eliminating this section, we feel we are providing better coverage of applications because these exercises have been placed strategically *throughout the exercise sets*. Some are in Getting Started, most are in Practice Exercises, and some are in Explorations and Challenges. The applications nearly always have a boldface heading so that the topic of the application is readily apparent.

Regarding the boldface heads that precede exercises: These heads provide instructors with a quick way to discern the topic of a problem when creating assignments. We heard from users of earlier editions, however, that some of these heads provided too much guidance in how to solve a given problem. In this edition, therefore, we eliminated or reworded run-in heads that provided too much information about the solution method for a problem.

Finally, the **Chapter Review** exercises received a major revamp to provide more exercises (particularly intermediate-level problems) and more opportunities for students to choose a strategy of solution. More than 26% of the Chapter Review exercises are new.

Content Changes

Below are noteworthy changes from the previous edition of the text. Many other detailed changes, not noted here, were made to improve the quality of the narrative and exercises. Bullet points with a  icon represent major content changes from the previous edition.

Chapter 1 Functions

- Example 2 in Section 1.1 was modified with more emphasis on using algebraic techniques to determine the domain and range of a function. To better illustrate a common feature of limits, we replaced part (c) with a rational function that has a common factor in the numerator and denominator.
- Examples 7 and 8 in Section 1.1 from the second edition (2e) were moved forward in the narrative so that students get an intuitive feel for the composition of two functions using graphs and tables; compositions of functions using algebraic techniques follow.
- Example 10 in Section 1.1, illustrating the importance of secant lines, was made more relevant to students by using real data from a GPS watch during a hike. Corresponding exercises were also added.
- The Section 1.1 exercise set illustrates how the exercises have been reorganized and modified for the new edition. We have included a variety of short-answer, algebraic, graphical, and tabular exercises near the beginning of the exercise set, along with some new applied exercises.
- New applied exercises in biology, involving yeast growth, were added to Section 1.2 to illustrate the usefulness of linear functions.
- There is a 63% increase in the number of review exercises for Chapter 1. Most of the new exercises are intermediate-level exercises, providing more exhaustive coverage of the Chapter 1 content.

Chapter 2 Limits

- Example 4 in Section 2.2 was revised, emphasizing an algebraic approach to a function with a jump discontinuity, rather than a graphical approach.
- Theorems 2.3 and 2.12 were modified, simplifying the notation to better connect with upcoming material.
- Example 7 in Section 2.3 was added to solidify the notions of left-, right-, and two-sided limits.
- Exercises were added to Section 2.5 to illustrate the similarities and differences between limits at infinity and infinite limits. We also included some easier exercises in Section 2.5 involving limits at infinity of functions containing square roots.
- Example 5 in Section 2.7 was added to demonstrate an epsilon-delta proof of a limit of a quadratic function.
- We added 17 epsilon-delta exercises to Section 2.7 to provide a greater variety of problems involving limits of quadratic, cubic, trigonometric, and absolute value functions.

Chapter 3 Derivatives

- Chapter 3 now begins with a look back at average and instantaneous velocity, first encountered in Section 2.1, with a corresponding revised example in Section 3.1.
-  The derivative at a point and the derivative as a function are now treated separately in Sections 3.1 and 3.2.
- After defining the derivative at a point in Section 3.1 with a supporting example, we added a new subsection: Interpreting the Derivative (with two supporting examples).
- Several exercises were added to Section 3.3 that require students to use the Sum and Constant Rules, together with geometry, to evaluate derivatives.

-  The Power Rule for derivatives in Section 3.4 is stated for all real powers (later proved in Chapter 7). Example 4 in Section 3.4 includes two additional parts to highlight this change, and subsequent examples in upcoming sections rely on the more robust version of the Power Rule. The Power Rule for Rational Exponents in Section 3.8 was deleted because of this change.
- We combined the intermediate-level exercises in Section 3.4 involving the Product Rule and Quotient Rule together under one unified set of directions.
- In Section 3.7, we deleted references to Version 1 and Version 2 of the Chain Rule. Additionally, Chain Rule exercises involving repeated use of the rule were merged with the standard exercises.
- In Section 3.8, we added emphasis on simplifying derivative formulas for implicitly defined functions; see Examples 4 and 5.
- Example 3 in Section 3.9 was replaced; the new version shows how similar triangles are used in solving a related-rates problem.

Chapter 4 Applications of the Derivative

-  The Mean Value Theorem (MVT) was moved from Section 4.6 to 4.2 so that the proof of Theorem 4.7 is not delayed. We added exercises to Section 4.2 that help students better understand the MVT geometrically.
- Example 5 in Section 4.5 was added to give guidance on a certain class of optimization problems.
- Example 3b in Section 4.7 was replaced to better drive home the need to simplify after applying l'Hôpital's Rule.
- Most of the intermediate exercises in Section 4.7 are no longer separated out by the type of indeterminate form, and we added some problems in which l'Hôpital's Rule does not apply.
-  Indefinite integrals of trigonometric functions with argument ax (Table 4.9) were relocated to Section 5.5, where they are derived with the Substitution Rule.
- Example 5b in Section 4.9 was added to foreshadow a more complete treatment of the domain of an initial value problem found in Chapter 9.
- We added to Section 4.9 a significant number of intermediate antiderivative exercises that require some preliminary work (e.g., factoring, cancellation, expansion) before the antiderivatives can be determined.

Chapter 5 Integration

- Examples 2 and 3 in Section 5.1 on approximating areas were replaced with a friendlier function where the grid points are more transparent; we return to these approximations in Section 5.3, where an exact result is given (Example 3b).
- Three properties of integrals (bounds on definite integrals) were added in Section 5.2 (Table 5.5); the last of these properties is used in the proof of the Fundamental Theorem (Section 5.3).
- Exercises were added to Sections 5.1 and 5.2 where students are required to evaluate Riemann sums using graphs or tables instead of formulas. These exercises will help students better understand the geometric meaning of Riemann sums.

- We added to Section 5.3 more exercises in which the integrand must be simplified before the integrals can be evaluated.
- A proof of Theorem 5.7 is now offered in Section 5.5.
- Table 5.6 lists the general integration formulas that were relocated from Section 4.9 to Section 5.5.

Chapter 6 Applications of Integration

- Exercises requiring students to evaluate net change using graphs were added to Section 6.1.
- Exercises in Section 6.2 involving area calculations with respect to x and y are now combined under one unified set of directions (so that students must first determine the appropriate variable of integration).
- We increased the number of exercises in Sections 6.3 and 6.4 in which curves are revolved about lines other than the x - and y -axes. We also added introductory exercises that guide students, step by step, through the processes used to find volumes.
- A more gentle introduction to lifting problems (specifically, lifting a chain) was added in Section 6.7 and illustrated in Example 3, accompanied by additional exercises.

Chapter 7 Logarithmic and Exponential Functions

- Exercises were added to Section 7.2 to give students practice at finding inverses of functions using the properties of exponential and logarithmic functions.
- New Getting Started application exercises (including a biology problem) were added to Section 7.2 to illustrate the usefulness of logarithmic and exponential functions.
- The introduction to exponential growth (Section 7.4) was rewritten to make a clear distinction between the relative growth rate (or percent change) of a quantity and the rate constant k . We revised the narrative so that the equation $y = y_0 e^{kt}$ applies to both growth and decay models. This revision resulted in a small change to the half-life formula.
- The variety of applied exercises in Section 7.4 was increased to further illustrate the utility of calculus in the study of exponential growth and decay.

Chapter 8 Integration Techniques

- Table 8.1 now includes four standard trigonometric integrals that previously appeared in the section Trigonometric Integrals (8.3); these integrals are derived in Examples 1 and 2 in Section 8.1.
-  A new section (8.6) was added so that students can master integration techniques (that is, choose a strategy) apart from the context given in the previous five sections.
- In Section 8.5 we increased the number and variety of exercises where students must set up the appropriate form of the partial fraction decomposition of a rational function, including more with irreducible quadratic factors.
- A full derivation of Simpson's Rule was added to Section 8.8, accompanied by Example 7, additional figures, and an expanded exercise set.

-  The Comparison Test for improper integrals was added to Section 8.9, accompanied by Example 7, a two-part example. New exercises in Section 8.9 include doubly infinite improper integrals over infinite intervals.

Chapter 9 Differential Equations

-  The chapter on differential equations that was available only online in the 2e was converted to a chapter of the text, replacing the single-section coverage found in the 2e.
- More attention was given to the domain of an initial value problem, resulting in the addition and revision of several examples and exercises throughout the chapter.

Chapter 10 Sequences and Infinite Series

-  The second half of Chapter 10 was reordered: Comparison Tests (Section 10.5), Alternating Series (Section 10.6, which includes the topic of absolute convergence), The Ratio and Root Tests (Section 10.7), and Choosing a Convergence Test (Section 10.8; new section). We split the 2e section that covered the Comparison, Ratio, and Root Tests to avoid overwhelming students with too many tests at one time. Section 10.5 focuses entirely on the comparison tests; 39% of the exercises are new. The topic of alternating series now appears before the Ratio and Root Tests so that the latter tests may be stated in their more general form (they now apply to any series rather than only to series with positive terms). The final section (10.8) gives students an opportunity to master convergence tests after encountering each of them separately.
- The terminology associated with sequences (10.2) now includes *bounded above*, *bounded below*, and *bounded* (rather than only *bounded*, as found in earlier editions).
- Theorem 10.3 (Geometric Sequences) is now developed in the narrative rather than within an example, and an additional example (10.2.3) was added to reinforce the theorem and limit laws from Theorem 10.2.
- Example 5c in Section 10.2 uses mathematical induction to find the limit of a sequence defined recursively; this technique is reinforced in the exercise set.
- Example 3 in Section 10.3 was replaced with telescoping series that are not geometric and that require re-indexing.
- We increased the number and variety of exercises where the student must determine the appropriate series test necessary to determine convergence of a given series.
- We added some easier intermediate-level exercises to Section 10.6, where series are estimated using n th partial sums for a given value of n .
- Properties of Convergent Series (Theorem 10.8) was expanded (two more properties) and moved to Section 10.3 to better balance the material presented in Sections 10.3 and 10.4. Example 4 in Section 10.3 now has two parts to give students more exposure to the theorem.

Chapter 11 Power Series

- Chapter 11 was revised to mesh with the changes made in Chapter 10.

- We included in Section 11.2 more exercises where the student must find the radius and interval of convergence.
- Example 2 in Section 11.3 was added to illustrate how to choose a different center for a series representation of a function when the original series for the function converges to the function on only part of its domain.
- We addressed an issue with the exercises in Section 11.2 of the previous edition by adding more exercises where the intervals of convergence either are closed or contain one, but not both, endpoints.
- We addressed an issue with exercises in the previous edition by adding many exercises that involve power series centered at locations other than 0.

Chapter 12 Parametric and Polar Curves

-  The arc length of a two-dimensional curve described by parametric equations was added to Section 12.1, supported by two examples and additional exercises. Area and surfaces of revolution associated with parametric curves were also added to the exercises.
- In Example 3 in Section 12.2, we derive more general polar coordinate equations for circles.
- The arc length of a curve described in polar coordinates is given in Section 12.3.

Chapter 13 Vectors and the Geometry of Space

-  The material from the 2e chapter Vectors and Vector-Valued Functions is now covered in this chapter and the following chapter.
- Example 5c in Section 13.1 was added to illustrate how to express a vector as a product of its magnitude and its direction.
- We increased the number of applied vector exercises in Section 13.1, starting with some easier exercises, resulting in a wider gradation of exercises.
-  We adopted a more traditional approach to lines and planes; these topics are now covered together in Section 13.5, followed by cylinders and quadric surfaces in Section 13.6. This arrangement gives students early exposure to all the basic three-dimensional objects that they will encounter throughout the remainder of the text.
-  A discussion of the distance from a point to a line was moved from the exercises into the narrative, supported with Example 3 in Section 13.5. Example 4 finds the point of intersection of two lines. Several related exercises were added to this section.
- In Section 13.6 there is a larger selection of exercises where the student must identify the quadric surface associated with a given equation. Exercises are also included where students design shapes using quadric surfaces.

Chapter 14 Vector-Valued Functions

- More emphasis was placed on the surface(s) on which a space curve lies in Sections 14.1 and 14.3.

- We added exercises in Section 14.1 where students are asked to find the curve of intersection of two surfaces and where students must verify that a curve lies on a given surface.
- Example 3c in Section 14.3 was added to illustrate how a space curve can be mapped onto a sphere.
- Because the arc length of plane curves (described parametrically in Section 12.1 and with polar coordinates in Section 12.3) was moved to an earlier location in the text, Section 14.4 is now a shorter section.

Chapter 15 Functions of Several Variables

-  Equations of planes and quadric surfaces were removed from this chapter and now appear in Chapter 13.
- The notation in Theorem 15.2 was simplified to match changes made to Theorem 2.3.
- Example 7 in Section 15.4 was added to illustrate how the Chain Rule is used to compute second partial derivatives.
- We added more challenging partial derivative exercises to Section 15.3 and more challenging Chain Rule exercises to Section 15.4.
- Example 7 in Section 15.5 was expanded to give students more practice finding equations of curves that lie on surfaces.
- Theorem 15.13 was added in Section 15.5; it's a three-dimensional version of Theorem 15.11.
- Example 7 in Section 15.7 was replaced with a more interesting example; the accompanying figure helps tell the story of maximum/minimum problems and can be used to preview Lagrange multipliers.
- We added to Section 15.7 some basic exercises that help students better understand the second derivative test for functions of two variables.
-  Example 1 in Section 15.8 was modified so that using Lagrange multipliers is the clear path to a solution, rather than eliminating one of the variables and using standard techniques. We also make it clear that care must be taken when using the method of Lagrange multipliers on sets that are not closed and bounded (absolute maximum and minimum values may not exist).

Chapter 16 Multiple Integration

- Example 2 in Section 16.3 was modified because it was too similar to Example 1.

- More care was given to the notation used with polar, cylindrical, and spherical coordinates (see, for example, Theorem 16.3 and the development of integration in different coordinate systems).
- Example 3 in Section 16.4 was modified to make the integration a little more transparent and to show that changing variables to polar coordinates is permissible in more than just the xy -plane.
- More multiple integral exercises were added to Sections 16.1, 16.2, and 16.4, where integration by substitution or integration by parts is needed to evaluate the integrals.
- In Section 16.4 we added more exercises in which the integrals must first be evaluated with respect to x or y instead of z . We also included more exercises that require triple integrals to be expressed in several orderings.

Chapter 17 Vector Calculus

-  Our approach to scalar line integrals was streamlined; Example 1 in Section 17.2 was modified to reflect this fact.
- We added basic exercises in Section 17.2 emphasizing the geometric meaning of line integrals in a vector field. A subset of exercises was added where line integrals are grouped so that the student must determine the type of line integral before evaluating the integral.
- Theorem 17.5 was added to Section 17.3; it addresses the converse of Theorem 17.4. We also promoted the area of a plane region by a line integral to theorem status (Theorem 17.8 in Section 17.4).
- More line integral exercises were added to Section 17.3 where the student must first find the potential function before evaluating the line integral over a conservative vector field using the Fundamental Theorem of Line Integrals.
- Example 3 in Section 17.7 was replaced to give an example of a surface whose bounding curve is not a plane curve and to provide an example that buttresses the claims made at the end of the section (that is, Two Final Notes on Stokes' Theorem).
- We added to Section 17.7 more challenging surface integrals that are evaluated using Stokes' Theorem.

New to MyLab Math

- **Assignable Exercises** To better support students and instructors, we made the following changes to the assignable exercises:
 - Updated the solution processes in Help Me Solve This and View an Example to better match the techniques used in the text.
 - Added more Setup & Solve exercises to better mirror the types of responses that students are expected to provide on tests. We also added a parallel “standard” version of each Setup & Solve exercise to allow the instructor to determine which version to assign.
 - Added exercises corresponding to new exercises in the text.

- Added exercises where MyLab Math users had identified gaps in coverage in the 2e.
 - Added extra practice exercises to each section (clearly labeled EXTRA). These “beyond the text” exercises are perfect for chapter reviews, quizzes, and tests.
 - Analyzed aggregated student usage and performance data from MyLab Math for the previous edition of this text. The results of this analysis helped improve the quality and quantity of exercises that matter the most to instructors and students.
- **Instructional Videos** For each section of the text, there is now a new full-lecture video. Many of these videos make use of Interactive Figures to enhance student understanding of concepts. To make it easier for students to navigate to the specific content they need, each lecture video is segmented into shorter clips (labeled Introduction, Example, or Summary). Both the full lectures and the video segments are assignable within MyLab Math. The videos were created by the following team: Matt Hudelson (Washington State University), Deb Carney and Rebecca Swanson (Colorado School of Mines), Greg Wisloski and Dan Radelet (Indiana University of Pennsylvania), and Nick Ormes (University of Denver).
 - **Enhanced Interactive Figures** Incorporating functionality from several standard Interactive Figures makes Enhanced Interactive Figures mathematically richer and ideal for in-class demonstrations. Using a single figure, instructors can illustrate concepts that are difficult for students to visualize and can make important connections to key themes of calculus.
 - **Enhanced Sample Assignments** These section-level assignments address gaps in pre-calculus skills with a personalized review of prerequisites, help keep skills fresh with spaced practice using key calculus concepts, and provide opportunities to work exercises without learning aids so students can check their understanding. They are assignable and editable.
 - **Quick Quizzes** have been added to Learning Catalytics™ (an in-class assessment system) for every section of the text.
 - **Maple™, Mathematica®, and Texas Instruments® Manuals and Projects** have all been updated to align with the latest software and hardware.

Noteworthy Features

Figures

Given the power of graphics software and the ease with which many students assimilate visual images, we devoted considerable time and deliberation to the figures in this text. Whenever possible, we let the figures communicate essential ideas using annotations reminiscent of an instructor’s voice at the board. Readers will quickly find that the figures facilitate learning in new ways.

Figure 6.40

Annotated Examples

Worked-out examples feature annotations in blue to guide students through the process of solving the example and to emphasize that each step in a mathematical argument must be rigorously justified. These annotations are designed to echo how instructors “talk through” examples in lecture. They also provide help for students who may struggle with the algebra and trigonometry steps within the solution process.

Quick Checks

The narrative is interspersed with Quick Check questions that encourage students to do the calculus as they are reading about it. These questions resemble the kinds of questions instructors pose in class. Answers to the Quick Check questions are found at the end of the section in which they occur.

Guided Projects

MyLab Math contains 78 Guided Projects that allow students to work in a directed, step-by-step fashion, with various objectives: to carry out extended calculations, to derive physical models, to explore related theoretical topics, or to investigate new applications of calculus. The Guided Projects vividly demonstrate the breadth of calculus and provide a wealth of mathematical excursions that go beyond the typical classroom experience. A list of related Guided Projects is included at the end of each chapter.

Incorporating Technology

We believe that a calculus text should help students strengthen their analytical skills and demonstrate how technology can extend (not replace) those skills. Calculators and graphing utilities are additional tools in the kit, and students must learn when and when not to use them. Our goal is to accommodate the different policies regarding technology adopted by various instructors.

Throughout the text, exercises marked with  indicate that the use of technology—ranging from plotting a function with a graphing calculator to carrying out a calculation using a computer algebra system—may be needed. See page xx for information regarding our technology resource manuals covering Maple, Mathematica, and Texas Instruments graphing calculators.

Text Versions

- **eBook with Interactive Figures** The text is supported by a groundbreaking and award-winning electronic book created by Eric Schulz of Walla Walla Community College. This “live book” runs in Wolfram CDF Player (the free version of Mathematica) and contains the complete text of the print book plus interactive versions of approximately 700 figures. Instructors can use these interactive figures in the classroom to illustrate the important ideas of calculus, and students can explore them while they are reading the text. Our experience confirms that the interactive figures help build students’ geometric intuition of calculus. The authors have written Interactive Figure Exercises that can be assigned via MyLab Math so that students can engage with the figures outside of class in a directed way. Available only within MyLab Math, the eBook provides instructors with powerful new teaching tools that expand and enrich the learning experience for students.
- **Other eBook Formats** The text is also available in various stand-alone eBook formats. These are listed in the Pearson online catalog: www.pearson.com. MyLab Math also contains an HTML eBook that is screen-reader accessible.
- **Other Print Formats** The text is also available in split editions (Single Variable [Chapters 1–12] and Multivariable [Chapters 10–17]) and in unbound (3-hole punched) formats. Again, see the Pearson online catalog for details: www.pearson.com.

Acknowledgments

We would like to express our thanks to the following people, who made valuable contributions to this edition as it evolved through its many stages.

MyLab Math Online Course for *Calculus, 3e*

(access code required)

MyLab™ Math is available to accompany Pearson's market-leading text offerings. To give students a consistent tone, voice, and teaching method, each text's flavor and approach are tightly integrated throughout the accompanying MyLab Math course, making learning the material as seamless as possible.

PREPAREDNESS

One of the biggest challenges in calculus courses is making sure students are adequately prepared with the prerequisite skills needed to successfully complete their course work. MyLab Math supports students with just-in-time remediation and review of key concepts.

Integrated Review Course

These special MyLab courses contain pre-made, assignable quizzes to assess the prerequisite skills needed for each chapter, plus personalized remediation for any gaps in skills that are identified. Each student, therefore, receives the appropriate level of help—no more, no less.

DEVELOPING DEEPER UNDERSTANDING

MyLab Math provides content and tools that help students build a deeper understanding of course content than would otherwise be possible.

eBook with Interactive Figures

The eBook includes approximately 700 figures that can be manipulated by students to provide a deeper geometric understanding of key concepts and examples as they read and learn new material. Students get unlimited access to the eBook within any MyLab Math course using that edition of the text. The authors have written Interactive Figure Exercises that can be assigned for homework so that students can engage with the figures outside of the classroom.

Exercises with Immediate Feedback

The over 8000 homework and practice exercises for this text regenerate algorithmically to give students unlimited opportunity for practice and mastery. MyLab Math provides helpful feedback when students enter incorrect answers and includes the optional learning aids Help Me Solve This, View an Example, videos, and/or the eBook.

NEW! Enhanced Sample Assignments

These section-level assignments include just-in-time review of prerequisites, help keep skills fresh with spaced practice of key concepts, and provide opportunities to work exercises without learning aids so students can check their understanding. They are assignable and editable within MyLab Math.

Additional Conceptual Questions

Additional Conceptual Questions focus on deeper, theoretical understanding of the key concepts in calculus. These questions were written by faculty at Cornell University under an NSF grant and are also assignable through Learning Catalytics™.

Setup & Solve Exercises

These exercises require students to show how they set up a problem, as well as the solution, thus better mirroring what is required on tests. This new type of exercise was widely praised by users of the second edition, so more were added to the third edition.

Compute the volume of the solid bounded by the planes below.

$$x = 0, x = 7, z = y - 2, z = -4y - 2, z = 0, z = 2$$

Find the double integral needed to determine the volume of the solid.

$$\frac{5}{4} \int_0^7 \int_0^2 (z+2) dz dx$$

The volume of the solid is $\frac{105}{2}$ cubic units. (Simplify your answer.)

ALL NEW! Instructional Videos

For each section of the text, there is now a new full-lecture video. Many of these videos make use of Interactive Figures to enhance student understanding of concepts. To make it easier for students to navigate to the content they need, each lecture video is segmented into shorter clips (labeled Introduction, Example, or Summary). Both the video lectures and the video segments are assignable within MyLab Math. The Guide to Video-Based Assignments makes it easy to assign videos for homework by showing which MyLab Math exercises correspond to each video.

UPDATED! Technology Manuals (downloadable)

- Maple™ Manual and Projects by Kevin Reeves, East Texas Baptist University
- Mathematica® Manual and Projects by Todd Lee, Elon University
- TI-Graphing Calculator Manual by Elaine McDonald-Newman, Sonoma State University

These manuals cover *Maple 2017*, *Mathematica 11*, and the TI-84 Plus and TI-89, respectively. Each manual provides detailed guidance for integrating the software package or graphing calculator throughout the course, including syntax and commands. The projects include instructions and ready-made application files for Maple and Mathematica. The files can be downloaded from within MyLab Math.

Student's Solutions Manuals (softcover and downloadable)

Single Variable Calculus (Chapters 1–12)

ISBN: 0-13-477034-X | 978-0-13-477034-5

Multivariable Calculus (Chapters 10–17)

ISBN: 0-13-476682-2 | 978-0-13-476682-9

Written by Mark Woodard (Furman University), the Student's Solutions Manual contains worked-out solutions to all the odd-numbered exercises. This manual is available in print and can be downloaded from within MyLab Math.

SUPPORTING INSTRUCTION

MyLab Math comes from an experienced partner with educational expertise and an eye on the future. It provides resources to help you assess and improve student results at every turn and unparalleled flexibility to create a course tailored to you and your students.

NEW! Enhanced Interactive Figures

Incorporating functionality from several standard Interactive Figures makes Enhanced Interactive Figures mathematically richer and ideal for in-class demonstrations. Using a single enhanced figure, instructors can illustrate concepts that are difficult for students to visualize and can make important connections to key themes of calculus.

Learning Catalytics

Now included in all MyLab Math courses, this student response tool uses students' smartphones, tablets, or laptops to engage them in more interactive tasks and thinking during lecture. Learning Catalytics™ fosters student engagement and peer-to-peer learning with real-time analytics. Access pre-built exercises created specifically for calculus, including Quick Quiz exercises for each section of the text.

The screenshot displays the Learning Catalytics web interface. The top navigation bar includes links for Courses, Questions, Classrooms, Training, Help, and Feedback. The main content area shows a "My Courses > Calculus I > Week 2 Thurs 1:00-12:00" session. A "Stop session" button is visible. Below, a "sketch" question is presented: "This is a graph of $f(x) = \ln x$. Sketch a graph of the derivative $f'(x)$." A graph of $f(x) = \ln x$ is shown on a coordinate plane. To the right, a "sketch question" panel shows the question text and a "Your response:" area where a student has sketched the graph of $f'(x) = 1/x$. The interface also includes a "Jump to" menu with numbered tabs (1-7) and a "Stop delivery" button.

PowerPoint Lecture Resources (downloadable)

Slides contain presentation resources such as key concepts, examples, definitions, figures, and tables from this text. They can be downloaded from within MyLab Math or from Pearson's online catalog at www.pearson.com.

Comprehensive Gradebook

The gradebook includes enhanced reporting functionality, such as item analysis and a reporting dashboard to enable you to efficiently manage your course. Student performance data are presented at the class, section, and program levels in an accessible, visual manner so you'll have the information you need to keep your students on track.

TestGen

TestGen® (www.pearson.com/testgen) enables instructors to build, edit, print, and administer tests using a computerized bank of questions developed to cover all the objectives of the text. TestGen is algorithmically based, allowing instructors to create multiple, but equivalent, versions of the same question or test with the click of a button. Instructors can also modify test bank questions and/or add new questions. The software and test bank are available for download from Pearson's online catalog, www.pearson.com. The questions are also assignable in MyLab Math.

Instructor's Solutions Manual (downloadable)

Written by Mark Woodard (Furman University), the Instructor's Solutions Manual contains complete solutions to all the exercises in the text. It can be downloaded from within MyLab Math or from Pearson's online catalog, www.pearson.com.

Instructor's Resource Guide (downloadable)

This resource includes Guided Projects that require students to make connections between concepts and applications from different parts of the calculus course. They are correlated to specific chapters of the text and can be assigned as individual or group work. The files can be downloaded from within MyLab Math or from Pearson's online catalog, www.pearson.com.

Accessibility

Pearson works continuously to ensure that our products are as accessible as possible to all students. We are working toward achieving WCAG 2.0 Level AA and Section 508 standards, as expressed in the Pearson Guidelines for Accessible Educational Web Media, www.pearson.com/mylab/math/accessibility.

Functions

- 1.1 Review of Functions
- 1.2 Representing Functions
- 1.3 Trigonometric Functions

Chapter Preview Mathematics is a language with an alphabet, a vocabulary, and many rules. Before beginning your calculus journey, you should be familiar with the elements of this language. Among these elements are algebra skills; the notation and terminology for various sets of real numbers; and the descriptions of lines, circles, and other basic sets in the coordinate plane. A review of this material is found in Appendix B, online at bit.ly/2y3Nck3. This chapter begins with the fundamental concept of a function and then presents some of the functions needed for calculus: polynomials, rational functions, algebraic functions, and the trigonometric functions. (Logarithmic, exponential, and inverse functions are introduced in Chapter 7.) Before you begin studying calculus, it is important that you master the ideas in this chapter.

1.1 Review of Functions

Everywhere around us we see relationships among quantities, or **variables**. For example, the consumer price index changes in time and the temperature of the ocean varies with latitude. These relationships can often be expressed by mathematical objects called *functions*. Calculus is the study of functions, and because we use functions to describe the world around us, calculus is a universal language for human inquiry.

DEFINITION Function

A **function** f is a rule that assigns to each value x in a set D a *unique* value denoted $f(x)$. The set D is the **domain** of the function. The **range** is the set of all values of $f(x)$ produced as x varies over the entire domain (Figure 1.1).

Figure 1.1

- If the domain is not specified, we take it to be the set of all values of x for which f is defined. We will see shortly that the domain and range of a function may be restricted by the context of the problem.

The **independent variable** is the variable associated with the domain; the **dependent variable** belongs to the range. The **graph** of a function f is the set of all points (x, y) in the xy -plane that satisfy the equation $y = f(x)$. The **argument** of a function is the expression on which the function works. For example, x is the argument when we write $f(x)$. Similarly, 2 is the argument in $f(2)$ and $x^2 + 4$ is the argument in $f(x^2 + 4)$.

QUICK CHECK 1 If $f(x) = x^2 - 2x$, find $f(-1)$, $f(x^2)$, $f(t)$, and $f(p - 1)$. ◀

The requirement that a function assigns a *unique* value of the dependent variable to each value in the domain is expressed in the vertical line test (Figure 1.2a). For example, the outside temperature as it varies over the course of a day is a function of time (Figure 1.2b).

Figure 1.2

Vertical Line Test

A graph represents a function if and only if it passes the **vertical line test**: Every vertical line intersects the graph at most once. A graph that fails this test does not represent a function.

- A set of points or a graph that does *not* correspond to a function represents a **relation** between the variables. All functions are relations, but not all relations are functions.

EXAMPLE 1 Identifying functions State whether each graph in Figure 1.3 represents a function.

Figure 1.3

SOLUTION The vertical line test indicates that only graphs (a) and (c) represent functions. In graphs (b) and (d), there are vertical lines that intersect the graph more than once. Equivalently, there are values of x that correspond to more than one value of y . Therefore, graphs (b) and (d) do not pass the vertical line test and do not represent functions.

Related Exercise 3 ◀

EXAMPLE 2 Domain and range Determine the domain and range of each function.

a. $f(x) = x^2 + 1$ b. $g(x) = \sqrt{4 - x^2}$ c. $h(x) = \frac{x^2 - 3x + 2}{x - 1}$

Figure 1.4

Figure 1.5

Figure 1.6

SOLUTION

- a. Note that f is defined for all values of x ; therefore, its domain is the set of all real numbers, written $(-\infty, \infty)$ or $\mathbb{R}$. Because $x^2 \geq 0$ for all x , it follows that $x^2 + 1 \geq 1$, which implies that the range of f is $[1, \infty)$. **Figure 1.4** shows the graph of f along with its domain and range.
- b. Functions involving square roots are defined provided the quantity under the root is nonnegative (additional restrictions may also apply). In this case, the function g is defined provided $4 - x^2 \geq 0$, which means $x^2 \leq 4$, or $-2 \leq x \leq 2$. Therefore, the domain of g is $[-2, 2]$. The graph of $g(x) = \sqrt{4 - x^2}$ is the upper half of a circle centered at the origin with radius 2 (**Figure 1.5**; see Appendix B, online at bit.ly/2y3Nck3). From the graph we see that the range of g is $[0, 2]$.
- c. The function h is defined for all values of $x \neq 1$, so its domain is $\{x: x \neq 1\}$. Factoring the numerator, we find that

$$h(x) = \frac{x^2 - 3x + 2}{x - 1} = \frac{(x - 1)(x - 2)}{x - 1} = x - 2, \text{ provided } x \neq 1.$$

The graph of $y = h(x)$, shown in **Figure 1.6**, is identical to the graph of the line $y = x - 2$ except that it has a hole at $(1, -1)$ because h is undefined at $x = 1$. Therefore, the range of h is $\{y: y \neq -1\}$. Related Exercises 23, 25 ◀

EXAMPLE 3 Domain and range in context At time $t = 0$, a stone is thrown vertically upward from the ground at a speed of 30 m/s. Its height h above the ground in meters (neglecting air resistance) is approximated by the function $f(t) = 30t - 5t^2$, where t is measured in seconds. Find the domain and range of f in the context of this particular problem.

SOLUTION Although f is defined for all values of t , the only relevant times are between the time the stone is thrown ($t = 0$) and the time it strikes the ground, when $h = 0$. Solving the equation $h = 30t - 5t^2 = 0$, we find that

$$\begin{aligned} 30t - 5t^2 &= 0 \\ 5t(6 - t) &= 0 && \text{Factor.} \\ 5t = 0 \quad \text{or} \quad 6 - t = 0 &&& \text{Set each factor equal to 0.} \\ t = 0 \quad \text{or} \quad t = 6. &&& \text{Solve.} \end{aligned}$$

Therefore, the stone leaves the ground at $t = 0$ and returns to the ground at $t = 6$. An appropriate domain that fits the context of this problem is $\{t: 0 \leq t \leq 6\}$. The range consists of all values of $h = 30t - 5t^2$ as t varies over $[0, 6]$. The largest value of h occurs when the stone reaches its highest point at $t = 3$ (halfway through its flight), which is $h = f(3) = 45$. Therefore, the range is $[0, 45]$. These observations are confirmed by the graph of the height function (**Figure 1.7**). Note that this graph is *not* the trajectory of the stone; the stone moves vertically.

Figure 1.7

Related Exercises 8–9 ◀

QUICK CHECK 2 State the domain and range of $f(x) = (x^2 + 1)^{-1}$. ◀

Composite Functions

Functions may be combined using sums $(f + g)$, differences $(f - g)$, products (fg) , or quotients (f/g) . The process called *composition* also produces new functions.

- In the composition $y = f(g(x))$, f is the *outer function* and g is the *inner function*.

DEFINITION Composite Functions

Given two functions f and g , the composite function $f \circ g$ is defined by $(f \circ g)(x) = f(g(x))$. It is evaluated in two steps: $y = f(u)$, where $u = g(x)$. The domain of $f \circ g$ consists of all x in the domain of g such that $u = g(x)$ is in the domain of f (Figure 1.8).

- Three different notations for intervals on the real number line will be used throughout the text:
- $[-2, 3)$ is an example of interval notation,
 - $-2 \leq x < 3$ is inequality notation, and
 - $\{x: -2 \leq x < 3\}$ is set notation.

Figure 1.8

Figure 1.9

EXAMPLE 4 Using graphs to evaluate composite functions Use the graphs of f and g in Figure 1.9 to find the following values.

- a. $f(g(3))$ b. $g(f(3))$ c. $f(f(4))$ d. $f(g(f(8)))$

SOLUTION

- a. The graphs indicate that $g(3) = 4$ and $f(4) = 8$, so $f(g(3)) = f(4) = 8$.
 b. We see that $g(f(3)) = g(5) = 1$. Observe that $f(g(3)) \neq g(f(3))$.
 c. In this case, $f(\underbrace{f(4)}_8) = f(8) = 6$.
 d. Starting on the inside,

$$f(g(\underbrace{f(8)}_6)) = f(\underbrace{g(6)}_1) = f(1) = 6.$$

Related Exercise 15 ◀

EXAMPLE 5 Using a table to evaluate composite functions Use the function values in the table to evaluate the following composite functions.

- a. $(f \circ g)(0)$ b. $g(f(-1))$ c. $f(g(g(-1)))$

x	-2	-1	0	1	2
$f(x)$	0	1	3	4	2
$g(x)$	-1	0	-2	-3	-4

SOLUTION

- a. Using the table, we see that $g(0) = -2$ and $f(-2) = 0$. Therefore, $(f \circ g)(0) = 0$.
 b. Because $f(-1) = 1$ and $g(1) = -3$, it follows that $g(f(-1)) = -3$.
 c. Starting with the inner function,

$$f(g(\underbrace{g(-1)}_0)) = f(\underbrace{g(0)}_{-2}) = f(-2) = 0.$$

Related Exercise 16 ◀

EXAMPLE 6 Composite functions and notation Let $f(x) = 3x^2 - x$ and $g(x) = 1/x$. Simplify the following expressions.

- a. $f(5p + 1)$ b. $g(1/x)$ c. $f(g(x))$ d. $g(f(x))$

SOLUTION In each case, the functions work on their arguments.

- a. The argument of f is $5p + 1$, so

$$f(5p + 1) = 3(5p + 1)^2 - (5p + 1) = 75p^2 + 25p + 2.$$

- b. Because g requires taking the reciprocal of the argument, we take the reciprocal of $1/x$ and find that $g(1/x) = 1/(1/x) = x$.

- c. The argument of f is $g(x)$, so

$$f(g(x)) = f\left(\frac{1}{x}\right) = 3\left(\frac{1}{x}\right)^2 - \left(\frac{1}{x}\right) = \frac{3}{x^2} - \frac{1}{x} = \frac{3-x}{x^2}.$$

- d. The argument of g is $f(x)$, so

$$g(f(x)) = g(3x^2 - x) = \frac{1}{3x^2 - x}.$$

Related Exercises 33–37 ◀

► Examples 6c and 6d demonstrate that, in general,

$$f(g(x)) \neq g(f(x)).$$

EXAMPLE 7 Working with composite functions Identify possible choices for the inner and outer functions in the following composite functions. Give the domain of the composite function.

- a. $h(x) = \sqrt{9x - x^2}$ b. $h(x) = \frac{2}{(x^2 - 1)^3}$

SOLUTION

- a. An obvious outer function is $f(x) = \sqrt{x}$, which works on the inner function $g(x) = 9x - x^2$. Therefore, h can be expressed as $h = f \circ g$ or $h(x) = f(g(x))$. The domain of $f \circ g$ consists of all values of x such that $9x - x^2 \geq 0$. Solving this inequality gives $\{x: 0 \leq x \leq 9\}$ as the domain of $f \circ g$.

- b. A good choice for an outer function is $f(x) = 2/x^3 = 2x^{-3}$, which works on the inner function $g(x) = x^2 - 1$. Therefore, h can be expressed as $h = f \circ g$ or $h(x) = f(g(x))$. The domain of $f \circ g$ consists of all values of $g(x)$ such that $g(x) \neq 0$, which is $\{x: x \neq \pm 1\}$.

Related Exercises 44–45 ◀

► Techniques for solving inequalities are discussed in Appendix B, online at bit.ly/2y3Nck3.

EXAMPLE 8 More composite functions Given $f(x) = \sqrt[3]{x}$ and $g(x) = x^2 - x - 6$, find the following composite functions and their domains.

- a. $g \circ f$ b. $g \circ g$

SOLUTION

- a. We have

$$(g \circ f)(x) = g(f(x)) = g(\sqrt[3]{x}) = \underbrace{(\sqrt[3]{x})^2}_{f(x)} - \underbrace{\sqrt[3]{x}}_{f(x)} - 6 = x^{2/3} - x^{1/3} - 6.$$

Because the domains of f and g are $(-\infty, \infty)$, the domain of $f \circ g$ is also $(-\infty, \infty)$.

- b. In this case, we have the composition of two polynomials:

$$\begin{aligned} (g \circ g)(x) &= g(g(x)) \\ &= g(x^2 - x - 6) \\ &= \underbrace{(x^2 - x - 6)^2}_{g(x)} - \underbrace{(x^2 - x - 6)}_{g(x)} - 6 \\ &= x^4 - 2x^3 - 12x^2 + 13x + 36. \end{aligned}$$

The domain of the composition of two polynomials is $(-\infty, \infty)$.

Related Exercises 47–48 ◀

QUICK CHECK 3 If $f(x) = x^2 + 1$ and $g(x) = x^2$, find $f \circ g$ and $g \circ f$. ◀

Figure 1.10

Figure 1.11

- Treat $f(x+h)$ like the composition $f(g(x))$, where $x+h$ plays the role of $g(x)$. It may help to establish a pattern in your mind before evaluating $f(x+h)$. For instance, using the function in Example 9a, we have

$$f(x) = 3x^2 - x;$$

$$f(12) = 3 \cdot 12^2 - 12;$$

$$f(b) = 3b^2 - b;$$

$$f(\text{math}) = 3 \cdot \text{math}^2 - \text{math};$$

therefore,

$$f(x+h) = 3(x+h)^2 - (x+h).$$

- See the front papers of this text for a review of factoring formulas.

Secant Lines and the Difference Quotient

As you will see shortly, slopes of lines and curves play a fundamental role in calculus. **Figure 1.10** shows two points $P(x, f(x))$ and $Q(x+h, f(x+h))$ on the graph of $y = f(x)$ in the case that $h > 0$. A line through any two points on a curve is called a **secant line**; its importance in the study of calculus is explained in Chapters 2 and 3. For now, we focus on the slope of the secant line through P and Q , which is denoted m_{sec} and is given by

$$m_{\text{sec}} = \frac{\text{change in } y}{\text{change in } x} = \frac{f(x+h) - f(x)}{(x+h) - x} = \frac{f(x+h) - f(x)}{h}.$$

The slope formula $\frac{f(x+h) - f(x)}{h}$ is also known as a **difference quotient**, and it can be expressed in several ways depending on how the coordinates of P and Q are labeled. For example, given the coordinates $P(a, f(a))$ and $Q(x, f(x))$ (**Figure 1.11**), the difference quotient is

$$m_{\text{sec}} = \frac{f(x) - f(a)}{x - a}.$$

We interpret the slope of the secant line in this form as the **average rate of change** of f over the interval $[a, x]$.

EXAMPLE 9 Working with difference quotients

- Simplify the difference quotient $\frac{f(x+h) - f(x)}{h}$, for $f(x) = 3x^2 - x$.
- Simplify the difference quotient $\frac{f(x) - f(a)}{x - a}$, for $f(x) = x^3$.

SOLUTION

- First note that $f(x+h) = 3(x+h)^2 - (x+h)$. We substitute this expression into the difference quotient and simplify:

$$\begin{aligned} \frac{f(x+h) - f(x)}{h} &= \frac{\overbrace{3(x+h)^2 - (x+h)}^{f(x+h)} - \overbrace{(3x^2 - x)}^{f(x)}}{h} \\ &= \frac{3(x^2 + 2xh + h^2) - (x+h) - (3x^2 - x)}{h} && \text{Expand } (x+h)^2. \\ &= \frac{3x^2 + 6xh + 3h^2 - x - h - 3x^2 + x}{h} && \text{Distribute.} \\ &= \frac{6xh + 3h^2 - h}{h} && \text{Simplify.} \\ &= \frac{h(6x + 3h - 1)}{h} = 6x + 3h - 1. && \text{Factor and simplify.} \end{aligned}$$

- The factoring formula for the difference of perfect cubes is needed:

$$\begin{aligned} \frac{f(x) - f(a)}{x - a} &= \frac{x^3 - a^3}{x - a} \\ &= \frac{(x-a)(x^2 + ax + a^2)}{x - a} && \text{Factoring formula} \\ &= x^2 + ax + a^2. && \text{Simplify.} \end{aligned}$$

Related Exercises 66, 72 ◀

EXAMPLE 10 Interpreting the slope of the secant line The position of a hiker on a trail at various times t is recorded by a GPS watch worn by the hiker. These data are then uploaded to a computer to produce the graph of the distance function $d = f(t)$ shown in Figure 1.12, where d measures the distance traveled on the trail in miles and t is the elapsed time in hours from the beginning of the hike.

- Find the slope of the secant line that passes through the points on the graph corresponding to the trail segment between milepost 3 and milepost 5, and interpret the result.
- Estimate the slope of the secant line that passes through points A and B in Figure 1.12, and compare it to the slope of the secant line found in part (a).

► Figure 1.12 contains actual GPS data collected in Rocky Mountain National Park. See Exercises 75–76 for another look at the data set.

Figure 1.12

SOLUTION

- We see from the graph of $d = f(t)$ that 1.76 hours (about 1 hour and 46 minutes) has elapsed when the hiker arrives at milepost 3, while milepost 5 is reached 3.33 hours into the hike. This information is also expressed as $f(1.76) = 3$ and $f(3.33) = 5$. To find the slope of the secant line through these points, we compute the change in distance divided by the change in time:

$$m_{\text{sec}} = \frac{f(3.33) - f(1.76)}{3.33 - 1.76} = \frac{5 - 3}{3.33 - 1.76} \approx 1.3 \frac{\text{mi}}{\text{hr}}.$$

The units provide a clue about the physical meaning of the slope: It measures the average rate at which the distance changes per hour, which is the average speed of the hiker. In this case, the hiker walks with an average speed of approximately 1.3 mi/hr between mileposts 3 and 5.

- From the graph we see that the coordinates of points A and B are approximately $(4.2, 5.3)$ and $(4.4, 5.8)$, respectively, which implies the hiker walks $5.8 - 5.3 = 0.5$ mi in $4.4 - 4.2 = 0.2$ hr. The slope of the secant line through A and B is

$$m_{\text{sec}} = \frac{\text{change in } d}{\text{change in } t} \approx \frac{0.5}{0.2} = 2.5 \frac{\text{mi}}{\text{hr}}.$$

For this segment of the trail, the hiker walks at an average speed of about 2.5 mi/hr, nearly twice as fast as the average speed computed in part (a). Expressed another way, steep sections of the distance curve yield steep secant lines, which correspond to faster average hiking speeds. Conversely, any secant line with slope equal to 0 corresponds

to an average speed of 0. Looking one last time at Figure 1.12, we can identify the time intervals during which the hiker was resting alongside the trail—whenever the distance curve is horizontal, the hiker is not moving.

Related Exercise 75 ◀

QUICK CHECK 4 Refer to Figure 1.12. Find the hiker's average speed during the first mile of the trail and then determine the hiker's average speed in the time interval from 3.9 to 4.1 hours. ◀

Symmetry

The word *symmetry* has many meanings in mathematics. Here we consider symmetries of graphs and the relations they represent. Taking advantage of symmetry often saves time and leads to insights.

DEFINITION Symmetry in Graphs

A graph is **symmetric with respect to the y -axis** if whenever the point (x, y) is on the graph, the point $(-x, y)$ is also on the graph. This property means that the graph is unchanged when reflected across the y -axis (Figure 1.13a).

A graph is **symmetric with respect to the x -axis** if whenever the point (x, y) is on the graph, the point $(x, -y)$ is also on the graph. This property means that the graph is unchanged when reflected across the x -axis (Figure 1.13b).

A graph is **symmetric with respect to the origin** if whenever the point (x, y) is on the graph, the point $(-x, -y)$ is also on the graph (Figure 1.13c). Symmetry about both the x - and y -axes implies symmetry about the origin, but not vice versa.

Figure 1.13

DEFINITION Symmetry in Functions

An **even function** f has the property that $f(-x) = f(x)$, for all x in the domain. The graph of an even function is symmetric about the y -axis.

An **odd function** f has the property that $f(-x) = -f(x)$, for all x in the domain. The graph of an odd function is symmetric about the origin.

Polynomials consisting of only even powers of the variable (of the form x^{2n} , where n is a nonnegative integer) are even functions. Polynomials consisting of only odd powers of the variable (of the form x^{2n+1} , where n is a nonnegative integer) are odd functions.

QUICK CHECK 5 Explain why the graph of a nonzero function is never symmetric with respect to the x -axis. ◀

Even function: If (x, y) is on the graph, then $(-x, y)$ is on the graph.

Figure 1.14

No symmetry: neither even nor odd function.

Figure 1.15

- The symmetry of compositions of even and odd functions is considered in Exercises 101–104.

EXAMPLE 11 Identifying symmetry in functions Identify the symmetry, if any, in the following functions.

a. $f(x) = x^4 - 2x^2 - 20$ b. $g(x) = x^3 - 3x + 1$ c. $h(x) = \frac{1}{x^3 - x}$

SOLUTION

- a. The function f consists of only even powers of x (where $20 = 20 \cdot 1 = 20x^0$ and x^0 is considered an even power). Therefore, f is an even function (Figure 1.14). This fact is verified by showing that $f(-x) = f(x)$:

$$f(-x) = (-x)^4 - 2(-x)^2 - 20 = x^4 - 2x^2 - 20 = f(x).$$

- b. The function g consists of two odd powers and one even power (again, $1 = x^0$ is an even power). Therefore, we expect that g has no symmetry about the y -axis or the origin (Figure 1.15). Note that

$$g(-x) = (-x)^3 - 3(-x) + 1 = -x^3 + 3x + 1,$$

so $g(-x)$ equals neither $g(x)$ nor $-g(x)$; therefore, g has no symmetry.

- c. In this case, h is a composition of an odd function $f(x) = 1/x$ with an odd function $g(x) = x^3 - x$. Note that

$$h(-x) = \frac{1}{(-x)^3 - (-x)} = -\frac{1}{x^3 - x} = -h(x).$$

Because $h(-x) = -h(x)$, h is an odd function (Figure 1.16).

Odd function: If (x, y) is on the graph, then $(-x, -y)$ is on the graph.

Figure 1.16

Related Exercises 79–81 ◀

SECTION 1.1 EXERCISES

Getting Started

- Use the terms *domain*, *range*, *independent variable*, and *dependent variable* to explain how a function relates one variable to another variable.
- Is the independent variable of a function associated with the domain or range? Is the dependent variable associated with the domain or range?

- Decide whether graph A, graph B, or both represent functions.

4. The entire graph of f is given. State the domain and range of f .

5. Which statement about a function is true? (i) For each value of x in the domain, there corresponds one unique value of y in the range; (ii) for each value of y in the range, there corresponds one unique value of x in the domain. Explain.

6. Determine the domain and range of $g(x) = \frac{x^2 - 1}{x - 1}$. Sketch a graph of g .

7. Determine the domain and range of $f(x) = 3x^2 - 10$.

8. **Throwing a stone** A stone is thrown vertically upward from the ground at a speed of 40 m/s at time $t = 0$. Its distance d (in meters) above the ground (neglecting air resistance) is approximated by the function $f(t) = 40t - 5t^2$. Determine an appropriate domain for this function. Identify the independent and dependent variables.

9. **Water tower** A cylindrical water tower with a radius of 10 m and a height of 50 m is filled to a height of h m. The volume V of water (in cubic meters) is given by the function $g(h) = 100\pi h$. Identify the independent and dependent variables for this function, and then determine an appropriate domain.

10. Let $f(x) = 1/(x^3 + 1)$. Compute $f(2)$ and $f(y^2)$.

11. Let $f(x) = 2x + 1$ and $g(x) = 1/(x - 1)$. Simplify the expressions $f(g(1/2))$, $g(f(4))$, and $g(f(x))$.

12. Find functions f and g such that $f(g(x)) = (x^2 + 1)^5$. Find a different pair of functions f and g that also satisfy $f(g(x)) = (x^2 + 1)^5$.

13. Explain how to find the domain of $f \circ g$ if you know the domain and range of f and g .

14. If $f(x) = \sqrt{x}$ and $g(x) = x^3 - 2$, simplify the expressions $(f \circ g)(3)$, $(f \circ f)(64)$, $(g \circ f)(x)$, and $(f \circ g)(x)$.

15. Use the graphs of f and g in the figure to determine the following function values.

- a. $(f \circ g)(2)$ b. $g(f(2))$
 c. $f(g(4))$ d. $g(f(5))$
 e. $f(f(8))$ f. $g(f(g(5)))$

16. Use the table to evaluate the given compositions.

x	-1	0	1	2	3	4
$f(x)$	3	1	0	-1	-3	-1
$g(x)$	-1	0	2	3	4	5
$h(x)$	0	-1	0	3	0	4

- a. $h(g(0))$ b. $g(f(4))$
 c. $h(h(0))$ d. $g(h(f(4)))$
 e. $f(f(f(1)))$ f. $h(h(h(0)))$
 g. $f(h(g(2)))$ h. $g(f(h(4)))$
 i. $g(g(g(1)))$ j. $f(f(h(3)))$

17. **Rising radiosonde** The National Weather Service releases approximately 70,000 radiosondes every year to collect data from the atmosphere. Attached to a balloon, a radiosonde rises at about 1000 ft/min until the balloon bursts in the upper atmosphere. Suppose a radiosonde is released from a point 6 ft above the ground and that 5 seconds later, it is 83 ft above the ground. Let $f(t)$ represent the height (in feet) that the radiosonde is above the ground t seconds after it is released. Evaluate $\frac{f(5) - f(0)}{5 - 0}$ and interpret the meaning of this quotient.

18. **World record free fall** On October 14, 2012, Felix Baumgartner stepped off a balloon capsule at an altitude of 127,852.4 feet and began his free fall. It is claimed that Felix reached the speed of sound 34 seconds into his fall at an altitude of 109,731 feet and that he continued to fall at supersonic speed for 30 seconds until he was at an altitude of 75,330.4 feet. Let $f(t)$ equal the distance that Felix had fallen t seconds after leaving his capsule. Calculate $f(0)$, $f(34)$, $f(64)$, and his average supersonic speed $\frac{f(64) - f(34)}{64 - 34}$ (in ft/s) over the time interval $[34, 64]$.

(Source: <http://www.redbullstratos.com>)

19. Suppose f is an even function with $f(2) = 2$ and g is an odd function with $g(2) = -2$. Evaluate $f(-2)$, $g(-2)$, $f(g(2))$, and $g(f(-2))$.

20. Complete the left half of the graph of g if g is an odd function.

21. State whether the functions represented by graphs A, B, and C in the figure are even, odd, or neither.

22. State whether the functions represented by graphs A, B, and C in the figure are even, odd, or neither.

Practice Exercises

- 23–26. **Domain and range** State the domain and range of the function.

23. $f(x) = \frac{x^2 - 5x + 6}{x - 2}$

24. $f(x) = \frac{x - 2}{2 - x}$

25. $f(x) = \sqrt{7 - x^2}$

26. $f(x) = -\sqrt{25 - x^2}$

- 27–30. **Domain** State the domain of the function.

27. $h(u) = \sqrt[3]{u - 1}$

28. $F(w) = \sqrt[4]{2 - w}$

29. $f(x) = (9 - x^2)^{3/2}$

30. $g(t) = \frac{1}{1 + t^2}$

- 31. Launching a rocket** A small rocket is launched vertically upward from the edge of a cliff 80 ft above the ground at a speed of 96 ft/s. Its height (in feet) above the ground is given by $h(t) = -16t^2 + 96t + 80$, where t represents time measured in seconds.

- Assuming the rocket is launched at $t = 0$, what is an appropriate domain for h ?
- Graph h and determine the time at which the rocket reaches its highest point. What is the height at that time?

- 32. Draining a tank (Torricelli's law)** A cylindrical tank with a cross-sectional area of 10 m^2 is filled to a depth of 25 m with water. At $t = 0$ s, a drain in the bottom of the tank with an area of 1 m^2 is opened, allowing water to flow out of the tank. The depth of water in the tank (in meters) at time $t \geq 0$ is $d(t) = (5 - 0.22t)^2$.

- Check that $d(0) = 25$, as specified.
- At what time is the tank empty?
- What is an appropriate domain for d ?

- 33–42. Composite functions and notation** Let $f(x) = x^2 - 4$, $g(x) = x^3$, and $F(x) = 1/(x - 3)$. Simplify or evaluate the following expressions.

33. $g(1/z)$

34. $F(y^4)$

35. $F(g(y))$

36. $f(g(w))$

37. $g(f(u))$

38. $\frac{f(2 + h) - f(2)}{h}$

39. $F(F(x))$

40. $g(F(f(x)))$

41. $f(\sqrt{x + 4})$

42. $F\left(\frac{3x + 1}{x}\right)$

- 43–46. Working with composite functions** Find possible choices for outer and inner functions f and g such that the given function h equals $f \circ g$.

43. $h(x) = (x^3 - 5)^{10}$

44. $h(x) = \frac{2}{(x^6 + x^2 + 1)^2}$

45. $h(x) = \sqrt{x^4 + 2}$

46. $h(x) = \frac{1}{\sqrt{x^3 - 1}}$

- 47–54. More composite functions** Let $f(x) = |x|$, $g(x) = x^2 - 4$, $F(x) = \sqrt{x}$, and $G(x) = 1/(x - 2)$. Determine the following composite functions and give their domains.

47. $f \circ g$

48. $g \circ f$

49. $f \circ G$

50. $f \circ g \circ G$

51. $G \circ g \circ f$

52. $g \circ F \circ F$

53. $g \circ g$

54. $G \circ G$

- 55–60. Missing piece** Let $g(x) = x^2 + 3$. Find a function f that produces the given composition.

55. $(f \circ g)(x) = x^2$

56. $(f \circ g)(x) = \frac{1}{x^2 + 3}$

57. $(f \circ g)(x) = x^4 + 6x^2 + 9$

58. $(f \circ g)(x) = x^4 + 6x^2 + 20$

59. $(g \circ f)(x) = x^4 + 3$

60. $(g \circ f)(x) = x^{2/3} + 3$

61. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- The range of $f(x) = 2x - 38$ is all real numbers.
- The relation $y = x^6 + 1$ is *not* a function because $y = 2$ for both $x = -1$ and $x = 1$.
- If $f(x) = x^{-1}$, then $f(1/x) = 1/f(x)$.
- In general, $f(f(x)) = (f(x))^2$.
- In general, $f(g(x)) = g(f(x))$.
- By definition, $f(g(x)) = (f \circ g)(x)$.
- If $f(x)$ is an even function, then $cf(ax)$ is an even function, where a and c are nonzero real numbers.
- If $f(x)$ is an odd function, then $f(x) + d$ is an odd function, where d is a nonzero real number.
- If f is both even *and* odd, then $f(x) = 0$ for all x .

62–68. Working with difference quotients Simplify the difference quotient $\frac{f(x+h) - f(x)}{h}$ for the following functions.

62. $f(x) = 10$ **63.** $f(x) = 3x$

64. $f(x) = 4x - 3$ **65.** $f(x) = x^2$

66. $f(x) = 2x^2 - 3x + 1$ **67.** $f(x) = \frac{2}{x}$

68. $f(x) = \frac{x}{x+1}$

69–74. Working with difference quotients Simplify the difference quotient $\frac{f(x) - f(a)}{x - a}$ for the following functions.

69. $f(x) = x^2 + x$ **70.** $f(x) = 4 - 4x - x^2$

71. $f(x) = x^3 - 2x$ **72.** $f(x) = x^4$

73. $f(x) = -\frac{4}{x^2}$ **74.** $f(x) = \frac{1}{x} - x^2$

75. GPS data A GPS device tracks the elevation E (in feet) of a hiker walking in the mountains. The elevation t hours after beginning the hike is given in the figure.

- Find the slope of the secant line that passes through points A and B. Interpret your answer as an average rate of change over the interval $1 \leq t \leq 3$.
- Repeat the procedure outlined in part (a) for the secant line that passes through points P and Q.
- Notice that the curve in the figure is horizontal for an interval of time near $t = 5.5$ hr. Give a plausible explanation for the horizontal line segment.

76. Elevation vs. Distance The following graph, obtained from GPS data, shows the elevation of a hiker as a function of the distance d from the starting point of the trail.

- Find the slope of the secant line that passes through points A and B. Interpret your answer as an average rate of change over the interval $1 \leq d \leq 3$.
- Repeat the procedure outlined in part (a) for the secant line that passes through points P and Q.
- Notice that the elevation function is nearly constant over the segment of the trail from mile $d = 4.5$ to mile $d = 5$. Give a plausible explanation for the horizontal line segment.

77–78. Interpreting the slope of secant lines In each exercise, a function and an interval of its independent variable are given. The endpoints of the interval are associated with points P and Q on the graph of the function.

- Sketch a graph of the function and the secant line through P and Q.
- Find the slope of the secant line in part (a), and interpret your answer in terms of an average rate of change over the interval. Include units in your answer.

77. After t seconds, an object dropped from rest falls a distance $d = 16t^2$, where d is measured in feet and $2 \leq t \leq 5$.

78. The volume V of an ideal gas in cubic centimeters is given by $V = 2/p$, where p is the pressure in atmospheres and $0.5 \leq p \leq 2$.

79–86. Symmetry Determine whether the graphs of the following equations and functions are symmetric about the x -axis, the y -axis, or the origin. Check your work by graphing.

79. $f(x) = x^4 + 5x^2 - 12$ **80.** $f(x) = 3x^5 + 2x^3 - x$

81. $f(x) = x^5 - x^3 - 2$ **82.** $f(x) = 2|x|$

83. $x^{2/3} + y^{2/3} = 1$ **84.** $x^3 - y^5 = 0$

85. $f(x) = x|x|$ **86.** $|x| + |y| = 1$

Explorations and Challenges

87. Composition of even and odd functions from graphs Assume f is an even function and g is an odd function. Use the (incomplete) graphs of f and g in the figure to determine the following function values.

- $f(g(-2))$
- $g(f(-2))$
- $f(g(-4))$
- $g(f(5) - 8)$
- $g(g(-7))$
- $f(1 - f(8))$

- 88. Composition of even and odd functions from tables** Assume f is an even function, g is an odd function, and both are defined at 0. Use the (incomplete) table to evaluate the given compositions.

x	1	2	3	4
$f(x)$	2	-1	3	-4
$g(x)$	-3	-1	-4	-2

- a. $f(g(-1))$ b. $g(f(-4))$
 c. $f(g(-3))$ d. $f(g(-2))$
 e. $g(g(-1))$ f. $f(g(0) - 1)$
 g. $f(g(g(-2)))$ h. $g(f(f(-4)))$
 i. $g(g(g(-1)))$
- 89. Absolute value graphs** Use the definition of absolute value (see Appendix B, online at bit.ly/2y3Nck3) to graph the equation $|x| - |y| = 1$. Use a graphing utility to check your work.
- 90. Graphing semicircles** Show that the graph of $f(x) = 10 + \sqrt{-x^2 + 10x - 9}$ is the upper half of a circle. Then determine the domain and range of the function.
- 91. Graphing semicircles** Show that the graph of $g(x) = 2 - \sqrt{-x^2 + 6x + 16}$ is the lower half of a circle. Then determine the domain and range of the function.

92. Even and odd at the origin

- a. If $f(0)$ is defined and f is an even function, is it necessarily true that $f(0) = 0$? Explain.
 b. If $f(0)$ is defined and f is an odd function, is it necessarily true that $f(0) = 0$? Explain.

93–96. Polynomial calculations Find a polynomial f that satisfies the following properties. (Hint: Determine the degree of f ; then substitute a polynomial of that degree and solve for its coefficients.)

93. $f(f(x)) = 9x - 8$

94. $(f(x))^2 = 9x^2 - 12x + 4$

95. $f(f(x)) = x^4 - 12x^2 + 30$

96. $(f(x))^2 = x^4 - 12x^2 + 36$

97–100. Difference quotients Simplify the difference quotients $\frac{f(x+h) - f(x)}{h}$ and $\frac{f(x) - f(a)}{x - a}$ by rationalizing the numerator.

97. $f(x) = \sqrt{x}$

98. $f(x) = \sqrt{1 - 2x}$

99. $f(x) = -\frac{3}{\sqrt{x}}$

100. $f(x) = \sqrt{x^2 + 1}$

101–104. Combining even and odd functions Let E be an even function and O be an odd function. Determine the symmetry, if any, of the following functions.

101. $E + O$

102. $E \cdot O$

103. $O \circ E$

104. $E \circ O$

QUICK CHECK ANSWERS

1. $3, x^4 - 2x^2, t^2 - 2t, p^2 - 4p + 3$ 2. Domain is all real numbers; range is $\{y: 0 < y \leq 1\}$. 3. $(f \circ g)(x) = x^4 + 1$ and $(g \circ f)(x) = (x^2 + 1)^2$ 4. Average speed ≈ 2.2 mi/hr for first mile; average speed $= 0$ on $3.9 \leq t \leq 4.1$. 5. If the graph were symmetric with respect to the x -axis, it would not pass the vertical line test. ◀

1.2 Representing Functions

We consider four approaches to defining and representing functions: formulas, graphs, tables, and words.

Using Formulas

The following list is a brief catalog of the families of functions that are introduced in this chapter and studied systematically throughout this text; they are all defined by *formulas*.

1. Polynomials are functions of the form

$$p(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0,$$

where the **coefficients** $a_0, a_1, \dots, a_n$ are real numbers with $a_n \neq 0$ and the nonnegative integer n is the **degree** of the polynomial. The domain of any polynomial is the set of all real numbers. An n th-degree polynomial can have as many as n real **zeros** or **roots**—values of x at which $p(x) = 0$; the zeros are points at which the graph of p intersects the x -axis.

- One version of the Fundamental Theorem of Algebra states that a nonzero polynomial of degree n has exactly n (possibly complex) roots, counting each root up to its multiplicity.

► Exponential and logarithmic functions, along with inverse trigonometric functions, are introduced in Chapter 7.

2. Rational functions are ratios of the form $f(x) = p(x)/q(x)$, where p and q are polynomials. Because division by zero is prohibited, the domain of a rational function is the set of all real numbers except those for which the denominator is zero.

3. Algebraic functions are constructed using the operations of algebra: addition, subtraction, multiplication, division, and roots. Examples of algebraic functions are $f(x) = \sqrt{2x^3 + 4}$ and $g(x) = x^{1/4}(x^3 + 2)$. In general, if an even root (square root, fourth root, and so forth) appears, then the domain does not contain points at which the quantity under the root is negative (and perhaps other points).

4. Exponential functions have the form $f(x) = b^x$, where the base $b \neq 1$ is a positive real number. Closely associated with exponential functions are **logarithmic functions** of the form $f(x) = \log_b x$, where $b > 0$ and $b \neq 1$. Exponential functions have a domain consisting of all real numbers. Logarithmic functions are defined for positive real numbers.

The **natural exponential function** is $f(x) = e^x$, with base $b = e$, where $e \approx 2.71828 \dots$ is one of the fundamental constants of mathematics. Associated with the natural exponential function is the **natural logarithm function** $f(x) = \ln x$, which also has the base $b = e$.

5. The trigonometric functions are $\sin x$, $\cos x$, $\tan x$, $\cot x$, $\sec x$, and $\csc x$; they are fundamental to mathematics and many areas of application. Also important are their relatives, the **inverse trigonometric functions**.

6. Trigonometric, exponential, and logarithmic functions are a few examples of a large family called **transcendental functions**. Figure 1.17 shows the organization of these functions, which are explored in detail in upcoming chapters.

Figure 1.17

QUICK CHECK 1 Are all polynomials rational functions? Are all algebraic functions polynomials? ◀

Using Graphs

Although formulas are the most compact way to represent many functions, graphs often provide the most illuminating representations. Two of countless examples of functions and their graphs are shown in Figure 1.18. Much of this text is devoted to creating and analyzing graphs of functions.

Figure 1.18

There are two approaches to graphing functions.

- Graphing calculators and graphing software are easy to use and powerful. Such **technology** easily produces graphs of most functions encountered in this text. We assume you know how to use a graphing utility.
- Graphing utilities, however, are not infallible. Therefore, you should also strive to master **analytical methods** (pencil-and-paper methods) in order to analyze functions and make accurate graphs by hand. Analytical methods rely heavily on calculus and are presented throughout this text.

The important message is this: Both technology and analytical methods are essential and must be used together in an integrated way to produce accurate graphs.

Linear Functions One form of the equation of a line (see Appendix B, online at bit.ly/2y3Nck3) is $y = mx + b$, where m and b are constants. Therefore, the function $f(x) = mx + b$ has a straight-line graph and is called a **linear function**.

Figure 1.19

► In the solution to Example 1b, we used the point (2, 1) to determine the value of b . Using the point (5, 7)—or, equivalently, the fact that $g(5) = 7$ —leads to the same result.

EXAMPLE 1 Linear functions and their graphs Determine the function represented by (a) line A in Figure 1.19 and (b) line B in Figure 1.19.

SOLUTION

- a. From the graph, we see that the y-intercept of line A is (0, 6). Using the points (0, 6) and (7, 3), we find that the slope of the line is

$$m = \frac{3 - 6}{7 - 0} = -\frac{3}{7}.$$

Therefore, the line is described by the function $f(x) = -\frac{3}{7}x + 6$.

- b. Line B passes through the points (2, 1) and (5, 7), so the slope of this line is

$$m = \frac{7 - 1}{5 - 2} = 2,$$

which implies that the line is described by a function of the form $g(x) = 2x + b$. To determine the value of b , note that $g(2) = 1$:

$$g(2) = 2 \cdot 2 + b = 1.$$

Solving for b , we find that $b = 1 - 4 = -3$. Therefore, the line is described by the function $g(x) = 2x - 3$.

Related Exercises 3, 15–16 ◀

EXAMPLE 2 Demand function for pizzas After studying sales for several months, the owner of a pizza chain knows that the number of two-topping pizzas sold in a week (called the *demand*) decreases as the price increases. Specifically, her data indicate that at a price of \$14 per pizza, an average of 400 pizzas are sold per week, while at a price of \$17 per pizza, an average of 250 pizzas are sold per week. Assume the demand d is a linear function of the price p .

- Find the constants m and b in the demand function $d = f(p) = mp + b$. Then graph f .
- According to this model, how many pizzas (on average) are sold per week at a price of \$20?

SOLUTION

- a. Two points on the graph of the demand function are given: $(p, d) = (14, 400)$ and $(17, 250)$. Therefore, the slope of the demand line is

$$m = \frac{400 - 250}{14 - 17} = -50 \text{ pizzas per dollar.}$$

Figure 1.20

- The units of the slope in Example 2 have meaning: For every dollar the price is reduced, an average of 50 more pizzas can be sold.

Figure 1.21

Figure 1.22

Figure 1.23

It follows that the equation of the linear demand function is

$$d - 250 = -50(p - 17).$$

Expressing d as a function of p , we have $d = f(p) = -50p + 1100$ (Figure 1.20).

- b. Using the demand function with a price of \$20, the average number of pizzas that could be sold per week is $f(20) = 100$.

Related Exercise 21 ◀

Piecewise Functions A function may have different definitions on different parts of its domain. For example, income tax is levied in tax brackets that have different tax rates. Functions that have different definitions on different parts of their domain are called **piecewise functions**. If all the pieces are linear, the function is **piecewise linear**. Here are some examples.

EXAMPLE 3 Defining a piecewise function The graph of a piecewise linear function g is shown in Figure 1.21. Find a formula for the function.

SOLUTION For $x < 2$, the graph is linear with a slope of 1 and a y-intercept of $(0, 0)$; its equation is $y = x$. For $x > 2$, the slope of the line is $-\frac{1}{2}$ and it passes through $(4, 3)$; an equation of this piece of the function is

$$y - 3 = -\frac{1}{2}(x - 4) \quad \text{or} \quad y = -\frac{1}{2}x + 5.$$

For $x = 2$, we have $g(2) = 3$. Therefore,

$$g(x) = \begin{cases} x & \text{if } x < 2 \\ 3 & \text{if } x = 2 \\ -\frac{1}{2}x + 5 & \text{if } x > 2. \end{cases}$$

Related Exercises 25–26 ◀

EXAMPLE 4 Graphing piecewise functions Graph the following functions.

a. $f(x) = \begin{cases} \frac{x^2 - 5x + 6}{x - 2} & \text{if } x \neq 2 \\ 1 & \text{if } x = 2 \end{cases}$

b. $f(x) = |x|$, the **absolute value** function

SOLUTION

- a. The function f is simplified by factoring and then canceling $x - 2$, assuming $x \neq 2$:

$$\frac{x^2 - 5x + 6}{x - 2} = \frac{(x - 2)(x - 3)}{x - 2} = x - 3.$$

Therefore, the graph of f is identical to the graph of the line $y = x - 3$ when $x \neq 2$. We are given that $f(2) = 1$ (Figure 1.22).

- b. The absolute value of a real number is defined as

$$f(x) = |x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0. \end{cases}$$

Graphing $y = -x$, for $x < 0$, and $y = x$, for $x \geq 0$, produces the graph in Figure 1.23.

Related Exercises 29–30 ◀

Power Functions Power functions are a special case of polynomials; they have the form $f(x) = x^n$, where n is a positive integer. When n is an even integer, the function values are

nonnegative and the graph passes through the origin, opening upward (Figure 1.24). For odd integers, the power function $f(x) = x^n$ has values that are positive when x is positive and negative when x is negative (Figure 1.25).

Figure 1.24

Figure 1.25

QUICK CHECK 2 What is the range of $f(x) = x^7$? What is the range of $f(x) = x^8$? ◀

Root Functions Root functions are a special case of algebraic functions; they have the form $f(x) = x^{1/n}$, where $n > 1$ is a positive integer. Notice that when n is even (square roots, fourth roots, and so forth), the domain and range consist of nonnegative numbers. Their graphs begin steeply at the origin and flatten out as x increases (Figure 1.26).

By contrast, the odd root functions (cube roots, fifth roots, and so forth) are defined for all real values of x , and their range is all real numbers. Their graphs pass through the origin, open upward for $x < 0$ and downward for $x > 0$, and flatten out as x increases in magnitude (Figure 1.27).

► Recall that if n is a positive integer, then $x^{1/n}$ is the n th root of x ; that is, $f(x) = x^{1/n} = \sqrt[n]{x}$.

QUICK CHECK 3 What are the domain and range of $f(x) = x^{1/7}$? What are the domain and range of $f(x) = x^{1/10}$? ◀

Figure 1.26

Figure 1.27

Rational Functions Rational functions appear frequently in this text, and much is said later about graphing rational functions. The following example illustrates how analysis and technology work together.

EXAMPLE 5 Technology and analysis Consider the rational function

$$f(x) = \frac{3x^3 - x - 1}{x^3 + 2x^2 - 6}.$$

- What is the domain of f ?
- Find the roots (zeros) of f .
- Graph the function using a graphing utility.

Figure 1.28

► In Chapter 4, we show how calculus is used to locate the local maximum and local minimum values of a function.

Table 1.1

t (s)	d (cm)
0	0
1	2
2	6
3	14
4	24
5	34
6	44
7	54

Using Tables

Sometimes functions do not originate as formulas or graphs; they may start as numbers or data. For example, suppose you do an experiment in which a marble is dropped into a cylinder filled with heavy oil and is allowed to fall freely. You measure the total distance d , in centimeters, that the marble falls at times $t = 0, 1, 2, 3, 4, 5, 6$, and 7 seconds after it is dropped (Table 1.1). The first step might be to plot the data points (Figure 1.29).

Figure 1.29

Figure 1.30

The data points suggest that there is a function $d = f(t)$ that gives the distance that the marble falls at *all* times of interest. Because the marble falls through the oil without abrupt changes, a smooth graph passing through the data points (Figure 1.30) is reasonable. Finding the function that best fits the data is a more difficult problem, which we discuss later in the text.

Using Words

Using words may be the least mathematical way to define functions, but it is often the way in which functions originate. Once a function is defined in words, it can often be tabulated, graphed, or expressed as a formula.

EXAMPLE 6 A slope function Let S be the **slope function** for a given function f . In words, this means that $S(x)$ is the slope of the curve $y = f(x)$ at the point $(x, f(x))$. Find and graph the slope function for the function f in Figure 1.31.

Figure 1.31

d. At what points does the function have peaks and valleys?

e. How does f behave as x grows large in magnitude?

SOLUTION

- The domain consists of all real numbers except those at which the denominator is zero. A graphing utility shows that the denominator has one real zero at $x \approx 1.34$ and therefore, the domain of f is $\{x: x \neq 1.34\}$.
- The roots of a rational function are the roots of the numerator, provided they are not also roots of the denominator. Using a graphing utility, the only real root of the numerator is $x \approx 0.85$.
- After experimenting with the graphing window, a reasonable graph of f is obtained (Figure 1.28). Because the denominator is zero at $x \approx 1.34$, the function becomes large in magnitude at nearby points, and f has a *vertical asymptote*.
- The function has two peaks (soon to be called *local maxima*), one near $x = -3.0$ and one near $x = 0.4$. The function also has two valleys (soon to be called *local minima*), one near $x = -0.3$ and one near $x = 2.6$.
- By zooming out, it appears that as x increases in the positive direction, the graph approaches the *horizontal asymptote* $y = 3$ from below, and as x becomes large and negative, the graph approaches $y = 3$ from above.

Related Exercises 35–36 ◀

Figure 1.32

Figure 1.33

► Slope functions and area functions reappear in upcoming chapters and play an essential part in calculus.

SOLUTION For $x < 1$, the slope of $y = f(x)$ is 2. The slope is 0 for $1 < x < 2$, and the slope is -1 for $x > 2$. At $x = 1$ and $x = 2$, the graph of f has a corner, so the slope is undefined at these points. Therefore, the domain of S is the set of all real numbers except $x = 1$ and $x = 2$, and the slope function (Figure 1.32) is defined by the piecewise function

$$S(x) = \begin{cases} 2 & \text{if } x < 1 \\ 0 & \text{if } 1 < x < 2 \\ -1 & \text{if } x > 2. \end{cases}$$

Related Exercises 47–48 ◀

EXAMPLE 7 An area function Let A be an **area function** for a positive function f . In words, this means that $A(x)$ is the area of the region bounded by the graph of f and the t -axis from $t = 0$ to $t = x$. Consider the function (Figure 1.33)

$$f(t) = \begin{cases} 2t & \text{if } 0 \leq t \leq 3 \\ 6 & \text{if } t > 3. \end{cases}$$

- Find $A(2)$ and $A(5)$.
- Find a piecewise formula for the area function for f .

SOLUTION

- The value of $A(2)$ is the area of the shaded region between the graph of f and the t -axis from $t = 0$ to $t = 2$ (Figure 1.34a). Using the formula for the area of a triangle,

$$A(2) = \frac{1}{2}(2)(4) = 4.$$

Figure 1.34

The value of $A(5)$ is the area of the shaded region between the graph of f and the t -axis on the interval $[0, 5]$ (Figure 1.34b). This area equals the area of the triangle whose base is the interval $[0, 3]$ plus the area of the rectangle whose base is the interval $[3, 5]$:

$$A(5) = \underbrace{\frac{1}{2}(3)(6)}_{\text{area of the triangle}} + \underbrace{(2)(6)}_{\text{area of the rectangle}} = 21.$$

- For $0 \leq x \leq 3$ (Figure 1.35a), $A(x)$ is the area of the triangle whose base is the interval $[0, x]$. Because the height of the triangle at $t = x$ is $f(x)$,

$$A(x) = \frac{1}{2}x f(x) = \frac{1}{2}x \underbrace{(2x)}_{f(x)} = x^2.$$

Figure 1.35

For $x > 3$ (Figure 1.35b), $A(x)$ is the area of the triangle on the interval $[0, 3]$ plus the area of the rectangle on the interval $[3, x]$:

$$A(x) = \underbrace{\frac{1}{2}(3)(6)}_{\text{area of the triangle}} + \underbrace{(x-3)(6)}_{\text{area of the rectangle}} = 6x - 9.$$

Therefore, the area function A (Figure 1.36) has the piecewise definition

$$A(x) = \begin{cases} x^2 & \text{if } 0 \leq x \leq 3 \\ 6x - 9 & \text{if } x > 3. \end{cases}$$

Related Exercises 51–52 ◀

Figure 1.36

Transformations of Functions and Graphs

There are several ways to transform the graph of a function to produce graphs of new functions. Four transformations are common: *shifts* in the x - and y -directions and *scalings* in the x - and y -directions. These transformations, summarized in Figures 1.37–1.42, can save time in graphing and visualizing functions.

Figure 1.37

Figure 1.38

For $c > 0$ and $c \neq 1$, the graph of $y = cf(x)$ is the graph of $y = f(x)$ scaled vertically by a factor of c : compressed if $0 < c < 1$ and stretched if $c > 1$.

Figure 1.39

For $c < 0$, the graph of $y = cf(x)$ is the graph of $y = f(x)$ reflected across the x -axis and scaled vertically (if $c \neq -1$) by a factor of $|c|$: compressed if $0 < |c| < 1$ and stretched if $|c| > 1$.

Figure 1.40

For $a > 0$ and $a \neq 1$, the graph of $y = f(ax)$ is the graph of $y = f(x)$ scaled horizontally by a factor of $1/a$: compressed if $0 < 1/a < 1$ and stretched if $1/a > 1$.

Figure 1.41

For $a < 0$, the graph of $y = f(ax)$ is the graph of $y = f(x)$ reflected across the y -axis and scaled horizontally (if $a \neq -1$) by a factor of $1/|a|$: compressed if $0 < 1/|a| < 1$ and stretched if $1/|a| > 1$.

Figure 1.42

Figure 1.43

EXAMPLE 8 Transforming parabolas The graphs A, B, and C in Figure 1.43 are obtained from the graph of $f(x) = x^2$ using shifts and scalings. Find the function that describes each graph.

SOLUTION

- a. Graph A is the graph of f shifted to the right by 2 units. It represents the function

$$f(x - 2) = (x - 2)^2 = x^2 - 4x + 4.$$

- b. Graph B is the graph of f shifted down by 4 units. It represents the function

$$f(x) - 4 = x^2 - 4.$$

- c. Graph C is a vertical scaling of the graph of f shifted down by 1 unit. Therefore, it represents $cf(x) - 1 = cx^2 - 1$, for some value of c , with $0 < c < 1$ (because the graph is vertically compressed). Using the fact that graph C passes through the points $(\pm 2, 0)$, we find that $c = \frac{1}{4}$. Therefore, the graph represents

$$y = \frac{1}{4}f(x) - 1 = \frac{1}{4}x^2 - 1.$$

► You should verify that graph C also corresponds to a horizontal stretch and a vertical shift. It has the equation $y = f(ax) - 1$, where $a = \frac{1}{2}$.

QUICK CHECK 4 How do you modify the graph of $f(x) = 1/x$ to produce the graph of $g(x) = 1/(x + 4)$? ◀

- Note that we can also write $g(x) = 2|x + \frac{1}{2}|$, which means the graph of g may also be obtained by vertically stretching the graph of f by a factor of 2, followed by a horizontal shift.

Figure 1.44

EXAMPLE 9 **Scaling and shifting** Graph $g(x) = |2x + 1|$.

SOLUTION We write the function as $g(x) = |2(x + \frac{1}{2})|$. Letting $f(x) = |x|$, we have $g(x) = f(2(x + \frac{1}{2}))$. Therefore, the graph of g is obtained by horizontally compressing the graph of f by a factor of $\frac{1}{2}$ and shifting it $\frac{1}{2}$ unit to the left (Figure 1.44).

Related Exercise 64 ◀

SUMMARY Transformations

Given real numbers a , b , c , and d and a function f , the graph of $y = cf(a(x - b)) + d$ can be obtained from the graph of $y = f(x)$ in the following steps.

$$\begin{array}{l}
 \text{horizontal scaling by a factor of } 1/|a| \text{ (and reflection across the } y\text{-axis if } a < 0\text{)} \\
 y = f(x) \xrightarrow{\hspace{1.5cm}} y = f(ax) \\
 \\
 \text{horizontal shift by } b \text{ units} \\
 \xrightarrow{\hspace{1.5cm}} y = f(a(x - b)) \\
 \\
 \text{vertical scaling by a factor of } |c| \text{ (and reflection across the } x\text{-axis if } c < 0\text{)} \\
 \xrightarrow{\hspace{1.5cm}} y = cf(a(x - b)) \\
 \\
 \text{vertical shift by } d \text{ units} \\
 \xrightarrow{\hspace{1.5cm}} y = cf(a(x - b)) + d
 \end{array}$$

SECTION 1.2 EXERCISES

Getting Started

- Give four ways in which functions may be defined and represented.
- What is the domain of a polynomial?
- Determine the function f represented by the graph of the line $y = f(x)$ in the figure.

- Determine the linear function g whose graph is parallel to the line $y = 2x + 1$ and passes through the point $(5, 0)$.
- What is the domain of a rational function?
- What is a piecewise linear function?

- Write a definition of the piecewise linear function $y = f(x)$ that is given in the graph.

- The graph of $y = \sqrt{x}$ is shifted 2 units to the right and 3 units up. Write an equation for this transformed graph.
- How do you obtain the graph of $y = f(x + 2)$ from the graph of $y = f(x)$?
- How do you obtain the graph of $y = -3f(x)$ from the graph of $y = f(x)$?
- How do you obtain the graph of $y = f(3x)$ from the graph of $y = f(x)$?

12. How do you obtain the graph of $y = 4(x + 3)^2 + 6$ from the graph of $y = x^2$?
13. The graphs of the functions f and g in the figure are obtained by vertical and horizontal shifts and scalings of $y = |x|$. Find formulas for f and g . Verify your answers with a graphing utility.

14. **Transformations** Use the graph of f in the figure to plot the following functions.

- a. $y = -f(x)$ b. $y = f(x + 2)$
 c. $y = f(x - 2)$ d. $y = f(2x)$
 e. $y = f(x - 1) + 2$ f. $y = 2f(x)$

Practice Exercises

15. **Graph of a linear function** Find and graph the linear function that passes through the points $(1, 3)$ and $(2, 5)$.
16. **Graph of a linear function** Find and graph the linear function that passes through the points $(2, -3)$ and $(5, 0)$.
17. **Linear function** Find the linear function whose graph passes through the point $(3, 2)$ and is parallel to the line $y = 3x + 8$.
18. **Linear function** Find the linear function whose graph passes through the point $(-1, 4)$ and is perpendicular to the line $y = \frac{1}{4}x - 7$.

19–20. Yeast growth Consider a colony of yeast cells that has the shape of a cylinder. As the number of yeast cells increases, the cross-sectional area A (in mm^2) of the colony increases but the height of the colony remains constant. If the colony starts from a single cell, the number of yeast cells (in millions) is approximated by the linear function $N(A) = C_s A$, where the constant C_s is known as the cell-surface

coefficient. Use the given information to determine the cell-surface coefficient for each of the following colonies of yeast cells, and find the number of yeast cells in the colony when the cross-sectional area A reaches 150 mm^2 . (Source: *Letters in Applied Microbiology*, 594, 59, 2014)

19. The scientific name of baker's or brewer's yeast (used in making bread, wine, and beer) is *Saccharomyces cerevisiae*. When the cross-sectional area of a colony of this yeast reaches 100 mm^2 , there are 571 million yeast cells.
20. The yeast *Rhodotorula glutinis* is a laboratory contaminant. When the cross-sectional area of a colony reaches 100 mm^2 , there are 226 million yeast cells.
21. **Demand function** Sales records indicate that if Blu-ray players are priced at \$250, then a large store sells an average of 12 units per day. If they are priced at \$200, then the store sells an average of 15 units per day. Find and graph the linear demand function for Blu-ray sales. For what prices is the demand function defined?
22. **Fundraiser** The Biology Club plans to have a fundraiser for which \$8 tickets will be sold. The cost of room rental and refreshments is \$175. Find and graph the function $p = f(n)$ that gives the profit from the fundraiser when n tickets are sold. Notice that $f(0) = -\$175$; that is, the cost of room rental and refreshments must be paid regardless of how many tickets are sold. How many tickets must be sold for the fundraiser to break even (zero profit)?
23. **Bald eagle population** After DDT was banned and the Endangered Species Act was passed in 1973, the number of bald eagles in the United States increased dramatically. In the lower 48 states, the number of breeding pairs of bald eagles increased at a nearly linear rate from 1875 pairs in 1986 to 6471 pairs in 2000.
- Use the data points for 1986 and 2000 to find a linear function p that models the number of breeding pairs from 1986 to 2000 ($0 \leq t \leq 14$).
 - Using the function in part (a), approximately how many breeding pairs were in the lower 48 states in 1995?

(Source: U.S. Fish and Wildlife Service)

24. **Taxicab fees** A taxicab ride costs \$3.50 plus \$2.50 per mile. Let m be the distance (in miles) from the airport to a hotel. Find and graph the function $c(m)$ that represents the cost of taking a taxi from the airport to the hotel. Also determine how much it will cost if the hotel is 9 miles from the airport.

25–26. Defining piecewise functions Write a definition of the function whose graph is given.

25.

26.

27. Parking fees Suppose that it costs 5¢ per minute to park at the airport, with the rate dropping to 3¢ per minute after 9 P.M. Find and graph the cost function $c(t)$ for values of t satisfying $0 \leq t \leq 120$. Assume that t is the number of minutes after 8 P.M.

28. Taxicab fees A taxicab ride costs \$3.50 plus \$2.50 per mile for the first 5 miles, with the rate dropping to \$1.50 per mile after the fifth mile. Let m be the distance (in miles) from the airport to a hotel. Find and graph the piecewise linear function $c(m)$ that represents the cost of taking a taxi from the airport to a hotel m miles away.

29–34. Piecewise linear functions Graph the following functions.

$$29. f(x) = \begin{cases} \frac{x^2 - x}{x - 1} & \text{if } x \neq 1 \\ 2 & \text{if } x = 1 \end{cases}$$

$$30. f(x) = \begin{cases} \frac{x^2 - x - 2}{x - 2} & \text{if } x \neq 2 \\ 4 & \text{if } x = 2 \end{cases}$$

$$31. f(x) = \begin{cases} 3x - 1 & \text{if } x \leq 0 \\ -2x + 1 & \text{if } x > 0 \end{cases}$$

$$32. f(x) = \begin{cases} 3x - 1 & \text{if } x < 1 \\ x + 1 & \text{if } x \geq 1 \end{cases}$$

$$33. f(x) = \begin{cases} -2x - 1 & \text{if } x < -1 \\ 1 & \text{if } -1 \leq x \leq 1 \\ 2x - 1 & \text{if } x > 1 \end{cases}$$

$$34. f(x) = \begin{cases} 2x + 2 & \text{if } x < 0 \\ x + 2 & \text{if } 0 \leq x \leq 2 \\ 3 - \frac{x}{2} & \text{if } x > 2 \end{cases}$$

35–40. Graphs of functions

- Use a graphing utility to produce a graph of the given function. Experiment with different windows to see how the graph changes on different scales. Sketch an accurate graph by hand after using the graphing utility.
- Give the domain of the function.
- Discuss interesting features of the function, such as peaks, valleys, and intercepts (as in Example 5).

$$35. f(x) = x^3 - 2x^2 + 6 \quad 36. f(x) = \sqrt[3]{2x^2 - 8}$$

$$37. g(x) = \left| \frac{x^2 - 4}{x + 3} \right| \quad 38. f(x) = \frac{\sqrt{3x^2 - 12}}{x + 1}$$

$$39. f(x) = 3 - |2x - 1| \quad 40. f(x) = \begin{cases} \frac{|x - 1|}{x - 1} & \text{if } x \neq 1 \\ 0 & \text{if } x = 1 \end{cases}$$

41. Features of a graph Consider the graph of the function f shown in the figure. Answer the following questions by referring to the points A–I.

- Which points correspond to the roots (zeros) of f ?
- Which points on the graph correspond to high points or peaks (soon to be called *local maximum* values of f)?
- Which points on the graph correspond to low points or valleys (soon to be called *local minimum* values of f)?
- As you move along the curve in the positive x -direction, at which point is the graph rising most rapidly?
- As you move along the curve in the positive x -direction, at which point is the graph falling most rapidly?

42. Features of a graph Consider the graph of the function g shown in the figure.

- Give the approximate roots (zeros) of g .
- Give the approximate coordinates of the high points or peaks (soon to be called *local maximum* values of g).
- Give the approximate coordinates of the low points or valleys (soon to be called *local minimum* values of g).

- d. Imagine moving along the curve in the positive x -direction on the interval $[0, 3]$. Give the approximate coordinates of the point at which the graph is rising most rapidly.
- e. Imagine moving along the curve in the positive x -direction on the interval $[0, 3]$. Give the approximate coordinates of the point at which the graph is falling most rapidly.

T 43. Relative acuity of the human eye The **fovea centralis** (or **fovea**) is responsible for the sharp central vision that humans use for reading and other detail-oriented eyesight. The relative acuity of a human eye, which measures the sharpness of vision, is modeled by the function

$$R(\theta) = \frac{0.568}{0.331|\theta| + 0.568},$$

where θ (in degrees) is the angular deviation of the line of sight from the center of the fovea (see figure).

- a. Graph R , for $-15 \leq \theta \leq 15$.
- b. For what value of θ is R maximized? What does this fact indicate about our eyesight?
- c. For what values of θ do we maintain at least 90% of our maximum relative acuity? (Source: *The Journal of Experimental Biology*, 203, 24, Dec 2000)

44–48. Slope functions Determine the slope function $S(x)$ for the following functions.

44. $f(x) = 3$ 45. $f(x) = 2x + 1$ 46. $f(x) = |x|$

47. Use the figure for Exercise 7.

48. Use the figure for Exercise 26.

49–52. Area functions Let $A(x)$ be the area of the region bounded by the t -axis and the graph of $y = f(t)$ from $t = 0$ to $t = x$. Consider the following functions and graphs.

a. Find $A(2)$. b. Find $A(6)$. c. Find a formula for $A(x)$.

49. $f(t) = 6$

50. $f(t) = \frac{t}{2}$

51. $f(t) = \begin{cases} -2t + 8 & \text{if } t \leq 3 \\ 2 & \text{if } t > 3 \end{cases}$

52. $f(t) = |t - 2| + 1$

53. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. All polynomials are rational functions, but not all rational functions are polynomials.
- b. If f is a linear polynomial, then $f \circ f$ is a quadratic polynomial.
- c. If f and g are polynomials, then the degrees of $f \circ g$ and $g \circ f$ are equal.
- d. The graph of $g(x) = f(x + 2)$ is the graph of f shifted 2 units to the right.

54. Shifting a graph Use a shift to explain how the graph of $f(x) = \sqrt{-x^2 + 8x + 9}$ is obtained from the graph of $g(x) = \sqrt{25 - x^2}$. Sketch a graph of f .

55. Transformations of $f(x) = x^2$ Use shifts and scalings to transform the graph of $f(x) = x^2$ into the graph of g . Use a graphing utility to check your work.

- a. $g(x) = f(x - 3)$
- b. $g(x) = f(2x - 4)$
- c. $g(x) = -3f(x - 2) + 4$
- d. $g(x) = 6f\left(\frac{x - 2}{3}\right) + 1$

56. Transformations of $f(x) = \sqrt{x}$ Use shifts and scalings to transform the graph of $f(x) = \sqrt{x}$ into the graph of g . Use a graphing utility to check your work.

- a. $g(x) = f(x + 4)$ b. $g(x) = 2f(2x - 1)$
 c. $g(x) = \sqrt{x - 1}$ d. $g(x) = 3\sqrt{x - 1} - 5$

57–64. Shifting and scaling Use shifts and scalings to graph the given functions. Then check your work with a graphing utility. Be sure to identify an original function on which the shifts and scalings are performed.

57. $f(x) = (x - 2)^2 + 1$ 58. $f(x) = x^2 - 2x + 3$
 (Hint: Complete the square first.)
 59. $g(x) = -3x^2$ 60. $g(x) = 2x^3 - 1$
 61. $g(x) = 2(x + 3)^2$ 62. $p(x) = x^2 + 3x - 5$
 63. $h(x) = -4x^2 - 4x + 12$ 64. $h(x) = |3x - 6| + 1$

65–67. Intersection problems Find the following points of intersection.

65. The point(s) of intersection of the curves $y = 4\sqrt{2x}$ and $y = 2x^2$
 66. The point(s) of intersection of the parabola $y = x^2 + 2$ and the line $y = x + 4$
 67. The point(s) of intersection of the parabolas $y = x^2$ and $y = -x^2 + 8x$

Explorations and Challenges

68. Two semicircles The entire graph of f consists of the upper half of a circle of radius 2 centered at the origin and the lower half of a circle of radius 3 centered at $(5, 0)$. Find a piecewise function for f and plot a graph of f .

69. Piecewise function Plot a graph of the function

$$f(x) = \begin{cases} \frac{3}{2}x & \text{if } 0 \leq x \leq 2 \\ 3 + \sqrt{x - 2} & \text{if } 2 < x \leq 6 \\ \sqrt{25 - (x - 6)^2} & \text{if } 6 < x \leq 11. \end{cases}$$

70. Floor function The floor function, or greatest integer function, $f(x) = \lfloor x \rfloor$, gives the greatest integer less than or equal to x . Graph the floor function for $-3 \leq x \leq 3$.

71. Ceiling function The ceiling function, or smallest integer function, $f(x) = \lceil x \rceil$, gives the smallest integer greater than or equal to x . Graph the ceiling function for $-3 \leq x \leq 3$.

72. Sawtooth wave Graph the sawtooth wave defined by

$$f(x) = \begin{cases} \vdots \\ x + 1 & \text{if } -1 \leq x < 0 \\ x & \text{if } 0 \leq x < 1 \\ x - 1 & \text{if } 1 \leq x < 2 \\ x - 2 & \text{if } 2 \leq x < 3 \\ \vdots \end{cases}$$

73. Square wave Graph the square wave defined by

$$f(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{if } 0 \leq x < 1 \\ 0 & \text{if } 1 \leq x < 2 \\ 1 & \text{if } 2 \leq x < 3 \\ \vdots \end{cases}$$

74–76. Roots and powers Sketch a graph of the given pairs of functions. Be sure to draw the graphs accurately relative to each other.

74. $y = x^4$ and $y = x^6$
 75. $y = x^3$ and $y = x^7$
 76. $y = x^{1/3}$ and $y = x^{1/5}$

77. Tennis probabilities Suppose the probability of a server winning any given point in a tennis match is a constant p , with $0 \leq p \leq 1$. Then the probability of the server winning a game when serving from deuce is

$$f(p) = \frac{p^2}{1 - 2p(1 - p)}.$$

- a. Evaluate $f(0.75)$ and interpret the result.
 b. Evaluate $f(0.25)$ and interpret the result.

(Source: *The College Mathematics Journal*, 38, 1, Jan 2007)

78. Temperature scales

- a. Find the linear function $C = f(F)$ that gives the reading on the Celsius temperature scale corresponding to a reading on the Fahrenheit scale. Use the facts that $C = 0$ when $F = 32$ (freezing point) and $C = 100$ when $F = 212$ (boiling point).
 b. At what temperature are the Celsius and Fahrenheit readings equal?

79. Automobile lease vs. purchase A car dealer offers a purchase option and a lease option on all new cars. Suppose you are interested in a car that can be bought outright for \$25,000 or leased for a start-up fee of \$1200 plus monthly payments of \$350.

- a. Find the linear function $y = f(m)$ that gives the total amount you have paid on the lease option after m months.
 b. With the lease option, after a 48-month (4-year) term, the car has a residual value of \$10,000, which is the amount that you could pay to purchase the car. Assuming no other costs, should you lease or buy?

80. Walking and rowing Kelly has finished a picnic on an island that is 200 m off shore (see figure). She wants to return to a beach house that is 600 m from the point P on the shore closest to the island. She plans to row a boat to a point on shore x meters from P and then jog along the (straight) shore to the house.

- a. Let $d(x)$ be the total length of her trip as a function of x . Find and graph this function.

- b. Suppose that Kelly can row at 2 m/s and jog at 4 m/s. Let $T(x)$ be the total time for her trip as a function of x . Find and graph $y = T(x)$.
- c. Based on your graph in part (b), estimate the point on the shore at which Kelly should land to minimize the total time of her trip. What is that minimum time?

81. Optimal boxes Imagine a lidless box with height h and a square base whose sides have length x . The box must have a volume of 125 ft^3 .

- a. Find and graph the function $S(x)$ that gives the surface area of the box, for all values of $x > 0$.
- b. Based on your graph in part (a), estimate the value of x that produces the box with a minimum surface area.

82. Composition of polynomials Let f be an n th-degree polynomial and let g be an m th-degree polynomial. What is the degree of the following polynomials?

- a. $f \cdot f$ b. $f \circ f$ c. $f \cdot g$ d. $f \circ g$

83. Parabola vertex property Prove that if a parabola crosses the x -axis twice, the x -coordinate of the vertex of the parabola is halfway between the x -intercepts.

84. Parabola properties Consider the general quadratic function $f(x) = ax^2 + bx + c$, with $a \neq 0$.

- a. Find the coordinates of the vertex of the graph of the parabola $y = f(x)$ in terms of a , b , and c .
- b. Find the conditions on a , b , and c that guarantee that the graph of f crosses the x -axis twice.

85. Factorial function The factorial function is defined for positive integers as $n! = n(n-1)(n-2) \cdots 3 \cdot 2 \cdot 1$.

- a. Make a table of the factorial function, for $n = 1, 2, 3, 4$, and 5 .
- b. Graph these data points and then connect them with a smooth curve.
- c. What is the least value of n for which $n! > 10^6$?

QUICK CHECK ANSWERS

1. Yes; no 2. $(-\infty, \infty)$; $[0, \infty)$ 3. Domain and range are $(-\infty, \infty)$. Domain and range are $[0, \infty)$. 4. Shift the graph of f horizontally 4 units to the left. ◀

1.3 Trigonometric Functions

This section is a review of what you need to know in order to study the calculus of trigonometric functions.

Radian Measure

Calculus typically requires that angles be measured in **radians** (rad). Working with a circle of radius r , the radian measure of an angle θ is the length of the arc associated with θ , denoted s , divided by the radius of the circle r (Figure 1.45a). Working on a unit circle ($r = 1$), the radian measure of an angle is simply the length of the arc associated with θ (Figure 1.45b). For example, the length of a full unit circle is 2π ; therefore, an angle with a radian measure of π corresponds to a half circle ($\theta = 180^\circ$) and an angle with a radian measure of $\pi/2$ corresponds to a quarter circle ($\theta = 90^\circ$).

Degrees	Radians
0	0
30	$\pi/6$
45	$\pi/4$
60	$\pi/3$
90	$\pi/2$
120	$2\pi/3$
135	$3\pi/4$
150	$5\pi/6$
180	π

Figure 1.45

QUICK CHECK 1 What is the radian measure of a 270° angle? What is the degree measure of a $5\pi/4$ -radian angle? ◀

Trigonometric Functions

For acute angles, the trigonometric functions are defined as ratios of the lengths of the sides of a right triangle (Figure 1.46). To extend these definitions to include all angles, we work in an xy -coordinate system with a circle of radius r centered at the origin. Suppose that $P(x, y)$ is a point on the circle. An angle θ is in **standard position** if its initial side is on the positive x -axis

and its terminal side is the line segment OP between the origin and P . An angle is positive if it is obtained by a counterclockwise rotation from the positive x -axis (Figure 1.47). When the right-triangle definitions of Figure 1.46 are used with the right triangle in Figure 1.47, the trigonometric functions may be expressed in terms of x , y , and the radius of the circle, $r = \sqrt{x^2 + y^2}$.

Figure 1.46

Figure 1.47

- When working on a unit circle ($r = 1$), these definitions become

$$\begin{aligned} \sin \theta &= y & \cos \theta &= x \\ \tan \theta &= \frac{y}{x} & \cot \theta &= \frac{x}{y} \\ \sec \theta &= \frac{1}{x} & \csc \theta &= \frac{1}{y} \end{aligned}$$

DEFINITION Trigonometric Functions

Let $P(x, y)$ be a point on a circle of radius r associated with the angle θ . Then

$$\begin{aligned} \sin \theta &= \frac{y}{r}, & \cos \theta &= \frac{x}{r}, & \tan \theta &= \frac{y}{x}, \\ \cot \theta &= \frac{x}{y}, & \sec \theta &= \frac{r}{x}, & \csc \theta &= \frac{r}{y}. \end{aligned}$$

- Standard triangles

To evaluate the trigonometric functions at the standard angles (multiples of 30° and 45°), it is helpful to know the radian measure of those angles and the coordinates of the associated points on the unit circle (Figure 1.48).

Figure 1.48

Combining the definitions of the trigonometric functions with the coordinates shown in Figure 1.48, we may evaluate these functions at any standard angle. For example,

$$\begin{aligned}\sin \frac{2\pi}{3} &= \frac{\sqrt{3}}{2}, & \cos \frac{5\pi}{6} &= -\frac{\sqrt{3}}{2}, & \tan \frac{7\pi}{6} &= \frac{1}{\sqrt{3}}, & \tan \frac{3\pi}{2} &\text{is undefined,} \\ \cot \frac{5\pi}{3} &= -\frac{1}{\sqrt{3}}, & \sec \frac{7\pi}{4} &= \sqrt{2}, & \csc \frac{3\pi}{2} &= -1, & \sec \frac{\pi}{2} &\text{is undefined.}\end{aligned}$$

Figure 1.49

Figure 1.50

EXAMPLE 1 Evaluating trigonometric functions Evaluate the following expressions.

a. $\sin(8\pi/3)$ b. $\csc(-11\pi/3)$

SOLUTION

- a. The angle $\theta = 8\pi/3 = 2\pi + 2\pi/3$ corresponds to a *counterclockwise* revolution of one full circle (2π radians) plus an additional $2\pi/3$ radians (Figure 1.49). Therefore, this angle has the same terminal side as the angle $2\pi/3$, and the corresponding point on the unit circle is $(-1/2, \sqrt{3}/2)$. It follows that $\sin(8\pi/3) = y = \sqrt{3}/2$.
- b. The angle $\theta = -11\pi/3 = -2\pi - 5\pi/3$ corresponds to a *clockwise* revolution of one full circle (2π radians) plus an additional $5\pi/3$ radians (Figure 1.50). Therefore, this angle has the same terminal side as the angle $\pi/3$. The coordinates of the corresponding point on the unit circle are $(1/2, \sqrt{3}/2)$, so $\csc(-11\pi/3) = 1/y = 2/\sqrt{3}$.

Related Exercises 14, 18 ◀

QUICK CHECK 2 Evaluate $\cos(11\pi/6)$ and $\sin(5\pi/4)$. ◀

Trigonometric Identities

Trigonometric functions have a variety of properties, called identities, that are true for all angles in their domain. Here is a list of some commonly used identities.

- In addition, to these identities, you should be familiar with the Law of Cosines and the Law of Sines. See Exercises 58 and 59.

- The half-angle identities for cosine and sine are also known as *Power-Reducing Identities*.

Trigonometric Identities

Reciprocal Identities

$$\begin{aligned}\tan \theta &= \frac{\sin \theta}{\cos \theta} & \cot \theta &= \frac{1}{\tan \theta} = \frac{\cos \theta}{\sin \theta} \\ \csc \theta &= \frac{1}{\sin \theta} & \sec \theta &= \frac{1}{\cos \theta}\end{aligned}$$

Pythagorean Identities

$$\sin^2 \theta + \cos^2 \theta = 1 \quad 1 + \cot^2 \theta = \csc^2 \theta \quad \tan^2 \theta + 1 = \sec^2 \theta$$

Double- and Half-Angle Identities

$$\begin{aligned}\sin 2\theta &= 2 \sin \theta \cos \theta & \cos 2\theta &= \cos^2 \theta - \sin^2 \theta \\ \cos^2 \theta &= \frac{1 + \cos 2\theta}{2} & \sin^2 \theta &= \frac{1 - \cos 2\theta}{2}\end{aligned}$$

QUICK CHECK 3 Use

$\sin^2 \theta + \cos^2 \theta = 1$ to prove that $1 + \cot^2 \theta = \csc^2 \theta$. ◀

► By rationalizing the denominator,

observe that $\frac{1}{\sqrt{2}} = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}$.

► Notice that the assumption $\cos 2x \neq 0$ is valid for these values of x .

EXAMPLE 2 Solving trigonometric equations Solve the following equations.

a. $\sqrt{2} \sin x + 1 = 0$ b. $\cos 2x = \sin 2x$, where $0 \leq x < 2\pi$

SOLUTION

a. First, we solve for $\sin x$ to obtain $\sin x = -1/\sqrt{2} = -\sqrt{2}/2$. From the unit circle (Figure 1.48), we find that $\sin x = -\sqrt{2}/2$ if $x = 5\pi/4$ or $x = 7\pi/4$. Adding integer multiples of 2π produces additional solutions. Therefore, the set of all solutions is

$$x = \frac{5\pi}{4} + 2n\pi \quad \text{and} \quad x = \frac{7\pi}{4} + 2n\pi, \quad \text{for } n = 0, \pm 1, \pm 2, \pm 3, \dots$$

b. Dividing both sides of the equation by $\cos 2x$ (assuming $\cos 2x \neq 0$), we obtain $\tan 2x = 1$. Letting $\theta = 2x$ gives us the equivalent equation $\tan \theta = 1$. This equation is satisfied by

$$\theta = \frac{\pi}{4}, \frac{5\pi}{4}, \frac{9\pi}{4}, \frac{13\pi}{4}, \frac{17\pi}{4}, \dots$$

Dividing by two and using the restriction $0 \leq x < 2\pi$ gives the solutions

$$x = \frac{\theta}{2} = \frac{\pi}{8}, \frac{5\pi}{8}, \frac{9\pi}{8}, \text{ and } \frac{13\pi}{8}.$$

Related Exercises 33, 38 ◀

Graphs of the Trigonometric Functions

Trigonometric functions are examples of **periodic functions**: Their values repeat over every interval of some fixed length. A function f is said to be periodic if $f(x + P) = f(x)$, for all x in the domain, where the **period** P is the smallest positive real number that has this property.

Period of Trigonometric Functions

The functions $\sin \theta$, $\cos \theta$, $\sec \theta$, and $\csc \theta$ have a period of 2π :

$$\begin{aligned} \sin(\theta + 2\pi) &= \sin \theta & \cos(\theta + 2\pi) &= \cos \theta \\ \sec(\theta + 2\pi) &= \sec \theta & \csc(\theta + 2\pi) &= \csc \theta, \end{aligned}$$

for all θ in the domain.

The functions $\tan \theta$ and $\cot \theta$ have a period of π :

$$\tan(\theta + \pi) = \tan \theta \quad \cot(\theta + \pi) = \cot \theta,$$

for all θ in the domain.

The graph of $y = \sin \theta$ is shown in Figure 1.51a. Because $\csc \theta = 1/\sin \theta$, these two functions have the same sign, but $y = \csc \theta$ is undefined with vertical asymptotes at $\theta = 0, \pm\pi, \pm2\pi, \dots$. The functions $\cos \theta$ and $\sec \theta$ have a similar relationship (Figure 1.51b).

The graphs of $y = \sin \theta$ and its reciprocal, $y = \csc \theta$

Figure 1.51

The graphs of $y = \cos \theta$ and its reciprocal, $y = \sec \theta$

The graphs of $\tan \theta$ and $\cot \theta$ are shown in Figure 1.52. Each function has points, separated by π units, at which it is undefined.

Figure 1.52

Figure 1.53

Transforming Graphs

Many physical phenomena, such as the motion of waves and the rising and setting of the sun, can be modeled using trigonometric functions; the sine and cosine functions are especially useful. Using the transformation methods introduced in Section 1.2, we can show that the functions

$$y = A \sin(B(\theta - C)) + D \quad \text{and} \quad y = A \cos(B(\theta - C)) + D,$$

when compared to the graphs of $y = \sin \theta$ and $y = \cos \theta$, have a vertical scaling (or **amplitude**) of $|A|$, a period of $2\pi/|B|$, a horizontal shift (or **phase shift**) of C , and a **vertical shift** of D (Figure 1.53).

For example, at latitude 40° north (Beijing, Madrid, Philadelphia), there are 12 hours of daylight on the equinoxes (approximately March 21 and September 21), with a maximum of 14.8 hours of daylight on the summer solstice (approximately June 21) and a minimum of 9.2 hours of daylight on the winter solstice (approximately December 21). Using this information, it can be shown that the function

$$D(t) = 2.8 \sin\left(\frac{2\pi}{365}(t - 81)\right) + 12$$

models the number of daylight hours t days after January 1 (Figure 1.54; Exercise 70). The graph of this function is obtained from the graph of $y = \sin t$ by (1) a horizontal stretch by a factor of $365/2\pi$, (2) a horizontal shift of 81, (3) a vertical stretch by a factor of 2.8, and (4) a vertical shift of 12.

Figure 1.54

SECTION 1.3 EXERCISES

Getting Started

1. Define the six trigonometric functions in terms of the sides of a right triangle.
2. For the given angle θ corresponding to the point $P(-4, -3)$ in the figure, evaluate $\sin \theta$, $\cos \theta$, $\tan \theta$, $\cot \theta$, $\sec \theta$, and $\csc \theta$.

3. A projectile is launched at an angle of θ above the horizontal with an initial speed of v ft/s and travels over level ground. The time of flight t (the time it takes, in seconds, for the projectile to return to the ground) is approximated by the equation $t = \frac{v \sin \theta}{16}$. Determine the time of flight of a projectile if $\theta = \pi/6$ and $v = 96$.
4. A boat approaches a 50-ft-high lighthouse whose base is at sea level. Let d be the distance between the boat and the base of the lighthouse. Let L be the distance between the boat and the top of the lighthouse. Let θ be the angle of elevation between the boat and the top of the lighthouse.
 - a. Express d as a function of θ .
 - b. Express L as a function of θ .
5. How is the radian measure of an angle determined?
6. Explain what is meant by the period of a trigonometric function. What are the periods of the six trigonometric functions?
7. What are the three Pythagorean identities for the trigonometric functions?
8. Given that $\sin \theta = 1/\sqrt{5}$ and $\cos \theta = -2/\sqrt{5}$, use trigonometric identities to find the values of $\tan \theta$, $\cot \theta$, $\sec \theta$, and $\csc \theta$.
9. Solve the equation $\sin \theta = -1$, for $0 \leq \theta < 2\pi$.
10. Solve the equation $\sin 2\theta = 1$, for $0 \leq \theta < 2\pi$.
11. Where is the tangent function undefined?
12. What is the domain of the secant function?

Practice Exercises

13–28. Evaluating trigonometric functions Without using a calculator, evaluate the following expressions or state that the quantity is undefined.

13. $\cos(2\pi/3)$
14. $\sin(2\pi/3)$
15. $\tan(-3\pi/4)$
16. $\tan(15\pi/4)$
17. $\cot(-13\pi/3)$
18. $\sec(7\pi/6)$

19. $\cot(-17\pi/3)$
20. $\sin(16\pi/3)$
21. $\cos 0$
22. $\sin(-\pi/2)$
23. $\cos(-\pi)$
24. $\tan 3\pi$
25. $\sec(5\pi/2)$
26. $\cot \pi$
27. $\cos(\pi/12)$ (Hint: Use a half-angle formula.)
28. $\sin(3\pi/8)$

29–40. Solving trigonometric equations Solve the following equations.

29. $\tan x = 1$
30. $2\theta \cos \theta + \theta = 0$
31. $\sin^2 \theta = \frac{1}{4}, 0 \leq \theta < 2\pi$
32. $\cos^2 \theta = \frac{1}{2}, 0 \leq \theta < 2\pi$
33. $\sqrt{2} \sin x - 1 = 0$
34. $\sin^2 \theta - 1 = 0$
35. $\sin \theta \cos \theta = 0, 0 \leq \theta < 2\pi$
36. $\sin 3x = \frac{\sqrt{2}}{2}, 0 \leq x < 2\pi$
37. $\cos 3x = \sin 3x, 0 \leq x < 2\pi$
38. $\tan^2 2\theta = 1, 0 \leq \theta < \pi$
39. $\sin 2\theta = \frac{1}{5}, 0 \leq \theta \leq \frac{\pi}{2}$
40. $\cos 3\theta = \frac{3}{7}, 0 \leq \theta \leq \pi$

41–42. Projectile range A projectile is launched from the ground at an angle θ above the horizontal with an initial speed v in ft/s. The range (the horizontal distance traveled by the projectile over level ground) is approximated by the equation $x = \frac{v^2}{32} \sin 2\theta$. Find all launch angles that satisfy the following conditions; express your answers in degrees.

41. Initial speed of 150 ft/s; range of 400 ft
42. Initial speed of 160 ft/s; range of 350 ft

43–48. Identities Prove the following identities.

43. $\sec \theta = \frac{1}{\cos \theta}$
44. $\tan \theta = \frac{\sin \theta}{\cos \theta}$
45. $\tan^2 \theta + 1 = \sec^2 \theta$
46. $\frac{\sin \theta}{\csc \theta} + \frac{\cos \theta}{\sec \theta} = 1$
47. $\sec(\pi/2 - \theta) = \csc \theta$
48. $\sec(x + \pi) = -\sec x$

49. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. $\sin(a + b) = \sin a + \sin b$
- b. The equation $\cos \theta = 2$ has multiple solutions.
- c. The equation $\sin \theta = \frac{1}{2}$ has exactly one solution.
- d. The function $\sin(\pi x/12)$ has a period of 12.
- e. Of the six basic trigonometric functions, only tangent and cotangent have a range of $(-\infty, \infty)$.

50–53. One function gives all six Given the following information about one trigonometric function, evaluate the other five functions.

50. $\sin \theta = -\frac{4}{5}$ and $\pi < \theta < \frac{3\pi}{2}$

51. $\cos \theta = \frac{5}{13}$ and $0 < \theta < \frac{\pi}{2}$

52. $\sec \theta = \frac{5}{3}$ and $\frac{3\pi}{2} < \theta < 2\pi$

53. $\csc \theta = \frac{13}{12}$ and $0 < \theta < \frac{\pi}{2}$

54–57. Amplitude and period Identify the amplitude and period of the following functions.

54. $f(\theta) = 2 \sin 2\theta$

55. $g(\theta) = 3 \cos (\theta/3)$

56. $p(t) = 2.5 \sin \left(\frac{1}{2}(t - 3) \right)$

57. $q(x) = 3.6 \cos (\pi x/24)$

Explorations and Challenges

58. Law of Cosines Use the figure to prove the Law of Cosines (which is a generalization of the Pythagorean theorem):
 $c^2 = a^2 + b^2 - 2ab \cos \theta$.

59. Law of Sines Use the figure to prove the Law of Sines:

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}.$$

60. Anchored sailboats A sailboat named Dittl is anchored 200 feet north and 300 feet east of an observer standing on shore, while a second sailboat named Windborne is anchored 250 feet north and 100 feet west of the observer. Find the angle between the two sailboats as determined by the observer on shore.

61. Area of a circular sector Prove that the area of a sector of a circle of radius r associated with a central angle θ (measured in radians) is $A = \frac{1}{2} r^2 \theta$.

62–65. Graphing sine and cosine functions Beginning with the graphs of $y = \sin x$ or $y = \cos x$, use shifting and scaling transformations to sketch the graph of the following functions. Use a graphing utility to check your work.

62. $f(x) = 3 \sin 2x$

63. $g(x) = -2 \cos (x/3)$

64. $p(x) = 3 \sin (2x - \pi/3) + 1$

65. $q(x) = 3.6 \cos (\pi x/24) + 2$

66–67. Designer functions Design a sine function with the given properties.

66. It has a period of 12 with a minimum value of -4 at $t = 0$ and a maximum value of 4 at $t = 6$.

67. It has a period of 24 with a minimum value of 10 at $t = 3$ and a maximum value of 16 at $t = 15$.

68. Field goal attempt During the 1950 Rose Bowl football game, The Ohio State University prepared to kick a field goal at a distance of 23 yd from the end line at point A on the edge of the kicking region (see figure). But before the kick, Ohio State committed a penalty and the ball was backed up 5 yd to point B . After the game, the Ohio State coach claimed that his team deliberately committed a penalty to improve the kicking angle. Given that a successful kick must go between the goal posts G_1 and G_2 , is $\angle G_1 B G_2$ greater than $\angle G_1 A G_2$? (In 1950, the goal posts were 23 ft 4 in apart, equidistant from the origin on the end line.) The boundaries of the kicking region are 53 ft 4 in apart and are equidistant from the y -axis. (Source: *The College Mathematics Journal*, 27, 4, Sep 1996)

69. A surprising result Earth is approximately circular in cross section, with a circumference at the equator of 24,882 miles. Suppose we use two ropes to create two concentric circles: one by wrapping a rope around the equator and another using a rope 38 ft longer (see figure). How much space is between the ropes?

- 70. Daylight function for 40° N** Verify that the function

$$D(t) = 2.8 \sin\left(\frac{2\pi}{365}(t - 81)\right) + 12$$

has the following properties, where t is measured in days and D is the number of hours between sunrise and sunset.

- It has a period of 365 days.
 - Its maximum and minimum values are 14.8 and 9.2, respectively, which occur approximately at $t = 172$ and $t = 355$, respectively (corresponding to the solstices).
 - $D(81) = 12$ and $D(264) \approx 12$ (corresponding to the equinoxes).
- 71. Block on a spring** A light block hangs at rest from the end of a spring when it is pulled down 10 cm and released (see figure). Assume the block oscillates with an amplitude of 10 cm on either side of its rest position with a period of 1.5 s. Find a trigonometric function $d(t)$ that gives the displacement of the block t seconds after it is released, where $d(t) > 0$ represents downward displacement.

- 72. Viewing angles** An auditorium with a flat floor has a large flat-panel television on one wall. The lower edge of the television is 3 ft above the floor and the upper edge is 10 ft above the floor (see figure). Estimate the viewing angle θ at a distance $x = 10$ ft from the screen.

- 73. Ladders** Two ladders of length a lean against opposite walls of an alley with their feet touching (see figure). One ladder extends h feet up the wall and makes a 75° angle with the ground. The other ladder extends k feet up the opposite wall and makes a 45° angle with the ground. Find the width of the alley in terms of h . Assume the ground is horizontal and perpendicular to both walls.

- 74. Pole in a corner** A pole of length L is carried horizontally around a corner where a 3-ft-wide hallway meets a 4-ft-wide hallway. For $0 < \theta < \pi/2$, find the relationship between L and θ at the moment when the pole simultaneously touches both walls and the corner P . Estimate θ when $L = 10$ ft.

QUICK CHECK ANSWERS

- $3\pi/2$; 225°
- $\sqrt{3}/2$; $-\sqrt{2}/2$
- Divide both sides of $\sin^2 \theta + \cos^2 \theta = 1$ by $\sin^2 \theta$.

CHAPTER 1 REVIEW EXERCISES

- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - A function could have the property that $f(-x) = f(x)$, for all x .
 - $\cos(a + b) = \cos a + \cos b$, for all a and b in $[0, 2\pi]$.
 - If f is a linear function of the form $f(x) = mx + b$, then $f(u + v) = f(u) + f(v)$, for all u and v .
 - The function $f(x) = 1 - x$ has the property that $f(f(x)) = x$.
 - The set $\{x: |x + 3| > 4\}$ can be drawn on the number line without lifting your pencil.

2. **Functions** Decide whether graph A, graph B, or both represent functions.

3–5. Domain and range Determine the domain and range of the following functions.

3. $f(w) = \frac{2w^2 - 3w - 2}{w - 2}$ 4. $f(x) = x^5 + \sqrt{x}$

5. $h(z) = \sqrt{z^2 - 2z - 3}$

6. Suppose f and g are even functions with $f(2) = 2$ and $g(2) = -2$. Evaluate $f(g(2))$ and $g(f(-2))$.

7. **Composite functions** Let $f(x) = x^3$, $g(x) = \sin x$, and $h(x) = \sqrt{x}$.

- Evaluate $h(g(\pi/2))$.
- Find $h(f(x))$.
- Find $f(g(h(x)))$.
- Find the domain of $g \circ f$.
- Find the range of $f \circ g$.

8. **Composite functions** Find functions f and g such that $h = f \circ g$.

a. $h(x) = \sin(x^2 + 1)$ b. $h(x) = (x^2 - 4)^{-3}$

9–12. Simplifying difference quotients Evaluate and simplify the difference quotients $\frac{f(x+h) - f(x)}{h}$ and $\frac{f(x) - f(a)}{x - a}$ for each function.

9. $f(x) = x^2 - 2x$

10. $f(x) = 4 - 5x$

11. $f(x) = x^3 + 2$

12. $f(x) = \frac{7}{x+3}$

13. **Equations of lines** In each part below, find an equation of the line with the given properties.

- The line passing through the points $(2, -3)$ and $(4, 2)$
- The line with slope $\frac{3}{4}$ and x -intercept $(-4, 0)$
- The line with intercepts $(4, 0)$ and $(0, -2)$

14. **Population function** The population of a small town was 500 in 2018 and is growing at a rate of 24 people per year. Find and graph the linear population function $p(t)$ that gives the population of the town t years after 2018. Then use this model to predict the population in 2033.

15. **Boiling-point function** Water boils at 212°F at sea level and at 200°F at an elevation of 6000 ft. Assume the boiling point B varies linearly with altitude a . Find the function $B = f(a)$ that describes the dependence.

16. **Publishing costs** A small publisher plans to spend \$1000 for advertising a paperback book and estimates the printing cost is \$2.50 per book. The publisher will receive \$7 for each book sold.

- Find the function $C = f(x)$ that gives the cost of producing x books.
- Find the function $R = g(x)$ that gives the revenue from selling x books.
- Graph the cost and revenue functions; then find the number of books that must be sold for the publisher to break even.

17. **Graphing equations** Graph the following equations.

- $2x - 3y + 10 = 0$
- $y = x^2 + 2x - 3$
- $x^2 + 2x + y^2 + 4y + 1 = 0$
- $x^2 - 2x + y^2 - 8y + 5 = 0$

- 18–20. Graphing functions** Sketch a graph of each function.

18. $f(x) = \begin{cases} 2x & \text{if } x \leq 1 \\ 3 - x & \text{if } x > 1 \end{cases}$

19. $g(x) = \begin{cases} 4 - 2x & \text{if } x \leq 1 \\ (x - 1)^2 + 2 & \text{if } x > 1 \end{cases}$

20. $h(x) = \begin{cases} \frac{3x^2 - 7x + 2}{x - 2} & \text{if } x \neq 2 \\ 6 & \text{if } x = 2 \end{cases}$

21. Let $f(t) = \begin{cases} t & \text{if } 0 \leq t \leq 4 \\ 8 - t & \text{if } 4 < t \leq 8 \end{cases}$ and let $A(x)$ equal the area of the region bounded by the graph of f and the t -axis from $t = 0$ to $t = x$, where $0 \leq x \leq 8$.

- Plot a graph of f .
- Find $A(2)$ and $A(6)$.
- Find a piecewise formula for $A(x)$.

22. **Piecewise linear functions** The parking costs in a city garage are \$2 for the first half hour and \$1 for each additional half hour. Graph the function $C = f(t)$ that gives the cost of parking for t hours, where $0 \leq t \leq 3$.

23. **Graphing absolute value** Consider the function $f(x) = 2(x - |x|)$. Express the function in two pieces without using the absolute value. Then graph the function.

24. **Root functions** Graph the functions $f(x) = x^{1/3}$ and $g(x) = x^{1/4}$. Find all points where the two graphs intersect. For $x > 1$, is $f(x) > g(x)$ or is $g(x) > f(x)$?

25. **Root functions** Find the domain and range of the functions $f(x) = x^{1/7}$ and $g(x) = x^{1/4}$.

26. **Intersection points** Graph the equations $y = x^2$ and $x^2 + y^2 - 7y + 8 = 0$. At what point(s) do the curves intersect?

27. **Transformation of graphs** How is the graph of $y = x^2 + 6x - 3$ obtained from the graph of $y = x^2$?

- 28. Shifting and scaling** The graph of f is shown in the figure. Graph the following functions.

a. $f(x + 1)$ b. $2f(x - 1)$ c. $-f(x/2)$ d. $f(2(x - 1))$

- 29. Symmetry** Identify the symmetry (if any) in the graphs of the following equations.

a. $y = \cos 3x$ b. $y = 3x^4 - 3x^2 + 1$ c. $y^2 - 4x^2 = 4$

30. Degrees and radians

- a. Convert 135° to radian measure.
 b. Convert $4\pi/5$ to degree measure.
 c. What is the length of the arc on a circle of radius 10 associated with an angle of $4\pi/3$ (radians)?

31–35. Solving equations Solve each equation.

31. $1 - 2 \sin^2 \theta = 0, 0 \leq \theta < 2\pi$

32. $\sin^2 2\theta = 1/2, -\pi/2 \leq \theta \leq \pi/2$

33. $4 \cos^2 2\theta = 3, -\pi/2 \leq \theta \leq \pi/2$

34. $\sqrt{2} \sin 3\theta + 1 = 2, 0 \leq \theta \leq \pi$

35. $2 \cos^2 2\theta - 3 \cos 2\theta + 1 = 0, 0 \leq \theta \leq \pi$

- 36. Graphing sine and cosine functions** Use shifts and scalings to graph the following functions, and identify the amplitude and period.

a. $f(x) = 4 \cos(x/2)$ b. $g(\theta) = 2 \sin(2\pi\theta/3)$
 c. $h(\theta) = -\cos(2(\theta - \pi/4))$

- 37. Designing functions** Find a trigonometric function f that satisfies each set of properties. Answers are not unique.

- a. It has a period of 6 with a minimum value of -2 at $t = 0$ and a maximum value of 2 at $t = 3$.
 b. It has a period of 24 with a maximum value of 20 at $t = 6$ and a minimum value of 10 at $t = 18$.

- 38. Graph to function** Find a trigonometric function f represented by the graph in the figure.

- 39. Matching** Match each function a–f with one of the graphs A–F.

a. $f(x) = -\sin x$ b. $f(x) = \cos 2x$
 c. $f(x) = \tan(x/2)$ d. $f(x) = -\sec x$
 e. $f(x) = \cot 2x$ f. $f(x) = \sin^2 x$

(A)

(B)

(C)

(D)

(E)

(F)

- 40–41. Intersection points** Find the points at which the curves intersect on the given interval.

40. $y = \sec x$ and $y = 2$ on $(-\pi/2, \pi/2)$

41. $y = \sin x$ and $y = -\frac{1}{2}$ on $(0, 2\pi)$

42. **Evaluating sine** Find the exact value of $\sin \frac{5\pi}{8}$.

43. **Evaluating cosine** Find the exact value of $\cos \frac{7\pi}{8}$.

- 44–45. Identities** Prove the following identities.

44. $\frac{\sin \theta}{1 + \cos \theta} = \frac{1 - \cos \theta}{\sin \theta}$ 45. $\tan 2\theta = \frac{2 \tan \theta}{1 - \tan^2 \theta}$

- 46. Stereographic projections** A common way of displaying a sphere (such as Earth) on a plane (such as a map) is to use a *stereographic projection*. Here is the two-dimensional version of the method, which maps a circle to a line. Let P be a point on the right half of a circle of radius R identified by the angle φ . Find the function $x = F(\varphi)$ that gives the x -coordinate ($x \geq 0$) corresponding to φ for $0 \leq \varphi \leq \pi$.

- 47. Sum of squared integers** Let $T(n) = 1^2 + 2^2 + \cdots + n^2$, where n is a positive integer. It can be shown that
- $$T(n) = \frac{n(n+1)(2n+1)}{6}.$$
- Make a table of $T(n)$, for $n = 1, 2, \dots, 10$.
 - How would you describe the domain of this function?
 - What is the least value of n for which $T(n) > 1000$?

- 48. Sum of integers** Let $S(n) = 1 + 2 + \cdots + n$, where n is a positive integer. It can be shown that $S(n) = n(n+1)/2$.
- Make a table of $S(n)$, for $n = 1, 2, \dots, 10$.
 - How would you describe the domain of this function?
 - What is the least value of n for which $S(n) > 1000$?

- 49. Little-known fact** The shortest day of the year occurs on the winter solstice (near December 21) and the longest day of the year occurs on the summer solstice (near June 21). However, the latest sunrise and the earliest sunset do not occur on the winter solstice, and the earliest sunrise and the latest sunset do not occur on the summer solstice. At latitude 40° north, the latest sunrise occurs on January 4 at 7:25 A.M. (14 days after the solstice), and the earliest sunset occurs on December 7 at 4:37 P.M. (14 days before the solstice). Similarly, the earliest sunrise occurs on July 2 at 4:30 A.M. (14 days after the solstice) and the latest sunset occurs on June 7 at 7:32 P.M. (14 days before the solstice). Using sine functions, devise a function $s(t)$ that gives the time of sunrise t days after January 1 and a function $S(t)$ that gives the time of sunset t days after January 1. Assume s and S are measured in minutes and that $s = 0$ and $S = 0$ correspond to 4:00 A.M. Graph the functions. Then graph the length of the day function $D(t) = S(t) - s(t)$ and show that the longest and shortest days occur on the solstices.

Chapter 1 Guided Projects

Applications of the material in this chapter and related topics can be found in the following Guided Projects. For additional information, see the Preface.

- Problem-solving skills
- Constant rate problems
- Functions in action I
- Functions in action II
- Supply and demand
- Phase and amplitude

Limits

- 2.1 The Idea of Limits
- 2.2 Definitions of Limits
- 2.3 Techniques for Computing Limits
- 2.4 Infinite Limits
- 2.5 Limits at Infinity
- 2.6 Continuity
- 2.7 Precise Definitions of Limits

Chapter Preview All of calculus is based on the idea of a *limit*. Not only are limits important in their own right but they also underlie the two fundamental operations of calculus: differentiation (calculating derivatives) and integration (evaluating integrals). Derivatives enable us to talk about the instantaneous rate of change of a function, which, in turn, leads to concepts such as velocity and acceleration, population growth rates, marginal cost, and flow rates. Integrals enable us to compute areas under curves, surface areas, and volumes. Because of the incredible reach of this single idea, it is essential to develop a solid understanding of limits. We first present limits intuitively by showing how they arise in computing instantaneous velocities and finding slopes of tangent lines. As the chapter progresses, we build more rigor into the definition of the limit and examine the different ways in which limits arise. The chapter concludes by introducing the important property of *continuity* and by giving the formal definition of a limit.

2.1 The Idea of Limits

This brief opening section illustrates how limits arise in two seemingly unrelated problems: finding the instantaneous velocity of a moving object and finding the slope of a line tangent to a curve. These two problems provide important insights into limits on an intuitive level. In the remainder of the chapter, we develop limits carefully and fill in the mathematical details.

Average Velocity

Suppose you want to calculate your average velocity as you travel along a straight highway. If you pass milepost 100 at noon and milepost 130 at 12:30 P.M., you travel 30 miles in a half hour, so your **average velocity** over this time interval is $(30 \text{ mi})/(0.5 \text{ hr}) = 60 \text{ mi/hr}$. By contrast, even though your average velocity may be 60 mi/hr, it's almost certain that your **instantaneous velocity**, the speed indicated by the speedometer, varies from one moment to the next.

EXAMPLE 1 Average velocity A rock is launched vertically upward from the ground with a speed of 96 ft/s. Neglecting air resistance, a well-known formula from physics states that the position of the rock after t seconds is given by the function

$$s(t) = -16t^2 + 96t.$$

The position s is measured in feet with $s = 0$ corresponding to the ground. Find the average velocity of the rock between each pair of times.

- a. $t = 1 \text{ s}$ and $t = 3 \text{ s}$ b. $t = 1 \text{ s}$ and $t = 2 \text{ s}$

SOLUTION Figure 2.1 shows the position function of the rock on the time interval $0 \leq t \leq 3$. The graph is *not* the path of the rock. The rock travels up and down on a vertical line.

Figure 2.1

- a. The average velocity of the rock over any time interval $[t_0, t_1]$ is the change in position divided by the elapsed time:

$$v_{\text{av}} = \frac{s(t_1) - s(t_0)}{t_1 - t_0}.$$

Therefore, the average velocity over the interval $[1, 3]$ is

$$v_{\text{av}} = \frac{s(3) - s(1)}{3 - 1} = \frac{144 \text{ ft} - 80 \text{ ft}}{3 \text{ s} - 1 \text{ s}} = \frac{64 \text{ ft}}{2 \text{ s}} = 32 \text{ ft/s}.$$

Here is an important observation: As shown in Figure 2.2a, the average velocity is simply the slope of the line joining the points $(1, s(1))$ and $(3, s(3))$ on the graph of the position function.

QUICK CHECK 1 In Example 1, what is the average velocity between $t = 2$ and $t = 3$? ◀

- b. The average velocity of the rock over the interval $[1, 2]$ is

$$v_{\text{av}} = \frac{s(2) - s(1)}{2 - 1} = \frac{128 \text{ ft} - 80 \text{ ft}}{2 \text{ s} - 1 \text{ s}} = \frac{48 \text{ ft}}{1 \text{ s}} = 48 \text{ ft/s}.$$

Again, the average velocity is the slope of the line joining the points $(1, s(1))$ and $(2, s(2))$ on the graph of the position function (Figure 2.2b).

Figure 2.2

► See Section 1.1 for a discussion of secant lines.

In Example 1, we computed slopes of lines passing through two points on a curve. Any such line joining two points on a curve is called a **secant line**. The slope of the secant line, denoted m_{sec} , for the position function in Example 1 on the interval $[t_0, t_1]$ is

$$m_{\text{sec}} = \frac{s(t_1) - s(t_0)}{t_1 - t_0}.$$

Example 1 demonstrates that the average velocity is the slope of a secant line on the graph of the position function; that is, $v_{\text{av}} = m_{\text{sec}}$ (Figure 2.3).

Figure 2.3

Instantaneous Velocity

To compute the average velocity, we use the position of the object at *two* distinct points in time. How do we compute the instantaneous velocity at a *single* point in time? As illustrated in Example 2, the instantaneous velocity at a point $t = t_0$ is determined by computing average velocities over intervals $[t_0, t_1]$ that decrease in length. As t_1 approaches t_0 , the average velocities typically approach a unique number, which is the instantaneous velocity. This single number is called a **limit**.

QUICK CHECK 2 Explain the difference between average velocity and instantaneous velocity. ◀

EXAMPLE 2 Instantaneous velocity Estimate the instantaneous velocity of the rock in Example 1 at the *single* point $t = 1$.

SOLUTION We are interested in the instantaneous velocity at $t = 1$, so we compute the average velocity over smaller and smaller time intervals $[1, t]$ using the formula

$$v_{\text{av}} = \frac{s(t) - s(1)}{t - 1}.$$

Notice that these average velocities are also slopes of secant lines, several of which are shown in Table 2.1. For example, the average velocity on the interval $[1, 1.0001]$ is 63.9984 ft/s. Because this time interval is so short, the average velocity gives a good approximation to the instantaneous velocity at $t = 1$. We see that as t approaches 1, the average velocities appear to approach 64 ft/s. In fact, we could make the average velocity as close to 64 ft/s as we like by taking t sufficiently close to 1. Therefore, 64 ft/s is a reasonable estimate of the instantaneous velocity at $t = 1$.

Related Exercises 17, 19 ◀

Table 2.1

Time interval	Average velocity
$[1, 2]$	48 ft/s
$[1, 1.5]$	56 ft/s
$[1, 1.1]$	62.4 ft/s
$[1, 1.01]$	63.84 ft/s
$[1, 1.001]$	63.984 ft/s
$[1, 1.0001]$	63.9984 ft/s

► The same instantaneous velocity is obtained as t approaches 1 from the left (with $t < 1$) and as t approaches 1 from the right (with $t > 1$).

In language to be introduced in Section 2.2, we say that the limit of v_{av} as t approaches 1 equals the instantaneous velocity v_{inst} , which is 64 ft/s. This statement is illustrated in Figure 2.4 and written compactly as

$$v_{\text{inst}} = \lim_{t \rightarrow 1} v_{\text{av}} = \lim_{t \rightarrow 1} \frac{s(t) - s(1)}{t - 1} = 64 \text{ ft/s}.$$

Figure 2.4

- We define tangent lines carefully in Section 3.1. For the moment, imagine zooming in on a point P on a smooth curve. As you zoom in, the curve appears more and more like a line passing through P . This line is the *tangent line* at P . Because a smooth curve approaches a line as we zoom in on a point, a smooth curve is said to be *locally linear* at any given point.

Slope of the Tangent Line

Several important conclusions follow from Examples 1 and 2. Each average velocity in Table 2.1 corresponds to the slope of a secant line on the graph of the position function (Figure 2.5). Just as the average velocities approach a limit as t approaches 1, the slopes of the secant lines approach the same limit as t approaches 1. Specifically, as t approaches 1, two things happen:

1. The secant lines approach a unique line called the **tangent line**.
2. The slopes of the secant lines m_{sec} approach the slope of the tangent line m_{tan} at the point $(1, s(1))$. Therefore, the slope of the tangent line is also expressed as a limit:

$$m_{tan} = \lim_{t \rightarrow 1} m_{sec} = \lim_{t \rightarrow 1} \frac{s(t) - s(1)}{t - 1} = 64.$$

This limit is the same limit that defines the instantaneous velocity. Therefore, the instantaneous velocity at $t = 1$ is the slope of the line tangent to the position curve at $t = 1$.

Figure 2.5

QUICK CHECK 3 In Figure 2.5, is m_{tan} at $t = 2$ greater than or less than m_{tan} at $t = 1$? ◀

The parallels between average and instantaneous velocities, on one hand, and between slopes of secant lines and tangent lines, on the other, illuminate the power behind the idea of a limit. As $t \rightarrow 1$, slopes of secant lines approach the slope of a tangent line. And as $t \rightarrow 1$, average velocities approach an instantaneous velocity. Figure 2.6 summarizes these two parallel limit processes. These ideas lie at the foundation of what follows in the coming chapters.

Figure 2.6

SECTION 2.1 EXERCISES

Getting Started

- Suppose $s(t)$ is the position of an object moving along a line at time $t \geq 0$. What is the average velocity between the times $t = a$ and $t = b$?
- Suppose $s(t)$ is the position of an object moving along a line at time $t \geq 0$. Describe a process for finding the instantaneous velocity at $t = a$.
- The function $s(t)$ represents the position of an object at time t moving along a line. Suppose $s(2) = 136$ and $s(3) = 156$. Find the average velocity of the object over the interval of time $[2, 3]$.
- The function $s(t)$ represents the position of an object at time t moving along a line. Suppose $s(1) = 84$ and $s(4) = 144$. Find the average velocity of the object over the interval of time $[1, 4]$.
- The table gives the position $s(t)$ of an object moving along a line at time t , over a two-second interval. Find the average velocity of the object over the following intervals.

- a. $[0, 2]$ b. $[0, 1.5]$ c. $[0, 1]$ d. $[0, 0.5]$

t	0	0.5	1	1.5	2
$s(t)$	0	30	52	66	72

- The graph gives the position $s(t)$ of an object moving along a line at time t , over a 2.5-second interval. Find the average velocity of the object over the following intervals.

- a. $[0.5, 2.5]$ b. $[0.5, 2]$ c. $[0.5, 1.5]$ d. $[0.5, 1]$

- The following table gives the position $s(t)$ of an object moving along a line at time t . Determine the average velocities over the time intervals $[1, 1.01]$, $[1, 1.001]$, and $[1, 1.0001]$. Then make a conjecture about the value of the instantaneous velocity at $t = 1$.

t	1	1.0001	1.001	1.01
$s(t)$	64	64.00479984	64.047984	64.4784

- The following table gives the position $s(t)$ of an object moving along a line at time t . Determine the average velocities over the time intervals $[2, 2.01]$, $[2, 2.001]$, and $[2, 2.0001]$. Then make a conjecture about the value of the instantaneous velocity at $t = 2$.

t	2	2.0001	2.001	2.01
$s(t)$	56	55.99959984	55.995984	55.9584

- What is the slope of the secant line that passes through the points $(a, f(a))$ and $(b, f(b))$ on the graph of f ?
- Describe a process for finding the slope of the line tangent to the graph of f at $(a, f(a))$.
- Describe the parallels between finding the instantaneous velocity of an object at a point in time and finding the slope of the line tangent to the graph of a function at a point on the graph.

- Given the function $f(x) = -16x^2 + 64x$, complete the following.

- Find the slopes of the secant lines that pass through the points $(x, f(x))$ and $(2, f(2))$, for $x = 1.5, 1.9, 1.99, 1.999$, and 1.9999 (see figure).
- Make a conjecture about the value of the limit of the slopes of the secant lines that pass through $(x, f(x))$ and $(2, f(2))$ as x approaches 2.
- What is the relationship between your answer to part (b) and the slope of the line tangent to the curve at $x = 2$ (see figure)?

Practice Exercises

- Average velocity** The position of an object moving vertically along a line is given by the function $s(t) = -16t^2 + 128t$. Find the average velocity of the object over the following intervals.
 - $[1, 4]$
 - $[1, 3]$
 - $[1, 2]$
 - $[1, 1 + h]$, where $h > 0$ is a real number
- Average velocity** The position of an object moving vertically along a line is given by the function $s(t) = -4.9t^2 + 30t + 20$. Find the average velocity of the object over the following intervals.
 - $[0, 3]$
 - $[0, 2]$
 - $[0, 1]$
 - $[0, h]$, where $h > 0$ is a real number
- Average velocity** Consider the position function $s(t) = -16t^2 + 100t$ representing the position of an object moving vertically along a line. Sketch a graph of s with the secant line passing through $(0.5, s(0.5))$ and $(2, s(2))$. Determine the slope of the secant line and explain its relationship to the moving object.
- Average velocity** Consider the position function $s(t) = \sin \pi t$ representing the position of an object moving along a line on the end of a spring. Sketch a graph of s together with the secant line passing through $(0, s(0))$ and $(0.5, s(0.5))$. Determine the slope of the secant line and explain its relationship to the moving object.
- Instantaneous velocity** Consider the position function $s(t) = -16t^2 + 128t$ (Exercise 13). Complete the following table with the appropriate average velocities. Then make a conjecture about the value of the instantaneous velocity at $t = 1$.

Time interval	$[1, 2]$	$[1, 1.5]$	$[1, 1.1]$	$[1, 1.01]$	$[1, 1.001]$
Average velocity					

- T 18. Instantaneous velocity** Consider the position function $s(t) = -4.9t^2 + 30t + 20$ (Exercise 14). Complete the following table with the appropriate average velocities. Then make a conjecture about the value of the instantaneous velocity at $t = 2$.

Time interval	[2, 3]	[2, 2.5]	[2, 2.1]	[2, 2.01]	[2, 2.001]
Average velocity					

- T 19. Instantaneous velocity** Consider the position function $s(t) = -16t^2 + 100t$. Complete the following table with the appropriate average velocities. Then make a conjecture about the value of the instantaneous velocity at $t = 3$.

Time interval	Average velocity
[2, 3]	
[2.9, 3]	
[2.99, 3]	
[2.999, 3]	
[2.9999, 3]	

- T 20. Instantaneous velocity** Consider the position function $s(t) = 3 \sin t$ that describes a block bouncing vertically on a spring. Complete the following table with the appropriate average velocities. Then make a conjecture about the value of the instantaneous velocity at $t = \pi/2$.

Time interval	Average velocity
$[\pi/2, \pi]$	
$[\pi/2, \pi/2 + 0.1]$	
$[\pi/2, \pi/2 + 0.01]$	
$[\pi/2, \pi/2 + 0.001]$	
$[\pi/2, \pi/2 + 0.0001]$	

- T 21–24. Instantaneous velocity** For the following position functions, make a table of average velocities similar to those in Exercises 19–20 and make a conjecture about the instantaneous velocity at the indicated time.

21. $s(t) = -16t^2 + 80t + 60$ at $t = 3$

22. $s(t) = 20 \cos t$ at $t = \pi/2$

23. $s(t) = 40 \sin 2t$ at $t = 0$

24. $s(t) = 20/(t + 1)$ at $t = 0$

- T 25–28. Slopes of tangent lines** For the following functions, make a table of slopes of secant lines and make a conjecture about the slope of the tangent line at the indicated point.

25. $f(x) = 2x^2$ at $x = 2$

26. $f(x) = 3 \cos x$ at $x = \pi/2$

27. $f(x) = 1/(1 + x^2)$ at $x = -1$

28. $f(x) = x^3 - x$ at $x = 1$

Explorations and Challenges

- T 29. Tangent lines with zero slope**

- Graph the function $f(x) = x^2 - 4x + 3$.
- Identify the point $(a, f(a))$ at which the function has a tangent line with zero slope.

- Confirm your answer to part (b) by making a table of slopes of secant lines to approximate the slope of the tangent line at this point.

- T 30. Tangent lines with zero slope**

- Graph the function $f(x) = 4 - x^2$.
- Identify the point $(a, f(a))$ at which the function has a tangent line with zero slope.
- Consider the point $(a, f(a))$ found in part (b). Is it true that the secant line between $(a - h, f(a - h))$ and $(a + h, f(a + h))$ has slope zero for any value of $h \neq 0$?

- T 31. Zero velocity** A projectile is fired vertically upward and has a position given by $s(t) = -16t^2 + 128t + 192$, for $0 \leq t \leq 9$.

- Graph the position function, for $0 \leq t \leq 9$.
- From the graph of the position function, identify the time at which the projectile has an instantaneous velocity of zero; call this time $t = a$.
- Confirm your answer to part (b) by making a table of average velocities to approximate the instantaneous velocity at $t = a$.
- For what values of t on the interval $[0, 9]$ is the instantaneous velocity positive (the projectile moves upward)?
- For what values of t on the interval $[0, 9]$ is the instantaneous velocity negative (the projectile moves downward)?

- T 32. Impact speed** A rock is dropped off the edge of a cliff, and its distance s (in feet) from the top of the cliff after t seconds is $s(t) = 16t^2$. Assume the distance from the top of the cliff to the ground is 96 ft.

- When will the rock strike the ground?
- Make a table of average velocities and approximate the velocity at which the rock strikes the ground.

- T 33. Slope of tangent line** Given the function $f(x) = 1 - \cos x$ and the points $A(\pi/2, f(\pi/2))$, $B(\pi/2 + 0.05, f(\pi/2 + 0.05))$, $C(\pi/2 + 0.5, f(\pi/2 + 0.5))$, and $D(\pi, f(\pi))$ (see figure), find the slopes of the secant lines through A and D , A and C , and A and B . Use your calculations to make a conjecture about the slope of the line tangent to the graph of f at $x = \pi/2$.

QUICK CHECK ANSWERS

- 16 ft/s
- Average velocity is the velocity over an interval of time. Instantaneous velocity is the velocity at one point in time.
- Less than ◀

2.2 Definitions of Limits

Computing slopes of tangent lines and instantaneous velocities (Section 2.1) are just two of many important calculus problems that rely on limits. We now put these two problems aside until Chapter 3 and begin with a preliminary definition of the limit of a function.

DEFINITION Limit of a Function (Preliminary)

Suppose the function f is defined for all x near a except possibly at a . If $f(x)$ is arbitrarily close to L (as close to L as we like) for all x sufficiently close (but not equal) to a , we write

$$\lim_{x \rightarrow a} f(x) = L$$

and say the limit of $f(x)$ as x approaches a equals L .

► The terms *arbitrarily close* and *sufficiently close* will be made precise when rigorous definitions of limits are given in Section 2.7.

Informally, we say that $\lim_{x \rightarrow a} f(x) = L$ if $f(x)$ gets closer and closer to L as x gets closer and closer to a from both sides of a . The value of $\lim_{x \rightarrow a} f(x)$ (if it exists) depends on the values of f near a , but it does not depend on the value of $f(a)$. In some cases, the limit $\lim_{x \rightarrow a} f(x)$ equals $f(a)$. In other instances, $\lim_{x \rightarrow a} f(x)$ and $f(a)$ differ, or $f(a)$ may not even be defined.

Figure 2.7

EXAMPLE 1 Finding limits from a graph Use the graph of f (Figure 2.7) to determine the following values, if possible.

- a. $f(1)$ and $\lim_{x \rightarrow 1} f(x)$ b. $f(2)$ and $\lim_{x \rightarrow 2} f(x)$ c. $f(3)$ and $\lim_{x \rightarrow 3} f(x)$

SOLUTION

- a. We see that $f(1) = 2$. As x approaches 1 from either side, the values of $f(x)$ approach 2 (Figure 2.8). Therefore, $\lim_{x \rightarrow 1} f(x) = 2$.
- b. We see that $f(2) = 5$. However, as x approaches 2 from either side, $f(x)$ approaches 3 because the points on the graph of f approach the open circle at $(2, 3)$ (Figure 2.9). Therefore, $\lim_{x \rightarrow 2} f(x) = 3$ even though $f(2) = 5$.
- c. In this case, $f(3)$ is undefined. We see that $f(x)$ approaches 4 as x approaches 3 from either side (Figure 2.10). Therefore, $\lim_{x \rightarrow 3} f(x) = 4$ even though $f(3)$ does not exist.

Figure 2.8

Figure 2.9

Figure 2.10

Related Exercises 3–4 ◀

QUICK CHECK 1 In Example 1, suppose we redefine the function at one point so that $f(1) = 1$. Does this change the value of $\lim_{x \rightarrow 1} f(x)$? ◀

In Example 1, we worked with the graph of a function to estimate limits. Let’s now estimate limits using tabulated values of a function.

► In Example 2, we have not stated with certainty that $\lim_{x \rightarrow 1} f(x) = 0.5$. But this is a reasonable conjecture based on the numerical evidence. Methods for calculating limits precisely are introduced in Section 2.3.

EXAMPLE 2 Finding limits from a table Create a table of values of $f(x) = \frac{\sqrt{x} - 1}{x - 1}$ corresponding to values of x near 1. Then make a conjecture about the value of $\lim_{x \rightarrow 1} f(x)$.

SOLUTION Table 2.2 lists values of f corresponding to values of x approaching 1 from both sides. The numerical evidence suggests that $f(x)$ approaches 0.5 as x approaches 1. Therefore, we make the conjecture that $\lim_{x \rightarrow 1} f(x) = 0.5$.

Table 2.2

x	0.9	0.99	0.999	0.9999	1.0001	1.001	1.01	1.1
$f(x) = \frac{\sqrt{x} - 1}{x - 1}$	0.5131670	0.5012563	0.5001251	0.5000125	0.4999875	0.4998751	0.4987562	0.4880885

Related Exercises 7–8 ◀

One-Sided Limits

The limit $\lim_{x \rightarrow a} f(x) = L$ is referred to as a *two-sided* limit because $f(x)$ approaches L as x approaches a for values of x less than a and for values of x greater than a . For some functions, it makes sense to examine *one-sided* limits called *right-sided* and *left-sided* limits.

► As with two-sided limits, the value of a one-sided limit (if it exists) depends on the values of $f(x)$ near a but not on the value of $f(a)$.

DEFINITION One-Sided Limits

1. Right-sided limit Suppose f is defined for all x near a with $x > a$. If $f(x)$ is arbitrarily close to L for all x sufficiently close to a with $x > a$, we write

$$\lim_{x \rightarrow a^+} f(x) = L$$

and say the limit of $f(x)$ as x approaches a from the right equals L .

2. Left-sided limit Suppose f is defined for all x near a with $x < a$. If $f(x)$ is arbitrarily close to L for all x sufficiently close to a with $x < a$, we write

$$\lim_{x \rightarrow a^-} f(x) = L$$

and say the limit of $f(x)$ as x approaches a from the left equals L .

EXAMPLE 3 Examining limits graphically and numerically Let $f(x) = \frac{x^3 - 8}{4(x - 2)}$.

Use tables and graphs to make a conjecture about the values of $\lim_{x \rightarrow 2^+} f(x)$, $\lim_{x \rightarrow 2^-} f(x)$, and $\lim_{x \rightarrow 2} f(x)$, if they exist.

SOLUTION Figure 2.11a shows the graph of f obtained with a graphing utility. The graph is misleading because $f(2)$ is undefined, which means there should be a hole in the graph at $(2, 3)$ (Figure 2.11b).

► Computer-generated graphs and tables help us understand the idea of a limit. Keep in mind, however, that computers are not infallible and they may produce incorrect results, even for simple functions (see Example 5).

Figure 2.11

The graph in Figure 2.12a and the function values in Table 2.3 suggest that $f(x)$ approaches 3 as x approaches 2 from the right. Therefore, we write the right-sided limit

$$\lim_{x \rightarrow 2^+} f(x) = 3,$$

which says the limit of $f(x)$ as x approaches 2 from the right equals 3.

Figure 2.12

Table 2.3

x	1.9	1.99	1.999	1.9999	2.0001	2.001	2.01	2.1
$f(x) = \frac{x^3 - 8}{4(x - 2)}$	2.8525	2.985025	2.99850025	2.99985000	3.00015000	3.00150025	3.015025	3.1525

- Remember that the value of the limit does not depend on the value of $f(2)$. In Example 3, $\lim_{x \rightarrow 2} f(x) = 3$ despite the fact that $f(2)$ is undefined.

Similarly, Figure 2.12b and Table 2.3 suggest that as x approaches 2 from the left, $f(x)$ approaches 3. So we write the left-sided limit

$$\lim_{x \rightarrow 2^-} f(x) = 3,$$

which says the limit of $f(x)$ as x approaches 2 from the left equals 3. Because $f(x)$ approaches 3 as x approaches 2 from either side, we write the two-sided limit $\lim_{x \rightarrow 2} f(x) = 3$.

Related Exercises 27–28 ◀

Based on the previous example, you might wonder whether the limits $\lim_{x \rightarrow a^-} f(x)$, $\lim_{x \rightarrow a^+} f(x)$, and $\lim_{x \rightarrow a} f(x)$ always exist and are equal. The remaining examples demonstrate

that these limits may have different values, and in some cases, one or more of these limits may not exist. The following theorem is useful when comparing one-sided and two-sided limits.

THEOREM 2.1 Relationship Between One-Sided and Two-Sided Limits

Assume f is defined for all x near a except possibly at a . Then $\lim_{x \rightarrow a} f(x) = L$ if and only if $\lim_{x \rightarrow a^+} f(x) = L$ and $\lim_{x \rightarrow a^-} f(x) = L$.

► Suppose P and Q are statements. We write P if and only if Q when P implies Q and Q implies P .

A proof of Theorem 2.1 is outlined in Exercise 56 of Section 2.7. Using this theorem, it follows that $\lim_{x \rightarrow a} f(x) \neq L$ if either $\lim_{x \rightarrow a^+} f(x) \neq L$ or $\lim_{x \rightarrow a^-} f(x) \neq L$ (or both). Furthermore, if either $\lim_{x \rightarrow a^+} f(x)$ or $\lim_{x \rightarrow a^-} f(x)$ does not exist, then $\lim_{x \rightarrow a} f(x)$ does not exist. We put these ideas to work in the next two examples.

EXAMPLE 4 A function with a jump Sketch the graph of $g(x) = \frac{2x^2 - 6x + 4}{|x - 1|}$ and use the graph to find the values of $\lim_{x \rightarrow 1^-} g(x)$, $\lim_{x \rightarrow 1^+} g(x)$, and $\lim_{x \rightarrow 1} g(x)$, if they exist.

SOLUTION Sketching the graph of g is straightforward if we first rewrite g as a piecewise function. Factoring the numerator of g , we obtain

$$g(x) = \frac{2x^2 - 6x + 4}{|x - 1|} = \frac{2(x - 1)(x - 2)}{|x - 1|}.$$

Observe that g is undefined at $x = 1$. For $x > 1$, $|x - 1| = x - 1$ and

$$g(x) = \frac{2(x - 1)(x - 2)}{x - 1} = 2x - 4.$$

Note that $x - 1 < 0$ when $x < 1$, which implies that $|x - 1| = -(x - 1)$ and

$$g(x) = \frac{2(x - 1)(x - 2)}{-(x - 1)} = -2x + 4.$$

Therefore, $g(x) = \begin{cases} 2x - 4 & \text{if } x > 1 \\ -2x + 4 & \text{if } x < 1 \end{cases}$ and the graph of g consists of two linear pieces with a jump at $x = 1$ (Figure 2.13).

Examining the graph of g , we see that as x approaches 1 from the left, $g(x)$ approaches 2. Therefore, $\lim_{x \rightarrow 1^-} g(x) = 2$. As x approaches 1 from the right, $g(x)$ approaches -2 and $\lim_{x \rightarrow 1^+} g(x) = -2$. By Theorem 2.1, $\lim_{x \rightarrow 1} g(x)$ does not exist because $\lim_{x \rightarrow 1^-} g(x) \neq \lim_{x \rightarrow 1^+} g(x)$.

Related Exercises 19–20 ◀

EXAMPLE 5 Some strange behavior Examine $\lim_{x \rightarrow 0} \cos(1/x)$.

SOLUTION From the first three values of $\cos(1/x)$ in Table 2.4, it is tempting to conclude that $\lim_{x \rightarrow 0^+} \cos(1/x) = -1$. But this conclusion is not confirmed when we evaluate $\cos(1/x)$ for values of x closer to 0.

Table 2.4

x	$\cos(1/x)$
0.001	0.56238
0.0001	-0.95216
0.00001	-0.99936
0.000001	0.93675
0.0000001	-0.90727
0.00000001	-0.36338

We might *incorrectly* conclude that $\cos(1/x)$ approaches -1 as x approaches 0 from the right.

Figure 2.13

The behavior of $\cos(1/x)$ near 0 is better understood by letting $x = 1/(n\pi)$, where n is a positive integer. By making this substitution, we can sample the function at discrete points that approach zero. In this case,

$$\cos \frac{1}{x} = \cos n\pi = \begin{cases} 1 & \text{if } n \text{ is even} \\ -1 & \text{if } n \text{ is odd.} \end{cases}$$

As n increases, the values of $x = 1/(n\pi)$ approach zero, while the values of $\cos(1/x)$ oscillate between -1 and 1 (Figure 2.14). Therefore, $\cos(1/x)$ does not approach a single number as x approaches 0 from the right. We conclude that $\lim_{x \rightarrow 0^+} \cos(1/x)$ does *not* exist, which implies that $\lim_{x \rightarrow 0} \cos(1/x)$ does not exist.

Figure 2.14

Related Exercise 43

QUICK CHECK 2 Why is the graph of $y = \cos(1/x)$ difficult to plot near $x = 0$, as suggested by Figure 2.14? ◀

Using tables and graphs to make conjectures for the values of limits worked well until Example 5. The limitation of technology in this example is not an isolated incident. For this reason, analytical techniques (paper-and-pencil methods) for finding limits are developed in the next section.

SECTION 2.2 EXERCISES

Getting Started

1. Explain the meaning of $\lim_{x \rightarrow a} f(x) = L$.
2. True or false: When $\lim_{x \rightarrow a} f(x)$ exists, it always equals $f(a)$. Explain.
3. Use the graph of h in the figure to find the following values or state that they do not exist.
 - a. $h(2)$
 - b. $\lim_{x \rightarrow 2} h(x)$
 - c. $h(4)$
 - d. $\lim_{x \rightarrow 4} h(x)$
 - e. $\lim_{x \rightarrow 5} h(x)$

4. Use the graph of g in the figure to find the following values or state that they do not exist.

a. $g(0)$ b. $\lim_{x \rightarrow 0} g(x)$ c. $g(1)$ d. $\lim_{x \rightarrow 1} g(x)$

5. Use the graph of f in the figure to find the following values or state that they do not exist.

a. $f(1)$ b. $\lim_{x \rightarrow 1} f(x)$ c. $f(0)$ d. $\lim_{x \rightarrow 0} f(x)$

6. Use the graph of f in the figure to find the following values or state that they do not exist.

a. $f(2)$ b. $\lim_{x \rightarrow 2} f(x)$ c. $\lim_{x \rightarrow 4} f(x)$ d. $\lim_{x \rightarrow 5} f(x)$

7. Let $f(x) = \frac{x^2 - 4}{x - 2}$.

- a. Calculate $f(x)$ for each value of x in the following table.
b. Make a conjecture about the value of $\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2}$.

x	1.9	1.99	1.999	1.9999
$f(x) = \frac{x^2 - 4}{x - 2}$				
x	2.1	2.01	2.001	2.0001
$f(x) = \frac{x^2 - 4}{x - 2}$				

8. Let $f(x) = \frac{x^3 - 1}{x - 1}$.

- a. Calculate $f(x)$ for each value of x in the following table.
b. Make a conjecture about the value of $\lim_{x \rightarrow 1} \frac{x^3 - 1}{x - 1}$.

x	0.9	0.99	0.999	0.9999
$f(x) = \frac{x^3 - 1}{x - 1}$				
x	1.1	1.01	1.001	1.0001
$f(x) = \frac{x^3 - 1}{x - 1}$				

9. Let $g(t) = \frac{t - 9}{\sqrt{t} - 3}$.

- a. Make two tables, one showing values of g for $t = 8.9, 8.99,$ and 8.999 and one showing values of g for $t = 9.1, 9.01,$ and 9.001 .

b. Make a conjecture about the value of $\lim_{t \rightarrow 9} \frac{t - 9}{\sqrt{t} - 3}$.

10. Let $f(x) = (1 + x)^{1/x}$.

- a. Make two tables, one showing values of f for $x = 0.01, 0.001, 0.0001,$ and 0.00001 and one showing values of f for $x = -0.01, -0.001, -0.0001,$ and -0.00001 . Round your answers to five digits.

b. Estimate the value of $\lim_{x \rightarrow 0} (1 + x)^{1/x}$.

- c. What mathematical constant does $\lim_{x \rightarrow 0} (1 + x)^{1/x}$ appear to equal?

11. Explain the meaning of $\lim_{x \rightarrow a^+} f(x) = L$.

12. Explain the meaning of $\lim_{x \rightarrow a^-} f(x) = L$.

13. If $\lim_{x \rightarrow a^-} f(x) = L$ and $\lim_{x \rightarrow a^+} f(x) = M$, where L and M are finite real numbers, then how are L and M related if $\lim_{x \rightarrow a} f(x)$ exists?

14. Let $g(x) = \frac{x^3 - 4x}{8|x - 2|}$.

- a. Calculate $g(x)$ for each value of x in the following table.

- b. Make a conjecture about the values of $\lim_{x \rightarrow 2^-} g(x)$, $\lim_{x \rightarrow 2^+} g(x)$, and $\lim_{x \rightarrow 2} g(x)$ or state that they do not exist.

x	1.9	1.99	1.999	1.9999
$g(x) = \frac{x^3 - 4x}{8 x - 2 }$				
x	2.1	2.01	2.001	2.0001
$g(x) = \frac{x^3 - 4x}{8 x - 2 }$				

15. Use the graph of f in the figure to find the following values or state that they do not exist. If a limit does not exist, explain why.

a. $f(1)$ b. $\lim_{x \rightarrow 1^-} f(x)$ c. $\lim_{x \rightarrow 1^+} f(x)$ d. $\lim_{x \rightarrow 1} f(x)$

16. What are the potential problems of using a graphing utility to estimate $\lim_{x \rightarrow a} f(x)$?

- 17. Finding limits from a graph** Use the graph of f in the figure to find the following values or state that they do not exist. If a limit does not exist, explain why.

- | | | |
|------------------------------------|------------------------------------|------------------------------------|
| a. $f(1)$ | b. $\lim_{x \rightarrow 1^-} f(x)$ | c. $\lim_{x \rightarrow 1^+} f(x)$ |
| d. $\lim_{x \rightarrow 1} f(x)$ | e. $f(3)$ | f. $\lim_{x \rightarrow 3^-} f(x)$ |
| g. $\lim_{x \rightarrow 3^+} f(x)$ | h. $\lim_{x \rightarrow 3} f(x)$ | i. $f(2)$ |

| g. $\lim_{x \rightarrow 3^+} g(x)$ | h. $g(4)$ | i. $\lim_{x \rightarrow 4} g(x)$ |

Practice Exercises

- 19–26. Evaluating limits graphically** Sketch a graph of f and use it to make a conjecture about the values of $f(a)$, $\lim_{x \rightarrow a^-} f(x)$, $\lim_{x \rightarrow a^+} f(x)$, and $\lim_{x \rightarrow a} f(x)$ or state that they do not exist.

19. $f(x) = \begin{cases} x^2 + 1 & \text{if } x \leq -1 \\ 3 & \text{if } x > -1 \end{cases}; a = -1$

20. $f(x) = \begin{cases} 3 - x & \text{if } x < 2 \\ x - 1 & \text{if } x > 2 \end{cases}; a = 2$

21. $f(x) = \begin{cases} \sqrt{x} & \text{if } x < 4 \\ 3 & \text{if } x = 4 \\ x + 1 & \text{if } x > 4 \end{cases}; a = 4$

22. $f(x) = |x + 2| + 2; a = -2$

23. $f(x) = \frac{x^2 - 25}{x - 5}; a = 5$

T 24. $f(x) = \frac{x - 100}{\sqrt{x} - 10}; a = 100$

25. $f(x) = \frac{x^2 + x - 2}{x - 1}; a = 1$

26. $f(x) = \frac{1 - x^4}{x^2 - 1}; a = 1$

- T 27–32. Estimating limits graphically and numerically** Use a graph of f to estimate $\lim_{x \rightarrow a} f(x)$ or to show that the limit does not exist. Evaluate $f(x)$ near $x = a$ to support your conjecture.

27. $f(x) = \frac{x - 2}{\sin(x - 2)}; a = 2$

28. $f(x) = \frac{\tan^2(\sin x)}{1 - \cos x}; a = 0$

29. $f(x) = \frac{1 - \cos(2x - 2)}{(x - 1)^2}; a = 1$

30. $f(x) = \frac{3 \sin x - 2 \cos x + 2}{x}; a = 0$

31. $f(x) = \frac{\sin(x + 1)}{|x + 1|}; a = -1$

32. $f(x) = \frac{x^3 - 4x^2 + 3x}{|x - 3|}; a = 3$

- 33. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. The value of $\lim_{x \rightarrow 3} \frac{x^2 - 9}{x - 3}$ does not exist.

b. The value of $\lim_{x \rightarrow a} f(x)$ is always found by computing $f(a)$.

c. The value of $\lim_{x \rightarrow a} f(x)$ does not exist if $f(a)$ is undefined.

d. $\lim_{x \rightarrow 0} \sqrt{x} = 0$. (Hint: Graph $y = \sqrt{x}$.)

e. $\lim_{x \rightarrow \pi/2} \cot x = 0$. (Hint: Graph $y = \cot x$.)

- 34. The Heaviside function** The Heaviside function is used in engineering applications to model flipping a switch. It is defined as

$$H(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{if } x \geq 0. \end{cases}$$

a. Sketch a graph of H on the interval $[-1, 1]$.

b. Does $\lim_{x \rightarrow 0} H(x)$ exist?

- 35. Postage rates** Assume postage for sending a first-class letter in the United States is \$0.47 for the first ounce (up to and including 1 oz) plus \$0.21 for each additional ounce (up to and including each additional ounce).

a. Graph the function $p = f(w)$ that gives the postage p for sending a letter that weighs w ounces, for $0 < w \leq 3.5$.

b. Evaluate $\lim_{w \rightarrow 2.3} f(w)$.

c. Does $\lim_{w \rightarrow 3} f(w)$ exist? Explain.

T 36–42. Calculator limits Estimate the following limits using graphs or tables.

36. $\lim_{h \rightarrow 0} \frac{\sin h}{h}$

37. $\lim_{x \rightarrow \pi/2} \frac{\cot 3x}{\cos x}$

38. $\lim_{x \rightarrow 1} \frac{18(\sqrt[3]{x} - 1)}{x^3 - 1}$

39. $\lim_{x \rightarrow 1} \frac{9(\sqrt{2x - x^4} - \sqrt[3]{x})}{1 - x^{3/4}}$

40. $\lim_{x \rightarrow 0} \frac{1 - \cos^5 2x}{1 - \cos x}$

41. $\lim_{x \rightarrow 8} \frac{(x^{4/3} - 1)(x^{2/3} - 4)}{x - 8}$

42. $\lim_{x \rightarrow 3} \frac{x^4 - 7x^3 + 15x^2 - 9x}{x - 3}$

T 43. Strange behavior near $x = 0$

- Create a table of values of $\sin(1/x)$, for $x = 2/\pi, 2/(3\pi), 2/(5\pi), 2/(7\pi), 2/(9\pi)$, and $2/(11\pi)$. Describe the pattern of values you observe.
- Why does a graphing utility have difficulty plotting the graph of $y = \sin(1/x)$ near $x = 0$ (see figure)?
- What do you conclude about $\lim_{x \rightarrow 0} \sin(1/x)$?

T 44. Strange behavior near $x = 0$

- Create a table of values of $\tan(3/x)$, for $x = 12/\pi, 12/(3\pi), 12/(5\pi), \dots, 12/(11\pi)$. Describe the general pattern in the values you observe.
- Use a graphing utility to graph $y = \tan(3/x)$. Why do graphing utilities have difficulty plotting the graph near $x = 0$?
- What do you conclude about $\lim_{x \rightarrow 0} \tan(3/x)$?

45–49. Sketching graphs of functions Sketch the graph of a function with the given properties. You do not need to find a formula for the function.

45. $f(2) = 1, \lim_{x \rightarrow 2} f(x) = 3$

46. $f(1) = 0, f(2) = 4, f(3) = 6, \lim_{x \rightarrow 2^-} f(x) = -3, \lim_{x \rightarrow 2^+} f(x) = 5$

47. $g(1) = 0, g(2) = 1, g(3) = -2, \lim_{x \rightarrow 2} g(x) = 0,$
 $\lim_{x \rightarrow 3^-} g(x) = -1, \lim_{x \rightarrow 3^+} g(x) = -2$

48. $h(-1) = 2, \lim_{x \rightarrow -1^-} h(x) = 0, \lim_{x \rightarrow -1^+} h(x) = 3,$
 $h(1) = \lim_{x \rightarrow 1^-} h(x) = 1, \lim_{x \rightarrow 1^+} h(x) = 4$

49. $p(0) = 2, \lim_{x \rightarrow 0} p(x) = 0, \lim_{x \rightarrow 2} p(x)$ does not exist,
 $p(2) = \lim_{x \rightarrow 2^+} p(x) = 1$

50. A step function Let $f(x) = \frac{|x|}{x}$, for $x \neq 0$.

- Sketch a graph of f on the interval $[-2, 2]$.
- Does $\lim_{x \rightarrow 0} f(x)$ exist? Explain your reasoning after first examining $\lim_{x \rightarrow 0^-} f(x)$ and $\lim_{x \rightarrow 0^+} f(x)$.

51. The floor function For any real number x , the *floor function* (or *greatest integer function*) $\lfloor x \rfloor$ is the greatest integer less than or equal to x (see figure).

- Compute $\lim_{x \rightarrow -1^-} \lfloor x \rfloor$, $\lim_{x \rightarrow -1^+} \lfloor x \rfloor$, $\lim_{x \rightarrow 2^-} \lfloor x \rfloor$, and $\lim_{x \rightarrow 2^+} \lfloor x \rfloor$.
- Compute $\lim_{x \rightarrow 2.3^-} \lfloor x \rfloor$, $\lim_{x \rightarrow 2.3^+} \lfloor x \rfloor$, and $\lim_{x \rightarrow 2.3} \lfloor x \rfloor$.
- For a given integer a , state the values of $\lim_{x \rightarrow a^-} \lfloor x \rfloor$ and $\lim_{x \rightarrow a^+} \lfloor x \rfloor$.
- In general, if a is not an integer, state the values of $\lim_{x \rightarrow a^-} \lfloor x \rfloor$ and $\lim_{x \rightarrow a^+} \lfloor x \rfloor$.
- For what values of a does $\lim_{x \rightarrow a} \lfloor x \rfloor$ exist? Explain?

52. The ceiling function For any real number x , the *ceiling function* $\lceil x \rceil$ is the smallest integer greater than or equal to x .

- Graph the ceiling function $y = \lceil x \rceil$, for $-2 \leq x \leq 3$.
- Evaluate $\lim_{x \rightarrow 2^-} \lceil x \rceil$, $\lim_{x \rightarrow 1^+} \lceil x \rceil$, and $\lim_{x \rightarrow 1.5} \lceil x \rceil$.
- For what values of a does $\lim_{x \rightarrow a} \lceil x \rceil$ exist? Explain.

Explorations and Challenges

53. Limits of even functions A function f is even if $f(-x) = f(x)$, for all x in the domain of f . Suppose f is even, with $\lim_{x \rightarrow 2^+} f(x) = 5$ and $\lim_{x \rightarrow 2^-} f(x) = 8$. Evaluate the following limits.

a. $\lim_{x \rightarrow -2^+} f(x)$ b. $\lim_{x \rightarrow -2^-} f(x)$

54. Limits of odd functions A function g is odd if $g(-x) = -g(x)$, for all x in the domain of g . Suppose g is odd, with $\lim_{x \rightarrow 2^+} g(x) = 5$ and $\lim_{x \rightarrow 2^-} g(x) = 8$. Evaluate the following limits.

a. $\lim_{x \rightarrow -2^+} g(x)$ b. $\lim_{x \rightarrow -2^-} g(x)$

T 55. Limits by graphs

- Use a graphing utility to estimate $\lim_{x \rightarrow 0} \frac{\tan 2x}{\sin x}$, $\lim_{x \rightarrow 0} \frac{\tan 3x}{\sin x}$, and $\lim_{x \rightarrow 0} \frac{\tan 4x}{\sin x}$.
- Make a conjecture about the value of $\lim_{x \rightarrow 0} \frac{\tan px}{\sin x}$, for any real constant p .

T 56. Limits by graphs Graph $f(x) = \frac{\sin nx}{x}$, for $n = 1, 2, 3$, and 4 (four graphs). Use the window $[-1, 1] \times [0, 5]$.

- Estimate $\lim_{x \rightarrow 0} \frac{\sin x}{x}$, $\lim_{x \rightarrow 0} \frac{\sin 2x}{x}$, $\lim_{x \rightarrow 0} \frac{\sin 3x}{x}$, and $\lim_{x \rightarrow 0} \frac{\sin 4x}{x}$.
- Make a conjecture about the value of $\lim_{x \rightarrow 0} \frac{\sin px}{x}$, for any real constant p .

- 57. Limits by graphs** Use a graphing utility to plot $y = \frac{\sin px}{\sin qx}$ for at least three different pairs of nonzero constants p and q of your choice. Estimate $\lim_{x \rightarrow 0} \frac{\sin px}{\sin qx}$ in each case. Then use your work to make a conjecture about the value of $\lim_{x \rightarrow 0} \frac{\sin px}{\sin qx}$ for any nonzero values of p and q .

QUICK CHECK ANSWERS

1. The value of $\lim_{x \rightarrow 1} f(x)$ depends on the value of f only near 1, not at 1. Therefore, changing the value of $f(1)$ will not change the value of $\lim_{x \rightarrow 1} f(x)$.
2. A graphing device has difficulty plotting $y = \cos(1/x)$ near 0 because values of the function vary between -1 and 1 over shorter and shorter intervals as x approaches 0. ◀

2.3 Techniques for Computing Limits

Graphical and numerical techniques for estimating limits, like those presented in the previous section, provide intuition about limits. These techniques, however, occasionally lead to incorrect results. Therefore, we turn our attention to analytical methods for evaluating limits precisely.

Limits of Linear Functions

The graph of $f(x) = mx + b$ is a line with slope m and y -intercept b . From Figure 2.15, we see that $f(x)$ approaches $f(a)$ as x approaches a . Therefore, if f is a linear function, we have $\lim_{x \rightarrow a} f(x) = f(a)$. It follows that for linear functions, $\lim_{x \rightarrow a} f(x)$ is found by direct substitution of $x = a$ into $f(x)$. This observation leads to the following theorem, which is proved in Exercise 39 of Section 2.7.

Figure 2.15

THEOREM 2.2 Limits of Linear Functions

Let a , b , and m be real numbers. For linear functions $f(x) = mx + b$,

$$\lim_{x \rightarrow a} f(x) = f(a) = ma + b.$$

EXAMPLE 1 Limits of linear functions Evaluate the following limits.

- a. $\lim_{x \rightarrow 3} f(x)$, where $f(x) = \frac{1}{2}x - 7$ b. $\lim_{x \rightarrow 2} g(x)$, where $g(x) = 6$

SOLUTION

- a. $\lim_{x \rightarrow 3} f(x) = \lim_{x \rightarrow 3} \left(\frac{1}{2}x - 7\right) = f(3) = -\frac{11}{2}$ b. $\lim_{x \rightarrow 2} g(x) = \lim_{x \rightarrow 2} 6 = g(2) = 6$

Related Exercises 19, 22 ◀

Limit Laws

The following limit laws greatly simplify the evaluation of many limits.

THEOREM 2.3 Limit Laws

Assume $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ exist. The following properties hold, where c is a real number, and $n > 0$ is an integer.

1. **Sum** $\lim_{x \rightarrow a} (f(x) + g(x)) = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x)$
2. **Difference** $\lim_{x \rightarrow a} (f(x) - g(x)) = \lim_{x \rightarrow a} f(x) - \lim_{x \rightarrow a} g(x)$
3. **Constant multiple** $\lim_{x \rightarrow a} (cf(x)) = c \lim_{x \rightarrow a} f(x)$
4. **Product** $\lim_{x \rightarrow a} (f(x)g(x)) = \left(\lim_{x \rightarrow a} f(x) \right) \left(\lim_{x \rightarrow a} g(x) \right)$
5. **Quotient** $\lim_{x \rightarrow a} \left(\frac{f(x)}{g(x)} \right) = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)}$, provided $\lim_{x \rightarrow a} g(x) \neq 0$
6. **Power** $\lim_{x \rightarrow a} (f(x))^n = \left(\lim_{x \rightarrow a} f(x) \right)^n$
7. **Root** $\lim_{x \rightarrow a} (f(x))^{1/n} = \left(\lim_{x \rightarrow a} f(x) \right)^{1/n}$, provided $f(x) > 0$, for x near a , if n is even

A proof of Law 1 is given in Example 6 of Section 2.7; the proofs of Laws 2 and 3 are asked for in Exercises 43 and 44 of the same section. Laws 4 and 5 are proved in Appendix A. Law 6 is proved from Law 4 as follows.

For a positive integer n , if $\lim_{x \rightarrow a} f(x)$ exists, we have

$$\begin{aligned}
 \lim_{x \rightarrow a} (f(x))^n &= \lim_{x \rightarrow a} \underbrace{(f(x) f(x) \cdots f(x))}_{n \text{ factors of } f(x)} \\
 &= \underbrace{\left(\lim_{x \rightarrow a} f(x) \right) \left(\lim_{x \rightarrow a} f(x) \right) \cdots \left(\lim_{x \rightarrow a} f(x) \right)}_{n \text{ factors of } \lim_{x \rightarrow a} f(x)} \quad \text{Repeated use of Law 4} \\
 &= \left(\lim_{x \rightarrow a} f(x) \right)^n.
 \end{aligned}$$

Law 7 is a direct consequence of Theorem 2.11 (Section 2.6).

EXAMPLE 2 Evaluating limits Suppose $\lim_{x \rightarrow 2} f(x) = 4$, $\lim_{x \rightarrow 2} g(x) = 5$, and $\lim_{x \rightarrow 2} h(x) = 8$. Use the limit laws in Theorem 2.3 to compute each limit.

$$\text{a. } \lim_{x \rightarrow 2} \frac{f(x) - g(x)}{h(x)} \qquad \text{b. } \lim_{x \rightarrow 2} (6f(x)g(x) + h(x)) \qquad \text{c. } \lim_{x \rightarrow 2} (g(x))^3$$

SOLUTION

$$\begin{aligned}
 \text{a. } \lim_{x \rightarrow 2} \frac{f(x) - g(x)}{h(x)} &= \frac{\lim_{x \rightarrow 2} (f(x) - g(x))}{\lim_{x \rightarrow 2} h(x)} \quad \text{Law 5} \\
 &= \frac{\lim_{x \rightarrow 2} f(x) - \lim_{x \rightarrow 2} g(x)}{\lim_{x \rightarrow 2} h(x)} \quad \text{Law 2} \\
 &= \frac{4 - 5}{8} = -\frac{1}{8}
 \end{aligned}$$

$$\begin{aligned}
 \text{b. } \lim_{x \rightarrow 2} (6f(x)g(x) + h(x)) &= \lim_{x \rightarrow 2} (6f(x)g(x)) + \lim_{x \rightarrow 2} h(x) && \text{Law 1} \\
 &= 6 \cdot \lim_{x \rightarrow 2} (f(x)g(x)) + \lim_{x \rightarrow 2} h(x) && \text{Law 3} \\
 &= 6 \left(\lim_{x \rightarrow 2} f(x) \right) \left(\lim_{x \rightarrow 2} g(x) \right) + \lim_{x \rightarrow 2} h(x) && \text{Law 4} \\
 &= 6 \cdot 4 \cdot 5 + 8 = 128
 \end{aligned}$$

$$\text{c. } \lim_{x \rightarrow 2} (g(x))^3 = \left(\lim_{x \rightarrow 2} g(x) \right)^3 = 5^3 = 125 \quad \text{Law 6}$$

Related Exercises 11–12 ◀

Limits of Polynomial and Rational Functions

The limit laws are now used to find the limits of polynomial and rational functions. For example, to evaluate the limit of the polynomial $p(x) = 7x^3 + 3x^2 + 4x + 2$ at an arbitrary point a , we proceed as follows:

$$\begin{aligned}
 \lim_{x \rightarrow a} p(x) &= \lim_{x \rightarrow a} (7x^3 + 3x^2 + 4x + 2) \\
 &= \lim_{x \rightarrow a} (7x^3) + \lim_{x \rightarrow a} (3x^2) + \lim_{x \rightarrow a} (4x + 2) && \text{Law 1} \\
 &= 7 \lim_{x \rightarrow a} (x^3) + 3 \lim_{x \rightarrow a} (x^2) + \lim_{x \rightarrow a} (4x + 2) && \text{Law 3} \\
 &= 7 \underbrace{\left(\lim_{x \rightarrow a} x \right)^3}_a + 3 \underbrace{\left(\lim_{x \rightarrow a} x \right)^2}_a + \underbrace{\lim_{x \rightarrow a} (4x + 2)}_{4a + 2} && \text{Law 6} \\
 &= 7a^3 + 3a^2 + 4a + 2 = p(a). && \text{Theorem 2.2}
 \end{aligned}$$

As in the case of linear functions, the limit of a polynomial is found by direct substitution; that is, $\lim_{x \rightarrow a} p(x) = p(a)$ (Exercise 105).

It is now a short step to evaluating limits of rational functions of the form $f(x) = p(x)/q(x)$, where p and q are polynomials. Applying Law 5, we have

$$\lim_{x \rightarrow a} \frac{p(x)}{q(x)} = \frac{\lim_{x \rightarrow a} p(x)}{\lim_{x \rightarrow a} q(x)} = \frac{p(a)}{q(a)}, \text{ provided } q(a) \neq 0,$$

which shows that limits of rational functions are also evaluated by direct substitution.

► The conditions under which direct substitution $\left(\lim_{x \rightarrow a} f(x) = f(a) \right)$ can be used to evaluate a limit become clear in Section 2.6, when we discuss the important property of *continuity*.

THEOREM 2.4 Limits of Polynomial and Rational Functions

Assume p and q are polynomials and a is a constant.

a. Polynomial functions: $\lim_{x \rightarrow a} p(x) = p(a)$

b. Rational functions: $\lim_{x \rightarrow a} \frac{p(x)}{q(x)} = \frac{p(a)}{q(a)}, \text{ provided } q(a) \neq 0$

QUICK CHECK 1 Use Theorem 2.4 to evaluate $\lim_{x \rightarrow 2} (2x^4 - 8x - 16)$ and

$$\lim_{x \rightarrow -1} \frac{x - 1}{x}. \quad \blacktriangleleft$$

EXAMPLE 3 Limit of a rational function Evaluate $\lim_{x \rightarrow 2} \frac{3x^2 - 4x}{5x^3 - 36}$.

SOLUTION Notice that the denominator of this function is nonzero at $x = 2$. Using Theorem 2.4b, we find that

$$\lim_{x \rightarrow 2} \frac{3x^2 - 4x}{5x^3 - 36} = \frac{3(2^2) - 4(2)}{5(2^3) - 36} = 1.$$

Related Exercise 25 ◀

QUICK CHECK 2 Use Theorem 2.4 to compute $\lim_{x \rightarrow 1} \frac{5x^4 - 3x^2 + 8x - 6}{x + 1}. \quad \blacktriangleleft$

EXAMPLE 4 An algebraic function Evaluate $\lim_{x \rightarrow 2} \frac{\sqrt{2x^3 + 9} + 3x - 1}{4x + 1}$.

SOLUTION Using Theorems 2.3 and 2.4, we have

$$\begin{aligned}
 \lim_{x \rightarrow 2} \frac{\sqrt{2x^3 + 9} + 3x - 1}{4x + 1} &= \frac{\lim_{x \rightarrow 2} (\sqrt{2x^3 + 9} + 3x - 1)}{\lim_{x \rightarrow 2} (4x + 1)} && \text{Law 5} \\
 &= \frac{\sqrt{\lim_{x \rightarrow 2} (2x^3 + 9)} + \lim_{x \rightarrow 2} (3x - 1)}{\lim_{x \rightarrow 2} (4x + 1)} && \text{Laws 1 and 7} \\
 &= \frac{\sqrt{(2(2))^3 + 9} + (3(2) - 1)}{(4(2) + 1)} && \text{Theorem 2.4} \\
 &= \frac{\sqrt{25} + 5}{9} = \frac{10}{9}.
 \end{aligned}$$

Notice that the limit at $x = 2$ equals the value of the function at $x = 2$.

Related Exercises 26–27 ◀

One-Sided Limits

Theorem 2.2, Limit Laws 1–6, and Theorem 2.4 also hold for left-sided and right-sided limits. In other words, these laws remain valid if we replace $\lim$ with $\lim_{x \rightarrow a}$, $\lim_{x \rightarrow a^+}$, or $\lim_{x \rightarrow a^-}$. Law 7 must be modified slightly for one-sided limits, as shown in the next theorem.

THEOREM 2.3 (CONTINUED) Limit Laws for One-Sided Limits

Laws 1–6 hold with $\lim$ replaced with $\lim_{x \rightarrow a}$, $\lim_{x \rightarrow a^+}$, or $\lim_{x \rightarrow a^-}$. Law 7 is modified as follows. Assume $n > 0$ is an integer.

7. Root

- $\lim_{x \rightarrow a^+} (f(x))^{1/n} = \left(\lim_{x \rightarrow a^+} f(x) \right)^{1/n}$, provided $f(x) \geq 0$, for x near a with $x > a$, if n is even
- $\lim_{x \rightarrow a^-} (f(x))^{1/n} = \left(\lim_{x \rightarrow a^-} f(x) \right)^{1/n}$, provided $f(x) \geq 0$, for x near a with $x < a$, if n is even

Figure 2.16

EXAMPLE 5 Calculating left- and right-sided limits Let

$$f(x) = \begin{cases} -2x + 4 & \text{if } x \leq 1 \\ \sqrt{x-1} & \text{if } x > 1 \end{cases}$$

Find the values of $\lim_{x \rightarrow 1^-} f(x)$, $\lim_{x \rightarrow 1^+} f(x)$, and $\lim_{x \rightarrow 1} f(x)$, or state that they do not exist.

SOLUTION Notice that $f(x) = -2x + 4$, for $x \leq 1$. Therefore,

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (-2x + 4) = 2. \quad \text{Theorem 2.2}$$

For $x > 1$, note that $x - 1 > 0$; it follows that

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} \sqrt{x-1} = \sqrt{\lim_{x \rightarrow 1^+} (x-1)} = 0. \quad \text{Law 7 for one-sided limits}$$

Because $\lim_{x \rightarrow 1^-} f(x) \neq \lim_{x \rightarrow 1^+} f(x)$, $\lim_{x \rightarrow 1} f(x)$ does not exist by Theorem 2.1. The graph of f (Figure 2.16) is consistent with these findings.

Related Exercises 72–73 ◀

Other Techniques

So far, we have evaluated limits by direct substitution. A more challenging problem is finding $\lim_{x \rightarrow a} f(x)$ when the limit exists, but $\lim_{x \rightarrow a} f(x) \neq f(a)$. Two typical cases are shown in Figure 2.17. In the first case, $f(a)$ is defined, but it is not equal to $\lim_{x \rightarrow a} f(x)$; in the second case, $f(a)$ is not defined at all. In both cases, direct substitution does not work—we need a new strategy. One way to evaluate a challenging limit is to replace it with an equivalent limit that *can* be evaluated by direct substitution. Example 6 illustrates two common scenarios.

Figure 2.17

EXAMPLE 6 Other techniques Evaluate the following limits.

a. $\lim_{x \rightarrow 2} \frac{x^2 - 6x + 8}{x^2 - 4}$ b. $\lim_{x \rightarrow 1} \frac{\sqrt{x} - 1}{x - 1}$

SOLUTION

a. Factor and cancel This limit cannot be found by direct substitution because the denominator is zero when $x = 2$. Instead, the numerator and denominator are factored; then, assuming $x \neq 2$, we cancel like factors:

$$\frac{x^2 - 6x + 8}{x^2 - 4} = \frac{(x - 2)(x - 4)}{(x - 2)(x + 2)} = \frac{x - 4}{x + 2}.$$

Because $\frac{x^2 - 6x + 8}{x^2 - 4} = \frac{x - 4}{x + 2}$ whenever $x \neq 2$, the two functions have the same limit as x approaches 2 (Figure 2.18). Therefore,

$$\lim_{x \rightarrow 2} \frac{x^2 - 6x + 8}{x^2 - 4} = \lim_{x \rightarrow 2} \frac{x - 4}{x + 2} = \frac{2 - 4}{2 + 2} = -\frac{1}{2}.$$

$$\lim_{x \rightarrow 2} \frac{x^2 - 6x + 8}{x^2 - 4} = \lim_{x \rightarrow 2} \frac{x - 4}{x + 2} = -\frac{1}{2}$$

Figure 2.18

► The argument used in Example 6a relies on the fact that in the limit process, x approaches 2, but $x \neq 2$. Therefore, we may cancel like factors.

► We multiply the given function by

$$1 = \frac{\sqrt{x} + 1}{\sqrt{x} + 1}.$$

b. Use conjugates This limit was approximated numerically in Example 2 of Section 2.2; we made a conjecture that the value of the limit is $1/2$. Using direct substitution to verify this conjecture fails in this case, because the denominator is zero at $x = 1$. Instead, we first simplify the function by multiplying the numerator and denominator by the *algebraic conjugate* of the numerator. The conjugate of $\sqrt{x} - 1$ is $\sqrt{x} + 1$; therefore,

$$\begin{aligned} \frac{\sqrt{x} - 1}{x - 1} &= \frac{(\sqrt{x} - 1)(\sqrt{x} + 1)}{(x - 1)(\sqrt{x} + 1)} && \text{Rationalize the numerator; multiply by 1.} \\ &= \frac{x + \sqrt{x} - \sqrt{x} - 1}{(x - 1)(\sqrt{x} + 1)} && \text{Expand the numerator.} \\ &= \frac{x - 1}{(x - 1)(\sqrt{x} + 1)} && \text{Simplify.} \\ &= \frac{1}{\sqrt{x} + 1}. && \text{Cancel like factors assuming } x \neq 1. \end{aligned}$$

The limit can now be evaluated:

$$\lim_{x \rightarrow 1} \frac{\sqrt{x} - 1}{x - 1} = \lim_{x \rightarrow 1} \frac{1}{\sqrt{x} + 1} = \frac{1}{1 + 1} = \frac{1}{2}.$$

Related Exercises 34, 41 ◀

QUICK CHECK 3 Evaluate

$$\lim_{x \rightarrow 5} \frac{x^2 - 7x + 10}{x - 5}.$$

EXAMPLE 7 Finding limits Let $f(x) = \frac{x^3 - 6x^2 + 8x}{\sqrt{x} - 2}$. Find the values of $\lim_{x \rightarrow 2^-} f(x)$, $\lim_{x \rightarrow 2^+} f(x)$, and $\lim_{x \rightarrow 2} f(x)$, or state that they do not exist.

SOLUTION Because the denominator of f is $\sqrt{x} - 2$, $f(x)$ is defined only when $x - 2 > 0$. Therefore, the domain of f is $x > 2$ and it follows that $\lim_{x \rightarrow 2^-} f(x)$ does not exist, which in turn implies that $\lim_{x \rightarrow 2} f(x)$ does not exist (Theorem 2.1). To evaluate $\lim_{x \rightarrow 2^+} f(x)$, factor the numerator of f and simplify:

$$\begin{aligned} \lim_{x \rightarrow 2^+} f(x) &= \lim_{x \rightarrow 2^+} \frac{x(x - 2)(x - 4)}{(x - 2)^{1/2}} && \text{Factor numerator;} \\ & && \sqrt{x - 2} = (x - 2)^{1/2}. \\ &= \lim_{x \rightarrow 2^+} x(x - 4)(x - 2)^{1/2} && \text{Simplify;} \\ & && (x - 2)/(x - 2)^{1/2} = (x - 2)^{1/2}. \\ &= \lim_{x \rightarrow 2^+} x \cdot \lim_{x \rightarrow 2^+} (x - 4) \cdot \lim_{x \rightarrow 2^+} (x - 2)^{1/2} && \text{Theorem 2.3} \\ &= 2(-2)(0) = 0. && \text{Theorem 2.2, Law 7 for one-sided limits} \end{aligned}$$

Related Exercises 69–70 ◀

► The Squeeze Theorem is also called the Pinching Theorem or the Sandwich Theorem.

Squeeze Theorem:
As $x \rightarrow a$, $h(x) \rightarrow L$ and $f(x) \rightarrow L$.
Therefore, $g(x) \rightarrow L$.

Figure 2.19

The Squeeze Theorem

The *Squeeze Theorem* provides another useful method for calculating limits. Suppose the functions f and h have the same limit L at a and assume the function g is trapped between f and h (Figure 2.19). The Squeeze Theorem says that g must also have the limit L at a . A proof of this theorem is assigned in Exercise 68 of Section 2.7.

THEOREM 2.5 The Squeeze Theorem

Assume the functions f , g , and h satisfy $f(x) \leq g(x) \leq h(x)$ for all values of x near a , except possibly at a . If $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} h(x) = L$, then $\lim_{x \rightarrow a} g(x) = L$.

EXAMPLE 8 Applying the Squeeze Theorem Use the Squeeze Theorem to verify that $\lim_{x \rightarrow 0} x^2 \sin(1/x) = 0$.

SOLUTION For any real number θ , $-1 \leq \sin \theta \leq 1$. Letting $\theta = 1/x$ for $x \neq 0$, it follows that

$$-1 \leq \sin \frac{1}{x} \leq 1.$$

Noting that $x^2 > 0$ for $x \neq 0$, each term in this inequality is multiplied by x^2 :

$$-x^2 \leq x^2 \sin \frac{1}{x} \leq x^2.$$

These inequalities are illustrated in **Figure 2.20**. Because $\lim_{x \rightarrow 0} x^2 = \lim_{x \rightarrow 0} (-x^2) = 0$, the Squeeze Theorem implies that $\lim_{x \rightarrow 0} x^2 \sin (1/x) = 0$.

Figure 2.20

Related Exercises 81–82 ◀

QUICK CHECK 4 Suppose f satisfies $1 \leq f(x) \leq 1 + \frac{x^2}{6}$ for all values of x near zero. Find $\lim_{x \rightarrow 0} f(x)$, if possible. ◀

Trigonometric Limits

The Squeeze Theorem is used to evaluate two important limits that play a crucial role in establishing fundamental properties of the trigonometric functions in Section 2.6. These limits are

$$\lim_{x \rightarrow 0} \sin x = 0 \quad \text{and} \quad \lim_{x \rightarrow 0} \cos x = 1.$$

To verify these limits, the following inequalities, both valid on $-\pi/2 < x < \pi/2$, are used:

$$-|x| \leq \sin x \leq |x| \quad (\text{Figure 2.21a}) \quad \text{and} \quad 1 - |x| \leq \cos x \leq 1 \quad (\text{Figure 2.21b}).$$

► See Exercise 104 for a geometric derivation of the inequalities illustrated in Figure 2.21.

Figure 2.21

Let's begin with the inequality illustrated in Figure 2.21a. Letting $f(x) = -|x|$, $g(x) = \sin x$, and $h(x) = |x|$, we see that g is trapped between f and h on $-\pi/2 < x < \pi/2$. Because $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} h(x) = 0$ (Exercise 85), the Squeeze Theorem implies that $\lim_{x \rightarrow 0} g(x) = \lim_{x \rightarrow 0} \sin x = 0$.

► Notice that direct substitution can be used to evaluate the important trigonometric limits just derived. That is, $\lim_{x \rightarrow 0} \sin x = \sin 0 = 0$ and $\lim_{x \rightarrow 0} \cos x = \cos 0 = 1$. In Section 2.6, these limits are used to show that

$$\lim_{x \rightarrow a} \sin x = \sin a \quad \text{and} \\ \lim_{x \rightarrow a} \cos x = \cos a.$$

In other words, direct substitution may be used to evaluate limits of the sine and cosine functions for any value of a .

To evaluate $\lim_{x \rightarrow 0} \cos x$, let $f(x) = 1 - |x|$, $g(x) = \cos x$, and $h(x) = 1$, and notice that g is again trapped between f and h on $-\pi/2 < x < \pi/2$ (Figure 2.21b). Because $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} h(x) = 1$, the Squeeze Theorem implies that $\lim_{x \rightarrow 0} g(x) = \lim_{x \rightarrow 0} \cos x = 1$. Having established that $\lim_{x \rightarrow 0} \sin x = 0$ and $\lim_{x \rightarrow 0} \cos x = 1$, we can evaluate more complicated limits involving trigonometric functions.

EXAMPLE 9 Trigonometric limits Evaluate the following trigonometric limits.

a. $\lim_{x \rightarrow 0} \frac{\sin^2 x}{1 - \cos x}$ b. $\lim_{x \rightarrow 0} \frac{1 - \cos 2x}{\sin x}$

SOLUTION Direct substitution does not work for either limit because the denominator is zero at $x = 0$ in both parts (a) and (b). Instead, trigonometric identities and limit laws are used to simplify the trigonometric function.

a. The Pythagorean identity $\sin^2 x + \cos^2 x = 1$ is used to simplify the function.

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sin^2 x}{1 - \cos x} &= \lim_{x \rightarrow 0} \frac{1 - \cos^2 x}{1 - \cos x} && \sin^2 x = 1 - \cos^2 x \\ &= \lim_{x \rightarrow 0} \frac{(1 - \cos x)(1 + \cos x)}{1 - \cos x} && \text{Factor the numerator.} \\ &= \lim_{x \rightarrow 0} (1 + \cos x) && \text{Simplify.} \\ &= \underbrace{\lim_{x \rightarrow 0} 1}_{1} + \underbrace{\lim_{x \rightarrow 0} \cos x}_{1} = 2 && \text{Theorem 2.3 (Law 1)} \end{aligned}$$

b. We use the identity $\cos 2x = \cos^2 x - \sin^2 x$ to simplify the function.

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{1 - \cos 2x}{\sin x} &= \lim_{x \rightarrow 0} \frac{1 - (\cos^2 x - \sin^2 x)}{\sin x} && \cos 2x = \cos^2 x - \sin^2 x \\ &= \lim_{x \rightarrow 0} \frac{1 - \cos^2 x + \sin^2 x}{\sin x} && \text{Distribute.} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin^2 x}{\sin x} && 1 - \cos^2 x = \sin^2 x \\ &= 2 \underbrace{\lim_{x \rightarrow 0} \sin x}_{0} = 0 && \text{Simplify; Theorem 2.3 (Law 3).} \end{aligned}$$

Related Exercises 60–61 ◀

SECTION 2.3 EXERCISES

Getting Started

- How is $\lim_{x \rightarrow a} p(x)$ calculated if p is a polynomial function?
- Evaluate $\lim_{x \rightarrow 1} (x^3 + 3x^2 - 3x + 1)$.
- For what values of a does $\lim_{x \rightarrow a} r(x) = r(a)$ if r is a rational function?
- Evaluate $\lim_{x \rightarrow 4} \left(\frac{x^2 - 4x - 1}{3x - 1} \right)$.
- Explain why $\lim_{x \rightarrow 3} \frac{x^2 - 7x + 12}{x - 3} = \lim_{x \rightarrow 3} (x - 4)$ and then evaluate $\lim_{x \rightarrow 3} \frac{x^2 - 7x + 12}{x - 3}$.
- Evaluate $\lim_{x \rightarrow 5} \left(\frac{4x^2 - 100}{x - 5} \right)$.

7–13. Assume $\lim_{x \rightarrow 1} f(x) = 8$, $\lim_{x \rightarrow 1} g(x) = 3$, and $\lim_{x \rightarrow 1} h(x) = 2$. Compute the following limits and state the limit laws used to justify your computations.

- $\lim_{x \rightarrow 1} (4f(x))$
- $\lim_{x \rightarrow 1} \frac{f(x)}{h(x)}$
- $\lim_{x \rightarrow 1} (f(x) - g(x))$
- $\lim_{x \rightarrow 1} \frac{f(x)}{g(x) - h(x)}$
- $\lim_{x \rightarrow 1} (f(x))^{2/3}$
- How are $\lim_{x \rightarrow a} p(x)$ and $\lim_{x \rightarrow a} p(x)$ calculated if p is a polynomial function?
- $\lim_{x \rightarrow 1} (4f(x))$
- $\lim_{x \rightarrow 1} \frac{f(x)}{h(x)}$
- $\lim_{x \rightarrow 1} (f(x)h(x))$
- $\lim_{x \rightarrow 1} \sqrt[3]{f(x)g(x) + 3}$

15. Suppose

$$g(x) = \begin{cases} 2x + 1 & \text{if } x \neq 0 \\ 5 & \text{if } x = 0. \end{cases}$$

Compute $g(0)$ and $\lim_{x \rightarrow 0} g(x)$.

16. Suppose

$$f(x) = \begin{cases} 4 & \text{if } x \leq 3 \\ x + 2 & \text{if } x > 3. \end{cases}$$

Compute $\lim_{x \rightarrow 3^-} f(x)$ and $\lim_{x \rightarrow 3^+} f(x)$. Then explain why $\lim_{x \rightarrow 3} f(x)$ does not exist.

17. Suppose p and q are polynomials. If $\lim_{x \rightarrow 0} \frac{p(x)}{q(x)} = 10$ and $q(0) = 2$, find $p(0)$.

18. Suppose $\lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} h(x) = 5$. Find $\lim_{x \rightarrow 2} g(x)$, where $f(x) \leq g(x) \leq h(x)$, for all x .

Practice Exercises

19–70. Evaluating limits Find the following limits or state that they do not exist. Assume a , b , c , and k are fixed real numbers.

19. $\lim_{x \rightarrow 4} (3x - 7)$

20. $\lim_{x \rightarrow 1} (-2x + 5)$

21. $\lim_{x \rightarrow -9} 5x$

22. $\lim_{x \rightarrow 6} 4$

23. $\lim_{x \rightarrow 1} (2x^3 - 3x^2 + 4x + 5)$

24. $\lim_{t \rightarrow -2} (t^2 + 5t + 7)$

25. $\lim_{x \rightarrow 1} \frac{5x^2 + 6x + 1}{8x - 4}$

26. $\lim_{t \rightarrow 3} \sqrt[3]{t^2 - 10}$

27. $\lim_{p \rightarrow 2} \frac{3p}{\sqrt{4p+1} - 1}$

28. $\lim_{x \rightarrow 2} (x^2 - x)^5$

29. $\lim_{x \rightarrow 3} \frac{-5x}{\sqrt{4x-3}}$

30. $\lim_{h \rightarrow 0} \frac{3}{\sqrt{16+3h} + 4}$

31. $\lim_{x \rightarrow 2} (5x - 6)^{3/2}$

32. $\lim_{h \rightarrow 0} \frac{100}{(10h - 1)^{11} + 2}$

33. $\lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1}$

34. $\lim_{x \rightarrow 3} \frac{x^2 - 2x - 3}{x - 3}$

35. $\lim_{x \rightarrow 4} \frac{x^2 - 16}{4 - x}$

36. $\lim_{t \rightarrow 2} \frac{3t^2 - 7t + 2}{2 - t}$

37. $\lim_{x \rightarrow b} \frac{(x-b)^{50} - x + b}{x - b}$

38. $\lim_{x \rightarrow -b} \frac{(x+b)^7 + (x+b)^{10}}{4(x+b)}$

39. $\lim_{x \rightarrow -1} \frac{(2x-1)^2 - 9}{x+1}$

40. $\lim_{h \rightarrow 0} \frac{\frac{1}{5+h} - \frac{1}{5}}{h}$

41. $\lim_{x \rightarrow 9} \frac{\sqrt{x} - 3}{x - 9}$

42. $\lim_{w \rightarrow 1} \left(\frac{1}{w^2 - w} - \frac{1}{w - 1} \right)$

43. $\lim_{t \rightarrow 5} \left(\frac{1}{t^2 - 4t - 5} - \frac{1}{6(t-5)} \right)$

44. $\lim_{t \rightarrow 3} \left(\left(4t - \frac{2}{t-3} \right) (6 + t - t^2) \right)$

45. $\lim_{x \rightarrow a} \frac{x-a}{\sqrt{x} - \sqrt{a}}, a > 0$

46. $\lim_{x \rightarrow a} \frac{x^2 - a^2}{\sqrt{x} - \sqrt{a}}, a > 0$

47. $\lim_{h \rightarrow 0} \frac{\sqrt{16+h} - 4}{h}$

48. $\lim_{x \rightarrow c} \frac{x^2 - 2cx + c^2}{x - c}$

49. $\lim_{x \rightarrow 4} \frac{\frac{1}{x} - \frac{1}{4}}{x - 4}$

50. $\lim_{x \rightarrow 3} \frac{\frac{1}{x^2 + 2x} - \frac{1}{15}}{x - 3}$

51. $\lim_{x \rightarrow 1} \frac{\sqrt{10x-9} - 1}{x - 1}$

52. $\lim_{x \rightarrow 2} \left(\frac{1}{x-2} - \frac{2}{x^2 - 2x} \right)$

53. $\lim_{h \rightarrow 0} \frac{(5+h)^2 - 25}{h}$

54. $\lim_{w \rightarrow -k} \frac{w^2 + 5kw + 4k^2}{w^2 + kw}, k \neq 0$

55. $\lim_{x \rightarrow 1} \frac{x-1}{\sqrt{x}-1}$

56. $\lim_{x \rightarrow 1} \frac{x-1}{\sqrt{4x+5}-3}$

57. $\lim_{x \rightarrow 4} \frac{3(x-4)\sqrt{x+5}}{3 - \sqrt{x+5}}$

58. $\lim_{x \rightarrow 0} \frac{x}{\sqrt{cx+1} - 1}, c \neq 0$

59. $\lim_{x \rightarrow 0} x \cos x$

60. $\lim_{x \rightarrow 0} \frac{\sin 2x}{\sin x}$

61. $\lim_{x \rightarrow 0} \frac{1 - \cos x}{\cos^2 x - 3 \cos x + 2}$

62. $\lim_{x \rightarrow 0} \frac{\cos x - 1}{\cos^2 x - 1}$

63. $\lim_{x \rightarrow 0^-} \frac{x^2 - x}{|x|}$

64. $\lim_{w \rightarrow 3} \frac{|w-3|}{w^2 - 7w + 12}$

65. $\lim_{t \rightarrow 2^+} \frac{|2t-4|}{t^2 - 4}$

66. $\lim_{x \rightarrow -1} g(x)$, where $g(x) = \begin{cases} \frac{x^2 - 1}{x + 1} & \text{if } x < -1 \\ -2 & \text{if } x \geq -1 \end{cases}$

67. $\lim_{x \rightarrow 3} \frac{x-3}{|x-3|}$

68. $\lim_{x \rightarrow 5} \frac{|x-5|}{x^2 - 25}$

69. $\lim_{x \rightarrow 1^-} \frac{x^3 + 1}{\sqrt{x} - 1}$

70. $\lim_{x \rightarrow 1^+} \frac{x-1}{\sqrt{x^2 - 1}}$

71. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample. Assume a and L are finite numbers.

a. If $\lim_{x \rightarrow a} f(x) = L$, then $f(a) = L$.

b. If $\lim_{x \rightarrow a^-} f(x) = L$, then $\lim_{x \rightarrow a^+} f(x) = L$.

c. If $\lim_{x \rightarrow a} f(x) = L$ and $\lim_{x \rightarrow a} g(x) = L$, then $f(a) = g(a)$.

d. The limit $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$ does not exist if $g(a) = 0$.

e. If $\lim_{x \rightarrow 1^+} \sqrt{f(x)} = \sqrt{\lim_{x \rightarrow 1^+} f(x)}$, it follows that

$$\lim_{x \rightarrow 1} \sqrt{f(x)} = \sqrt{\lim_{x \rightarrow 1} f(x)}.$$

72. One-sided limits Let

$$g(x) = \begin{cases} 5x - 15 & \text{if } x < 4 \\ \sqrt{6x + 1} & \text{if } x \geq 4. \end{cases}$$

Compute the following limits or state that they do not exist.

a. $\lim_{x \rightarrow 4^-} g(x)$ b. $\lim_{x \rightarrow 4^+} g(x)$ c. $\lim_{x \rightarrow 4} g(x)$

73. One-sided limits Let

$$f(x) = \begin{cases} x^2 + 1 & \text{if } x < -1 \\ \sqrt{x + 1} & \text{if } x \geq -1. \end{cases}$$

Compute the following limits or state that they do not exist.

a. $\lim_{x \rightarrow -1^-} f(x)$ b. $\lim_{x \rightarrow -1^+} f(x)$ c. $\lim_{x \rightarrow -1} f(x)$

74. One-sided limits Let

$$f(x) = \begin{cases} 0 & \text{if } x \leq -5 \\ \sqrt{25 - x^2} & \text{if } -5 < x < 5 \\ 3x & \text{if } x \geq 5. \end{cases}$$

Compute the following limits or state that they do not exist.

a. $\lim_{x \rightarrow -5^-} f(x)$ b. $\lim_{x \rightarrow -5^+} f(x)$ c. $\lim_{x \rightarrow -5} f(x)$
d. $\lim_{x \rightarrow 5^-} f(x)$ e. $\lim_{x \rightarrow 5^+} f(x)$ f. $\lim_{x \rightarrow 5} f(x)$

75. One-sided limits

- a. Evaluate $\lim_{x \rightarrow 2^+} \sqrt{x - 2}$.
b. Explain why $\lim_{x \rightarrow 2^-} \sqrt{x - 2}$ does not exist.

76. One-sided limits

- a. Evaluate $\lim_{x \rightarrow 3^-} \sqrt{\frac{x-3}{2-x}}$.
b. Explain why $\lim_{x \rightarrow 3^+} \sqrt{\frac{x-3}{2-x}}$ does not exist.

- 77. Electric field** The magnitude of the electric field at a point x meters from the midpoint of a 0.1-m line of charge is given by

$$E(x) = \frac{4.35}{x\sqrt{x^2 + 0.01}} \quad (\text{in units of newtons per coulomb, N/C}).$$

Evaluate $\lim_{x \rightarrow 10} E(x)$.

- 78. Torricelli's law** A cylindrical tank is filled with water to a depth of 9 meters. At $t = 0$, a drain in the bottom of the tank is opened, and water flows out of the tank. The depth of water in the tank (measured from the bottom of the tank) t seconds after the drain is opened is approximated by $d(t) = (3 - 0.015t)^2$, for $0 \leq t \leq 200$. Evaluate and interpret $\lim_{t \rightarrow 200^-} d(t)$.

- 79. Limit of the radius of a cylinder** A right circular cylinder with a height of 10 cm and a surface area of $S \text{ cm}^2$ has a radius given by

$$r(S) = \frac{1}{2} \left(\sqrt{100 + \frac{2S}{\pi}} - 10 \right).$$

Find $\lim_{S \rightarrow 0^+} r(S)$ and interpret your result.

- 80. A problem from relativity theory** Suppose a spaceship of length L_0 travels at a high speed v relative to an observer. To the observer, the ship appears to have a smaller length given by the *Lorentz contraction formula*

$$L = L_0 \sqrt{1 - \frac{v^2}{c^2}},$$

where c is the speed of light.

- a. What is the observed length L of the ship if it is traveling at 50% of the speed of light?
b. What is the observed length L of the ship if it is traveling at 75% of the speed of light?
c. In parts (a) and (b), what happens to L as the speed of the ship increases?

- d. Find $\lim_{v \rightarrow c^-} L_0 \sqrt{1 - \frac{v^2}{c^2}}$ and explain the significance of this limit.

- 81.** a. Show that $-|x| \leq x \sin \frac{1}{x} \leq |x|$, for $x \neq 0$.

- b. Illustrate the inequalities in part (a) with a graph.

- c. Show that $\lim_{x \rightarrow 0} x \sin \frac{1}{x} = 0$.

- 82. A cosine limit** It can be shown that $1 - \frac{x^2}{2} \leq \cos x \leq 1$, for x near 0.

- a. Illustrate these inequalities with a graph.

- b. Use these inequalities to evaluate $\lim_{x \rightarrow 0} \cos x$.

- 83. A sine limit** It can be shown that $1 - \frac{x^2}{6} \leq \frac{\sin x}{x} \leq 1$, for x near 0.

- a. Illustrate these inequalities with a graph.

- b. Use these inequalities to evaluate $\lim_{x \rightarrow 0} \frac{\sin x}{x}$.

- 84. A secant limit**

- a. Draw a graph to verify that $0 \leq x^2 \sec x^2 \leq x^4 + x^2$, for x near 0.

- b. Use the Squeeze Theorem to determine $\lim_{x \rightarrow 0} x^2 \sec x^2$.

- 85. Absolute value** Show that $\lim_{x \rightarrow 0} |x| = 0$ by first evaluating $\lim_{x \rightarrow 0^-} |x|$ and $\lim_{x \rightarrow 0^+} |x|$. Recall that

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0. \end{cases}$$

- 86. Absolute value limit** Show that $\lim_{x \rightarrow a} |x| = |a|$, for any real number a . (Hint: Consider the cases $a < 0$, $a = 0$, and $a > 0$.)

- 87. Finding a constant** Suppose

$$f(x) = \begin{cases} \frac{x^2 - 5x + 6}{x - 3} & \text{if } x \neq 3 \\ a & \text{if } x = 3. \end{cases}$$

Determine the value of the constant a for which $\lim_{x \rightarrow 3} f(x) = f(3)$.

- 88. Finding a constant** Suppose

$$f(x) = \begin{cases} 3x + b & \text{if } x \leq 2 \\ x - 2 & \text{if } x > 2. \end{cases}$$

Determine the value of the constant b for which $\lim_{x \rightarrow 2} f(x)$ exists and state the value of the limit, if possible.

- 89. Finding a constant** Suppose

$$g(x) = \begin{cases} x^2 - 5x & \text{if } x \leq -1 \\ ax^3 - 7 & \text{if } x > -1. \end{cases}$$

Determine the value of the constant a for which $\lim_{x \rightarrow -1} g(x)$ exists and state the value of the limit, if possible.

90–94. Useful factorization formula Calculate the following limits using the factorization formula

$x^n - a^n = (x - a)(x^{n-1} + ax^{n-2} + a^2x^{n-3} + \cdots + a^{n-2}x + a^{n-1})$, where n is a positive integer and a is a real number.

90. $\lim_{x \rightarrow 2} \frac{x^5 - 32}{x - 2}$

91. $\lim_{x \rightarrow 1} \frac{x^6 - 1}{x - 1}$

92. $\lim_{x \rightarrow -1} \frac{x^7 + 1}{x + 1}$ (Hint: Use the formula for $x^7 - a^7$ with $a = -1$.)

93. $\lim_{x \rightarrow a} \frac{x^5 - a^5}{x - a}$

94. $\lim_{x \rightarrow a} \frac{x^n - a^n}{x - a}$, for any positive integer n

Explorations and Challenges

95. Even function limits Suppose f is an even function where $\lim_{x \rightarrow 1^-} f(x) = 5$ and $\lim_{x \rightarrow 1^+} f(x) = 6$. Find $\lim_{x \rightarrow -1^-} f(x)$ and $\lim_{x \rightarrow -1^+} f(x)$.

96. Odd function limits Suppose g is an odd function where $\lim_{x \rightarrow 1^-} g(x) = 5$ and $\lim_{x \rightarrow 1^+} g(x) = 6$. Find $\lim_{x \rightarrow -1^-} g(x)$ and $\lim_{x \rightarrow -1^+} g(x)$.

97. Evaluate $\lim_{x \rightarrow 1} \frac{\sqrt[3]{x} - 1}{x - 1}$. (Hint: $x - 1 = (\sqrt[3]{x})^3 - 1^3$.)

98. Evaluate $\lim_{x \rightarrow 16} \frac{\sqrt[4]{x} - 2}{x - 16}$.

99. Creating functions satisfying given limit conditions Find functions f and g such that $\lim_{x \rightarrow 1} f(x) = 0$ and $\lim_{x \rightarrow 1} (f(x)g(x)) = 5$.

100. Creating functions satisfying given limit conditions Find a function f satisfying $\lim_{x \rightarrow 1} \frac{f(x)}{x - 1} = 2$.

101. Finding constants Find constants b and c in the polynomial

$p(x) = x^2 + bx + c$ such that $\lim_{x \rightarrow 2} \frac{p(x)}{x - 2} = 6$. Are the constants unique?

102. If $\lim_{x \rightarrow 1} f(x) = 4$, find $\lim_{x \rightarrow -1} f(x^2)$.

103. Suppose $g(x) = f(1 - x)$ for all x , $\lim_{x \rightarrow 1^+} f(x) = 4$, and $\lim_{x \rightarrow 1^-} f(x) = 6$. Find $\lim_{x \rightarrow 0^+} g(x)$ and $\lim_{x \rightarrow 0^-} g(x)$.

104. Two trigonometric inequalities Consider the angle θ in standard position in a unit circle where $0 \leq \theta < \pi/2$ or $-\pi/2 < \theta < 0$ (use both figures).

- Show that $|AC| = |\sin \theta|$, for $-\pi/2 < \theta < \pi/2$. (Hint: Consider the cases $0 < \theta < \pi/2$ and $-\pi/2 < \theta < 0$ separately.)
- Show that $|\sin \theta| < |\theta|$, for $-\pi/2 < \theta < \pi/2$. (Hint: The length of arc AB is θ if $0 \leq \theta < \pi/2$, and is $-\theta$ if $-\pi/2 < \theta < 0$.)
- Conclude that $-|\theta| \leq \sin \theta \leq |\theta|$, for $-\pi/2 < \theta < \pi/2$.
- Show that $0 \leq 1 - \cos \theta \leq |\theta|$, for $-\pi/2 < \theta < \pi/2$.
- Show that $1 - |\theta| \leq \cos \theta \leq 1$, for $-\pi/2 < \theta < \pi/2$.

105. Theorem 2.4a Given the polynomial

$$p(x) = b_n x^n + b_{n-1} x^{n-1} + \cdots + b_1 x + b_0,$$

prove that $\lim_{x \rightarrow a} p(x) = p(a)$ for any value of a .

2.4 Infinite Limits

Two more limit scenarios are frequently encountered in calculus and are discussed in this section and the following section. An *infinite limit* occurs when function values increase or decrease without bound near a point. The other type of limit, known as a *limit at infinity*, occurs when the independent variable x increases or decreases without bound. The ideas behind infinite limits and limits at infinity are quite different. Therefore, it is important to distinguish between these limits and the methods used to calculate them.

An Overview

To illustrate the differences between infinite limits and limits at infinity, consider the values of $f(x) = 1/x^2$ in Table 2.5. As x approaches 0 from either side, $f(x)$ grows larger and larger. Because $f(x)$ does not approach a finite number as x approaches 0, $\lim_{x \rightarrow 0} f(x)$ does not exist.

Nevertheless, we use limit notation and write $\lim_{x \rightarrow 0} f(x) = \infty$. The infinity symbol indicates that $f(x)$ grows arbitrarily large as x approaches 0. This is an example of an *infinite limit*; in general, the *dependent variable* becomes arbitrarily large in magnitude as the *independent variable* approaches a finite number.

Table 2.5

x	$f(x) = 1/x^2$
± 0.1	100
± 0.01	10,000
± 0.001	1,000,000
$\downarrow$ 0	$\downarrow$ ∞

With *limits at infinity*, the opposite occurs: The *dependent variable* approaches a finite number as the *independent variable* becomes arbitrarily large in magnitude. In Table 2.6 we see that $f(x) = 1/x^2$ approaches 0 as x increases. In this case, we write $\lim_{x \rightarrow \infty} f(x) = 0$.

Table 2.6

x	$f(x) = 1/x^2$
10	0.01
100	0.0001
1000	0.000001
$\downarrow$ ∞	$\downarrow$ 0

A general picture of these two limit scenarios—occurring with the same function—is shown in Figure 2.22.

Figure 2.22

Figure 2.23

Figure 2.24

Infinite Limits

The following definition of infinite limits is informal, but it is adequate for most functions encountered in this book. A precise definition is given in Section 2.7.

DEFINITION Infinite Limits

Suppose f is defined for all x near a . If $f(x)$ grows arbitrarily large for all x sufficiently close (but not equal) to a (Figure 2.23a), we write

$$\lim_{x \rightarrow a} f(x) = \infty$$

and say the limit of $f(x)$ as x approaches a is infinity.

If $f(x)$ is negative and grows arbitrarily large in magnitude for all x sufficiently close (but not equal) to a (Figure 2.23b), we write

$$\lim_{x \rightarrow a} f(x) = -\infty$$

and say the limit of $f(x)$ as x approaches a is negative infinity. In both cases, the limit does not exist.

EXAMPLE 1 Infinite limits Analyze $\lim_{x \rightarrow 1} \frac{x}{(x^2 - 1)^2}$ and $\lim_{x \rightarrow -1} \frac{x}{(x^2 - 1)^2}$ using the graph of the function.

SOLUTION The graph of $f(x) = \frac{x}{(x^2 - 1)^2}$ (Figure 2.24) shows that as x approaches 1 (from either side), the values of f grow arbitrarily large. Therefore, the limit does not exist and we write

$$\lim_{x \rightarrow 1} \frac{x}{(x^2 - 1)^2} = \infty.$$

As x approaches -1 , the values of f are negative and grow arbitrarily large in magnitude; therefore,

$$\lim_{x \rightarrow -1} \frac{x}{(x^2 - 1)^2} = -\infty.$$

Related Exercise 6 ◀

Example 1 illustrates *two-sided* infinite limits. As with finite limits, we also need to work with right-sided and left-sided infinite limits.

DEFINITION One-Sided Infinite Limits

Suppose f is defined for all x near a with $x > a$. If $f(x)$ becomes arbitrarily large for all x sufficiently close to a with $x > a$, we write $\lim_{x \rightarrow a^+} f(x) = \infty$ (Figure 2.25a).

The one-sided infinite limits $\lim_{x \rightarrow a^+} f(x) = -\infty$ (Figure 2.25b), $\lim_{x \rightarrow a^-} f(x) = \infty$ (Figure 2.25c), and $\lim_{x \rightarrow a^-} f(x) = -\infty$ (Figure 2.25d) are defined analogously.

Figure 2.25

In all the infinite limits illustrated in Figure 2.25, the line $x = a$ is called a *vertical asymptote*; it is a vertical line that is approached by the graph of f as x approaches a .

QUICK CHECK 1 Sketch the graph of a function and its vertical asymptote that satisfies the conditions $\lim_{x \rightarrow 2^+} f(x) = -\infty$ and $\lim_{x \rightarrow 2^-} f(x) = \infty$. ◀

DEFINITION Vertical Asymptote

If $\lim_{x \rightarrow a} f(x) = \pm \infty$, $\lim_{x \rightarrow a^+} f(x) = \pm \infty$, or $\lim_{x \rightarrow a^-} f(x) = \pm \infty$, the line $x = a$ is called a **vertical asymptote** of f .

Figure 2.26

EXAMPLE 2 Determining limits graphically The vertical lines $x = 1$ and $x = 3$ are vertical asymptotes of the function $g(x) = \frac{x-2}{(x-1)^2(x-3)}$. Use

Figure 2.26 to analyze the following limits.

- a. $\lim_{x \rightarrow 1} g(x)$ b. $\lim_{x \rightarrow 3^-} g(x)$ c. $\lim_{x \rightarrow 3} g(x)$

SOLUTION

- a. The values of g grow arbitrarily large as x approaches 1 from either side. Therefore, $\lim_{x \rightarrow 1} g(x) = \infty$.
- b. The values of g are negative and grow arbitrarily large in magnitude as x approaches 3 from the left, so $\lim_{x \rightarrow 3^-} g(x) = -\infty$.
- c. Note that $\lim_{x \rightarrow 3^+} g(x) = \infty$ and $\lim_{x \rightarrow 3^-} g(x) = -\infty$. Because g behaves differently as $x \rightarrow 3^-$ and as $x \rightarrow 3^+$, we do not write $\lim_{x \rightarrow 3} g(x) = \infty$, nor do we write $\lim_{x \rightarrow 3} g(x) = -\infty$. We simply say that the limit does not exist.

Table 2.7

x	$\frac{5+x}{x}$
0.01	$\frac{5.01}{0.01} = 501$
0.001	$\frac{5.001}{0.001} = 5001$
0.0001	$\frac{5.0001}{0.0001} = 50,001$
$\downarrow$ 0^+	$\downarrow$ ∞

Finding Infinite Limits Analytically

Many infinite limits are analyzed using a simple arithmetic property: The fraction a/b grows arbitrarily large in magnitude if b approaches 0 while a remains nonzero and relatively constant. For example, consider the fraction $(5+x)/x$ for values of x approaching 0 from the right (Table 2.7).

We see that $\frac{5+x}{x} \rightarrow \infty$ as $x \rightarrow 0^+$ because the numerator $5+x$ approaches 5 while the denominator is positive and approaches 0. Therefore, we write $\lim_{x \rightarrow 0^+} \frac{5+x}{x} = \infty$. Similarly, $\lim_{x \rightarrow 0^-} \frac{5+x}{x} = -\infty$ because the numerator approaches 5 while the denominator approaches 0 through negative values.

EXAMPLE 3 **Determining limits analytically** Analyze the following limits.

a. $\lim_{x \rightarrow 3^+} \frac{2-5x}{x-3}$ b. $\lim_{x \rightarrow 3^-} \frac{2-5x}{x-3}$

SOLUTION

a. As $x \rightarrow 3^+$, the numerator $2-5x$ approaches $2-5(3) = -13$ while the denominator $x-3$ is positive and approaches 0. Therefore,

$$\lim_{x \rightarrow 3^+} \frac{\overbrace{2-5x}^{\text{approaches } -13}}{\underbrace{x-3}_{\text{positive and approaches 0}}} = -\infty.$$

b. As $x \rightarrow 3^-$, $2-5x$ approaches $2-5(3) = -13$ while $x-3$ is negative and approaches 0. Therefore,

$$\lim_{x \rightarrow 3^-} \frac{\overbrace{2-5x}^{\text{approaches } -13}}{\underbrace{x-3}_{\text{negative and approaches 0}}} = \infty.$$

These limits imply that the given function has a vertical asymptote at $x = 3$; they also imply that the two-sided limit $\lim_{x \rightarrow 3} \frac{2-5x}{x-3}$ does not exist.

Related Exercises 21–22 ◀

QUICK CHECK 2 Analyze $\lim_{x \rightarrow 0^+} \frac{x-5}{x}$ and $\lim_{x \rightarrow 0^-} \frac{x-5}{x}$ by determining the sign of the numerator and denominator. ◀

► We can assume $x \neq 0$ because we are considering function values near $x = -4$.

EXAMPLE 4 **Determining limits analytically** Analyze $\lim_{x \rightarrow -4^+} \frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2}$.

SOLUTION First we factor and simplify, assuming $x \neq 0$:

$$\frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2} = \frac{-x(x-2)(x-3)}{-x^2(x+4)} = \frac{(x-2)(x-3)}{x(x+4)}.$$

As $x \rightarrow -4^+$, we find that

$$\lim_{x \rightarrow -4^+} \frac{-x^3 + 5x^2 - 6x}{-x^3 - 4x^2} = \lim_{x \rightarrow -4^+} \frac{\overbrace{(x-2)(x-3)}^{\text{approaches 42}}}{\underbrace{x(x+4)}_{\text{negative and approaches 0}}} = -\infty.$$

This limit implies that the given function has a vertical asymptote at $x = -4$.

Related Exercises 28, 31 ◀

QUICK CHECK 3 Verify that $x(x+4) \rightarrow 0$ through negative values as $x \rightarrow -4^+$. ◀

► Example 5 illustrates that $f(x)/g(x)$ might not grow arbitrarily large in magnitude if *both* $f(x)$ and $g(x)$ approach 0. Such limits are called *indeterminate forms*; they are examined in detail in Section 4.7.

► It is permissible to cancel the factor $x - 1$ in $\lim_{x \rightarrow 1} \frac{(x-1)(x-3)}{(x-1)(x+1)}$ because x approaches 1 but is not equal to 1. Therefore, $x - 1 \neq 0$.

EXAMPLE 5 Location of vertical asymptotes Let $f(x) = \frac{x^2 - 4x + 3}{x^2 - 1}$. Determine the following limits and find the vertical asymptotes of f . Verify your work with a graphing utility.

a. $\lim_{x \rightarrow 1} f(x)$ b. $\lim_{x \rightarrow -1^-} f(x)$ c. $\lim_{x \rightarrow -1^+} f(x)$

SOLUTION

a. Notice that as $x \rightarrow 1$, both the numerator and denominator of f approach 0, and the function is undefined at $x = 1$. To compute $\lim_{x \rightarrow 1} f(x)$, we first factor:

$$\begin{aligned} \lim_{x \rightarrow 1} f(x) &= \lim_{x \rightarrow 1} \frac{x^2 - 4x + 3}{x^2 - 1} \\ &= \lim_{x \rightarrow 1} \frac{(x-1)(x-3)}{(x-1)(x+1)} && \text{Factor.} \\ &= \lim_{x \rightarrow 1} \frac{(x-3)}{(x+1)} && \text{Cancel like factors, } x \neq 1. \\ &= \frac{1-3}{1+1} = -1. && \text{Substitute } x = 1. \end{aligned}$$

Therefore, $\lim_{x \rightarrow 1} f(x) = -1$ (even though $f(1)$ is undefined). The line $x = 1$ is *not* a vertical asymptote of f .

b. In part (a) we showed that

$$f(x) = \frac{x^2 - 4x + 3}{x^2 - 1} = \frac{x-3}{x+1}, \quad \text{provided } x \neq 1.$$

We use this fact again. As x approaches -1 from the left, the one-sided limit is

$$\lim_{x \rightarrow -1^-} f(x) = \lim_{x \rightarrow -1^-} \frac{\overbrace{x-3}^{\text{approaches } -4}}{\underbrace{x+1}_{\substack{\text{negative and} \\ \text{approaches } 0}}} = \infty.$$

c. As x approaches -1 from the right, the one-sided limit is

$$\lim_{x \rightarrow -1^+} f(x) = \lim_{x \rightarrow -1^+} \frac{\overbrace{x-3}^{\text{approaches } -4}}{\underbrace{x+1}_{\substack{\text{positive and} \\ \text{approaches } 0}}} = -\infty.$$

The infinite limits $\lim_{x \rightarrow -1^+} f(x) = -\infty$ and $\lim_{x \rightarrow -1^-} f(x) = \infty$ each imply that the line $x = -1$ is a vertical asymptote of f . The graph of f generated by a graphing utility *may* appear as shown in [Figure 2.27a](#). If so, two corrections must be made. A hole should appear in the graph at $(1, -1)$ because $\lim_{x \rightarrow 1} f(x) = -1$, but $f(1)$ is undefined. It is also a good idea to replace the solid vertical line with a dashed line to emphasize that the vertical asymptote is not a part of the graph of f ([Figure 2.27b](#)).

- Graphing utilities vary in how they display vertical asymptotes. The errors shown in Figure 2.27a do not occur on all graphing utilities.

Figure 2.27

Related Exercises 45–46 ◀

QUICK CHECK 4 The line $x = 2$ is not a vertical asymptote of $y = \frac{(x-1)(x-2)}{x-2}$. Why not? ◀

Figure 2.28

EXAMPLE 6 Limits of trigonometric functions Analyze the following limits.

a. $\lim_{\theta \rightarrow 0^+} \cot \theta$ b. $\lim_{\theta \rightarrow 0^-} \cot \theta$

SOLUTION

- a. Recall that $\cot \theta = \cos \theta / \sin \theta$. Furthermore, it was shown in Section 2.3 that $\lim_{\theta \rightarrow 0^+} \cos \theta = 1$ and that $\sin \theta$ is positive and approaches 0 as $\theta \rightarrow 0^+$. Therefore, as $\theta \rightarrow 0^+$, $\cot \theta$ becomes arbitrarily large and positive, which means $\lim_{\theta \rightarrow 0^+} \cot \theta = \infty$. This limit is consistent with the graph of $\cot \theta$ (Figure 2.28), which has a vertical asymptote at $\theta = 0$.
- b. In this case, $\lim_{\theta \rightarrow 0^-} \cos \theta = 1$ and as $\theta \rightarrow 0^-$, $\sin \theta \rightarrow 0$ with $\sin \theta < 0$. Therefore, as $\theta \rightarrow 0^-$, $\cot \theta$ is negative and becomes arbitrarily large in magnitude. It follows that $\lim_{\theta \rightarrow 0^-} \cot \theta = -\infty$, as confirmed by the graph of $\cot \theta$.

SECTION 2.4 EXERCISES

Getting Started

1. Explain the meaning of $\lim_{x \rightarrow a^+} f(x) = -\infty$.
2. Explain the meaning of $\lim_{x \rightarrow a} f(x) = \infty$.
3. What is a vertical asymptote?
4. Consider the function $F(x) = f(x)/g(x)$ with $g(a) = 0$. Does F necessarily have a vertical asymptote at $x = a$? Explain your reasoning.
5. Compute the values of $f(x) = \frac{x+1}{(x-1)^2}$ in the following table and use them to determine $\lim_{x \rightarrow 1} f(x)$.

x	$\frac{x+1}{(x-1)^2}$	x	$\frac{x+1}{(x-1)^2}$
1.1		0.9	
1.01		0.99	
1.001		0.999	
1.0001		0.9999	

6. Use the graph of $f(x) = \frac{x}{(x^2 - 2x - 3)^2}$ to determine $\lim_{x \rightarrow -1} f(x)$ and $\lim_{x \rightarrow 3} f(x)$.

7. The graph of f in the figure has vertical asymptotes at $x = 1$ and $x = 2$. Analyze the following limits.

a. $\lim_{x \rightarrow 1^-} f(x)$ b. $\lim_{x \rightarrow 1^+} f(x)$ c. $\lim_{x \rightarrow 1} f(x)$
 d. $\lim_{x \rightarrow 2^-} f(x)$ e. $\lim_{x \rightarrow 2^+} f(x)$ f. $\lim_{x \rightarrow 2} f(x)$

8. The graph of g in the figure has vertical asymptotes at $x = 2$ and $x = 4$. Analyze the following limits.

a. $\lim_{x \rightarrow 2^-} g(x)$ b. $\lim_{x \rightarrow 2^+} g(x)$ c. $\lim_{x \rightarrow 2} g(x)$
 d. $\lim_{x \rightarrow 4^-} g(x)$ e. $\lim_{x \rightarrow 4^+} g(x)$ f. $\lim_{x \rightarrow 4} g(x)$

9. The graph of h in the figure has vertical asymptotes at $x = -2$ and $x = 3$. Analyze the following limits.

a. $\lim_{x \rightarrow -2^-} h(x)$ b. $\lim_{x \rightarrow -2^+} h(x)$ c. $\lim_{x \rightarrow -2} h(x)$
 d. $\lim_{x \rightarrow 3^-} h(x)$ e. $\lim_{x \rightarrow 3^+} h(x)$ f. $\lim_{x \rightarrow 3} h(x)$

10. The graph of p in the figure has vertical asymptotes at $x = -2$ and $x = 3$. Analyze the following limits.

a. $\lim_{x \rightarrow -2^-} p(x)$ b. $\lim_{x \rightarrow -2^+} p(x)$ c. $\lim_{x \rightarrow -2} p(x)$
 d. $\lim_{x \rightarrow 3^-} p(x)$ e. $\lim_{x \rightarrow 3^+} p(x)$ f. $\lim_{x \rightarrow 3} p(x)$

11. Graph the function $f(x) = \frac{1}{x^2 - x}$ using a graphing utility with the window $[-1, 2] \times [-10, 10]$. Use your graph to determine the following limits.

a. $\lim_{x \rightarrow 0^-} f(x)$ b. $\lim_{x \rightarrow 0^+} f(x)$ c. $\lim_{x \rightarrow 1^-} f(x)$ d. $\lim_{x \rightarrow 1^+} f(x)$

12. **Analyzing infinite limits graphically** Graph the function $f(x) = x \cot x$ using a graphing utility. (Experiment with your choice of a graphing window.) Use your graph to determine the following limits.

a. $\lim_{x \rightarrow \pi^+} f(x)$ b. $\lim_{x \rightarrow \pi^-} f(x)$ c. $\lim_{x \rightarrow -\pi^+} f(x)$ d. $\lim_{x \rightarrow -\pi^-} f(x)$

13. Suppose $f(x) \rightarrow 100$ and $g(x) \rightarrow 0$, with $g(x) < 0$ as $x \rightarrow 2$.

Determine $\lim_{x \rightarrow 2} \frac{f(x)}{g(x)}$.

14. Evaluate $\lim_{x \rightarrow 3^-} \frac{1}{x - 3}$ and $\lim_{x \rightarrow 3^+} \frac{1}{x - 3}$.

15. Verify that the function $f(x) = \frac{x^2 - 4x + 3}{x^2 - 3x + 2}$ is undefined at $x = 1$ and at $x = 2$. Does the graph of f have vertical asymptotes at both these values of x ? Explain.

16. Evaluate $\lim_{x \rightarrow 0} \frac{x + 1}{1 - \cos x}$.

17. Sketch a possible graph of a function f , together with vertical asymptotes, satisfying all the following conditions on $[0, 4]$.

$f(1) = 0$, $f(3)$ is undefined, $\lim_{x \rightarrow 3} f(x) = 1$,
 $\lim_{x \rightarrow 0^+} f(x) = -\infty$, $\lim_{x \rightarrow 2} f(x) = \infty$, $\lim_{x \rightarrow 4^-} f(x) = \infty$

18. Sketch a possible graph of a function g , together with vertical asymptotes, satisfying all the following conditions.

$g(2) = 1$, $g(5) = -1$, $\lim_{x \rightarrow 4} g(x) = -\infty$,
 $\lim_{x \rightarrow 7^-} g(x) = \infty$, $\lim_{x \rightarrow 7^+} g(x) = -\infty$

19. Which of the following statements are correct? Choose all that apply.

a. $\lim_{x \rightarrow 1} \frac{1}{(x - 1)^2}$ does not exist b. $\lim_{x \rightarrow 1} \frac{1}{(x - 1)^2} = \infty$

c. $\lim_{x \rightarrow 1} \frac{1}{(x - 1)^2} = -\infty$

20. Which of the following statements are correct? Choose all that apply.

a. $\lim_{x \rightarrow 1^+} \frac{1}{1 - x}$ does not exist b. $\lim_{x \rightarrow 1^+} \frac{1}{1 - x} = \infty$

c. $\lim_{x \rightarrow 1^+} \frac{1}{1 - x} = -\infty$

43. $\lim_{\theta \rightarrow 0} \frac{2 + \sin \theta}{1 - \cos^2 \theta}$ 44. $\lim_{\theta \rightarrow 0^-} \frac{\sin \theta}{\cos^2 \theta - 1}$
45. **Location of vertical asymptotes** Analyze the following limits and find the vertical asymptotes of $f(x) = \frac{x-5}{x^2 - 25}$.
- a. $\lim_{x \rightarrow 5} f(x)$ b. $\lim_{x \rightarrow -5^-} f(x)$ c. $\lim_{x \rightarrow -5^+} f(x)$

46. **Location of vertical asymptotes** Analyze the following limits and find the vertical asymptotes of $f(x) = \frac{x+7}{x^4 - 49x^2}$.

a. $\lim_{x \rightarrow 7^-} f(x)$ b. $\lim_{x \rightarrow 7^+} f(x)$ c. $\lim_{x \rightarrow -7} f(x)$ d. $\lim_{x \rightarrow 0} f(x)$

47–50. **Finding vertical asymptotes** Find all vertical asymptotes $x = a$ of the following functions. For each value of a , determine $\lim_{x \rightarrow a^+} f(x)$, $\lim_{x \rightarrow a^-} f(x)$, and $\lim_{x \rightarrow a} f(x)$.

47. $f(x) = \frac{x^2 - 9x + 14}{x^2 - 5x + 6}$

48. $f(x) = \frac{\cos x}{x^2 + 2x}$

49. $f(x) = \frac{x+1}{x^3 - 4x^2 + 4x}$

50. $f(x) = \frac{x^3 - 10x^2 + 16x}{x^2 - 8x}$

51. **Checking your work graphically** Analyze the following limits. Then sketch a graph of $y = \tan x$ with the window $[-\pi, \pi] \times [-10, 10]$ and use your graph to check your work.

a. $\lim_{x \rightarrow \pi/2^+} \tan x$

b. $\lim_{x \rightarrow \pi/2^-} \tan x$

c. $\lim_{x \rightarrow -\pi/2^+} \tan x$

d. $\lim_{x \rightarrow -\pi/2^-} \tan x$

52. **Checking your work graphically** Analyze the following limits. Then sketch a graph of $y = \sec x \tan x$ with the window $[-\pi, \pi] \times [-10, 10]$ and use your graph to check your work.

a. $\lim_{x \rightarrow \pi/2^+} \sec x \tan x$

b. $\lim_{x \rightarrow \pi/2^-} \sec x \tan x$

c. $\lim_{x \rightarrow -\pi/2^+} \sec x \tan x$

d. $\lim_{x \rightarrow -\pi/2^-} \sec x \tan x$

53. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. The line $x = 1$ is a vertical asymptote of the function

$$f(x) = \frac{x^2 - 7x + 6}{x^2 - 1}.$$

b. The line $x = -1$ is a vertical asymptote of the function

$$f(x) = \frac{x^2 - 7x + 6}{x^2 - 1}.$$

c. If g has a vertical asymptote at $x = 1$ and $\lim_{x \rightarrow 1^+} g(x) = \infty$, then $\lim_{x \rightarrow 1^-} g(x) = \infty$.

54. **Matching** Match functions a–f with graphs A–F in the figure without using a graphing utility.

a. $f(x) = \frac{x}{x^2 + 1}$

b. $f(x) = \frac{x}{x^2 - 1}$

c. $f(x) = \frac{1}{x^2 - 1}$

d. $f(x) = \frac{x}{(x-1)^2}$

e. $f(x) = \frac{1}{(x-1)^2}$

f. $f(x) = \frac{x}{x+1}$

A.

B.

Explorations and Challenges

55. **Finding a rational function** Find a rational function $r(x)$ such that $r(1)$ is undefined, $\lim_{x \rightarrow 1} r(x) = 0$, and $\lim_{x \rightarrow 2} r(x) = \infty$.
56. **Finding a function with vertical asymptotes** Find polynomials p and q such that $f = p/q$ is undefined at 1 and 2, but f has a vertical asymptote only at 2. Sketch a graph of your function.
57. **Finding a function with infinite limits** Give a formula for a function f that satisfies $\lim_{x \rightarrow 6^+} f(x) = \infty$ and $\lim_{x \rightarrow 6^-} f(x) = -\infty$.

58–66. Asymptotes Use analytical methods and/or a graphing utility to identify the vertical asymptotes (if any) of the following functions.

58. $f(x) = \frac{x^2 - 1}{x^4 - 1}$ 59. $f(x) = \frac{x^2 - 3x + 2}{x^{10} - x^9}$
60. $g(x) = \cot\left(x - \frac{\pi}{2}\right)$, for $|x| \leq \pi$
61. $h(x) = \frac{\cos x}{(x + 1)^3}$ 62. $p(x) = \sec \frac{\pi x}{2}$, for $|x| < 2$

63. $g(\theta) = \tan \frac{\pi\theta}{10}$

64. $q(s) = \frac{\pi}{s - \sin s}$

65. $f(x) = \frac{1}{\sqrt{x} \sec x}$

66. $g(x) = \frac{1}{\sqrt{x(x^2 - 1)}}$

67. **Limits with a parameter** Let $f(x) = \frac{x^2 - 7x + 12}{x - a}$.

- a. For what values of a , if any, does $\lim_{x \rightarrow a^+} f(x)$ equal a finite number?
- b. For what values of a , if any, does $\lim_{x \rightarrow a^+} f(x) = \infty$?
- c. For what values of a , if any, does $\lim_{x \rightarrow a^+} f(x) = -\infty$?

68–69. Steep secant lines

- a. Given the graph of f in the following figures, find the slope of the secant line that passes through $(0, 0)$ and $(h, f(h))$ in terms of h , for $h > 0$ and $h < 0$.
- b. Analyze the limit of the slope of the secant line found in part (a) as $h \rightarrow 0^+$ and $h \rightarrow 0^-$. What does this tell you about the line tangent to the curve at $(0, 0)$?

68. $f(x) = x^{1/3}$

69. $f(x) = x^{2/3}$

QUICK CHECK ANSWERS

1. Answers will vary, but all graphs should have a vertical asymptote at $x = 2$. 2. $-\infty; \infty$ 3. As $x \rightarrow -4^+$, $x < 0$ and $(x + 4) > 0$, so $x(x + 4) \rightarrow 0$ through negative values.
4. $\lim_{x \rightarrow 2} \frac{(x - 1)(x - 2)}{x - 2} = \lim_{x \rightarrow 2} (x - 1) = 1$, which is not an infinite limit, so $x = 2$ is not a vertical asymptote. ◀

2.5 Limits at Infinity

Limits at infinity—as opposed to infinite limits—occur when the independent variable becomes large in magnitude. For this reason, limits at infinity determine what is called the *end behavior* of a function. An application of these limits is to determine whether a system (such as an ecosystem or a large oscillating structure) reaches a steady state as time increases.

Limits at Infinity and Horizontal Asymptotes

Consider the function $f(x) = \frac{x}{\sqrt{x^2 + 1}}$ (Figure 2.29), whose domain is $(-\infty, \infty)$. As x becomes arbitrarily large (denoted $x \rightarrow \infty$), $f(x)$ approaches 1, and as x becomes arbitrarily

large in magnitude and negative (denoted $x \rightarrow -\infty$), $f(x)$ approaches -1 . These limits are expressed as

$$\lim_{x \rightarrow \infty} f(x) = 1 \quad \text{and} \quad \lim_{x \rightarrow -\infty} f(x) = -1.$$

The graph of f approaches the horizontal line $y = 1$ as $x \rightarrow \infty$, and it approaches the horizontal line $y = -1$ as $x \rightarrow -\infty$. These lines are called *horizontal asymptotes*.

Figure 2.30

QUICK CHECK 1 Evaluate $x/(x + 1)$ for $x = 10$, 100 , and 1000 . What is $\lim_{x \rightarrow \infty} \frac{x}{x + 1}$? ◀

- The limit laws of Theorem 2.3 and the Squeeze Theorem apply if $x \rightarrow a$ is replaced with $x \rightarrow \infty$ or $x \rightarrow -\infty$.

Figure 2.31

DEFINITION Limits at Infinity and Horizontal Asymptotes

If $f(x)$ becomes arbitrarily close to a finite number L for all sufficiently large and positive x , then we write

$$\lim_{x \rightarrow \infty} f(x) = L.$$

We say the limit of $f(x)$ as x approaches infinity is L . In this case, the line $y = L$ is a **horizontal asymptote** of f (Figure 2.30). The limit at negative infinity, $\lim_{x \rightarrow -\infty} f(x) = M$, is defined analogously. When this limit exists, $y = M$ is a horizontal asymptote.

EXAMPLE 1 Limits at infinity Evaluate the following limits.

a. $\lim_{x \rightarrow -\infty} \left(2 + \frac{10}{x^2} \right)$ b. $\lim_{x \rightarrow \infty} \left(5 + \frac{\sin x}{\sqrt{x}} \right)$

SOLUTION

a. As x becomes large and negative, x^2 becomes large and positive; in turn, $10/x^2$ approaches 0. By the limit laws of Theorem 2.3,

$$\lim_{x \rightarrow -\infty} \left(2 + \frac{10}{x^2} \right) = \underbrace{\lim_{x \rightarrow -\infty} 2}_{\text{equals 2}} + \underbrace{\lim_{x \rightarrow -\infty} \left(\frac{10}{x^2} \right)}_{\text{equals 0}} = 2 + 0 = 2.$$

Therefore, the graph of $y = 2 + 10/x^2$ approaches the horizontal asymptote $y = 2$ as $x \rightarrow -\infty$ (Figure 2.31). Notice that $\lim_{x \rightarrow \infty} \left(2 + \frac{10}{x^2} \right)$ is also equal to 2, which implies that the graph has a single horizontal asymptote.

b. The numerator of $\sin x/\sqrt{x}$ is bounded between -1 and 1 ; therefore, for $x > 0$,

$$-\frac{1}{\sqrt{x}} \leq \frac{\sin x}{\sqrt{x}} \leq \frac{1}{\sqrt{x}}.$$

As $x \rightarrow \infty$, $\sqrt{x}$ becomes arbitrarily large, which means that

$$\lim_{x \rightarrow \infty} \frac{-1}{\sqrt{x}} = \lim_{x \rightarrow \infty} \frac{1}{\sqrt{x}} = 0.$$

It follows by the Squeeze Theorem (Theorem 2.5) that $\lim_{x \rightarrow \infty} \frac{\sin x}{\sqrt{x}} = 0$.

Using the limit laws of Theorem 2.3,

$$\lim_{x \rightarrow \infty} \left(5 + \frac{\sin x}{\sqrt{x}} \right) = \underbrace{\lim_{x \rightarrow \infty} 5}_{\text{equals } 5} + \underbrace{\lim_{x \rightarrow \infty} \frac{\sin x}{\sqrt{x}}}_{\text{equals } 0} = 5.$$

The graph of $y = 5 + \frac{\sin x}{\sqrt{x}}$ approaches the horizontal asymptote $y = 5$ as x becomes large (Figure 2.32). Note that the curve intersects its asymptote infinitely many times.

Related Exercises 10, 19 ◀

Figure 2.32

Figure 2.33

Infinite Limits at Infinity

It is possible for a limit to be *both* an infinite limit and a limit at infinity. This type of limit occurs if $f(x)$ becomes arbitrarily large in magnitude as x becomes arbitrarily large in magnitude. Such a limit is called an *infinite limit at infinity* and is illustrated by the function $f(x) = x^3$ (Figure 2.33).

DEFINITION Infinite Limits at Infinity

If $f(x)$ becomes arbitrarily large as x becomes arbitrarily large, then we write

$$\lim_{x \rightarrow \infty} f(x) = \infty.$$

The limits $\lim_{x \rightarrow \infty} f(x) = -\infty$, $\lim_{x \rightarrow -\infty} f(x) = \infty$, and $\lim_{x \rightarrow -\infty} f(x) = -\infty$ are defined similarly.

Infinite limits at infinity tell us about the behavior of polynomials for large-magnitude values of x . First, consider power functions $f(x) = x^n$, where n is a positive integer. Figure 2.34 shows that when n is even, $\lim_{x \rightarrow \pm \infty} x^n = \infty$, and when n is odd, $\lim_{x \rightarrow \infty} x^n = \infty$ and $\lim_{x \rightarrow -\infty} x^n = -\infty$.

Figure 2.34

It follows that reciprocals of power functions $f(x) = 1/x^n = x^{-n}$, where n is a positive integer, behave as follows:

$$\lim_{x \rightarrow \infty} \frac{1}{x^n} = \lim_{x \rightarrow \infty} x^{-n} = 0 \quad \text{and} \quad \lim_{x \rightarrow -\infty} \frac{1}{x^n} = \lim_{x \rightarrow -\infty} x^{-n} = 0.$$

QUICK CHECK 2 Describe the behavior of $p(x) = -3x^3$ as $x \rightarrow \infty$ and as $x \rightarrow -\infty$. ◀

From here, it is a short step to finding the behavior of any polynomial as $x \rightarrow \pm \infty$. Let $p(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$. We now write p in the equivalent form

$$p(x) = x^n \left(\underbrace{a_n}_{\rightarrow 0} + \underbrace{\frac{a_{n-1}}{x}}_{\rightarrow 0} + \underbrace{\frac{a_{n-2}}{x^2}}_{\rightarrow 0} + \cdots + \underbrace{\frac{a_0}{x^n}}_{\rightarrow 0} \right).$$

Notice that as x becomes large in magnitude, all the terms in p except the first term approach zero. Therefore, as $x \rightarrow \pm \infty$, we see that $p(x) \approx a_n x^n$. This means that as $x \rightarrow \pm \infty$, the behavior of p is determined by the term $a_n x^n$ with the highest power of x .

THEOREM 2.6 Limits at Infinity of Powers and Polynomials

Let n be a positive integer and let p be the polynomial

$$p(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0, \text{ where } a_n \neq 0.$$

1. $\lim_{x \rightarrow \pm \infty} x^n = \infty$ when n is even.
2. $\lim_{x \rightarrow \infty} x^n = \infty$ and $\lim_{x \rightarrow -\infty} x^n = -\infty$ when n is odd.
3. $\lim_{x \rightarrow \pm \infty} \frac{1}{x^n} = \lim_{x \rightarrow \pm \infty} x^{-n} = 0$.
4. $\lim_{x \rightarrow \pm \infty} p(x) = \lim_{x \rightarrow \pm \infty} a_n x^n = \pm \infty$, depending on the degree of the polynomial and the sign of the leading coefficient a_n .

Figure 2.35

Figure 2.36

EXAMPLE 2 Limits at infinity Determine the limits as $x \rightarrow \pm \infty$ of the following functions.

a. $p(x) = 3x^4 - 6x^2 + x - 10$ b. $q(x) = -2x^3 + 3x^2 - 12$

SOLUTION

a. We use the fact that the limit is determined by the behavior of the leading term:

$$\lim_{x \rightarrow \infty} (3x^4 - 6x^2 + x - 10) = \lim_{x \rightarrow \infty} 3x^4 = \infty.$$

Similarly,

$$\lim_{x \rightarrow -\infty} (3x^4 - 6x^2 + x - 10) = \lim_{x \rightarrow -\infty} 3x^4 = \infty.$$

Figure 2.35 illustrates these limits.

b. Noting that the leading coefficient is negative, we have

$$\lim_{x \rightarrow \infty} (-2x^3 + 3x^2 - 12) = \lim_{x \rightarrow \infty} (-2x^3) = -\infty$$

$$\lim_{x \rightarrow -\infty} (-2x^3 + 3x^2 - 12) = \lim_{x \rightarrow -\infty} (-2x^3) = \infty.$$

The graph of q (Figure 2.36) confirms these results.

End Behavior

The behavior of polynomials as $x \rightarrow \pm \infty$ is an example of what is often called *end behavior*. Having treated polynomials, we now turn to the end behavior of rational and algebraic functions.

EXAMPLE 3 End behavior of rational functions Use limits at infinity to determine the end behavior of the following rational functions.

a. $f(x) = \frac{3x + 2}{x^2 - 1}$ b. $g(x) = \frac{40x^4 + 4x^2 - 1}{10x^4 + 8x^2 + 1}$ c. $h(x) = \frac{x^3 - 2x + 1}{2x + 4}$

► Recall that the *degree* of a polynomial is the highest power of x that appears.

SOLUTION

- a. An effective approach for determining limits of rational functions at infinity is to divide both the numerator and denominator by x^n , where n is the degree of the polynomial in the denominator. This strategy forces the terms corresponding to lower powers of x to approach 0 in the limit. In this case, we divide by x^2 :

$$\lim_{x \rightarrow \infty} \frac{3x + 2}{x^2 - 1} = \lim_{x \rightarrow \infty} \frac{\frac{3x + 2}{x^2}}{\frac{x^2 - 1}{x^2}} = \lim_{x \rightarrow \infty} \frac{\overbrace{\frac{3}{x} + \frac{2}{x^2}}^{\text{approaches 0}}}{\underbrace{1 - \frac{1}{x^2}}_{\text{approaches 0}}} = \frac{0}{1} = 0.$$

A similar calculation gives $\lim_{x \rightarrow -\infty} \frac{3x + 2}{x^2 - 1} = 0$; therefore, the graph of f has the

horizontal asymptote $y = 0$. You should confirm that the zeros of the denominator are -1 and 1 , which correspond to vertical asymptotes (Figure 2.37). In this example, the degree of the polynomial in the numerator is *less than* the degree of the polynomial in the denominator.

- b. Again we divide both the numerator and denominator by the largest power appearing in the denominator, which is x^4 :

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{40x^4 + 4x^2 - 1}{10x^4 + 8x^2 + 1} &= \lim_{x \rightarrow \infty} \frac{\frac{40x^4}{x^4} + \frac{4x^2}{x^4} - \frac{1}{x^4}}{\frac{10x^4}{x^4} + \frac{8x^2}{x^4} + \frac{1}{x^4}} && \text{Divide the numerator and denominator by } x^4. \\ &= \lim_{x \rightarrow \infty} \frac{40 + \overbrace{\frac{4}{x^2}}^{\text{approaches 0}} - \overbrace{\frac{1}{x^4}}^{\text{approaches 0}}}{10 + \underbrace{\frac{8}{x^2}}_{\text{approaches 0}} + \underbrace{\frac{1}{x^4}}_{\text{approaches 0}}} && \text{Simplify.} \\ &= \frac{40 + 0 + 0}{10 + 0 + 0} = 4. && \text{Evaluate limits.} \end{aligned}$$

Using the same steps (dividing each term by x^4), it can be shown that

$$\lim_{x \rightarrow -\infty} \frac{40x^4 + 4x^2 - 1}{10x^4 + 8x^2 + 1} = 4. \text{ This function has the horizontal asymptote } y = 4$$

(Figure 2.38). Notice that the degree of the polynomial in the numerator *equals* the degree of the polynomial in the denominator.

Figure 2.37

Figure 2.38

- c. We divide the numerator and denominator by the largest power of x appearing in the denominator, which is x , and then take the limit:

$$\begin{aligned}\lim_{x \rightarrow \infty} \frac{x^3 - 2x + 1}{2x + 4} &= \lim_{x \rightarrow \infty} \frac{\frac{x^3}{x} - \frac{2x}{x} + \frac{1}{x}}{\frac{2x}{x} + \frac{4}{x}} && \text{Divide the numerator and denominator by } x. \\ &= \lim_{x \rightarrow \infty} \frac{\underbrace{\frac{x^3}{x}}_{\text{arbitrarily large}} - \underbrace{\frac{2x}{x}}_{\text{constant}} + \underbrace{\frac{1}{x}}_{\text{approaches 0}}}{\underbrace{\frac{2x}{x}}_{\text{constant}} + \underbrace{\frac{4}{x}}_{\text{approaches 0}}} && \text{Simplify.} \\ &= \infty. && \text{Take limits.}\end{aligned}$$

Figure 2.39

As $x \rightarrow \infty$, all the terms in this function either approach zero or are constant—except the x^2 -term in the numerator, which becomes arbitrarily large. Therefore, the limit of the function does not exist. Using a similar analysis, we find that $\lim_{x \rightarrow -\infty} \frac{x^3 - 2x + 1}{2x + 4} = \infty$.

These limits are not finite, so the graph of the function has no horizontal asymptote (Figure 2.39). There is, however, a vertical asymptote due to the fact that $x = -2$ is a zero of the denominator. In this case, the degree of the polynomial in the numerator is *greater than* the degree of the polynomial in the denominator.

Related Exercises 38, 41, 43 ◀

A special case of end behavior arises with rational functions. As shown in the next example, if the graph of a function f approaches a line (with finite and nonzero slope) as $x \rightarrow \pm \infty$, then that line is a **slant asymptote**, or **oblique asymptote**, of f .

EXAMPLE 4 Slant asymptotes Determine the end behavior of the function

$$f(x) = \frac{2x^2 + 6x - 2}{x + 1}.$$

SOLUTION We first divide the numerator and denominator by the largest power of x appearing in the denominator, which is x :

$$\begin{aligned}\lim_{x \rightarrow \infty} \frac{2x^2 + 6x - 2}{x + 1} &= \lim_{x \rightarrow \infty} \frac{\frac{2x^2}{x} + \frac{6x}{x} - \frac{2}{x}}{\frac{x}{x} + \frac{1}{x}} && \text{Divide the numerator and denominator by } x. \\ &= \lim_{x \rightarrow \infty} \frac{\underbrace{\frac{2x^2}{x}}_{\text{arbitrarily large}} + \underbrace{\frac{6x}{x}}_{\text{constant}} - \underbrace{\frac{2}{x}}_{\text{approaches 0}}}{\underbrace{\frac{x}{x}}_{\text{constant}} + \underbrace{\frac{1}{x}}_{\text{approaches 0}}} && \text{Simplify.} \\ &= \infty. && \text{Take limits.}\end{aligned}$$

A similar analysis shows that $\lim_{x \rightarrow -\infty} \frac{2x^2 + 6x - 2}{x + 1} = -\infty$. Because these limits are not finite, f has no horizontal asymptote.

However, there is more to be learned about the end behavior of this function. Using long division, the function f is written

$$f(x) = \frac{2x^2 + 6x - 2}{x + 1} = \underbrace{2x + 4}_{\ell(x)} - \frac{6}{x + 1}.$$

approaches 0 as $x \rightarrow \infty$

Figure 2.40

- More generally, a line $y = \ell(x)$ (with finite and nonzero slope) is a slant asymptote of a function f if $\lim_{x \rightarrow \infty} (f(x) - \ell(x)) = 0$ or $\lim_{x \rightarrow -\infty} (f(x) - \ell(x)) = 0$.

QUICK CHECK 3 Use Theorem 2.7 to find the vertical and horizontal asymptotes

of $y = \frac{10x}{3x - 1}$. ◀

As $x \rightarrow \infty$, the term $6/(x + 1)$ approaches 0, and we see that the function f behaves like the linear function $\ell(x) = 2x + 4$. For this reason, the graph of f approaches the graph of ℓ as $x \rightarrow \infty$ (Figure 2.40). A similar argument shows that the graph of f also approaches the graph of ℓ as $x \rightarrow -\infty$. The line described by ℓ is a slant asymptote; it occurs with rational functions only when the degree of the polynomial in the numerator exceeds the degree of the polynomial in the denominator by exactly 1.

Related Exercises 51–52 ◀

The conclusions reached in Examples 3 and 4 can be generalized for all rational functions. These results are summarized in Theorem 2.7; its proof is assigned in Exercise 80.

THEOREM 2.7 End Behavior and Asymptotes of Rational Functions

Suppose $f(x) = \frac{p(x)}{q(x)}$ is a rational function, where

$$p(x) = a_m x^m + a_{m-1} x^{m-1} + \cdots + a_2 x^2 + a_1 x + a_0 \quad \text{and} \\ q(x) = b_n x^n + b_{n-1} x^{n-1} + \cdots + b_2 x^2 + b_1 x + b_0,$$

with $a_m \neq 0$ and $b_n \neq 0$.

- Degree of numerator less than degree of denominator** If $m < n$, then $\lim_{x \rightarrow \pm\infty} f(x) = 0$, and $y = 0$ is a horizontal asymptote of f .
- Degree of numerator equals degree of denominator** If $m = n$, then $\lim_{x \rightarrow \pm\infty} f(x) = a_m/b_n$, and $y = a_m/b_n$ is a horizontal asymptote of f .
- Degree of numerator greater than degree of denominator** If $m > n$, then $\lim_{x \rightarrow \pm\infty} f(x) = \infty$ or $-\infty$, and f has no horizontal asymptote.
- Slant asymptote** If $m = n + 1$, then $\lim_{x \rightarrow \pm\infty} f(x) = \infty$ or $-\infty$, and f has no horizontal asymptote, but f has a slant asymptote.
- Vertical asymptotes** Assuming f is in reduced form (p and q share no common factors), vertical asymptotes occur at the zeros of q .

Although it isn't stated explicitly, Theorem 2.7 implies that a rational function can have at most one horizontal asymptote, and whenever there is a horizontal asymptote,

$\lim_{x \rightarrow \infty} \frac{p(x)}{q(x)} = \lim_{x \rightarrow -\infty} \frac{p(x)}{q(x)}$. The same cannot be said of other functions, as the next examples show.

EXAMPLE 5 End behavior of an algebraic function Use limits at infinity to deter-

mine the end behavior of $f(x) = \frac{10x^3 - 3x^2 + 8}{\sqrt{25x^6 + x^4 + 2}}$.

SOLUTION The square root in the denominator forces us to revise the strategy used with rational functions. First, consider the limit as $x \rightarrow \infty$. The highest power of the polynomial in the denominator is 6. However, the polynomial is under a square root, so effectively, the term with the highest power in the denominator is $\sqrt{x^6} = x^3$. When we divide the numerator and denominator by x^3 , for $x > 0$, the limit becomes

$$\begin{aligned}
 \lim_{x \rightarrow \infty} \frac{10x^3 - 3x^2 + 8}{\sqrt{25x^6 + x^4 + 2}} &= \lim_{x \rightarrow \infty} \frac{\frac{10x^3}{x^3} - \frac{3x^2}{x^3} + \frac{8}{x^3}}{\sqrt{\frac{25x^6}{x^6} + \frac{x^4}{x^6} + \frac{2}{x^6}}} && \text{Divide by } \sqrt{x^6} = x^3. \\
 &= \lim_{x \rightarrow \infty} \frac{10 - \frac{3}{x} + \frac{8}{x^3}}{\sqrt{25 + \frac{1}{x^2} + \frac{2}{x^6}}} && \begin{array}{l} \text{approaches 0} \quad \text{approaches 0} \\ \text{Simplify.} \end{array} \\
 &= \frac{10}{\sqrt{25}} = 2. && \text{Evaluate limits.}
 \end{aligned}$$

► Recall that

$$\sqrt{x^2} = |x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0. \end{cases}$$

Therefore,

$$\sqrt{x^6} = |x^3| = \begin{cases} x^3 & \text{if } x \geq 0 \\ -x^3 & \text{if } x < 0. \end{cases}$$

Because x is negative as $x \rightarrow -\infty$, we have

$$\sqrt{x^6} = -x^3.$$

As $x \rightarrow -\infty$, x^3 is negative, so we divide the numerator and denominator by $\sqrt{x^6} = -x^3$ (which is positive):

$$\begin{aligned}
 \lim_{x \rightarrow -\infty} \frac{10x^3 - 3x^2 + 8}{\sqrt{25x^6 + x^4 + 2}} &= \lim_{x \rightarrow -\infty} \frac{\frac{10x^3}{-x^3} - \frac{3x^2}{-x^3} + \frac{8}{-x^3}}{\sqrt{\frac{25x^6}{x^6} + \frac{x^4}{x^6} + \frac{2}{x^6}}} && \text{Divide by } \sqrt{x^6} = -x^3 > 0. \\
 &= \lim_{x \rightarrow -\infty} \frac{-10 + \frac{3}{x} - \frac{8}{x^3}}{\sqrt{25 + \frac{1}{x^2} + \frac{2}{x^6}}} && \begin{array}{l} \text{approaches 0} \quad \text{approaches 0} \\ \text{Simplify.} \end{array} \\
 &= -\frac{10}{\sqrt{25}} = -2. && \text{Evaluate limits.}
 \end{aligned}$$

Figure 2.41

The limits reveal two asymptotes, $y = 2$ and $y = -2$. In this particular case, the graph crosses both horizontal asymptotes (Figure 2.41). Related Exercises 46–47 ◀

End Behavior of $\sin x$ and $\cos x$

Our future work requires knowing about the end behavior of $\sin x$ and $\cos x$. The values of both functions oscillate between -1 and 1 as x increases in magnitude. Therefore,

$\lim_{x \rightarrow \pm \infty} \sin x$ and $\lim_{x \rightarrow \pm \infty} \cos x$ do not exist. However, both functions are bounded as $x \rightarrow \pm \infty$;

that is, $|\sin x| \leq 1$ and $|\cos x| \leq 1$ for all x .

SECTION 2.5 EXERCISES

Getting Started

1. Explain the meaning of $\lim_{x \rightarrow \infty} f(x) = 10$.
2. Evaluate $\lim_{x \rightarrow \infty} f(x)$ and $\lim_{x \rightarrow -\infty} f(x)$ using the figure.

3–13. Determine the following limits at infinity.

3. $\lim_{x \rightarrow \infty} x^{12}$
4. $\lim_{x \rightarrow -\infty} 3x^{11}$
5. $\lim_{x \rightarrow \infty} x^{-6}$
6. $\lim_{x \rightarrow -\infty} x^{-11}$
7. $\lim_{t \rightarrow \infty} (-12t^{-5})$
8. $\lim_{x \rightarrow -\infty} 2x^{-8}$
9. $\lim_{x \rightarrow \infty} \left(3 + \frac{10}{x^2} \right)$
10. $\lim_{x \rightarrow \infty} \left(5 + \frac{1}{x} + \frac{10}{x^2} \right)$
11. $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)}$ if $f(x) \rightarrow 100,000$ and $g(x) \rightarrow \infty$ as $x \rightarrow \infty$

12. $\lim_{x \rightarrow \infty} \frac{4x^2 + 2x + 3}{x^2}$
13. $\lim_{x \rightarrow \infty} \frac{1-x}{2x}$, $\lim_{x \rightarrow -\infty} \frac{1-x}{x^2}$, and $\lim_{x \rightarrow \infty} \frac{1-x^2}{2x}$
14. Describe with a sketch the end behavior of $f(x) = \cos x$.
15. Suppose the function g satisfies the inequality $3 - \frac{1}{x^2} \leq g(x) \leq 3 + \frac{1}{x^2}$, for all nonzero values of x . Evaluate $\lim_{x \rightarrow \infty} g(x)$ and $\lim_{x \rightarrow -\infty} g(x)$.
16. The graph of g has a vertical asymptote at $x = 2$ and horizontal asymptotes at $y = -1$ and $y = 3$ (see figure). Determine the following limits: $\lim_{x \rightarrow -\infty} g(x)$, $\lim_{x \rightarrow 2^-} g(x)$, $\lim_{x \rightarrow 2^+} g(x)$, and $\lim_{x \rightarrow \infty} g(x)$.

Practice Exercises

17–36. **Limits at infinity** Determine the following limits.

17. $\lim_{\theta \rightarrow \infty} \frac{\cos \theta}{\theta^2}$
18. $\lim_{t \rightarrow \infty} \frac{5t^2 + t \sin t}{t^2}$
19. $\lim_{x \rightarrow \infty} \frac{\cos x^5}{\sqrt{x}}$

26. $\lim_{x \rightarrow \infty} \frac{9x^3 + x^2 - 5}{3x^4 + 4x^2}$
27. $\lim_{x \rightarrow -\infty} \frac{3x^2 + 3x}{x + 1}$
28. $\lim_{x \rightarrow \infty} \frac{x^4 + 7}{x^5 + x^2 - x}$
29. $\lim_{w \rightarrow \infty} \frac{15w^2 + 3w + 1}{\sqrt{9w^4 + w^3}}$
30. $\lim_{x \rightarrow -\infty} \frac{40x^4 + x^2 + 5x}{\sqrt{64x^8 + x^6}}$
31. $\lim_{x \rightarrow -\infty} \frac{\sqrt{16x^2 + x}}{x}$
32. $\lim_{x \rightarrow \infty} \frac{6x^2}{4x^2 + \sqrt{16x^4 + x^2}}$
33. $\lim_{x \rightarrow \infty} (x^2 - \sqrt{x^4 + 3x^2})$ (Hint: Multiply by $\frac{x^2 + \sqrt{x^4 + 3x^2}}{x^2 + \sqrt{x^4 + 3x^2}}$ first.)

34. $\lim_{x \rightarrow -\infty} (x + \sqrt{x^2 - 5x})$
35. $\lim_{x \rightarrow \infty} \frac{\sin x}{x^2 + 1}$
36. $\lim_{x \rightarrow -\infty} \frac{x^4 \cos x}{3x^6 + 7x^4}$

37–50. **Horizontal asymptotes** Determine $\lim_{x \rightarrow \infty} f(x)$ and $\lim_{x \rightarrow -\infty} f(x)$ for the following functions. Then give the horizontal asymptotes of f (if any).

37. $f(x) = \frac{4x}{20x + 1}$
38. $f(x) = \frac{3x^2 - 7}{x^2 + 5x}$
39. $f(x) = \frac{6x^2 - 9x + 8}{3x^2 + 2}$
40. $f(x) = \frac{12x^8 - 3}{3x^8 - 2x^7}$
41. $f(x) = \frac{3x^3 - 7}{x^4 + 5x^2}$
42. $f(x) = \frac{2x + 1}{3x^4 - 2}$
43. $f(x) = \frac{40x^5 + x^2}{16x^4 - 2x}$
44. $f(x) = \frac{6x^2 + 1}{\sqrt{4x^4 + 3x + 1}}$
45. $f(x) = \frac{1}{2x^4 - \sqrt{4x^8 - 9x^4}}$
46. $f(x) = \frac{\sqrt{x^2 + 1}}{2x + 1}$
47. $f(x) = \frac{4x^3 + 1}{2x^3 + \sqrt{16x^6 + 1}}$
48. $f(x) = x - \sqrt{x^2 - 9x}$
49. $f(x) = \frac{\sqrt[3]{x^6 + 8}}{4x^2 + \sqrt{3x^4 + 1}}$
50. $f(x) = 4x(3x - \sqrt{9x^2 + 1})$

51–56. **Slant (oblique) asymptotes** Complete the following steps for the given functions.

- Find the slant asymptote of f .
- Find the vertical asymptotes of f (if any).
- Graph f and all of its asymptotes with a graphing utility. Then sketch a graph of the function by hand, correcting any errors appearing in the computer-generated graph.

51. $f(x) = \frac{x^2 - 3}{x + 6}$
52. $f(x) = \frac{x^2 - 1}{x + 2}$
53. $f(x) = \frac{x^2 - 2x + 5}{3x - 2}$
54. $f(x) = \frac{5x^2 - 4}{5x - 5}$
55. $f(x) = \frac{4x^3 + 4x^2 + 7x + 4}{x^2 + 1}$
56. $f(x) = \frac{3x^2 - 2x + 5}{3x + 4}$

57. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- The graph of a function can never cross one of its horizontal asymptotes.
- A rational function f has both $\lim_{x \rightarrow \infty} f(x) = L$ (where L is finite) and $\lim_{x \rightarrow -\infty} f(x) = \infty$.
- The graph of a function can have any number of vertical asymptotes but at most two horizontal asymptotes.
- $\lim_{x \rightarrow \infty} (x^3 - x) = \lim_{x \rightarrow \infty} x^3 - \lim_{x \rightarrow \infty} x = \infty - \infty = 0$

58–61. Steady states If a function f represents a system that varies in time, the existence of $\lim_{t \rightarrow \infty} f(t)$ means that the system reaches a steady state (or equilibrium). For the following systems, determine whether a steady state exists and give the steady-state value.

58. The population of a bacteria culture is given by $p(t) = \frac{2500}{t+1}$.

59. The population of a culture of tumor cells is given by $p(t) = \frac{3500t}{t+1}$.

60. The population of a colony of squirrels is given by $p(t) = \frac{1500t^2}{2t^2+3}$.

61. The amplitude of an oscillator is given by $a(t) = 2\left(\frac{t + \sin t}{t}\right)$.

62–73. Horizontal and vertical asymptotes

a. Analyze $\lim_{x \rightarrow \infty} f(x)$ and $\lim_{x \rightarrow -\infty} f(x)$, and then identify any horizontal asymptotes.

b. Find the vertical asymptotes. For each vertical asymptote $x = a$, analyze $\lim_{x \rightarrow a^-} f(x)$ and $\lim_{x \rightarrow a^+} f(x)$.

62. $f(x) = \frac{x^2 - 4x + 3}{x - 1}$ 63. $f(x) = \frac{2x^3 + 10x^2 + 12x}{x^3 + 2x^2}$

64. $f(x) = \frac{\sqrt{16x^4 + 64x^2 + x^2}}{2x^2 - 4}$

65. $f(x) = \frac{3x^4 + 3x^3 - 36x^2}{x^4 - 25x^2 + 144}$

66. $f(x) = x^2(4x^2 - \sqrt{16x^4 + 1})$

67. $f(x) = \frac{x^2 - 9}{x(x - 3)}$ 68. $f(x) = \frac{x^4 - 1}{x^2 - 1}$

69. $f(x) = \frac{\sqrt{x^2 + 2x + 6} - 3}{x - 1}$

70. $f(x) = \frac{|1 - x^2|}{x(x + 1)}$

71. $f(x) = \sqrt{|x|} - \sqrt{|x - 1|}$

72. $f(x) = \frac{2x}{\sqrt{x^2 - x - 2}}$ 73. $f(x) = \frac{\cos x + 2\sqrt{x}}{\sqrt{x}}$

74–75. Sketching graphs Sketch a possible graph of a function f that satisfies all of the given conditions. Be sure to identify all vertical and horizontal asymptotes.

74. $f(-1) = -2$, $f(1) = 2$, $f(0) = 0$, $\lim_{x \rightarrow \infty} f(x) = 1$,
 $\lim_{x \rightarrow -\infty} f(x) = -1$

75. $\lim_{x \rightarrow 0^+} f(x) = \infty$, $\lim_{x \rightarrow 0^-} f(x) = -\infty$, $\lim_{x \rightarrow \infty} f(x) = 1$,
 $\lim_{x \rightarrow -\infty} f(x) = -2$

Explorations and Challenges

76–79. Looking ahead to sequences A sequence is an infinite, ordered list of numbers that is often defined by a function. For example, the sequence $\{2, 4, 6, 8, \dots\}$ is specified by the function $f(n) = 2n$, where $n = 1, 2, 3, \dots$. The limit of such a sequence is $\lim_{n \rightarrow \infty} f(n)$, provided the limit exists. All the limit laws for limits at infinity may be applied to limits of sequences. Find the limit of the following sequences or state that the limit does not exist.

76. $\left\{4, 2, \frac{4}{3}, 1, \frac{4}{5}, \frac{2}{3}, \dots\right\}$, which is defined by $f(n) = \frac{4}{n}$, for $n = 1, 2, 3, \dots$

77. $\left\{0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \dots\right\}$, which is defined by $f(n) = \frac{n-1}{n}$, for $n = 1, 2, 3, \dots$

78. $\left\{\frac{1}{2}, \frac{4}{3}, \frac{9}{4}, \frac{16}{5}, \dots\right\}$, which is defined by $f(n) = \frac{n^2}{n+1}$, for $n = 1, 2, 3, \dots$

79. $\left\{2, \frac{3}{4}, \frac{4}{9}, \frac{5}{16}, \dots\right\}$, which is defined by $f(n) = \frac{n+1}{n^2}$, for $n = 1, 2, 3, \dots$

80. End behavior of rational functions Suppose $f(x) = \frac{p(x)}{q(x)}$ is a rational function, where

$$p(x) = a_mx^m + a_{m-1}x^{m-1} + \dots + a_2x^2 + a_1x + a_0,$$

$$q(x) = b_nx^n + b_{n-1}x^{n-1} + \dots + b_2x^2 + b_1x + b_0, \quad a_m \neq 0,$$

and $b_n \neq 0$.

a. Prove that if $m = n$, then $\lim_{x \rightarrow \pm\infty} f(x) = \frac{a_m}{b_n}$.

b. Prove that if $m < n$, then $\lim_{x \rightarrow \pm\infty} f(x) = 0$.

81. Horizontal and slant asymptotes

a. Is it possible for a rational function to have both slant and horizontal asymptotes? Explain.

b. Is it possible for an algebraic function to have two distinct slant asymptotes? Explain or give an example.

QUICK CHECK ANSWERS

- 10/11, 100/101, 1000/1001; 1
- $p(x) \rightarrow -\infty$ as $x \rightarrow \infty$ and $p(x) \rightarrow \infty$ as $x \rightarrow -\infty$
- Horizontal asymptote is $y = \frac{10}{3}$; vertical asymptote is $x = \frac{1}{3}$. ◀

2.6 Continuity

The graphs of many functions encountered in this text contain no holes, jumps, or breaks. For example, if $L = f(t)$ represents the length (in inches) of a fish t years after it is hatched, then the length of the fish changes gradually as t increases. Consequently, the graph of $L = f(t)$ contains no breaks (Figure 2.42a). Some functions, however, do contain abrupt changes in their values. Consider a parking meter that accepts only quarters, where each quarter buys 15 minutes of parking. Letting $c(t)$ be the cost (in dollars) of parking for t minutes, the graph of c has breaks at integer multiples of 15 minutes (Figure 2.42b).

Figure 2.42

Informally, we say that a function f is *continuous* at a if the graph of f does not have a hole or break at a (that is, if the graph near a can be drawn without lifting the pencil).

Continuity at a Point

This informal description of continuity is sufficient for determining the continuity of simple functions, but it is not precise enough to deal with more complicated functions such as

$$h(x) = \begin{cases} x \sin \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0. \end{cases}$$

It is difficult to determine whether the graph of h has a break at 0 because it oscillates rapidly as x approaches 0 (Figure 2.43). We need a better definition.

Figure 2.43

DEFINITION Continuity at a Point

A function f is **continuous** at a if $\lim_{x \rightarrow a} f(x) = f(a)$.

There is more to this definition than first appears. If $\lim_{x \rightarrow a} f(x) = f(a)$, then $f(a)$ and $\lim_{x \rightarrow a} f(x)$ must both exist, and they must be equal. The following checklist is helpful in determining whether a function is continuous at a .

Continuity Checklist

In order for f to be continuous at a , the following three conditions must hold.

1. $f(a)$ is defined (a is in the domain of f).
2. $\lim_{x \rightarrow a} f(x)$ exists.
3. $\lim_{x \rightarrow a} f(x) = f(a)$ (the value of f equals the limit of f at a).

Figure 2.44

► In Example 1, the discontinuities at $x = 1$ and $x = 2$ are called **removable discontinuities** because they can be removed by redefining the function at these points (in this case, $f(1) = 3$ and $f(2) = 1$). The discontinuity at $x = 3$ is called a **jump discontinuity**. The discontinuity at $x = 5$ is called an **infinite discontinuity**. These terms are discussed in Exercises 89–95.

QUICK CHECK 1 For what values of t in $(0, 60)$ does the graph of $y = c(t)$ in Figure 2.42b have a discontinuity? ◀

If *any* item in the continuity checklist fails to hold, the function fails to be continuous at a . From this definition, we see that continuity has an important practical consequence:

If f is continuous at a , then $\lim_{x \rightarrow a} f(x) = f(a)$, and direct substitution may be used to evaluate $\lim_{x \rightarrow a} f(x)$.

Note that when f is defined on an open interval containing a (except possibly at a), we say that f has a **discontinuity** at a (or that a is a **point of discontinuity**) if f is not continuous at a .

EXAMPLE 1 Points of discontinuity Use the graph of f in Figure 2.44 to identify values of x on the interval $(0, 7)$ at which f has a discontinuity.

SOLUTION The function f has discontinuities at $x = 1, 2, 3$, and 5 because the graph contains holes or breaks at these locations. The continuity checklist tells us why f is not continuous at these points.

- $f(1)$ is not defined.
- $f(2) = 3$ and $\lim_{x \rightarrow 2} f(x) = 1$. Therefore, $f(2)$ and $\lim_{x \rightarrow 2} f(x)$ exist but are not equal.
- $\lim_{x \rightarrow 3} f(x)$ does not exist because the left-sided limit $\lim_{x \rightarrow 3^-} f(x) = 2$ differs from the right-sided limit $\lim_{x \rightarrow 3^+} f(x) = 1$.
- Neither $\lim_{x \rightarrow 5} f(x)$ nor $f(5)$ exists.

Related Exercises 5–6 ◀

EXAMPLE 2 Continuity at a point Determine whether the following functions are continuous at a . Justify each answer using the continuity checklist.

- a. $f(x) = \frac{3x^2 + 2x + 1}{x - 1}$; $a = 1$ b. $g(x) = \frac{3x^2 + 2x + 1}{x - 1}$; $a = 2$
- c. $h(x) = \begin{cases} x \sin \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$; $a = 0$

SOLUTION

- a. The function f is not continuous at 1 because $f(1)$ is undefined.
- b. Because g is a rational function and the denominator is nonzero at 2, it follows by Theorem 2.4 that $\lim_{x \rightarrow 2} g(x) = g(2) = 17$. Therefore, g is continuous at 2.
- c. By definition, $h(0) = 0$. In Exercise 81 of Section 2.3, we used the Squeeze Theorem to show that $\lim_{x \rightarrow 0} x \sin \frac{1}{x} = 0$. Therefore, $\lim_{x \rightarrow 0} h(x) = h(0)$, which implies that h is continuous at 0.

Related Exercises 17, 22 ◀

The following theorems make it easier to test various combinations of functions for continuity at a point.

THEOREM 2.8 Continuity Rules

If f and g are continuous at a , then the following functions are also continuous at a . Assume c is a constant and $n > 0$ is an integer.

- | | |
|-----------------------------------|---------------|
| a. $f + g$ | b. $f - g$ |
| c. cf | d. fg |
| e. f/g , provided $g(a) \neq 0$ | f. $(f(x))^n$ |

To prove the first result, note that if f and g are continuous at a , then $\lim_{x \rightarrow a} f(x) = f(a)$ and $\lim_{x \rightarrow a} g(x) = g(a)$. From the limit laws of Theorem 2.3, it follows that

$$\lim_{x \rightarrow a} (f(x) + g(x)) = f(a) + g(a).$$

Therefore, $f + g$ is continuous at a . Similar arguments lead to the continuity of differences, products, quotients, and powers of continuous functions. The next theorem is a direct consequence of Theorem 2.8.

THEOREM 2.9 Polynomial and Rational Functions

- A polynomial function is continuous for all x .
- A rational function (a function of the form $\frac{p}{q}$, where p and q are polynomials) is continuous for all x for which $q(x) \neq 0$.

EXAMPLE 3 Applying the continuity theorems For what values of x is the function

$$f(x) = \frac{x}{x^2 - 7x + 12} \text{ continuous?}$$

SOLUTION Because f is rational, Theorem 2.9b implies it is continuous for all x at which the denominator is nonzero. The denominator factors as $(x - 3)(x - 4)$, so it is zero at $x = 3$ and $x = 4$. Therefore, f is continuous for all x except $x = 3$ and $x = 4$ (Figure 2.45).

Related Exercises 26–27 ◀

Figure 2.45

The following theorem enables us to determine when a composition of two functions is continuous at a point. Its proof is informative and is outlined in Exercise 96.

THEOREM 2.10 Continuity of Composite Functions at a Point

If g is continuous at a and f is continuous at $g(a)$, then the composite function $f \circ g$ is continuous at a .

Theorem 2.10 is useful because it allows us to conclude that the composition of two continuous functions is continuous at a point. For example, the composite function $\left(\frac{x}{x-1}\right)^3$ is continuous for all $x \neq 1$. Furthermore, under the stated conditions on f and g , the limit of $f \circ g$ is evaluated by direct substitution; that is,

$$\lim_{x \rightarrow a} f(g(x)) = f(g(a)).$$

EXAMPLE 4 Limit of a composition Evaluate $\lim_{x \rightarrow 0} \left(\frac{x^4 - 2x + 2}{x^6 + 2x^4 + 1} \right)^{10}$.

SOLUTION The rational function $\frac{x^4 - 2x + 2}{x^6 + 2x^4 + 1}$ is continuous for all x because its denominator is always positive (Theorem 2.9b). Therefore, $\left(\frac{x^4 - 2x + 2}{x^6 + 2x^4 + 1} \right)^{10}$, which is the composition of the continuous function $f(x) = x^{10}$ and a continuous rational function, is continuous for all x by Theorem 2.10. By direct substitution,

$$\lim_{x \rightarrow 0} \left(\frac{x^4 - 2x + 2}{x^6 + 2x^4 + 1} \right)^{10} = \left(\frac{0^4 - 2 \cdot 0 + 2}{0^6 + 2 \cdot 0^4 + 1} \right)^{10} = 2^{10} = 1024.$$

Related Exercises 31–32 ◀

Closely related to Theorem 2.10 are two useful results dealing with limits of composite functions. We present these results—one a more general version of the other—in a single theorem.

THEOREM 2.11 Limits of Composite Functions

1. If g is continuous at a and f is continuous at $g(a)$, then

$$\lim_{x \rightarrow a} f(g(x)) = f\left(\lim_{x \rightarrow a} g(x)\right).$$

2. If $\lim_{x \rightarrow a} g(x) = L$ and f is continuous at L , then

$$\lim_{x \rightarrow a} f(g(x)) = f\left(\lim_{x \rightarrow a} g(x)\right).$$

Proof: The first statement follows directly from Theorem 2.10, which states that $\lim_{x \rightarrow a} f(g(x)) = f(g(a))$. If g is continuous at a , then $\lim_{x \rightarrow a} g(x) = g(a)$, and it follows that

$$\lim_{x \rightarrow a} f(g(x)) = f(\underbrace{g(a)}_{\lim_{x \rightarrow a} g(x)}) = f\left(\lim_{x \rightarrow a} g(x)\right).$$

The proof of the second statement (see Appendix A) relies on the formal definition of a limit, which is discussed in Section 2.7. ▶

Both statements of Theorem 2.11 justify interchanging the order of a limit and a function evaluation. By the second statement, the inner function of the composition needn't be continuous at the point of interest, but it must have a limit at that point. Note also that $\lim$ can be replaced with $\lim_{x \rightarrow a^+}$ or $\lim_{x \rightarrow a^-}$ in statement (1) of Theorem 2.11, provided g is *right-* or *left-continuous* (see p. 107) at a , respectively. In statement (2), $\lim$ can be replaced with $\lim_{x \rightarrow \infty}$ or $\lim_{x \rightarrow -\infty}$.

EXAMPLE 5 Limits of a composite functions Evaluate the following limits.

a. $\lim_{x \rightarrow -1} \sqrt{2x^2 - 1}$ b. $\lim_{x \rightarrow 2} \cos\left(\frac{x^2 - 4}{x - 2}\right)$

SOLUTION

a. The inner function of the composite function $\sqrt{2x^2 - 1}$ is $g(x) = 2x^2 - 1$; it is continuous and positive at -1 , and $g(-1) = 1$. Because $f(x) = \sqrt{x}$ is continuous at $g(-1) = 1$ (a consequence of Law 7, Theorem 2.3), we have, by the first statement of Theorem 2.11,

$$\lim_{x \rightarrow -1} \sqrt{2x^2 - 1} = \sqrt{\underbrace{\lim_{x \rightarrow -1} (2x^2 - 1)}_1} = \sqrt{1} = 1.$$

- b. We show later in this section that $\cos x$ is continuous at all points of its domain. The inner function of the composite function $\cos\left(\frac{x^2 - 4}{x - 2}\right)$ is $\frac{x^2 - 4}{x - 2}$, which is not continuous at 2. However,

$$\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2} = \lim_{x \rightarrow 2} \frac{(x - 2)(x + 2)}{x - 2} = \lim_{x \rightarrow 2} (x + 2) = 4.$$

Therefore, by the second statement of Theorem 2.11,

$$\lim_{x \rightarrow 2} \cos\left(\frac{x^2 - 4}{x - 2}\right) = \cos\left(\underbrace{\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2}}_4\right) = \cos 4 \approx -0.654.$$

Related Exercises 33–34 ◀

Continuity on an Interval

A function is *continuous on an interval* if it is continuous at every point in that interval. Consider the functions f and g whose graphs are shown in Figure 2.46. Both these functions are continuous for all x in (a, b) , but what about the endpoints? To answer this question, we introduce the ideas of *left-continuity* and *right-continuity*.

Figure 2.46

DEFINITION Continuity at Endpoints

A function f is **continuous from the right** (or **right-continuous**) at a if $\lim_{x \rightarrow a^+} f(x) = f(a)$, and f is **continuous from the left** (or **left-continuous**) at b if $\lim_{x \rightarrow b^-} f(x) = f(b)$.

Combining the definitions of left-continuous and right-continuous with the definition of continuity at a point, we define what it means for a function to be continuous on an interval.

DEFINITION Continuity on an Interval

A function f is **continuous on an interval I** if it is continuous at all points of I . If I contains its endpoints, continuity on I means continuous from the right or left at the endpoints.

To illustrate these definitions, consider again the functions in Figure 2.46. In Figure 2.46a, f is continuous from the right at a because $\lim_{x \rightarrow a^+} f(x) = f(a)$, but it is not continuous from the left at b because $f(b)$ is not defined. Therefore, f is continuous on the interval $[a, b)$. The behavior of the function g in Figure 2.46b is the opposite: It is continuous from the left at b , but it is not continuous from the right at a . Therefore, g is continuous on $(a, b]$.

QUICK CHECK 2 Modify the graphs of the functions f and g in Figure 2.46 to obtain functions that are continuous on $[a, b]$. ◀

EXAMPLE 6 Intervals of continuity Determine the intervals of continuity for

$$f(x) = \begin{cases} x^2 + 1 & \text{if } x \leq 0 \\ 3x + 5 & \text{if } x > 0. \end{cases}$$

SOLUTION This piecewise function consists of two polynomials that describe a parabola and a line (Figure 2.47). By Theorem 2.9, f is continuous for all $x \neq 0$. From its graph, it appears that f is left-continuous at 0. This observation is verified by noting that

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (x^2 + 1) = 1,$$

Figure 2.47

which means that $\lim_{x \rightarrow 0^-} f(x) = f(0)$. However, because

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} (3x + 5) = 5 \neq f(0),$$

we see that f is not right-continuous at 0. Therefore, f is continuous on $(-\infty, 0]$ and on $(0, \infty)$.

Related Exercises 39–40 ◀

Functions Involving Roots

Recall that Limit Law 7 of Theorem 2.3 states

$$\lim_{x \rightarrow a} (f(x))^{1/n} = \left(\lim_{x \rightarrow a} f(x) \right)^{1/n},$$

provided $f(x) > 0$, for x near a , if n is even. Therefore, if n is odd and f is continuous at a , then $(f(x))^{1/n}$ is continuous at a , because

$$\lim_{x \rightarrow a} (f(x))^{1/n} = \left(\lim_{x \rightarrow a} f(x) \right)^{1/n} = (f(a))^{1/n}.$$

When n is even, the continuity of $(f(x))^{1/n}$ must be handled more carefully because this function is defined only when $f(x) \geq 0$. Exercise 73 of Section 2.7 establishes an important fact:

If f is continuous at a , and $f(a) > 0$, then $f(x) > 0$ for all values of x in some interval containing a .

Combining this fact with Theorem 2.10 (the continuity of composite functions), it follows that $(f(x))^{1/n}$ is continuous at a provided $f(a) > 0$. At points where $f(a) = 0$, the behavior of $(f(x))^{1/n}$ varies. Often we find that $(f(x))^{1/n}$ is left- or right-continuous at that point, or it may be continuous from both sides.

THEOREM 2.12 Continuity of Functions with Roots

Assume n is a positive integer. If n is an odd integer, then $(f(x))^{1/n}$ is continuous at all points at which f is continuous.

If n is even, then $(f(x))^{1/n}$ is continuous at all points a at which f is continuous and $f(a) > 0$.

Figure 2.48

EXAMPLE 7 Continuity with roots For what values of x are the following functions continuous?

- $g(x) = \sqrt{9 - x^2}$
- $f(x) = (x^2 - 2x + 4)^{2/3}$

SOLUTION

- The graph of g is the upper half of the circle $x^2 + y^2 = 9$ (which can be verified by solving $x^2 + y^2 = 9$ for y). From Figure 2.48, it appears that g is continuous on $[-3, 3]$. To verify this fact, note that g involves an even root ($n = 2$ in Theorem 2.12). If $-3 < x < 3$, then $9 - x^2 > 0$ and by Theorem 2.12, g is continuous for all x on $(-3, 3)$.

At the right endpoint, $\lim_{x \rightarrow 3^-} \sqrt{9 - x^2} = 0 = g(3)$ by Limit Law 7 for one-sided limits, which implies that g is left-continuous at 3. Similarly, g is right-continuous at -3 because $\lim_{x \rightarrow -3^+} \sqrt{9 - x^2} = 0 = g(-3)$. Therefore, g is continuous on $[-3, 3]$.

- The polynomial $x^2 - 2x + 4$ is continuous for all x by Theorem 2.9a. Rewriting f as $f(x) = ((x^2 - 2x + 4)^{1/3})^2$, we see that f involves an odd root ($n = 3$ in Theorem 2.12). Therefore, f is continuous for all x .

QUICK CHECK 3 On what interval is $f(x) = x^{1/4}$ continuous? On what interval is $f(x) = x^{2/5}$ continuous? ◀

Continuity of Trigonometric Functions

In Section 2.3, we used the Squeeze Theorem to show that $\lim_{x \rightarrow 0} \sin x = 0$ and $\lim_{x \rightarrow 0} \cos x = 1$. Because $\sin 0 = 0$ and $\cos 0 = 1$, these limits imply that $\sin x$ and $\cos x$ are continuous at 0. The graph of $y = \sin x$ (Figure 2.49) suggests that $\lim_{x \rightarrow a} \sin x = \sin a$ for any value of a , which means that $\sin x$ is continuous on $(-\infty, \infty)$. The graph of $y = \cos x$ also indicates that $\cos x$ is continuous for all x . Exercise 99 outlines a proof of these results.

Figure 2.49

Figure 2.50

With these facts in hand, we appeal to Theorem 2.8e to discover that the remaining trigonometric functions are continuous on their domains. For example, because $\sec x = 1/\cos x$, the secant function is continuous for all x for which $\cos x \neq 0$ (for all x except odd multiples of $\pi/2$; Figure 2.50). Likewise, the tangent, cotangent, and cosecant functions are continuous at all points of their domains.

THEOREM 2.13 Continuity of Trigonometric Functions

The functions $\sin x$, $\cos x$, $\tan x$, $\cot x$, $\sec x$, and $\csc x$ are continuous at all points of their domains.

For each function listed in Theorem 2.13, we have $\lim_{x \rightarrow a} f(x) = f(a)$, provided a is in the domain of the function. This means that limits of these functions may be evaluated by direct substitution at points in the domain.

EXAMPLE 8 Limits involving trigonometric functions Evaluate $\lim_{x \rightarrow 0} \frac{\cos^2 x - 1}{\cos x - 1}$.

SOLUTION Both $\cos^2 x - 1$ and $\cos x - 1$ are continuous for all x by Theorems 2.8 and 2.13. However, the ratio of these functions is continuous only when $\cos x - 1 \neq 0$, which occurs when x is not an integer multiple of 2π . Note that both the numerator and denominator of $\frac{\cos^2 x - 1}{\cos x - 1}$ approach 0 as $x \rightarrow 0$. To evaluate the limit, we factor and simplify:

$$\lim_{x \rightarrow 0} \frac{\cos^2 x - 1}{\cos x - 1} = \lim_{x \rightarrow 0} \frac{(\cos x - 1)(\cos x + 1)}{\cos x - 1} = \lim_{x \rightarrow 0} (\cos x + 1)$$

(where $\cos x - 1$ may be canceled because it is nonzero as x approaches 0). The limit on the right is now evaluated using direct substitution:

$$\lim_{x \rightarrow 0} (\cos x + 1) = \cos 0 + 1 = 2.$$

Related Exercises 62–63 ◀

We close this section with an important theorem that has both practical and theoretical uses.

Intermediate Value Theorem

A common problem in mathematics is finding solutions to equations of the form $f(x) = L$. Before attempting to find values of x satisfying this equation, it is worthwhile to determine whether a solution exists.

► Limits like the one in Example 8 are denoted $0/0$ and are known as *indeterminate forms*, to be studied further in Section 4.7.

The existence of solutions is often established using a result known as the *Intermediate Value Theorem*. Given a function f and a constant L , we assume L lies strictly between $f(a)$ and $f(b)$. The Intermediate Value Theorem says that if f is continuous on $[a, b]$, then the graph of f must cross the horizontal line $y = L$ at least once (Figure 2.51). Although this theorem is easily illustrated, its proof is beyond the scope of this text.

Figure 2.51

THEOREM 2.14 Intermediate Value Theorem

Suppose f is continuous on the interval $[a, b]$ and L is a number strictly between $f(a)$ and $f(b)$. Then there exists at least one number c in (a, b) satisfying $f(c) = L$.

Figure 2.52

The importance of continuity in Theorem 2.14 is illustrated in Figure 2.52, where we see a function f that is not continuous on $[a, b]$. For the value of L shown in the figure, there is no value of c in (a, b) satisfying $f(c) = L$. The next example illustrates a practical application of the Intermediate Value Theorem.

EXAMPLE 9 Finding an interest rate Suppose you invest \$1000 in a special 5-year savings account with a fixed annual interest rate r , with monthly compounding. The amount of money A in the account after 5 years (60 months) is

$$A(r) = 1000 \left(1 + \frac{r}{12} \right)^{60}.$$

Your goal is to have \$1400 in the account after 5 years.

- Use the Intermediate Value Theorem to show there is a value of r in $(0, 0.08)$ —that is, an interest rate between 0% and 8%—for which $A(r) = 1400$.
- Use a graphing utility to illustrate your explanation in part (a) and then estimate the interest rate required to reach your goal.

SOLUTION

- As a polynomial in r (of degree 60), $A(r) = 1000 \left(1 + \frac{r}{12} \right)^{60}$ is continuous for all r .

Evaluating $A(r)$ at the endpoints of the interval $[0, 0.08]$, we have $A(0) = 1000$ and $A(0.08) \approx 1489.85$. Therefore,

$$A(0) < 1400 < A(0.08),$$

and it follows, by the Intermediate Value Theorem, that there is a value of r in $(0, 0.08)$ for which $A(r) = 1400$.

QUICK CHECK 4 Does the equation $f(x) = x^3 + x + 1 = 0$ have a solution on the interval $[-1, 1]$? Explain. ◀

Figure 2.53

- b. The graphs of $y = A(r)$ and the horizontal line $y = 1400$ are shown in [Figure 2.53](#); it is evident that they intersect between $r = 0$ and $r = 0.08$. Solving $A(r) = 1400$ algebraically or using a root finder reveals that the curve and line intersect at $r \approx 0.0675$. Therefore, an interest rate of approximately 6.75% is required for the investment to be worth \$1400 after 5 years.

Related Exercises 65, 71 ◀

SECTION 2.6 EXERCISES

Getting Started

- Which of the following functions are continuous for all values in their domain? Justify your answers.
 - $a(t)$ = altitude of a skydiver t seconds after jumping from a plane
 - $n(t)$ = number of quarters needed to park legally in a metered parking space for t minutes
 - $T(t)$ = temperature t minutes after midnight in Chicago on January 1
 - $p(t)$ = number of points scored by a basketball player after t minutes of a basketball game
- Give the three conditions that must be satisfied by a function to be continuous at a point.
- What does it mean for a function to be continuous on an interval?
- We informally describe a function f to be continuous at a if its graph contains no holes or breaks at a . Explain why this is not an adequate definition of continuity.

5–8. Determine the points on the interval $(0, 5)$ at which the following functions f have discontinuities. At each point of discontinuity, state the conditions in the continuity checklist that are violated.

- Complete the following sentences in terms of a limit.
 - A function is continuous from the left at a if _____.
 - A function is continuous from the right at a if _____.
- Evaluate $f(3)$ if $\lim_{x \rightarrow 3^-} f(x) = 5$, $\lim_{x \rightarrow 3^+} f(x) = 6$, and f is right-continuous at $x = 3$.
- 11–14. Determine the intervals of continuity for the following functions. At which endpoints of these intervals of continuity is f continuous from the left or continuous from the right?
 - The graph of Exercise 5
 - The graph of Exercise 6
 - The graph of Exercise 7
 - The graph of Exercise 8
- What is the domain of $f(x) = \sqrt{1 - x^2}$? Where is f continuous?
- Parking costs** Determine the intervals of continuity for the parking cost function c introduced at the outset of this section (see figure). Consider $0 \leq t \leq 60$.

Practice Exercises

17–24. **Continuity at a point** Determine whether the following functions are continuous at a . Use the continuity checklist to justify your answer.

17. $f(x) = \frac{2x^2 + 3x + 1}{x^2 + 5x}$; $a = -5$

18. $f(x) = \frac{2x^2 + 3x + 1}{x^2 + 5x}$; $a = 5$

19. $f(x) = \sqrt{x - 2}$; $a = 1$

20. $g(x) = \frac{1}{x - 3}$; $a = 3$

$$21. f(x) = \begin{cases} \frac{x^2 - 1}{x - 1} & \text{if } x \neq 1 \\ 3 & \text{if } x = 1 \end{cases}; a = 1$$

$$22. f(x) = \begin{cases} \frac{x^2 - 4x + 3}{x - 3} & \text{if } x \neq 3 \\ 2 & \text{if } x = 3 \end{cases}; a = 3$$

$$23. f(x) = \frac{5x - 2}{x^2 - 9x + 20}; a = 4$$

$$24. f(x) = \begin{cases} \frac{x^2 + x}{x + 1} & \text{if } x \neq -1 \\ 2 & \text{if } x = -1 \end{cases}; a = -1$$

25–30. Continuity Determine the interval(s) on which the following functions are continuous.

$$25. p(x) = 4x^5 - 3x^2 + 1 \quad 26. g(x) = \frac{3x^2 - 6x + 7}{x^2 + x + 1}$$

$$27. f(x) = \frac{x^5 + 6x + 17}{x^2 - 9} \quad 28. s(x) = \frac{x^2 - 4x + 3}{x^2 - 1}$$

$$29. f(x) = \frac{1}{x^2 - 4} \quad 30. f(t) = \frac{t + 2}{t^2 - 4}$$

31–38. Limits Evaluate each limit and justify your answer.

$$31. \lim_{x \rightarrow 0} (x^8 - 3x^6 - 1)^{40} \quad 32. \lim_{x \rightarrow 2} \left(\frac{3}{2x^5 - 4x^2 - 50} \right)^4$$

$$33. \lim_{x \rightarrow 4} \sqrt{\frac{x^3 - 2x^2 - 8x}{x - 4}} \quad 34. \lim_{t \rightarrow 4} \frac{t - 4}{\sqrt{t} - 2}$$

$$35. \lim_{x \rightarrow 1} \left(\frac{x + 5}{x + 2} \right)^4 \quad 36. \lim_{x \rightarrow \infty} \left(\frac{2x + 1}{x} \right)^3$$

$$37. \lim_{x \rightarrow 5} \left(\frac{\sqrt{x^2 - 16} - 3}{5x - 25} \right)^4 \quad 38. \lim_{x \rightarrow 0} \left(\frac{x}{\sqrt{16x + 1} - 1} \right)^{1/3}$$

39–40. Intervals of continuity Complete the following steps for each function.

- Use the continuity checklist to show that f is not continuous at the given value of a .
- Determine whether f is continuous from the left or the right at a .
- State the interval(s) of continuity.

$$39. f(x) = \begin{cases} 2x & \text{if } x < 1 \\ x^2 + 3x & \text{if } x \geq 1 \end{cases}; a = 1$$

$$40. f(x) = \begin{cases} x^3 + 4x + 1 & \text{if } x \leq 0 \\ 2x^3 & \text{if } x > 0 \end{cases}; a = 0$$

41–48. Functions with roots Determine the interval(s) on which the following functions are continuous. At which finite endpoints of the intervals of continuity is f continuous from the left or continuous from the right?

$$41. f(x) = \sqrt{5 - x} \quad 42. f(x) = \sqrt{25 - x^2}$$

$$43. f(x) = \sqrt{2x^2 - 16} \quad 44. f(x) = \sqrt{x^2 - 3x + 2}$$

$$45. f(x) = \sqrt[3]{x^2 - 2x - 3}$$

$$47. f(x) = (2x - 3)^{2/3}$$

49–60. Evaluate each limit.

$$49. \lim_{x \rightarrow 2} \sqrt{\frac{4x + 10}{2x - 2}}$$

$$51. \lim_{x \rightarrow \pi} \frac{\cos^2 x + 3 \cos x + 2}{\cos x + 1}$$

$$53. \lim_{x \rightarrow 3} \sqrt{x^2 + 7}$$

$$55. \lim_{x \rightarrow \pi/2} \frac{\sin x - 1}{\sqrt{\sin x} - 1}$$

$$57. \lim_{x \rightarrow 0} \frac{\cos x - 1}{\sin^2 x}$$

$$59. \lim_{t \rightarrow \infty} \frac{\sin t}{t^2}$$

$$46. f(t) = (t^2 - 1)^{3/2}$$

$$48. f(z) = (z - 1)^{3/4}$$

$$50. \lim_{x \rightarrow -1} (x^2 - 4 + \sqrt[3]{x^2 - 9})$$

$$52. \lim_{\theta \rightarrow 3\pi/2} \frac{\sin^2 \theta + 6 \sin \theta + 5}{\sin^2 \theta - 1}$$

$$54. \lim_{t \rightarrow 2} \frac{t^2 + 5}{1 + \sqrt{t^2 + 5}}$$

$$56. \lim_{\theta \rightarrow 0} \frac{\frac{1}{2 + \sin \theta} - \frac{1}{2}}{\sin \theta}$$

$$58. \lim_{x \rightarrow 0^+} \frac{1 - \cos^2 x}{\sin x}$$

$$60. \lim_{x \rightarrow 0^+} \frac{\cos x}{x}$$

61–64. Continuity and limits with trigonometric functions Determine the interval(s) on which the following functions are continuous; then analyze the given limits.

$$61. f(x) = \csc x; \lim_{x \rightarrow \pi/4} f(x); \lim_{x \rightarrow 2\pi^-} f(x)$$

$$62. f(x) = \sqrt{\sin x}; \lim_{x \rightarrow \pi/2} f(x); \lim_{x \rightarrow 0^+} f(x)$$

$$63. f(x) = \frac{1 + \sin x}{\cos x}; \lim_{x \rightarrow \pi/2^-} f(x); \lim_{x \rightarrow 4\pi/3} f(x)$$

$$64. f(x) = \frac{1}{2 \cos x - 1}; \lim_{x \rightarrow \pi/6} f(x)$$

T 65–68. Applying the Intermediate Value Theorem

- Use the Intermediate Value Theorem to show that the following equations have a solution on the given interval.
- Use a graphing utility to find all the solutions to the equation on the given interval.
- Illustrate your answers with an appropriate graph.

$$65. 2x^3 + x - 2 = 0; (-1, 1)$$

$$66. \sqrt{x^4 + 25x^3 + 10} = 5; (0, 1)$$

$$67. x^3 - 5x^2 + 2x = -1; (-1, 5)$$

$$68. -x^5 - 4x^2 + 2\sqrt{x} + 5 = 0; (0, 3)$$

69. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- If a function is left-continuous and right-continuous at a , then it is continuous at a .
- If a function is continuous at a , then it is left-continuous and right-continuous at a .
- If $a < b$ and $f(a) \leq L \leq f(b)$, then there is some value of c in (a, b) for which $f(c) = L$.
- Suppose f is continuous on $[a, b]$. Then there is a point c in (a, b) such that $f(c) = (f(a) + f(b))/2$.

- 70. Mortgage payments** You are shopping for a \$250,000, 30-year (360-month) loan to buy a house. The monthly payment is given by

$$m(r) = \frac{250,000(r/12)}{1 - (1 + r/12)^{-360}},$$

where r is the annual interest rate. Suppose banks are currently offering interest rates between 4% and 5%.

- Show there is a value of r in $(0.04, 0.05)$ —an interest rate between 4% and 5%—that allows you to make monthly payments of \$1300 per month.
 - Use a graph to illustrate your explanation to part (a). Then determine the interest rate you need for monthly payments of \$1300.
- 71. Interest rates** Suppose \$5000 is invested in a savings account for 10 years (120 months), with an annual interest rate of r , compounded monthly. The amount of money in the account after 10 years is given by $A(r) = 5000(1 + r/12)^{120}$.
- Show there is a value of r in $(0, 0.08)$ —an interest rate between 0% and 8%—that allows you to reach your savings goal of \$7000 in 10 years.
 - Use a graph to illustrate your explanation in part (a). Then approximate the interest rate required to reach your goal.
- 72. Investment problem** Assume you invest \$250 at the end of each year for 10 years at an annual interest rate of r . The amount of money in your account after 10 years is given by $A(r) = \frac{250((1 + r)^{10} - 1)}{r}$. Assume your goal is to have \$3500 in your account after 10 years.
- Show that there is an interest rate r in the interval $(0.01, 0.10)$ —between 1% and 10%—that allows you to reach your financial goal.
 - Use a calculator to estimate the interest rate required to reach your financial goal.
- 73.** Find an interval containing a solution to the equation $2x = \cos x$. Use a graphing utility to approximate the solution.

Explorations and Challenges

- 74. Continuity of the absolute value function** Prove that the absolute value function $|x|$ is continuous for all values of x . (*Hint:* Using the definition of the absolute value function, compute $\lim_{x \rightarrow 0^-} |x|$ and $\lim_{x \rightarrow 0^+} |x|$.)

75–78. Continuity of functions with absolute values Use the continuity of the absolute value function (Exercise 74) to determine the interval(s) on which the following functions are continuous.

75. $f(x) = |x^2 + 3x - 18|$ 76. $g(x) = \left| \frac{x + 4}{x^2 - 4} \right|$

77. $h(x) = \left| \frac{1}{\sqrt{x} - 4} \right|$

78. $h(x) = |x^2 + 2x + 5| + \sqrt{x}$

- 79. Pitfalls using technology** The graph of the *sawtooth function* $y = x - \lfloor x \rfloor$, where $\lfloor x \rfloor$ is the greatest integer function or floor function (Exercise 51, Section 2.2), was obtained using a graphing utility (see figure). Identify any inaccuracies appearing in the graph and then plot an accurate graph by hand.

- 80. Pitfalls using technology** Graph the function $f(x) = \frac{\sin x}{x}$ using a graphing window of $[-\pi, \pi] \times [0, 2]$.

- Sketch a copy of the graph obtained with your graphing device and describe any inaccuracies appearing in the graph.
- Sketch an accurate graph of the function. Is f continuous at 0?
- What is the value of $\lim_{x \rightarrow 0} \frac{\sin x}{x}$?

81. Sketching functions

- Sketch the graph of a function that is not continuous at 1, but is defined at 1.
- Sketch the graph of a function that is not continuous at 1, but has a limit at 1.

- 82. An unknown constant** Determine the value of the constant a for which the function

$$f(x) = \begin{cases} \frac{x^2 + 3x + 2}{x + 1} & \text{if } x \neq -1 \\ a & \text{if } x = -1 \end{cases}$$

is continuous at -1 .

83. An unknown constant

$$g(x) = \begin{cases} x^2 + x & \text{if } x < 1 \\ a & \text{if } x = 1 \\ 3x + 5 & \text{if } x > 1. \end{cases}$$

- Determine the value of a for which g is continuous from the left at 1.
- Determine the value of a for which g is continuous from the right at 1.
- Is there a value of a for which g is continuous at 1? Explain.

- 84–85. Applying the Intermediate Value Theorem** Use the Intermediate Value Theorem to verify that the following equations have three solutions on the given interval. Use a graphing utility to find the approximate roots.

84. $x^3 + 10x^2 - 100x + 50 = 0$; $(-20, 10)$

85. $70x^3 - 87x^2 + 32x - 3 = 0$; $(0, 1)$

86. Walk in the park Suppose you park your car at a trailhead in a national park and begin a 2-hr hike to a lake at 7 A.M. on a Friday morning. On Sunday morning, you leave the lake at 7 A.M. and start the 2-hr hike back to your car. Assume the lake is 3 mi from your car. Let $f(t)$ be your distance from the car t hours after 7 A.M. on Friday morning, and let $g(t)$ be your distance from the car t hours after 7 A.M. on Sunday morning.

- Evaluate $f(0)$, $f(2)$, $g(0)$, and $g(2)$.
- Let $h(t) = f(t) - g(t)$. Find $h(0)$ and $h(2)$.
- Show that there is some point along the trail that you will pass at exactly the same time on both days.

87. The monk and the mountain A monk set out from a monastery in the valley at dawn. He walked all day up a winding path, stopping for lunch and taking a nap along the way. At dusk, he arrived at a temple on the mountaintop. The next day the monk made the return walk to the valley, leaving the temple at dawn, walking the same path for the entire day, and arriving at the monastery in the evening. Must there be one point along the path that the monk occupied at the same time of day on both the ascent and the descent? Explain. (*Hint*: The question can be answered without the Intermediate Value Theorem.) (*Source*: Arthur Koestler, *The Act of Creation*)

88. Does continuity of $|f|$ imply continuity of f ? Let

$$g(x) = \begin{cases} 1 & \text{if } x \geq 0 \\ -1 & \text{if } x < 0. \end{cases}$$

- Write a formula for $|g(x)|$.
- Is g continuous at $x = 0$? Explain.
- Is $|g|$ continuous at $x = 0$? Explain.
- For any function f , if $|f|$ is continuous at a , does it necessarily follow that f is continuous at a ? Explain.

89–95. Classifying discontinuities The discontinuities in graphs (a) and (b) are **removable discontinuities** because they disappear if we define or redefine f at a such that $f(a) = \lim_{x \rightarrow a} f(x)$. The function in graph (c) has a **jump discontinuity** because left and right limits exist at a but are unequal. The discontinuity in graph (d) is an **infinite discontinuity** because the function has a vertical asymptote at a .

89. Is the discontinuity at a in graph (c) removable? Explain.

90. Is the discontinuity at a in graph (d) removable? Explain.

91–94. Classify the discontinuities in the following functions at the given points.

91. $f(x) = \frac{x^2 - 7x + 10}{x - 2}$; $x = 2$

92. $g(x) = \begin{cases} \frac{x^2 - 1}{1 - x} & \text{if } x \neq 1 \\ 3 & \text{if } x = 1 \end{cases}$; $x = 1$

93. $h(x) = \frac{x^3 - 4x^2 + 4x}{x(x - 1)}$; $x = 0$ and $x = 1$

94. $f(x) = \frac{|x - 2|}{x - 2}$; $x = 2$

95. Do removable discontinuities exist?

- Does the function $f(x) = x \sin(1/x)$ have a removable discontinuity at $x = 0$? Explain.
- Does the function $g(x) = \sin(1/x)$ have a removable discontinuity at $x = 0$? Explain.

96. Continuity of composite functions Prove Theorem 2.10: If g is continuous at a and f is continuous at $g(a)$, then the composition $f \circ g$ is continuous at a . (*Hint*: Write the definition of continuity for f and g separately; then combine them to form the definition of continuity for $f \circ g$.)

97. Continuity of compositions

- Find functions f and g such that each function is continuous at 0 but $f \circ g$ is not continuous at 0.
- Explain why examples satisfying part (a) do not contradict Theorem 2.10.

98. Violation of the Intermediate Value Theorem? Let

$f(x) = \frac{|x|}{x}$. Then $f(-2) = -1$ and $f(2) = 1$. Therefore, $f(-2) < 0 < f(2)$, but there is no value of c between -2 and 2 for which $f(c) = 0$. Does this fact violate the Intermediate Value Theorem? Explain.

99. Continuity of $\sin x$ and $\cos x$

- Use the identity $\sin(a + h) = \sin a \cos h + \cos a \sin h$ with the fact that $\lim_{x \rightarrow 0} \sin x = 0$ to prove that $\lim_{x \rightarrow a} \sin x = \sin a$, thereby establishing that $\sin x$ is continuous for all x . (*Hint*: Let $h = x - a$ so that $x = a + h$ and note that $h \rightarrow 0$ as $x \rightarrow a$.)
- Use the identity $\cos(a + h) = \cos a \cos h - \sin a \sin h$ with the fact that $\lim_{x \rightarrow 0} \cos x = 1$ to prove that $\lim_{x \rightarrow a} \cos x = \cos a$.

QUICK CHECK ANSWERS

- $t = 15, 30, 45$
- Fill in the endpoints.
- $[0, \infty)$; $(-\infty, \infty)$
- The equation has a solution on the interval $[-1, 1]$ because f is continuous on $[-1, 1]$ and $f(-1) < 0 < f(1)$. ◀

2.7 Precise Definitions of Limits

The limit definitions already encountered in this chapter are adequate for most elementary limits. However, some of the terminology used, such as *sufficiently close* and *arbitrarily large*, needs clarification. The goal of this section is to give limits a solid mathematical foundation by transforming the previous limit definitions into precise mathematical statements.

- The phrase *for all x near a* means for all x in an open interval containing a .
- The Greek letters δ (delta) and ε (epsilon) represent small positive numbers in the discussion of limits.
- The two conditions $|x - a| < \delta$ and $x \neq a$ are written concisely as $0 < |x - a| < \delta$.

Figure 2.54

- The founders of calculus, Isaac Newton (1642–1727) and Gottfried Leibniz (1646–1716), developed the core ideas of calculus without using a precise definition of a limit. It was not until the 19th century that a rigorous definition was introduced by Augustin-Louis Cauchy (1789–1857) and later refined by Karl Weierstrass (1815–1897).

Moving Toward a Precise Definition

Assume the function f is defined for all x near a , except possibly at a . Recall that $\lim_{x \rightarrow a} f(x) = L$ means that $f(x)$ is arbitrarily close to L for all x sufficiently close (but not equal) to a . This limit definition is made precise by observing that the distance between $f(x)$ and L is $|f(x) - L|$ and that the distance between x and a is $|x - a|$. Therefore, we write $\lim_{x \rightarrow a} f(x) = L$ if we can make $|f(x) - L|$ arbitrarily small for any x , distinct from a , with $|x - a|$ sufficiently small. For instance, if we want $|f(x) - L|$ to be less than 0.1, then we must find a number $\delta > 0$ such that

$$|f(x) - L| < 0.1 \quad \text{whenever} \quad |x - a| < \delta \quad \text{and} \quad x \neq a.$$

If, instead, we want $|f(x) - L|$ to be less than 0.001, then we must find *another* number $\delta > 0$ such that

$$|f(x) - L| < 0.001 \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

For the limit to exist, it must be true that for *any* $\varepsilon > 0$, we can always find a $\delta > 0$ such that

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

EXAMPLE 1 **Determining values of δ from a graph** Figure 2.54 shows the graph of a linear function f with $\lim_{x \rightarrow 3} f(x) = 5$. For each value of $\varepsilon > 0$, determine a value of $\delta > 0$ satisfying the statement

$$|f(x) - 5| < \varepsilon \quad \text{whenever} \quad 0 < |x - 3| < \delta.$$

- a. $\varepsilon = 1$ b. $\varepsilon = \frac{1}{2}$

SOLUTION

- a. With $\varepsilon = 1$, we want $f(x)$ to be less than 1 unit from 5, which means $f(x)$ is between 4 and 6. To determine a corresponding value of δ , draw the horizontal lines $y = 4$ and $y = 6$ (Figure 2.55a). Then sketch vertical lines passing through the points where the horizontal lines and the graph of f intersect (Figure 2.55b). We see that the vertical

Figure 2.55

- Once an acceptable value of δ is found satisfying the statement

$$|f(x) - L| < \varepsilon \quad \text{whenever} \\ 0 < |x - a| < \delta,$$

any smaller positive value of δ also works.

lines intersect the x -axis at $x = 1$ and $x = 5$. Note that $f(x)$ is less than 1 unit from 5 on the y -axis if x is within 2 units of 3 on the x -axis. So for $\varepsilon = 1$, we let $\delta = 2$ or any smaller positive value.

- b. With $\varepsilon = \frac{1}{2}$, we want $f(x)$ to lie within a half-unit of 5, or equivalently, $f(x)$ must lie between 4.5 and 5.5. Proceeding as in part (a), we see that $f(x)$ is within a half-unit of 5 on the y -axis (Figure 2.56a) if x is less than 1 unit from 3 (Figure 2.56b). So for $\varepsilon = \frac{1}{2}$, we let $\delta = 1$ or any smaller positive number.

Figure 2.57

QUICK CHECK 1 In Example 1, find a positive number δ satisfying the statement

$$|f(x) - 5| < \frac{1}{100} \quad \text{whenever} \quad 0 < |x - 3| < \delta. \quad \blacktriangleleft$$

The idea of a limit, as illustrated in Example 1, may be described in terms of a contest between two people named Epp and Del. First, Epp picks a particular number $\varepsilon > 0$; then he challenges Del to find a corresponding value of $\delta > 0$ such that

$$|f(x) - 5| < \varepsilon \quad \text{whenever} \quad 0 < |x - 3| < \delta. \quad (1)$$

To illustrate, suppose Epp chooses $\varepsilon = 1$. From Example 1, we know that Del will satisfy (1) by choosing $0 < \delta \leq 2$. If Epp chooses $\varepsilon = \frac{1}{2}$, then (by Example 1) Del responds by letting $0 < \delta \leq 1$. If Epp lets $\varepsilon = \frac{1}{8}$, then Del chooses $0 < \delta \leq \frac{1}{4}$ (Figure 2.57). In fact, there is a pattern: For *any* $\varepsilon > 0$ that Epp chooses, no matter how small, Del will satisfy (1) by choosing a positive value of δ satisfying $0 < \delta \leq 2\varepsilon$. Del has discovered a mathematical relationship: If $0 < \delta \leq 2\varepsilon$ and $0 < |x - 3| < \delta$, then $|f(x) - 5| < \varepsilon$, for *any* $\varepsilon > 0$. This conversation illustrates the general procedure for proving that $\lim_{x \rightarrow a} f(x) = L$.

A Precise Definition

Example 1 dealt with a linear function, but it points the way to a precise definition of a limit for any function. As shown in Figure 2.58, $\lim_{x \rightarrow a} f(x) = L$ means that for *any* positive number ε , there is another positive number δ such that

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

In all limit proofs, the goal is to find a relationship between ε and δ that gives an admissible value of δ , in terms of ε only. This relationship must work for any positive value of ε .

Figure 2.58

DEFINITION Limit of a Function

Assume $f(x)$ is defined for all x in some open interval containing a , except possibly at a . We say **the limit of $f(x)$ as x approaches a is L** , written

$$\lim_{x \rightarrow a} f(x) = L,$$

if for *any* number $\epsilon > 0$ there is a corresponding number $\delta > 0$ such that

$$|f(x) - L| < \epsilon \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

EXAMPLE 2 Finding δ for a given ϵ using a graphing utility Let $f(x) = x^3 - 6x^2 + 12x - 5$ and demonstrate that $\lim_{x \rightarrow 2} f(x) = 3$ as follows. For the given values of ϵ , use a graphing utility to find a value of $\delta > 0$ such that

$$|f(x) - 3| < \epsilon \quad \text{whenever} \quad 0 < |x - 2| < \delta.$$

- The value of δ in the precise definition of a limit depends only on ϵ .

a. $\epsilon = 1$ b. $\epsilon = \frac{1}{2}$

- Definitions of the one-sided limits $\lim_{x \rightarrow a^+} f(x) = L$ and $\lim_{x \rightarrow a^-} f(x) = L$ are discussed in Exercises 51–55.

SOLUTION

- a. The condition $|f(x) - 3| < \epsilon = 1$ implies that $f(x)$ lies between 2 and 4. Using a graphing utility, we graph f and the lines $y = 2$ and $y = 4$ (Figure 2.59). These lines intersect the graph of f at $x = 1$ and at $x = 3$. We now sketch the vertical lines $x = 1$ and $x = 3$ and observe that $f(x)$ is within 1 unit of 3 whenever x is within 1 unit of 2 on the x -axis (Figure 2.59). Therefore, with $\epsilon = 1$, we can choose any δ with $0 < \delta \leq 1$.

Figure 2.59

- b. The condition $|f(x) - 3| < \varepsilon = \frac{1}{2}$ implies that $f(x)$ lies between 2.5 and 3.5 on the y -axis. We now find that the lines $y = 2.5$ and $y = 3.5$ intersect the graph of f at $x \approx 1.21$ and $x \approx 2.79$ (Figure 2.60). Observe that if x is less than 0.79 unit from 2 on the x -axis, then $f(x)$ is less than a half-unit from 3 on the y -axis. Therefore, with $\varepsilon = \frac{1}{2}$ we can choose any δ with $0 < \delta \leq 0.79$.

Figure 2.60

This procedure could be repeated for smaller and smaller values of $\varepsilon > 0$. For each value of ε , there exists a corresponding value of δ , proving that the limit exists.

Related Exercise 13 ◀

QUICK CHECK 2 For the function f given in Example 2, estimate a value of $\delta > 0$ satisfying $|f(x) - 3| < 0.25$ whenever $0 < |x - 2| < \delta$. ◀

The inequality $0 < |x - a| < \delta$ means that x lies between $a - \delta$ and $a + \delta$ with $x \neq a$. We say that the interval $(a - \delta, a + \delta)$ is **symmetric about a** because a is the midpoint of the interval. Symmetric intervals are convenient, but Example 3 demonstrates that we don't always get symmetric intervals without a bit of extra work.

Figure 2.61

EXAMPLE 3 Finding a symmetric interval Figure 2.61 shows the graph of g with $\lim_{x \rightarrow 2} g(x) = 3$. For each value of ε , find the corresponding values of $\delta > 0$ that satisfy the condition

$$|g(x) - 3| < \varepsilon \quad \text{whenever} \quad 0 < |x - 2| < \delta.$$

- $\varepsilon = 2$
- $\varepsilon = 1$
- For any given value of ε , make a conjecture about the corresponding values of δ that satisfy the limit condition.

SOLUTION

- With $\varepsilon = 2$, we need a value of $\delta > 0$ such that $g(x)$ is within 2 units of 3, which means $g(x)$ is between 1 and 5, whenever x is less than δ units from 2. The horizontal lines $y = 1$ and $y = 5$ intersect the graph of g at $x = 1$ and $x = 6$. Therefore, $|g(x) - 3| < 2$ if x lies in the interval $(1, 6)$ with $x \neq 2$ (Figure 2.62a). However, we want x to lie in an interval that is *symmetric* about 2. We can guarantee that $|g(x) - 3| < 2$ in an interval symmetric about 2 only if x is less than 1 unit away from 2, on either side of 2 (Figure 2.62b). Therefore, with $\varepsilon = 2$, we take $\delta = 1$ or any smaller positive number.

Figure 2.62

- b. With $\varepsilon = 1$, $g(x)$ must lie between 2 and 4 (Figure 2.63a). This implies that x must be within a half-unit to the left of 2 and within 2 units to the right of 2. Therefore, $|g(x) - 3| < 1$ provided x lies in the interval $(1.5, 4)$. To obtain a symmetric interval about 2, we take $\delta = \frac{1}{2}$ or any smaller positive number. Then we are still guaranteed that $|g(x) - 3| < 1$ when $0 < |x - 2| < \frac{1}{2}$ (Figure 2.63b).

Figure 2.63

- c. From parts (a) and (b), it appears that if we choose $\delta \leq \varepsilon/2$, the limit condition is satisfied for any $\varepsilon > 0$.

Related Exercises 15–16 ◀

In Examples 2 and 3, we showed that a limit exists by discovering a relationship between ε and δ that satisfies the limit condition. We now generalize this procedure.

Limit Proofs

We use the following two-step process to prove that $\lim_{x \rightarrow a} f(x) = L$.

► The first step of the limit-proving process is the preliminary work of finding a candidate for δ . The second step verifies that the δ found in the first step actually works.

Steps for proving that $\lim_{x \rightarrow a} f(x) = L$

- 1. Find δ .** Let ε be an arbitrary positive number. Use the inequality $|f(x) - L| < \varepsilon$ to find a condition of the form $|x - a| < \delta$, where δ depends only on the value of ε .
- 2. Write a proof.** For any $\varepsilon > 0$, assume $0 < |x - a| < \delta$ and use the relationship between ε and δ found in Step 1 to prove that $|f(x) - L| < \varepsilon$.

EXAMPLE 4 Limit of a linear function Prove that $\lim_{x \rightarrow 4} (4x - 15) = 1$ using the precise definition of a limit.

SOLUTION

Step 1: Find δ . In this case, $a = 4$ and $L = 1$. Assuming $\varepsilon > 0$ is given, we use $|(4x - 15) - 1| < \varepsilon$ to find an inequality of the form $|x - 4| < \delta$. If $|(4x - 15) - 1| < \varepsilon$, then

$$\begin{aligned} |4x - 16| &< \varepsilon \\ 4|x - 4| &< \varepsilon && \text{Factor } 4x - 16. \\ |x - 4| &< \frac{\varepsilon}{4}. && \text{Divide by 4 and identify } \delta = \varepsilon/4. \end{aligned}$$

We have shown that $|(4x - 15) - 1| < \varepsilon$ implies that $|x - 4| < \varepsilon/4$. Therefore, a plausible relationship between δ and ε is $\delta = \varepsilon/4$. We now write the actual proof.

Step 2: Write a proof. Let $\varepsilon > 0$ be given and assume $0 < |x - 4| < \delta$, where $\delta = \varepsilon/4$. The aim is to show that $|(4x - 15) - 1| < \varepsilon$ for all x such that $0 < |x - 4| < \delta$. We simplify $|(4x - 15) - 1|$ and isolate the $|x - 4|$ term:

$$\begin{aligned} |(4x - 15) - 1| &= |4x - 16| \\ &= 4 \underbrace{|x - 4|}_{\text{less than } \delta = \varepsilon/4} \\ &< 4\left(\frac{\varepsilon}{4}\right) = \varepsilon. \end{aligned}$$

We have shown that for any $\varepsilon > 0$,

$$|f(x) - L| = |(4x - 15) - 1| < \varepsilon \quad \text{whenever} \quad 0 < |x - 4| < \delta,$$

provided $0 < \delta \leq \varepsilon/4$. Therefore, $\lim_{x \rightarrow 4} (4x - 15) = 1$.

Related Exercises 19–20 ◀

EXAMPLE 5 Limit of a quadratic function Prove that $\lim_{x \rightarrow 5} x^2 = 25$ using the precise definition of a limit.

SOLUTION

Step 1: Find δ . Given $\varepsilon > 0$, our task is to find an expression for $\delta > 0$ that depends only on ε , such that $|x^2 - 25| < \varepsilon$ whenever $0 < |x - 5| < \delta$. We begin by factoring $|x^2 - 25|$:

$$\begin{aligned} |x^2 - 25| &= |(x + 5)(x - 5)| && \text{Factor.} \\ &= |x + 5||x - 5|. && |ab| = |a||b| \end{aligned}$$

Because the value of $\delta > 0$ in the inequality $0 < |x - 5| < \delta$ typically represents a small positive number, let's assume $\delta \leq 1$ so that $|x - 5| < 1$, which implies that $-1 < x - 5 < 1$ or $4 < x < 6$. It follows that x is positive, $|x + 5| < 11$, and

$$|x^2 - 25| = |x + 5||x - 5| < 11|x - 5|.$$

- The minimum value of a and b is denoted $\min \{a, b\}$. If $x = \min \{a, b\}$, then x is the smaller of a and b . If $a = b$, then x equals the common value of a and b . In either case, $x \leq a$ and $x \leq b$.

Using this inequality, we have $|x^2 - 25| < \varepsilon$, provided $11|x - 5| < \varepsilon$ or $|x - 5| < \varepsilon/11$. Note that two restrictions have been placed on $|x - 5|$:

$$|x - 5| < 1 \quad \text{and} \quad |x - 5| < \frac{\varepsilon}{11}.$$

To ensure that both these inequalities are satisfied, let $\delta = \min \{1, \varepsilon/11\}$ so that δ equals the smaller of 1 and $\varepsilon/11$.

Step 2: Write a proof. Let $\varepsilon > 0$ be given and assume $0 < |x - 5| < \delta$, where $\delta = \min \{1, \varepsilon/11\}$. By factoring $x^2 - 25$, we have

$$|x^2 - 25| = |x + 5||x - 5|.$$

Because $0 < |x - 5| < \delta$ and $\delta \leq \varepsilon/11$, we have $|x - 5| < \varepsilon/11$. It is also the case that $|x - 5| < 1$ because $\delta \leq 1$, which implies that $-1 < x - 5 < 1$ or $4 < x < 6$. Therefore, $|x + 5| < 11$ and

$$|x^2 - 25| = |x + 5||x - 5| < 11\left(\frac{\varepsilon}{11}\right) = \varepsilon.$$

We have shown that for any $\varepsilon > 0$, $|x^2 - 25| < \varepsilon$ whenever $0 < |x - 5| < \delta$, provided $0 < \delta = \min \{1, \varepsilon/11\}$. Therefore, $\lim_{x \rightarrow 5} x^2 = 25$.

Related Exercises 27, 29 ◀

Justifying Limit Laws

The precise definition of a limit is used to prove the limit laws in Theorem 2.3. Essential in several of these proofs is the **triangle inequality**, which states that

$$|x + y| \leq |x| + |y|, \quad \text{for all real numbers } x \text{ and } y.$$

EXAMPLE 6 Proof of Limit Law 1 Prove that if $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ exist, then

$$\lim_{x \rightarrow a} (f(x) + g(x)) = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x).$$

- Because $\lim_{x \rightarrow a} f(x)$ exists, if there exists a $\delta > 0$ for any given $\varepsilon > 0$, then there also exists a $\delta > 0$ for any given $\frac{\varepsilon}{2}$.

SOLUTION Assume $\varepsilon > 0$ is given. Let $\lim_{x \rightarrow a} f(x) = L$, which implies there exists a $\delta_1 > 0$ such that

$$|f(x) - L| < \frac{\varepsilon}{2} \quad \text{whenever} \quad 0 < |x - a| < \delta_1.$$

Similarly, let $\lim_{x \rightarrow a} g(x) = M$, which implies there exists a $\delta_2 > 0$ such that

$$|g(x) - M| < \frac{\varepsilon}{2} \quad \text{whenever} \quad 0 < |x - a| < \delta_2.$$

Let $\delta = \min \{\delta_1, \delta_2\}$ and suppose $0 < |x - a| < \delta$. Because $\delta \leq \delta_1$, it follows that $0 < |x - a| < \delta_1$ and $|f(x) - L| < \varepsilon/2$. Similarly, because $\delta \leq \delta_2$, it follows that $0 < |x - a| < \delta_2$ and $|g(x) - M| < \varepsilon/2$. Therefore,

$$\begin{aligned} |(f(x) + g(x)) - (L + M)| &= |(f(x) - L) + (g(x) - M)| && \text{Rearrange terms.} \\ &\leq |f(x) - L| + |g(x) - M| && \text{Triangle inequality} \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon. \end{aligned}$$

We have shown that given any $\varepsilon > 0$, if $0 < |x - a| < \delta$, then $|(f(x) + g(x)) - (L + M)| < \varepsilon$, which implies that $\lim_{x \rightarrow a} (f(x) + g(x)) = L + M = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x)$.

Related Exercises 43–44 ◀

Infinite Limits

In Section 2.4, we stated that $\lim_{x \rightarrow a} f(x) = \infty$ if $f(x)$ grows *arbitrarily large* as x approaches a . More precisely, this means that for any positive number N (no matter how large), $f(x)$ is larger than N if x is sufficiently close to a but not equal to a .

- Proofs of other limit laws are outlined in Exercises 43–44.

- Notice that for infinite limits, N plays the role that ε plays for regular limits. It sets a tolerance or bound for the function values $f(x)$.

- Precise definitions for $\lim_{x \rightarrow a} f(x) = -\infty$,
 $\lim_{x \rightarrow a^+} f(x) = -\infty$, $\lim_{x \rightarrow a^+} f(x) = \infty$,
 $\lim_{x \rightarrow a^-} f(x) = -\infty$, and $\lim_{x \rightarrow a^-} f(x) = \infty$
 are given in Exercises 57–63.

DEFINITION Two-Sided Infinite Limit

The **infinite limit** $\lim_{x \rightarrow a} f(x) = \infty$ means that for any positive number N , there exists a corresponding $\delta > 0$ such that

$$f(x) > N \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

As shown in Figure 2.64, to prove that $\lim_{x \rightarrow a} f(x) = \infty$, we let N represent *any* positive number. Then we find a value of $\delta > 0$, depending only on N , such that

$$f(x) > N \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

This process is similar to the two-step process for finite limits.

Figure 2.64

Steps for proving that $\lim_{x \rightarrow a} f(x) = \infty$

- Find δ .** Let N be an arbitrary positive number. Use the statement $f(x) > N$ to find an inequality of the form $|x - a| < \delta$, where δ depends only on N .
- Write a proof.** For any $N > 0$, assume $0 < |x - a| < \delta$ and use the relationship between N and δ found in Step 1 to prove that $f(x) > N$.

EXAMPLE 7 An Infinite Limit Proof Let $f(x) = \frac{1}{(x-2)^2}$. Prove that $\lim_{x \rightarrow 2} f(x) = \infty$.

SOLUTION

Step 1: Find $\delta > 0$. Assuming $N > 0$, we use the inequality $\frac{1}{(x-2)^2} > N$ to find δ , where δ depends only on N . Taking reciprocals of this inequality, it follows that

$$(x-2)^2 < \frac{1}{N}$$

$$|x-2| < \frac{1}{\sqrt{N}}. \quad \text{Take the square root of both sides.}$$

- Recall that $\sqrt{x^2} = |x|$.

The inequality $|x-2| < \frac{1}{\sqrt{N}}$ has the form $|x-2| < \delta$ if we let $\delta = \frac{1}{\sqrt{N}}$. We now write a proof based on this relationship between δ and N .

Step 2: Write a proof. Suppose $N > 0$ is given. Let $\delta = \frac{1}{\sqrt{N}}$ and assume $0 < |x - 2| < \delta = \frac{1}{\sqrt{N}}$. Squaring both sides of the inequality

$$|x - 2| < \frac{1}{\sqrt{N}} \text{ and taking reciprocals, we have}$$

$$(x - 2)^2 < \frac{1}{N} \quad \text{Square both sides.}$$

$$\frac{1}{(x - 2)^2} > N. \quad \text{Take reciprocals of both sides.}$$

QUICK CHECK 3 In Example 7, if N is increased by a factor of 100, how must δ change? ◀

We see that for any positive N , if $0 < |x - 2| < \delta = \frac{1}{\sqrt{N}}$, then $f(x) = \frac{1}{(x - 2)^2} > N$. It follows that $\lim_{x \rightarrow 2} \frac{1}{(x - 2)^2} = \infty$. Note that because $\delta = \frac{1}{\sqrt{N}}$, δ decreases as N increases.

Related Exercises 45–46 ◀

Limits at Infinity

Precise definitions can also be written for the limits at infinity $\lim_{x \rightarrow \infty} f(x) = L$ and $\lim_{x \rightarrow -\infty} f(x) = L$. For discussion and examples, see Exercises 64–65.

SECTION 2.7 EXERCISES

Getting Started

- Suppose x lies in the interval $(1, 3)$ with $x \neq 2$. Find the smallest positive value of δ such that the inequality $0 < |x - 2| < \delta$ is true.
- Suppose $f(x)$ lies in the interval $(2, 6)$. What is the smallest value of ε such that $|f(x) - 4| < \varepsilon$?
- Which one of the following intervals is not symmetric about $x = 5$?
a. $(1, 9)$ b. $(4, 6)$ c. $(3, 8)$ d. $(4.5, 5.5)$
- Suppose a is a constant and δ is a positive constant. Give a geometric description of the sets $\{x: |x - a| < \delta\}$ and $\{x: 0 < |x - a| < \delta\}$.
- State the precise definition of $\lim_{x \rightarrow a} f(x) = L$.
- Interpret $|f(x) - L| < \varepsilon$ in words.
- Suppose $|f(x) - 5| < 0.1$ whenever $0 < x < 5$. Find all values of $\delta > 0$ such that $|f(x) - 5| < 0.1$ whenever $0 < |x - 2| < \delta$.
- Give the definition of $\lim_{x \rightarrow a} f(x) = \infty$ and interpret it using pictures.
- Determining values of δ from a graph** The function f in the figure satisfies $\lim_{x \rightarrow 2} f(x) = 5$. Determine the largest value of $\delta > 0$ satisfying each statement.
a. If $0 < |x - 2| < \delta$, then $|f(x) - 5| < 2$.
b. If $0 < |x - 2| < \delta$, then $|f(x) - 5| < 1$.

- 10. Determining values of δ from a graph** The function f in the figure satisfies $\lim_{x \rightarrow 2} f(x) = 4$. Determine the largest value of $\delta > 0$ satisfying each statement.

- If $0 < |x - 2| < \delta$, then $|f(x) - 4| < 1$.
- If $0 < |x - 2| < \delta$, then $|f(x) - 4| < 1/2$.

Practice Exercises

- 11. Determining values of δ from a graph** The function f in the figure satisfies $\lim_{x \rightarrow 3} f(x) = 6$. Determine the largest value of $\delta > 0$ satisfying each statement.

- a. If $0 < |x - 3| < \delta$, then $|f(x) - 6| < 3$.
 b. If $0 < |x - 3| < \delta$, then $|f(x) - 6| < 1$.

- 12. Determining values of δ from a graph** The function f in the figure satisfies $\lim_{x \rightarrow 4} f(x) = 5$. Determine the largest value of $\delta > 0$ satisfying each statement.

- a. If $0 < |x - 4| < \delta$, then $|f(x) - 5| < 1$.
 b. If $0 < |x - 4| < \delta$, then $|f(x) - 5| < 0.5$.

- T 13. Finding δ for a given ε using a graph** Let $f(x) = x^3 + 3$ and note that $\lim_{x \rightarrow 0} f(x) = 3$. For each value of ε , use a graphing utility to find all values of $\delta > 0$ such that $|f(x) - 3| < \varepsilon$ whenever $0 < |x - 0| < \delta$. Sketch graphs illustrating your work.

- a. $\varepsilon = 1$ b. $\varepsilon = 0.5$

- T 14. Finding δ for a given ε using a graph** Let $g(x) = 2x^3 - 12x^2 + 26x + 4$ and note that $\lim_{x \rightarrow 2} g(x) = 24$. For each value of ε , use a graphing utility to find all values of $\delta > 0$ such that $|g(x) - 24| < \varepsilon$ whenever $0 < |x - 2| < \delta$. Sketch graphs illustrating your work.

- a. $\varepsilon = 1$ b. $\varepsilon = 0.5$

- 15. Finding a symmetric interval** The function f in the figure satisfies $\lim_{x \rightarrow 2} f(x) = 3$. For each value of ε , find all values of $\delta > 0$ such that

$$|f(x) - 3| < \varepsilon \quad \text{whenever} \quad 0 < |x - 2| < \delta. \quad (2)$$

- a. $\varepsilon = 1$

- b. $\varepsilon = \frac{1}{2}$

- c. For any $\varepsilon > 0$, make a conjecture about the corresponding values of δ satisfying (2).

- 16. Finding a symmetric interval** The function f in the figure satisfies $\lim_{x \rightarrow 4} f(x) = 5$. For each value of ε , find all values of $\delta > 0$ such that

$$|f(x) - 5| < \varepsilon \quad \text{whenever} \quad 0 < |x - 4| < \delta. \quad (3)$$

- a. $\varepsilon = 2$

- b. $\varepsilon = 1$

- c. For any $\varepsilon > 0$, make a conjecture about the corresponding values of δ satisfying (3).

- T 17. Finding a symmetric interval** Let $f(x) = \frac{2x^2 - 2}{x - 1}$ and note that $\lim_{x \rightarrow 1} f(x) = 4$. For each value of ε , use a graphing utility to find all values of $\delta > 0$ such that $|f(x) - 4| < \varepsilon$ whenever $0 < |x - 1| < \delta$.

- a. $\varepsilon = 2$

- b. $\varepsilon = 1$

- c. For any $\varepsilon > 0$, make a conjecture about the value of δ that satisfies the preceding inequality.

- T 18. Finding a symmetric interval** Let $f(x) = \begin{cases} \frac{1}{3}x + 1 & \text{if } x \leq 3 \\ \frac{1}{2}x + \frac{1}{2} & \text{if } x > 3 \end{cases}$

and note that $\lim_{x \rightarrow 3} f(x) = 2$. For each value of ε , use a graphing utility to find all values of $\delta > 0$ such that $|f(x) - 2| < \varepsilon$ whenever $0 < |x - 3| < \delta$.

- a. $\varepsilon = \frac{1}{2}$

- b. $\varepsilon = \frac{1}{4}$

- c. For any $\varepsilon > 0$, make a conjecture about the value of δ that satisfies the preceding inequality.

- 19–42. Limit proofs** Use the precise definition of a limit to prove the following limits. Specify a relationship between ε and δ that guarantees the limit exists.

19. $\lim_{x \rightarrow 1} (8x + 5) = 13$

20. $\lim_{x \rightarrow 3} (-2x + 8) = 2$

21. $\lim_{x \rightarrow 4} \frac{x^2 - 16}{x - 4} = 8$ (Hint: Factor and simplify.)
22. $\lim_{x \rightarrow 3} \frac{x^2 - 7x + 12}{x - 3} = -1$
23. $\lim_{x \rightarrow 0} |x| = 0$ 24. $\lim_{x \rightarrow 0} |5x| = 0$
25. $\lim_{x \rightarrow 7} f(x) = 9$, where $f(x) = \begin{cases} 3x - 12 & \text{if } x \leq 7 \\ x + 2 & \text{if } x > 7 \end{cases}$
26. $\lim_{x \rightarrow 5} f(x) = 4$, where $f(x) = \begin{cases} 2x - 6 & \text{if } x \leq 5 \\ -4x + 24 & \text{if } x > 5 \end{cases}$
27. $\lim_{x \rightarrow 0} x^2 = 0$ (Hint: Use the identity $\sqrt{x^2} = |x|$.)
28. $\lim_{x \rightarrow 3} (x - 3)^2 = 0$ (Hint: Use the identity $\sqrt{x^2} = |x|$.)
29. $\lim_{x \rightarrow 2} (x^2 + 3x) = 10$ 30. $\lim_{x \rightarrow 4} (2x^2 - 4x + 1) = 17$
31. $\lim_{x \rightarrow 3} |2x| = 6$ (Hint: Use the inequality $||a| - |b|| \leq |a - b|$, which holds for all constants a and b (see Exercise 74).)
32. $\lim_{x \rightarrow 25} \sqrt{x} = 5$ (Hint: The factorization $x - 25 = (\sqrt{x} - 5)(\sqrt{x} + 5)$ implies that $\sqrt{x} - 5 = \frac{x - 25}{\sqrt{x} + 5}$.)
33. $\lim_{x \rightarrow 3} \frac{1}{x} = \frac{1}{3}$ (Hint: As $x \rightarrow 3$, eventually the distance between x and 3 is less than 1. Start by assuming $|x - 3| < 1$ and show $\frac{1}{|x|} < \frac{1}{2}$.)
34. $\lim_{x \rightarrow 4} \frac{x - 4}{\sqrt{x} - 2} = 4$ (Hint: Multiply the numerator and denominator by $\sqrt{x} + 2$.)
35. $\lim_{x \rightarrow 1/10} \frac{1}{x} = 10$ (Hint: To find δ , you need to bound x away from 0. So let $\left|x - \frac{1}{10}\right| < \frac{1}{20}$.)
36. $\lim_{x \rightarrow 0} x \sin \frac{1}{x} = 0$
37. $\lim_{x \rightarrow 0} (x^2 + x^4) = 0$ (Hint: You may use the fact that if $|x| < c$, then $x^2 < c^2$.)
38. $\lim_{x \rightarrow a} b = b$, for any constants a and b
39. $\lim_{x \rightarrow a} (mx + b) = ma + b$, for any constants a , b , and m
40. $\lim_{x \rightarrow 3} x^3 = 27$ 41. $\lim_{x \rightarrow 1} x^4 = 1$
42. $\lim_{x \rightarrow 5} \frac{1}{x^2} = \frac{1}{25}$
43. **Proof of Limit Law 2** Suppose $\lim_{x \rightarrow a} f(x) = L$ and $\lim_{x \rightarrow a} g(x) = M$. Prove that $\lim_{x \rightarrow a} (f(x) - g(x)) = L - M$.
44. **Proof of Limit Law 3** Suppose $\lim_{x \rightarrow a} f(x) = L$. Prove that $\lim_{x \rightarrow a} (cf(x)) = cL$, where c is a constant.

45–48. Limit proofs for infinite limits Use the precise definition of infinite limits to prove the following limits.

45. $\lim_{x \rightarrow 4} \frac{1}{(x - 4)^2} = \infty$ 46. $\lim_{x \rightarrow -1} \frac{1}{(x + 1)^4} = \infty$
47. $\lim_{x \rightarrow 0} \left(\frac{1}{x^2} + 1\right) = \infty$ 48. $\lim_{x \rightarrow 0} \left(\frac{1}{x^4} - \sin x\right) = \infty$
49. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample. Assume a and L are finite numbers and assume $\lim_{x \rightarrow a} f(x) = L$.
- For a given $\varepsilon > 0$, there is one value of $\delta > 0$ for which $|f(x) - L| < \varepsilon$ whenever $0 < |x - a| < \delta$.
 - The limit $\lim_{x \rightarrow a} f(x) = L$ means that given an arbitrary $\delta > 0$, we can always find an $\varepsilon > 0$ such that $|f(x) - L| < \varepsilon$ whenever $0 < |x - a| < \delta$.
 - The limit $\lim_{x \rightarrow a} f(x) = L$ means that for any arbitrary $\varepsilon > 0$, we can always find a $\delta > 0$ such that $|f(x) - L| < \varepsilon$ whenever $0 < |x - a| < \delta$.
 - If $|x - a| < \delta$, then $a - \delta < x < a + \delta$.

50. **Finding δ algebraically** Let $f(x) = x^2 - 2x + 3$.

- a. For $\varepsilon = 0.25$, find the largest value of $\delta > 0$ satisfying the statement

$$|f(x) - 2| < \varepsilon \quad \text{whenever} \quad 0 < |x - 1| < \delta.$$

- b. Verify that $\lim_{x \rightarrow 1} f(x) = 2$ as follows. For any $\varepsilon > 0$, find the largest value of $\delta > 0$ satisfying the statement

$$|f(x) - 2| < \varepsilon \quad \text{whenever} \quad 0 < |x - 1| < \delta.$$

51–55. Precise definitions for left- and right-sided limits Use the following definitions.

Assume f exists for all x near a with $x > a$. We say that **the limit of $f(x)$ as x approaches a from the right of a is L** and write $\lim_{x \rightarrow a^+} f(x) = L$, if for any $\varepsilon > 0$ there exists $\delta > 0$ such that

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad 0 < x - a < \delta.$$

Assume f exists for all x near a with $x < a$. We say that **the limit of $f(x)$ as x approaches a from the left of a is L** and write $\lim_{x \rightarrow a^-} f(x) = L$, if for any $\varepsilon > 0$ there exists $\delta > 0$ such that

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad 0 < a - x < \delta.$$

51. **Comparing definitions** Why is the last inequality in the definition of $\lim_{x \rightarrow a} f(x) = L$, namely, $0 < |x - a| < \delta$, replaced with $0 < x - a < \delta$ in the definition of $\lim_{x \rightarrow a^+} f(x) = L$?
52. **Comparing definitions** Why is the last inequality in the definition of $\lim_{x \rightarrow a} f(x) = L$, namely, $0 < |x - a| < \delta$, replaced with $0 < a - x < \delta$ in the definition of $\lim_{x \rightarrow a^-} f(x) = L$?
53. **One-sided limit proofs** Prove the following limits for

$$f(x) = \begin{cases} 3x - 4 & \text{if } x < 0 \\ 2x - 4 & \text{if } x \geq 0 \end{cases}$$

- a. $\lim_{x \rightarrow 0^+} f(x) = -4$ b. $\lim_{x \rightarrow 0^-} f(x) = -4$ c. $\lim_{x \rightarrow 0} f(x) = -4$

- 54. Determining values of δ from a graph** The function f in the figure satisfies $\lim_{x \rightarrow 2^+} f(x) = 0$ and $\lim_{x \rightarrow 2^-} f(x) = 1$. Determine all values of $\delta > 0$ that satisfy each statement.

- $|f(x) - 0| < 2$ whenever $0 < x - 2 < \delta$
- $|f(x) - 0| < 1$ whenever $0 < x - 2 < \delta$
- $|f(x) - 1| < 2$ whenever $0 < 2 - x < \delta$
- $|f(x) - 1| < 1$ whenever $0 < 2 - x < \delta$

- 55. One-sided limit proof** Prove that $\lim_{x \rightarrow 0^+} \sqrt{x} = 0$.

Explorations and Challenges

- 56. The relationship between one-sided and two-sided limits** Prove the following statements to establish the fact that $\lim_{x \rightarrow a} f(x) = L$ if and only if $\lim_{x \rightarrow a^-} f(x) = L$ and $\lim_{x \rightarrow a^+} f(x) = L$.

- If $\lim_{x \rightarrow a^-} f(x) = L$ and $\lim_{x \rightarrow a^+} f(x) = L$, then $\lim_{x \rightarrow a} f(x) = L$.
- If $\lim_{x \rightarrow a} f(x) = L$, then $\lim_{x \rightarrow a^-} f(x) = L$ and $\lim_{x \rightarrow a^+} f(x) = L$.

- 57. Definition of one-sided infinite limits** We write $\lim_{x \rightarrow a^+} f(x) = -\infty$ if for any negative number N , there exists $\delta > 0$ such that

$$f(x) < N \quad \text{whenever} \quad 0 < x - a < \delta.$$

- Write an analogous formal definition for $\lim_{x \rightarrow a^+} f(x) = \infty$.
- Write an analogous formal definition for $\lim_{x \rightarrow a^-} f(x) = -\infty$.
- Write an analogous formal definition for $\lim_{x \rightarrow a^-} f(x) = \infty$.

- 58–59. One-sided infinite limits** Use the definitions given in Exercise 57 to prove the following infinite limits.

58. $\lim_{x \rightarrow 1^+} \frac{1}{1-x} = -\infty$ **59.** $\lim_{x \rightarrow 1^-} \frac{1}{1-x} = \infty$

- 60–61. Definition of an infinite limit** We write $\lim_{x \rightarrow a} f(x) = -\infty$ if for any negative number M , there exists $\delta > 0$ such that

$$f(x) < M \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

Use this definition to prove the following statements.

- $\lim_{x \rightarrow 1} \frac{-2}{(x-1)^2} = -\infty$
- $\lim_{x \rightarrow -2} \frac{-10}{(x+2)^4} = -\infty$
- Suppose $\lim_{x \rightarrow a} f(x) = \infty$. Prove that $\lim_{x \rightarrow a} (f(x) + c) = \infty$ for any constant c .
- Suppose $\lim_{x \rightarrow a} f(x) = \infty$ and $\lim_{x \rightarrow a} g(x) = \infty$. Prove that $\lim_{x \rightarrow a} (f(x) + g(x)) = \infty$.

- 64–65. Definition of a limit at infinity** The limit at infinity

$\lim_{x \rightarrow \infty} f(x) = L$ means that for any $\varepsilon > 0$, there exists $N > 0$ such that

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad x > N.$$

Use this definition to prove the following statements.

64. $\lim_{x \rightarrow \infty} \frac{10}{x} = 0$ **65.** $\lim_{x \rightarrow \infty} \frac{2x+1}{x} = 2$

- 66–67. Definition of infinite limits at infinity** We write

$\lim_{x \rightarrow \infty} f(x) = \infty$ if for any positive number M , there is a corresponding $N > 0$ such that

$$f(x) > M \quad \text{whenever} \quad x > N.$$

Use this definition to prove the following statements.

66. $\lim_{x \rightarrow \infty} \frac{x}{100} = \infty$ **67.** $\lim_{x \rightarrow \infty} \frac{x^2 + x}{x} = \infty$

- 68. Proof of the Squeeze Theorem** Assume the functions f , g , and h satisfy the inequality $f(x) \leq g(x) \leq h(x)$, for all x near a , except possibly at a . Prove that if $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} h(x) = L$, then $\lim_{x \rightarrow a} g(x) = L$.

- 69. Limit proof** Suppose f is defined for all x near a , except possibly at a . Assume for any integer $N > 0$, there is another integer $M > 0$ such that $|f(x) - L| < 1/N$ whenever $|x - a| < 1/M$. Prove that $\lim_{x \rightarrow a} f(x) = L$ using the precise definition of a limit.

- 70–72. Proving that $\lim_{x \rightarrow a} f(x) \neq L$** Use the following definition for the nonexistence of a limit. Assume f is defined for all x near a , except possibly at a . We write $\lim_{x \rightarrow a} f(x) \neq L$ if for some $\varepsilon > 0$, there is no value of $\delta > 0$ satisfying the condition

$$|f(x) - L| < \varepsilon \quad \text{whenever} \quad 0 < |x - a| < \delta.$$

- 70.** For the following function, note that $\lim_{x \rightarrow 2} f(x) \neq 3$. Find all values of $\varepsilon > 0$ for which the preceding condition for nonexistence is satisfied.

- 71.** Prove that $\lim_{x \rightarrow 0} \frac{|x|}{x}$ does not exist.

- 72.** Let

$$f(x) = \begin{cases} 0 & \text{if } x \text{ is rational} \\ 1 & \text{if } x \text{ is irrational.} \end{cases}$$

Prove that $\lim_{x \rightarrow a} f(x)$ does not exist for any value of a . (Hint: Assume $\lim_{x \rightarrow a} f(x) = L$ for some values of a and L , and let $\varepsilon = \frac{1}{2}$.)

- 73. A continuity proof** Suppose f is continuous at a and defined for all x near a . If $f(a) > 0$, show that there is a positive number $\delta > 0$ for which $f(x) > 0$ for all x in $(a - \delta, a + \delta)$. (In other words, f is positive for all x in some interval containing a .)
- 74.** Show that $||a| - |b|| \leq |a - b|$ for all constants a and b . (Hint: Write $|a| = |(a - b) + b|$ and apply the triangle inequality to $|(a - b) + b|$.)

CHAPTER 2 REVIEW EXERCISES

- 1. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- The rational function $\frac{x-1}{x^2-1}$ has vertical asymptotes at $x = -1$ and $x = 1$.
- Numerical or graphical methods always produce good estimates of $\lim_{x \rightarrow a} f(x)$.
- The value of $\lim_{x \rightarrow a} f(x)$, if it exists, is found by calculating $f(a)$.
- If $\lim_{x \rightarrow a} f(x) = \infty$ or $\lim_{x \rightarrow a} f(x) = -\infty$, then $\lim_{x \rightarrow a} f(x)$ does not exist.
- If $\lim_{x \rightarrow a} f(x)$ does not exist, then either $\lim_{x \rightarrow a} f(x) = \infty$ or $\lim_{x \rightarrow a} f(x) = -\infty$.
- The line $y = 2x + 1$ is a slant asymptote of the function $f(x) = \frac{2x^2 + x}{x - 3}$.
- If a function is continuous on the intervals (a, b) and $[b, c]$, where $a < b < c$, then the function is also continuous on (a, c) .
- If $\lim_{x \rightarrow a} f(x)$ can be calculated by direct substitution, then f is continuous at $x = a$.

- 2. Average velocity** The height above the ground of a stone thrown upwards is given by $s(t)$, where t is measured in seconds. After 1 second, the height of the stone is 48 feet above the ground, and after 1.5 seconds, the height of the stone is 60 feet above the ground. Evaluate $s(1)$ and $s(1.5)$, and then find the average velocity of the stone over the time interval $[1, 1.5]$.

- 3. Instantaneous velocity** A baseball is thrown upwards into the air; its distance above the ground after t seconds is given by $s(t) = -16t^2 + 60t + 6$. Make a table of average velocities to make a conjecture about the instantaneous velocity of the baseball at $t = 1.5$ seconds after it was thrown into the air.

- 4. Estimating limits graphically** Use the graph of f in the figure to evaluate the function or analyze the limit.

- $f(-1)$
- $\lim_{x \rightarrow -1^-} f(x)$
- $\lim_{x \rightarrow -1^+} f(x)$
- $\lim_{x \rightarrow -1} f(x)$
- $f(1)$
- $\lim_{x \rightarrow 1} f(x)$
- $\lim_{x \rightarrow 2} f(x)$
- $\lim_{x \rightarrow 3^-} f(x)$
- $\lim_{x \rightarrow 3^+} f(x)$
- $\lim_{x \rightarrow 3} f(x)$

QUICK CHECK ANSWERS

1. $\delta \leq \frac{1}{50}$ 2. $\delta \leq 0.62$ 3. δ must decrease by a factor of $\sqrt{100} = 10$ (at least).

- 5. Points of discontinuity** Use the graph of f in the figure to determine the values of x in the interval $(-3, 5)$ at which f fails to be continuous. Justify your answers using the continuity checklist.

- 6. Computing a limit graphically and analytically**

- Graph $y = \frac{\sin 2\theta}{\sin \theta}$ with a graphing utility. Comment on any inaccuracies in the graph and then sketch an accurate graph of the function.
- Estimate $\lim_{\theta \rightarrow 0} \frac{\sin 2\theta}{\sin \theta}$ using the graph in part (a).
- Verify your answer to part (b) by finding the value of $\lim_{\theta \rightarrow 0} \frac{\sin 2\theta}{\sin \theta}$ analytically using the trigonometric identity $\sin 2\theta = 2 \sin \theta \cos \theta$.

- 7. Computing a limit numerically and analytically**

- Estimate $\lim_{x \rightarrow \pi/4} \frac{\cos 2x}{\cos x - \sin x}$ by making a table of values of $\frac{\cos 2x}{\cos x - \sin x}$ for values of x approaching $\pi/4$. Round your estimate to four digits.
- Use analytic methods to find the value of $\lim_{x \rightarrow \pi/4} \frac{\cos 2x}{\cos x - \sin x}$.

8. **Snowboard rental** Suppose the rental cost for a snowboard is \$25 for the first day (or any part of the first day) plus \$15 for each additional day (or any part of a day).

- Graph the function $c = f(t)$ that gives the cost of renting a snowboard for t days, for $0 \leq t \leq 5$.
- Evaluate $\lim_{t \rightarrow 2.9} f(t)$.
- Evaluate $\lim_{x \rightarrow 3^-} f(t)$ and $\lim_{t \rightarrow 3^+} f(t)$.
- Interpret the meaning of the limits in part (c).
- For what values of t is f continuous? Explain.

9. **Sketching a graph** Sketch the graph of a function f with all the following properties.

$$\begin{aligned} \lim_{x \rightarrow -2^-} f(x) &= \infty & \lim_{x \rightarrow -2^+} f(x) &= -\infty & \lim_{x \rightarrow 0} f(x) &= \infty \\ \lim_{x \rightarrow 3^-} f(x) &= 2 & \lim_{x \rightarrow 3^+} f(x) &= 4 & f(3) &= 1 \end{aligned}$$

10–45. Calculating limits Determine the following limits.

- $\lim_{x \rightarrow 1000} 18\pi^2$
- $\lim_{h \rightarrow 0} \frac{\sqrt{5x+5h} - \sqrt{5x}}{h}$, where $x > 0$ is constant
- $\lim_{h \rightarrow 0} \frac{(h+6)^2 + (h+6) - 42}{h}$
- $\lim_{x \rightarrow a} \frac{(3x+1)^2 - (3a+1)^2}{x-a}$, where a is constant
- $\lim_{x \rightarrow 1} \frac{x^3 - 7x^2 + 12x}{4-x}$
- $\lim_{x \rightarrow 3} \frac{1-x^2}{x^2 - 8x + 7}$
- $\lim_{x \rightarrow 3} \frac{1}{x-3} \left(\frac{1}{\sqrt{x+1}} - \frac{1}{2} \right)$
- $\lim_{x \rightarrow 3} \frac{x^4 - 81}{x-3}$
- $\lim_{x \rightarrow 81} \frac{\sqrt[4]{x} - 3}{x-81}$
- $\lim_{x \rightarrow \pi/2} \frac{1}{\sqrt{\sin x}} - 1$
- $\lim_{x \rightarrow 1^+} \sqrt{\frac{x-1}{x-3}}$ and $\lim_{x \rightarrow 1^-} \sqrt{\frac{x-1}{x-3}}$
- $\lim_{x \rightarrow 5} \frac{x-7}{x(x-5)^2}$
- $\lim_{x \rightarrow 3^-} \frac{x-4}{x^2-3x}$
- $\lim_{x \rightarrow 1^+} \frac{4x^3 - 4x^2}{|x-1|}$
- $\lim_{x \rightarrow 0^-} \frac{2}{\tan x}$
- $\lim_{x \rightarrow 1} \sqrt{5x+6}$
- $\lim_{x \rightarrow 4} \frac{x^3 - 7x^2 + 12x}{4-x}$
- $\lim_{x \rightarrow 3} \frac{\sqrt{3x+16} - 5}{x-3}$
- $\lim_{t \rightarrow 1/3} \frac{t-1/3}{(3t-1)^2}$
- $\lim_{p \rightarrow 1} \frac{p^5 - 1}{p-1}$
- $\lim_{\theta \rightarrow \pi/2} \frac{\sin^2 \theta - 5 \sin \theta + 4}{\sin^2 \theta - 1}$

- $\lim_{x \rightarrow \infty} \frac{2x-3}{4x+10}$
- $\lim_{x \rightarrow \infty} \frac{x^4 - 1}{x^5 + 2}$
- $\lim_{x \rightarrow -\infty} \frac{3x+1}{\sqrt{ax^2+2}}$, where a is a positive constant
- $\lim_{x \rightarrow \infty} (\sqrt{x^2+ax} - \sqrt{x^2-b})$, where a and b are constants
- $\lim_{x \rightarrow \infty} \left(\frac{1}{\sqrt{x^2-ax} - \sqrt{x^2-x}} \right)$, where a is constant and $a \neq 1$
- $\lim_{x \rightarrow -\infty} \frac{x^5}{\sqrt{x^{10}+1} + \sqrt{3x^{10}+1}}$
- $\lim_{x \rightarrow -\infty} \frac{\sqrt{16x^6-x}}{2x^3}$
- $\lim_{x \rightarrow -\infty} (-3x^3 + 5)$
- $\lim_{x \rightarrow -\infty} (|x-1| + x)$ and $\lim_{x \rightarrow \infty} (|x-1| + x)$
- $\lim_{x \rightarrow -\infty} \frac{(|x-2| + x)}{x}$ and $\lim_{x \rightarrow \infty} \frac{(|x-2| + x)}{x}$
- $\lim_{x \rightarrow \infty} \left(5 + \frac{\cos^4 x}{x^2 + x + 1} \right)$
- Assume the function g satisfies the inequality $1 \leq g(x) \leq \sin^2 x + 1$, for all values of x near 0. Find $\lim_{x \rightarrow 0} g(x)$.

T 47. An important limit

- a. Use a graphing utility to illustrate the inequalities

$$\cos x \leq \frac{\sin x}{x} \leq \frac{1}{\cos x}$$

on $[-1, 1]$.

- b. Use part (a) to explain why $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$.

T 48. Finding vertical asymptotes Let $f(x) = \frac{x^2 - 5x + 6}{x^2 - 2x}$.

- Analyze $\lim_{x \rightarrow 0^-} f(x)$, $\lim_{x \rightarrow 0^+} f(x)$, $\lim_{x \rightarrow 2^-} f(x)$, and $\lim_{x \rightarrow 2^+} f(x)$.
- Does the graph of f have any vertical asymptotes? Explain.
- Graph f using a graphing utility and then sketch the graph with paper and pencil, correcting any errors obtained with the graphing utility.

49–54. End behavior Evaluate $\lim_{x \rightarrow \infty} f(x)$ and $\lim_{x \rightarrow -\infty} f(x)$.

- $f(x) = \frac{4x^3 + 1}{1 - x^3}$
- $f(x) = \frac{x^6 + 1}{\sqrt{16x^{14} + 1}}$
- $f(x) = \frac{12x^2}{\sqrt{16x^4 + 7}}$
- $f(x) = \frac{3x^5 + 7x^3 + x}{4x^2 + 1}$
- $f(x) = \frac{x^6 + 1}{\sqrt{16x^{14} + 1}}$
- $f(x) = \frac{3\sqrt[3]{8x+1}}{\sqrt{x-3}}$
- $f(x) = \frac{x+1}{\sqrt{9x^2+x}}$

55–59. Slant asymptotes

- Analyze $\lim_{x \rightarrow \infty} f(x)$ and $\lim_{x \rightarrow -\infty} f(x)$ for each function.
- Determine whether f has a slant asymptote. If so, write the equation of the slant asymptote.

- $f(x) = \frac{3x^2 + 5x + 7}{x+1}$
- $f(x) = \frac{9x^2 + 4}{(2x-1)^2}$

$$57. f(x) = \frac{1 + x - 2x^2 - x^3}{x^2 + 1} \quad 58. f(x) = \frac{x(x + 2)^3}{3x^2 - 4x}$$

$$59. f(x) = \frac{4x^3 + x^2 + 7}{x^2 - x + 1}$$

60–63. Finding asymptotes Find all the asymptotes of the following functions.

$$60. f(x) = \frac{2x^2 + 6}{2x^2 + 3x - 2} \quad 61. f(x) = \frac{\sqrt{x^6 + 1}}{x^3 - 1}$$

$$62. f(x) = \frac{2x^2 - 7}{x - 2} \quad 63. f(x) = \frac{|x^3 + x|}{2x^2 + 1}$$

64. Finding all asymptotes Find all the asymptotes of $f(x) = \frac{x^2 + x + 3}{|x|}$. Plot a graph of f together with its asymptotes. (Hint: Consider the cases $x = 0$, $x > 0$, and $x < 0$.)

65–68. Continuity at a point Use the continuity checklist to determine whether the following functions are continuous at the given value of a .

$$65. f(x) = \frac{1}{x - 5}; a = 5$$

$$66. g(x) = \begin{cases} \frac{x^2 - 16}{x - 4} & \text{if } x \neq 4 \\ 9 & \text{if } x = 4 \end{cases}; a = 4$$

$$67. h(x) = \begin{cases} -2x + 14 & \text{if } x \leq 5 \\ \sqrt{x^2 - 9} & \text{if } x > 5 \end{cases}; a = 5$$

$$68. g(x) = \begin{cases} \frac{x^3 - 5x^2 + 6x}{x - 2} & \text{if } x \neq 2 \\ -2 & \text{if } x = 2 \end{cases}; a = 2$$

69–72. Continuity on intervals Find the intervals on which the following functions are continuous. Specify right- or left-continuity at the finite endpoints.

$$69. f(x) = \sqrt{x^2 - 5} \quad 70. g(x) = \sqrt{x^2 - 5x + 6}$$

$$71. h(x) = \frac{2x}{x^3 - 25x} \quad 72. g(x) = \cos \sqrt{x}$$

73. Determining unknown constants Let

$$g(x) = \begin{cases} 5x - 2 & \text{if } x < 1 \\ a & \text{if } x = 1 \\ ax^2 + bx & \text{if } x > 1. \end{cases}$$

Determine values of the constants a and b , if possible, for which g is continuous at $x = 1$.

74. Left- and right-continuity

- Is $h(x) = \sqrt{x^2 - 9}$ left-continuous at $x = 3$? Explain.
- Is $h(x) = \sqrt{x^2 - 9}$ right-continuous at $x = 3$? Explain.

75. Sketch the graph of a function that is continuous on $(0, 1]$ and on $(1, 2)$ but is not continuous on $(0, 2)$.

76–77. Intermediate Value Theorem

- Use the Intermediate Value Theorem to show that the equation has a solution in the given interval.
- Estimate a solution to the equation in the given interval using a root finder.

76. $x^5 + 7x + 5 = 0; (-1, 0)$

77. $x = \cos x; \left(0, \frac{\pi}{2}\right)$

78. Suppose on a certain day, the low temperature was 32° at midnight, the high temperature was 65° at noon, and then the temperature dropped to 32° the following midnight. Prove there were two times during that day, which were 12 hours apart, when the temperatures were equal. (Hint: Let $T(t)$ equal the temperature t hours after midnight and examine the function $f(t) = T(t) - T(t + 12)$, for $0 \leq t \leq 12$.)

79. Variable rectangles Imagine the collection of rectangles with length x and width y , such that their area is $xy = 100$.

- Show that the rectangle in this collection with length x has perimeter $P(x) = 2x + 200/x$, where $x > 0$.
- Use the Intermediate Value Theorem to show that there is at least one rectangle with $2 \leq x \leq 30$ and perimeter 50.
- Estimate the length of the rectangle(s) with perimeter 50.
- Is there a rectangle in the collection with a perimeter of 30? Explain.
- Estimate the dimensions of the rectangle in the collection with the smallest possible perimeter.

80–85. Limit proofs Use an appropriate limit definition to prove the following limits.

$$80. \lim_{x \rightarrow 1} (5x - 2) = 3 \quad 81. \lim_{x \rightarrow 5} \frac{x^2 - 25}{x - 5} = 10$$

$$82. \lim_{x \rightarrow 3} f(x) = 5, \text{ where } f(x) = \begin{cases} 3x - 4 & \text{if } x \leq 3 \\ -4x + 17 & \text{if } x > 3 \end{cases}$$

$$83. \lim_{x \rightarrow 2} (3x^2 - 4) = 8 \quad 84. \lim_{x \rightarrow 2^+} \sqrt{4x - 8} = 0$$

$$85. \lim_{x \rightarrow 2} \frac{1}{(x - 2)^4} = \infty$$

86. Limit proofs

- Assume $|f(x)| \leq L$ for all x near a and $\lim_{x \rightarrow a} g(x) = 0$. Give a formal proof that $\lim_{x \rightarrow a} (f(x)g(x)) = 0$.
- Find a function f for which $\lim_{x \rightarrow 2} (f(x)(x - 2)) \neq 0$. Why doesn't this violate the result stated in part (a)?
- The Heaviside function is defined as

$$H(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{if } x \geq 0. \end{cases}$$

Explain why $\lim_{x \rightarrow 0} (xH(x)) = 0$.

Chapter Preview Now that you are familiar with limits, the door to calculus stands open. The first task is to introduce the fundamental concept of the *derivative*. Suppose a function f represents a quantity of interest—for example, the variable cost of manufacturing an item, the population of a country, or the position of an orbiting satellite. The derivative of f is another function, denoted f' , that gives the slope of the curve $y = f(x)$ as it changes with respect to x . Equivalently, the derivative of f gives the *instantaneous rate of change* of f with respect to the independent variable. We use limits not only to define the derivative but also to develop efficient rules for finding derivatives. The applications of the derivative—which we introduce along the way—are endless because almost everything around us is in a state of change, and derivatives describe change.

3.1 Introducing the Derivative

In this section, we return to the problem of finding the slope of a line tangent to a curve, introduced at the beginning of Chapter 2. This problem is important for several reasons.

- We identify the slope of the tangent line with the *instantaneous rate of change* of a function (Figure 3.1).
- The slopes of the tangent lines as they change along a curve are the values of a new function called the *derivative*.
- Looking farther ahead, if a curve represents the trajectory of a moving object, the tangent line at a point on the curve indicates the direction of motion at that point (Figure 3.2).

Figure 3.1

Figure 3.2

In Section 2.1, we used a limit to define the instantaneous velocity of an object that moves along a line. Recall that if $s(t)$ is the position of the object at time t , then the average velocity of the object over the time interval $[a, t]$ is

$$v_{\text{av}} = \frac{s(t) - s(a)}{t - a}.$$

The instantaneous velocity at time $t = a$ is the limit of the average velocity as $t \rightarrow a$:

$$v_{\text{inst}} = \lim_{t \rightarrow a} \frac{s(t) - s(a)}{t - a}.$$

We also learned that these quantities have important geometric interpretations. The average velocity is the slope of the secant line through the points $(a, s(a))$ and $(t, s(t))$ on the graph of s , and the instantaneous velocity is the slope of the tangent line through the point $(a, s(a))$ (Figure 3.3).

Figure 3.3

EXAMPLE 1 Instantaneous velocity and tangent lines A rock is launched vertically upward from the ground with an initial speed of 96 ft/s. The position of the rock in feet above the ground after t seconds is given by the function $s(t) = -16t^2 + 96t$. Consider the point $P(1, 80)$ on the curve $y = s(t)$.

- Find the instantaneous velocity of the rock 1 second after launch and find the slope of the line tangent to the graph of s at P .
- Find an equation of the tangent line in part (a).

SOLUTION

- In Example 2 of Section 2.1, we used numerical evidence to estimate that the instantaneous velocity at $t = 1$ is 64 ft/s. Using limit techniques developed in Chapter 2, we can verify this conjectured value:

$$\begin{aligned} v_{\text{inst}} &= \lim_{t \rightarrow 1} \frac{s(t) - s(1)}{t - 1} && \text{Definition of instantaneous velocity} \\ &= \lim_{t \rightarrow 1} \frac{-16t^2 + 96t - 80}{t - 1} && s(t) = -16t^2 + 96t; s(1) = 80 \\ &= \lim_{t \rightarrow 1} \frac{-16(t - 5)(t - 1)}{t - 1} && \text{Factor the numerator.} \\ &= -16 \lim_{t \rightarrow 1} \underbrace{(t - 5)}_{-4} = 64. && \text{Cancel factors } (t \neq 1) \text{ and evaluate the limit.} \end{aligned}$$

We see that the instantaneous velocity at $t = 1$ is 64 ft/s, which also equals the slope of the line tangent to the graph of s at the point $P(1, 80)$.

Figure 3.4

- b. An equation of the line passing through $(1, 80)$ with slope 64 is $y - 80 = 64(t - 1)$ or $y = 64t + 16$ (Figure 3.4).

Related Exercises 13–14 ◀

QUICK CHECK 1 In Example 1, is the slope of the tangent line at $(2, 128)$ greater than or less than the slope at $(1, 80)$? ◀

The connection between the instantaneous rate of change of an object's position and the slope of a tangent line on the graph of the position function can be extended far beyond a discussion of velocity. In fact, the slope of a tangent line is one of the central concepts in calculus because it measures the instantaneous rate of change of a function. Whether a given function describes the position of an object, the population of a city, the concentration of a reactant in a chemical reaction, or the weight of a growing child, the slopes of tangent lines associated with these functions measure rates at which the quantities change.

Tangent Lines and Rates of Change

Consider the curve $y = f(x)$ and a secant line intersecting the curve at the points $P(a, f(a))$ and $Q(x, f(x))$ (Figure 3.5). The difference $f(x) - f(a)$ is the change in the value of f on the interval $[a, x]$, while $x - a$ is the change in x . As discussed in Chapters 1 and 2, the slope of the secant line $\overrightarrow{PQ}$ is

$$m_{\text{sec}} = \frac{f(x) - f(a)}{x - a},$$

and it gives the *average rate of change* in f on the interval $[a, x]$.

Figure 3.5 also shows what happens as the variable point x approaches the fixed point a . If the curve is smooth at $P(a, f(a))$ —it has no kinks or corners—the secant lines approach a *unique* line that intersects the curve at P ; this line is the *tangent line* at P . As x approaches a , the slopes m_{sec} of the secant lines approach a unique number m_{tan} that we call the *slope of the tangent line*; that is,

$$m_{\text{tan}} = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}.$$

The slope of the tangent line at P is also called the *instantaneous rate of change* in f at a because it measures how quickly f changes at a .

The tangent line has another geometric interpretation. As discussed in Section 2.1, if the curve $y = f(x)$ is smooth at a point $P(a, f(a))$, then the curve looks more like a line as we zoom in on P . The line that is approached as we zoom in on P is the tangent line (Figure 3.6). A smooth curve has the property of *local linearity*, which means that if we look at a point on the curve locally (by zooming in), then the curve appears linear.

Figure 3.5

Figure 3.6

- ▶ The definition of m_{sec} involves a *difference quotient*, introduced in Section 1.1.
- ▶ If x and y have physical units, then the average and instantaneous rates of change have units of (units of y)/(units of x). For example, if y has units of meters and x has units of seconds, the units of the rates of change are meters/second (m/s).

DEFINITION Rate of Change and the Slope of the Tangent Line

The **average rate of change** in f on the interval $[a, x]$ is the slope of the corresponding secant line:

$$m_{\text{sec}} = \frac{f(x) - f(a)}{x - a}.$$

The **instantaneous rate of change** in f at a is

$$m_{\text{tan}} = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}, \quad (1)$$

which is also the **slope of the tangent line** at $(a, f(a))$, provided this limit exists. The **tangent line** is the unique line through $(a, f(a))$ with slope m_{tan} . Its equation is

$$y - f(a) = m_{\text{tan}}(x - a).$$

QUICK CHECK 2 Sketch the graph of a function f near a point a . As in Figure 3.5, draw a secant line that passes through $(a, f(a))$ and a neighboring point $(x, f(x))$ with $x < a$. Use arrows to show how the secant lines approach the tangent line as x approaches a . ◀

EXAMPLE 2 Equation of a tangent line Find an equation of the line tangent to the graph of $f(x) = \frac{3}{x}$ at $\left(2, \frac{3}{2}\right)$.

SOLUTION We use the definition of the slope of the tangent line with $a = 2$:

$$\begin{aligned}
 m_{\tan} &= \lim_{x \rightarrow 2} \frac{f(x) - f(2)}{x - 2} && \text{Definition of slope of tangent line} \\
 &= \lim_{x \rightarrow 2} \frac{\frac{3}{x} - \frac{3}{2}}{x - 2} && f(x) = 3/x; f(2) = 3/2 \\
 &= \lim_{x \rightarrow 2} \frac{6 - 3x}{2x(x - 2)} && \text{Combine fractions with common denominator.} \\
 &= \lim_{x \rightarrow 2} \frac{-3(x - 2)}{2x(x - 2)} && \text{Simplify.} \\
 &= \lim_{x \rightarrow 2} \left(-\frac{3}{2x}\right) = -\frac{3}{4}. && \text{Cancel factors } (x \neq 2) \text{ and evaluate the limit.}
 \end{aligned}$$

Figure 3.7

The tangent line has slope $m_{\tan} = -\frac{3}{4}$ and passes through the point $\left(2, \frac{3}{2}\right)$ (Figure 3.7).

Its equation is $y - \frac{3}{2} = -\frac{3}{4}(x - 2)$ or $y = -\frac{3}{4}x + 3$. We could also say that the instantaneous rate of change in f at $x = 2$ is $-3/4$. Related Exercises 17–18 ◀

An alternative formula for the slope of the tangent line is helpful for future work. Consider again the curve $y = f(x)$ and the secant line intersecting the curve at the points P and Q . We now let $(a, f(a))$ and $(a + h, f(a + h))$ be the coordinates of P and Q , respectively (Figure 3.8). The difference in the x -coordinates of P and Q is $(a + h) - a = h$. Note that Q is located to the right of P if $h > 0$ and to the left of P if $h < 0$.

Figure 3.8

The slope of the secant line $\overrightarrow{PQ}$ using the new notation is $m_{\sec} = \frac{f(a + h) - f(a)}{h}$. As h approaches 0, the variable point Q approaches P , and the slopes of the secant lines approach the slope of the tangent line. Therefore, the slope of the tangent line at $(a, f(a))$, which is also the instantaneous rate of change in f at a , is

$$m_{\tan} = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}.$$

ALTERNATIVE DEFINITION Rate of Change and the Slope of the Tangent Line

The **average rate of change** in f on the interval $[a, a + h]$ is the slope of the corresponding secant line:

$$m_{\text{sec}} = \frac{f(a + h) - f(a)}{h}.$$

The **instantaneous rate of change** in f at a is

$$m_{\text{tan}} = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}, \quad (2)$$

which is also the **slope of the tangent line** at $(a, f(a))$, provided this limit exists.

Figure 3.9

► By the definition of the limit as $h \rightarrow 0$, notice that h approaches 0 but $h \neq 0$. Therefore, it is permissible to cancel h from the numerator and denominator of $\frac{h(h^2 - 3h + 7)}{h}$.

QUICK CHECK 3 Set up the calculation in Example 3 using definition (1) for the slope of the tangent line rather than definition (2). Does the calculation appear more difficult using definition (1)? ◀

► The derivative notation $f'(a)$ is read *f prime of a*. A minor modification in the notation for the derivative is necessary when the name of the function changes. For example, given the function $y = g(x)$, its derivative at the point a is $g'(a)$.

EXAMPLE 3 Equation of a tangent line Find an equation of the line tangent to the graph of $f(x) = x^3 + 4x$ at $(1, 5)$.

SOLUTION We let $a = 1$ in definition (2) and first find $f(1 + h)$. After expanding and collecting terms, we have

$$f(1 + h) = (1 + h)^3 + 4(1 + h) = h^3 + 3h^2 + 7h + 5.$$

Substituting $f(1 + h)$ and $f(1) = 5$, the slope of the tangent line is

$$\begin{aligned} m_{\text{tan}} &= \lim_{h \rightarrow 0} \frac{f(1 + h) - f(1)}{h} && \text{Definition of } m_{\text{tan}} \\ &= \lim_{h \rightarrow 0} \frac{(h^3 + 3h^2 + 7h + 5) - 5}{h} && \text{Substitute } f(1 + h) \text{ and } f(1) = 5. \\ &= \lim_{h \rightarrow 0} \frac{h(h^2 + 3h + 7)}{h} && \text{Simplify.} \\ &= \lim_{h \rightarrow 0} (h^2 + 3h + 7) && \text{Cancel } h, \text{ noting } h \neq 0. \\ &= 7. && \text{Evaluate the limit.} \end{aligned}$$

The tangent line has slope $m_{\text{tan}} = 7$ and passes through the point $(1, 5)$ (Figure 3.9); its equation is $y - 5 = 7(x - 1)$ or $y = 7x - 2$. We could also say that the instantaneous rate of change in f at $x = 1$ is 7.

Related Exercises 23, 27 ◀

The Derivative

Computing the slope of the line tangent to the graph of a function f at a given point a gives us the instantaneous rate of change in f at a . This information about the behavior of a function is so important that it has its own name and notation.

DEFINITION The Derivative of a Function at a Point

The **derivative of f at a** , denoted $f'(a)$, is given by either of the two following limits, provided the limits exist and a is in the domain of f :

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a} \quad (1) \quad \text{or} \quad f'(a) = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}. \quad (2)$$

If $f'(a)$ exists, we say that f is **differentiable** at a .

The limits that define the derivative of a function at a point are exactly the same limits used to compute the slope of a tangent line and the instantaneous rate of change of a function at a point. When you compute a derivative, remember that you are also finding a rate of change and the slope of a tangent line.

Figure 3.10

► Definition (2) could also be used to find $f'(2)$ in Example 4.

QUICK CHECK 4 Verify that the derivative of the function f in Example 4 at the point $(8, 5)$ is $f'(8) = 1/4$. Then find an equation of the line tangent to the graph of f at the point $(8, 5)$. ◀

EXAMPLE 4 Derivatives and tangent lines Let $f(x) = \sqrt{2x} + 1$. Compute $f'(2)$, the derivative of f at $x = 2$, and use the result to find an equation of the line tangent to the graph of f at $(2, 3)$.

SOLUTION Definition (1) for $f'(a)$ is used here, with $a = 2$.

$$\begin{aligned}
 f'(2) &= \lim_{x \rightarrow 2} \frac{f(x) - f(2)}{x - 2} && \text{Definition of the derivative at a point} \\
 &= \lim_{x \rightarrow 2} \frac{\sqrt{2x} + 1 - 3}{x - 2} && \text{Substitute: } f(x) = \sqrt{2x} + 1 \text{ and } f(2) = 3. \\
 &= \lim_{x \rightarrow 2} \frac{\sqrt{2x} - 2}{x - 2} \cdot \frac{\sqrt{2x} + 2}{\sqrt{2x} + 2} && \text{Multiply numerator and denominator by } \sqrt{2x} + 2. \\
 &= \lim_{x \rightarrow 2} \frac{2x - 4}{(x - 2)(\sqrt{2x} + 2)} && \text{Simplify.} \\
 &= \lim_{x \rightarrow 2} \frac{2}{\sqrt{2x} + 2} = \frac{1}{2} && \text{Cancel factors } (x \neq 2) \text{ and evaluate the limit.}
 \end{aligned}$$

Because $f'(2) = 1/2$ is the slope of the line tangent to the graph of f at $(2, 3)$, an equation of the tangent line (Figure 3.10) is

$$y - 3 = \frac{1}{2}(x - 2) \quad \text{or} \quad y = \frac{1}{2}x + 2.$$

Related Exercises 39–40 ◀

Interpreting the Derivative

The derivative of a function f at a point a measures the instantaneous rate of change in f at a . When the variables associated with a function represent physical quantities, the derivative takes on special meaning. For instance, suppose $T = g(d)$ describes the water temperature T at depth d in the ocean. Then $g'(d)$ measures the instantaneous rate of change in the water temperature at depth d . The following examples illustrate this idea.

EXAMPLE 5 Instantaneous rate of change Sound intensity I , measured in watts per square meter (W/m^2) at a point x meters from a sound source with acoustic power P , is given by $I(x) = \frac{P}{4\pi x^2}$. A typical sound system at a rock concert produces an acoustic power of about $P = 3$ W. Compute $I'(3)$ and interpret the result.

SOLUTION With $P = 3$, the sound intensity function is $I(x) = \frac{3}{4\pi x^2}$. A useful trick is to write I as $I(x) = \frac{3}{4\pi} \cdot \frac{1}{x^2}$. Using definition (2) of the derivative at a point (p. 113), with $a = 3$, we have

$$\begin{aligned}
 I'(3) &= \lim_{h \rightarrow 0} \frac{I(3+h) - I(3)}{h} && \text{Definition of } I'(3) \\
 &&& \text{Numerator units: } \text{W}/\text{m}^2; \text{ denominator units: m} \\
 &= \lim_{h \rightarrow 0} \frac{\frac{3}{4\pi} \cdot \frac{1}{(3+h)^2} - \frac{3}{4\pi} \cdot \frac{1}{9}}{h} && \text{Evaluate } I(3+h) \text{ and } I(3). \\
 &= \frac{3}{4\pi} \lim_{h \rightarrow 0} \frac{9 - (3+h)^2}{9(3+h)^2 h} && \text{Factor out } \frac{3}{4\pi} \text{ and simplify remaining fraction.} \\
 &= \frac{3}{4\pi} \lim_{h \rightarrow 0} \frac{-h(6+h)}{9(3+h)^2} \cdot \frac{1}{h} && \text{Simplify.} \\
 &= -\frac{3}{4\pi} \lim_{h \rightarrow 0} \frac{6+h}{9(3+h)^2} && \text{Cancel } h; h \neq 0. \\
 &= -\frac{3}{4\pi} \cdot \frac{6}{81} = -\frac{1}{18\pi}. && \text{Evaluate limit.}
 \end{aligned}$$

Figure 3.11

The units associated with the numerator and denominator help to interpret this result. The change in sound intensity I is measured in W/m^2 while the distance from the sound source is measured in meters (Figure 3.11). Therefore, the result $I'(3) = -1/(18\pi)$ means that the sound intensity decreases with an instantaneous rate of change of $1/(18\pi) \text{ W}/\text{m}^2$ per meter at a point 3 m from the sound source. Another useful interpretation is that when the distance from the source increases from 3 m to 4 m, the sound intensity decreases by about $1/(18\pi) \text{ W}/\text{m}^2$.

Related Exercises 49–50 ◀

EXAMPLE 6 Growth rates of Indian spotted owlets The Indian spotted owlet is a small owl that is indigenous to Southeast Asia. The body mass $m(t)$ (in grams) of an owl at an age of t weeks is modeled by the graph in Figure 3.12. Estimate $m'(2)$ and state the physical meaning of this quantity. (Source: ZooKeys, 132, 2011)

Figure 3.12

Figure 3.13

SOLUTION Recall that the derivative $m'(2)$ equals the slope of the line tangent to the graph of $y = m(t)$ at $t = 2$. One method for estimating $m'(2)$ is to sketch the line tangent to the curve at $t = 2$ and then estimate its slope (Figure 3.13). Searching for two convenient points on this line, we see that the tangent line passes through—or close to—the points $(1, 30)$ and $(2.5, 110)$. Therefore,

$$m'(2) \approx \frac{110 - 30}{2.5 - 1} = \frac{80}{1.5} \approx 53.3 \text{ g/week},$$

which means that the owl is growing at 53.3 g/week two weeks after birth.

Related Exercises 53–54 ◀

► The graphical method used in Example 6 to estimate $m'(2)$ provides only a rough approximation to the value of the derivative: The answer depends on the accuracy with which the tangent line is sketched.

SECTION 3.1 EXERCISES

Getting Started

- Use definition (1) (p. 111) for the slope of a tangent line to explain how slopes of secant lines approach the slope of the tangent line at a point.
- Explain why the slope of a secant line can be interpreted as an average rate of change.
- Explain why the slope of the tangent line can be interpreted as an instantaneous rate of change.
- Explain the relationships among the slope of a tangent line, the instantaneous rate of change, and the value of the derivative at a point.
- Given a function f and a point a in its domain, what does $f'(a)$ represent?

- The following figure shows the graph of f and a line tangent to the graph of f at $x = 6$. Find $f(6)$ and $f'(6)$.

7. An equation of the line tangent to the graph of f at the point $(2, 7)$ is $y = 4x - 1$. Find $f(2)$ and $f'(2)$.
8. An equation of the line tangent to the graph of g at $x = 3$ is $y = 5x + 4$. Find $g(3)$ and $g'(3)$.
9. If $h(1) = 2$ and $h'(1) = 3$, find an equation of the line tangent to the graph of h at $x = 1$.
10. If $f'(-2) = 7$, find an equation of the line tangent to the graph of f at the point $(-2, 4)$.
11. Use definition (1) (p. 111) to find the slope of the line tangent to the graph of $f(x) = -5x + 1$ at the point $(1, -4)$.
12. Use definition (2) (p. 113) to find the slope of the line tangent to the graph of $f(x) = 5$ at $P(1, 5)$.

Practice Exercises

13–14. Velocity functions A projectile is fired vertically upward into the air; its position (in feet) above the ground after t seconds is given by the function $s(t)$. For the following functions, use limits to determine the instantaneous velocity of the projectile at $t = a$ seconds for the given value of a .

13. $s(t) = -16t^2 + 100t$; $a = 1$

14. $s(t) = -16t^2 + 128t + 192$; $a = 2$

15–20. Equations of tangent lines by definition (1)

- a. Use definition (1) (p. 111) to find the slope of the line tangent to the graph of f at P .
- b. Determine an equation of the tangent line at P .
- c. Plot the graph of f and the tangent line at P .

15. $f(x) = x^2 - 5$; $P(3, 4)$

T 16. $f(x) = -3x^2 - 5x + 1$; $P(1, -7)$

17. $f(x) = \frac{1}{x}$; $P(-1, -1)$

T 18. $f(x) = \frac{4}{x^2}$; $P(-1, 4)$

T 19. $f(x) = \sqrt{3x + 3}$; $P(2, 3)$

T 20. $f(x) = \frac{2}{\sqrt{x}}$; $P(4, 1)$

21–32. Equations of tangent lines by definition (2)

- a. Use definition (2) (p. 113) to find the slope of the line tangent to the graph of f at P .
- b. Determine an equation of the tangent line at P .

21. $f(x) = 2x + 1$; $P(0, 1)$ 22. $f(x) = -7x$; $P(-1, 7)$

23. $f(x) = 3x^2 - 4x$; $P(1, -1)$ 24. $f(x) = 8 - 2x^2$; $P(0, 8)$

25. $f(x) = x^2 - 4$; $P(2, 0)$ 26. $f(x) = \frac{1}{x}$; $P(1, 1)$

27. $f(x) = x^3$; $P(1, 1)$ 28. $f(x) = \frac{1}{2x + 1}$; $P(0, 1)$

29. $f(x) = \frac{1}{3 - 2x}$; $P\left(-1, \frac{1}{5}\right)$ 30. $f(x) = \sqrt{x - 1}$; $P(2, 1)$

31. $f(x) = \sqrt{x + 3}$; $P(1, 2)$ 32. $f(x) = \frac{x}{x + 1}$; $P(-2, 2)$

33–42. Derivatives and tangent lines

- a. For the following functions and values of a , find $f'(a)$.
- b. Determine an equation of the line tangent to the graph of f at the point $(a, f(a))$ for the given value of a .

33. $f(x) = 8x$; $a = -3$

34. $f(x) = x^2$; $a = 3$

35. $f(x) = 4x^2 + 2x$; $a = -2$ 36. $f(x) = 2x^3$; $a = 10$

37. $f(x) = \frac{1}{\sqrt{x}}$; $a = \frac{1}{4}$

38. $f(x) = \frac{1}{x^2}$; $a = 1$

39. $f(x) = \sqrt{2x + 1}$; $a = 4$

40. $f(x) = \sqrt{3x}$; $a = 12$

41. $f(x) = \frac{1}{x + 5}$; $a = 5$

42. $f(x) = \frac{1}{3x - 1}$; $a = 2$

43–46. Derivative calculations Evaluate the derivative of the following functions at the given point.

43. $f(t) = \frac{1}{t + 1}$; $a = 1$

44. $f(t) = t - t^2$; $a = 2$

45. $f(s) = 2\sqrt{s} - 1$; $a = 25$

46. $f(r) = \pi r^2$; $a = 3$

47. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. For linear functions, the slope of any secant line always equals the slope of any tangent line.
- b. The slope of the secant line passing through the points P and Q is less than the slope of the tangent line at P .
- c. Consider the graph of the parabola $f(x) = x^2$. For $a > 0$ and $h > 0$, the secant line through $(a, f(a))$ and $(a + h, f(a + h))$ always has a greater slope than the tangent line at $(a, f(a))$.

48–51. Interpreting the derivative Find the derivative of each function at the given point and interpret the physical meaning of this quantity. Include units in your answer.

48. When a faucet is turned on to fill a bathtub, the volume of water in gallons in the tub after t minutes is $V(t) = 3t$. Find $V'(12)$.

49. An object dropped from rest falls $d(t) = 16t^2$ feet in t seconds. Find $d'(4)$.

50. The gravitational force of attraction between two masses separated by a distance of x meters is inversely proportional to the square of the distance between them, which implies that the force is described by the function $F(x) = k/x^2$, for some constant k , where $F(x)$ is measured in newtons. Find $F'(10)$, expressing your answer in terms of k .

51. Suppose the speed of a car approaching a stop sign is given by $v(t) = (t - 5)^2$, for $0 \leq t \leq 5$, where t is measured in seconds and $v(t)$ is measured in meters per second. Find $v'(3)$.

T 52. Population of Las Vegas Let $p(t)$ represent the population of the Las Vegas metropolitan area t years after 1970, as shown in the table and figure.

- a. Compute the average rate of growth of Las Vegas from 1970 to 1980.
- b. Explain why the average rate of growth calculated in part (a) is a good estimate of the instantaneous rate of growth of Las Vegas in 1975.

- c. Compute the average rate of growth of Las Vegas from 1970 to 2000. Is the average rate of growth an overestimate or an underestimate of the instantaneous rate of growth of Las Vegas in 2000? Approximate the growth rate in 2000.

Year	1970	1980	1990	2000	2010	2020
t	0	10	20	30	40	50
$p(t)$	305,000	528,000	853,000	1,563,000	1,951,000	2,223,000

Source: U.S. Bureau of Census

53. **Owlet talons** Let $L(t)$ equal the average length (in mm) of the middle talon on an Indian spotted owlet that is t weeks old, as shown in the figure.
- Estimate $L'(1.5)$ and state the physical meaning of this quantity.
 - Estimate the value of $L'(a)$, for $a \geq 4$. What does this tell you about the talon lengths on these birds? (Source: ZooKeys, 132, 2011)

54. **Caffeine levels** Let $A(t)$ be the amount of caffeine (in mg) in the bloodstream t hours after a cup of coffee has been consumed (see figure). Estimate the values of $A'(7)$ and $A'(15)$, rounding answers to the nearest whole number. Include units in your answers and interpret the physical meaning of these values.

55. Let $D(t)$ equal the number of daylight hours at a latitude of 40° N, t days after January 1. Assuming $D(t)$ is approximated by a continuous function (see figure), estimate the values of $D'(60)$ and $D'(170)$. Include units in your answers and interpret your results.

Explorations and Challenges

56–61. **Find the function** The following limits represent the slope of a curve $y = f(x)$ at the point $(a, f(a))$. Determine a possible function f and number a ; then calculate the limit.

56. $\lim_{x \rightarrow 1} \frac{3x^2 + 4x - 7}{x - 1}$

57. $\lim_{x \rightarrow 2} \frac{5x^2 - 20}{x - 2}$

58. $\lim_{x \rightarrow 2} \frac{\frac{1}{x+1} - \frac{1}{3}}{x - 2}$

59. $\lim_{h \rightarrow 0} \frac{(2+h)^4 - 16}{h}$

60. $\lim_{h \rightarrow 0} \frac{\sqrt{2+h} - \sqrt{2}}{h}$

61. $\lim_{h \rightarrow 0} \frac{|-1+h| - 1}{h}$

62–65. **Approximating derivatives** Assuming the limit exists, the definition of the derivative $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$ implies that if h is small, then an approximation to $f'(a)$ is given by

$$f'(a) \approx \frac{f(a+h) - f(a)}{h}.$$

If $h > 0$, then this approximation is called a **forward difference quotient**; if $h < 0$, it is a **backward difference quotient**. As shown in the following exercises, these formulas are used to approximate f' at a point when f is a complicated function or when f is represented by a set of data points.

62. Let $f(x) = \sqrt{x}$.

- a. Find the exact value of $f'(4)$.

b. Show that $f'(4) \approx \frac{f(4+h) - f(4)}{h} = \frac{\sqrt{4+h} - 2}{h}$.

- c. Complete columns 2 and 5 of the following table and describe how $\frac{\sqrt{4+h} - 2}{h}$ behaves as h approaches 0.

h	$(\sqrt{4+h} - 2)/h$	Error	h	$(\sqrt{4+h} - 2)/h$	Error
0.1			-0.1		
0.01			-0.01		
0.001			-0.001		
0.0001			-0.0001		

- d. The accuracy of an approximation is measured by

$$\text{error} = |\text{exact value} - \text{approximate value}|.$$

Use the exact value of $f'(4)$ in part (a) to complete columns 3 and 6 in the table. Describe the behavior of the errors as h approaches 0.

63. Another way to approximate derivatives is to use the **centered difference quotient**:

$$f'(a) \approx \frac{f(a+h) - f(a-h)}{2h}.$$

Again, consider $f(x) = \sqrt{x}$.

- a. Graph f near the point $(4, 2)$ and let $h = 1/2$ in the centered difference quotient. Draw the line whose slope is computed by the centered difference quotient and explain why the centered difference quotient approximates $f'(4)$.
- b. Use the centered difference quotient to approximate $f'(4)$ by completing the table.

h	Approximation	Error
0.1		
0.01		
0.001		

- c. Explain why it is not necessary to use negative values of h in the table of part (b).
- d. Compare the accuracy of the derivative estimates in part (b) with those found in Exercise 62.
64. The following table gives the distance $f(t)$ fallen by a smoke jumper t seconds after she opens her chute.
- a. Use the forward difference quotient with $h = 0.5$ to estimate the velocity of the smoke jumper at $t = 2$ seconds.
- b. Repeat part (a) using the centered difference quotient.

t (seconds)	$f(t)$ (feet)
0	0
0.5	4
1.0	15
1.5	33
2.0	55
2.5	81
3.0	109
3.5	138
4.0	169

65. The *error function* (denoted $\text{erf}(x)$) is an important function in statistics because it is related to the normal distribution. Its graph is shown in the figure, and values of $\text{erf}(x)$ at several points are shown in the table.

x	$\text{erf}(x)$	x	$\text{erf}(x)$
0.75	0.711156	1.05	0.862436
0.8	0.742101	1.1	0.880205
0.85	0.770668	1.15	0.896124
0.9	0.796908	1.2	0.910314
0.95	0.820891	1.25	0.922900
1.0	0.842701	1.3	0.934008

- a. Use forward and centered difference quotients to find approximations to the derivative $\text{erf}'(1)$.
- b. Given that $\text{erf}'(1) \approx 0.4151075$, compute the error in the approximations in part (a).

QUICK CHECK ANSWERS

1. The slope is less at $x = 2$. 3. Definition (1) requires factoring the numerator or long division to cancel $(x - 1)$.
4. $y - 5 = \frac{1}{4}(x - 8) \leftarrow$

3.2 The Derivative as a Function

In Section 3.1, we learned that the derivative of a function f at a point a is the slope of the line tangent to the graph of f that passes through the point $(a, f(a))$. We now extend the concept of a derivative at a point to all (suitable) points in the domain of f to create a new function called the derivative of f .

The Derivative Function

So far we have computed the derivative of a function (or, equivalently, the slope of the tangent line) at one fixed point on a curve. If this point is moved along the curve, the tangent line also moves, and, in general, its slope changes (Figure 3.14). For this reason, the slope of the tangent line for the function f is itself a function, called the *derivative* of f .

Figure 3.14

We let f' (read *f prime*) denote the derivative function for f , which means that $f'(a)$, when it exists, is the slope of the line tangent to the graph of f at $(a, f(a))$. Using definition (2) for the derivative of f at the point a from Section 3.1, we have

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

We now take an important step. The derivative is a special function, but it works just like any other function. For example, if the graph of f is smooth and 2 is in the domain of f , then $f'(2)$ is the slope of the line tangent to the graph of f at the point $(2, f(2))$. Similarly, if -2 is in the domain of f , then $f'(-2)$ is the slope of the tangent line at the point $(-2, f(-2))$. In fact, if x is *any* point in the domain of f , then $f'(x)$ is the slope of the tangent line at the point $(x, f(x))$. When we introduce a variable point x , the expression $f'(x)$ becomes the *derivative function*.

- To emphasize an important point, $f'(2)$ or $f'(-2)$ or $f'(a)$, for a real number a , are real numbers, whereas f' and $f'(x)$ refer to the derivative *function*.

- The process of finding f' is called *differentiation*, and to *differentiate* f means to find f' .

DEFINITION The Derivative Function

The **derivative** of f is the function

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h},$$

provided the limit exists and x is in the domain of f . If $f'(x)$ exists, we say that f is **differentiable** at x . If f is differentiable at every point of an open interval I , we say that f is differentiable on I .

Notice that the definition of f' applies only at points in the domain of f . Therefore, the domain of f' is no larger than the domain of f . If the limit in the definition of f' fails to exist at some points, then the domain of f' is a subset of the domain of f . Let's use this definition to compute a derivative function.

EXAMPLE 1 Computing a derivative Find the derivative of $f(x) = -x^2 + 6x$.

SOLUTION

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} && \text{Definition of } f'(x) \\ &= \lim_{h \rightarrow 0} \frac{\overbrace{-(x+h)^2 + 6(x+h)}^{f(x+h)} - \overbrace{(-x^2 + 6x)}^{f(x)}}{h} && \text{Substitute.} \\ &= \lim_{h \rightarrow 0} \frac{-(x^2 + 2xh + h^2) + 6x + 6h + x^2 - 6x}{h} && \text{Expand the numerator.} \end{aligned}$$

- Notice that this argument applies for $h > 0$ and for $h < 0$; that is, the limit as $h \rightarrow 0^+$ and the limit as $h \rightarrow 0^-$ are equal.

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{h(-2x - h + 6)}{h} \\
 &= \lim_{h \rightarrow 0} (-2x - h + 6) = -2x + 6
 \end{aligned}$$

Simplify and factor out h .

Cancel h and evaluate the limit.

The derivative is $f'(x) = -2x + 6$, which gives the slope of the tangent line (equivalently, the instantaneous rate of change) at *any* point on the curve. For example, at the point $(1, 5)$, the slope of the tangent line is $f'(1) = -2(1) + 6 = 4$. The slope of the tangent line at $(3, 9)$ is $f'(3) = -2(3) + 6 = 0$, which means the tangent line is horizontal at that point (Figure 3.15).

Figure 3.15

Related Exercises 23–24 ◀

QUICK CHECK 1 In Example 1, determine the slope of the tangent line at $x = 2$. ◀

Figure 3.16

► The notation $\frac{dy}{dx}$ is read *the derivative of y with respect to x* or *dy dx*. It does not mean dy divided by dx , but it is a reminder of the limit of the quotient $\frac{\Delta y}{\Delta x}$.

► The derivative notation dy/dx was introduced by Gottfried Wilhelm von Leibniz (1646–1716), one of the coinventors of calculus. His notation is used today in its original form. The notation used by Sir Isaac Newton (1642–1727), the other coinventor of calculus, is rarely used.

Derivative Notation

For historical and practical reasons, several notations for the derivative are used. To see the origin of one notation, recall that the slope of the secant line through two points $P(x, f(x))$ and $Q(x + h, f(x + h))$ on the curve $y = f(x)$ is $\frac{f(x + h) - f(x)}{h}$. The quantity h is the change in the x -coordinate in moving from P to Q . A standard notation for change is the symbol Δ (upercase Greek letter delta). So we replace h with Δx to represent the change in x . Similarly, $f(x + h) - f(x) = f(x + \Delta x) - f(x)$ is the change in y , denoted Δy (Figure 3.16). Therefore, the slope of the secant line is

$$m_{\text{sec}} = \frac{f(x + \Delta x) - f(x)}{\Delta x} = \frac{\Delta y}{\Delta x}.$$

By letting $\Delta x \rightarrow 0$, the slope of the tangent line at $(x, f(x))$ is

$$f'(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \frac{dy}{dx}.$$

The new notation for the derivative is $\frac{dy}{dx}$; it reminds us that $f'(x)$ is the limit of $\frac{\Delta y}{\Delta x}$ as $\Delta x \rightarrow 0$.

In addition to the notation $f'(x)$ and $\frac{dy}{dx}$, other common ways of writing the derivative include

$$\frac{df}{dx}, \quad \frac{d}{dx}(f(x)), \quad D_x(f(x)), \quad \text{and} \quad y'(x).$$

The following notations represent the derivative of f evaluated at a .

$$f'(a), \quad y'(a), \quad \left. \frac{df}{dx} \right|_{x=a}, \quad \text{and} \quad \left. \frac{dy}{dx} \right|_{x=a}$$

QUICK CHECK 2 What are some other ways to write $f'(3)$, where $y = f(x)$? ◀

► Example 2 gives the first of many derivative formulas to be presented in the text:

$$\frac{d}{dx}(\sqrt{x}) = \frac{1}{2\sqrt{x}}.$$

Remember this result. It will be used often.

Figure 3.17

QUICK CHECK 3 In Example 2, do the slopes of the tangent lines increase or decrease as x increases? Explain. ◀

EXAMPLE 2 A derivative calculation Let $y = f(x) = \sqrt{x}$.

a. Compute $\frac{dy}{dx}$.

b. Find an equation of the line tangent to the graph of f at $(4, 2)$.

SOLUTION

$$\begin{aligned} \text{a. } \frac{dy}{dx} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} && \text{Definition of } \frac{dy}{dx} = f'(x) \\ &= \lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} && \text{Substitute } f(x) = \sqrt{x}. \\ &= \lim_{h \rightarrow 0} \frac{(\sqrt{x+h} - \sqrt{x})(\sqrt{x+h} + \sqrt{x})}{h(\sqrt{x+h} + \sqrt{x})} && \text{Multiply the numerator and denominator by } \sqrt{x+h} + \sqrt{x}. \\ &= \lim_{h \rightarrow 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = \frac{1}{2\sqrt{x}} && \text{Simplify and evaluate the limit.} \end{aligned}$$

b. The slope of the tangent line at $(4, 2)$ is

$$\left. \frac{dy}{dx} \right|_{x=4} = \frac{1}{2\sqrt{4}} = \frac{1}{4}.$$

Therefore, an equation of the tangent line (Figure 3.17) is

$$y - 2 = \frac{1}{4}(x - 4) \quad \text{or} \quad y = \frac{1}{4}x + 1.$$

Related Exercises 37–38 ◀

If a function is given in terms of variables other than x and y , we make an adjustment to the derivative definition. For example, if $y = g(t)$, we replace f with g and x with t to obtain the *derivative of g with respect to t* :

$$g'(t) = \lim_{h \rightarrow 0} \frac{g(t+h) - g(t)}{h}.$$

QUICK CHECK 4 Express the derivative of $p = q(r)$ in three ways. ◀

Other notations for $g'(t)$ include $\frac{dg}{dt}$, $\frac{d}{dt}(g(t))$, $D_t(g(t))$, and $y'(t)$.

EXAMPLE 3 Another derivative calculation Let $g(t) = 1/t^2$ and compute $g'(t)$.

SOLUTION

$$\begin{aligned} g'(t) &= \lim_{h \rightarrow 0} \frac{g(t+h) - g(t)}{h} && \text{Definition of } g' \\ &= \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{1}{(t+h)^2} - \frac{1}{t^2} \right) && \text{Substitute } g(t) = 1/t^2. \\ &= \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{t^2 - (t+h)^2}{t^2(t+h)^2} \right) && \text{Common denominator} \\ &= \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{-2ht - h^2}{t^2(t+h)^2} \right) && \text{Expand the numerator and simplify.} \\ &= \lim_{h \rightarrow 0} \left(\frac{-2t - h}{t^2(t+h)^2} \right) && h \neq 0; \text{ cancel } h. \\ &= -\frac{2}{t^3} && \text{Evaluate the limit.} \end{aligned}$$

Related Exercises 25–27 ◀

Graphs of Derivatives

The function f' is called the derivative of f because it is *derived* from f . The following examples illustrate how to *derive* the graph of f' from the graph of f .

Figure 3.18

► In terms of limits at $x = -2$, we can write $\lim_{h \rightarrow 0^-} \frac{f(-2+h) - f(-2)}{h} = -1$ and $\lim_{h \rightarrow 0^+} \frac{f(-2+h) - f(-2)}{h} = 1$. Because the one-sided limits are not equal, $f'(-2)$ does not exist. The analogous one-sided limits at $x = 0$ are also unequal.

Figure 3.19

Notice that the slopes of the tangent lines change abruptly at $x = -2$ and $x = 0$. As a result, $f'(-2)$ and $f'(0)$ are undefined and the graph of the derivative has a discontinuity at these points.

Related Exercises 17–18 ◀

Figure 3.20

QUICK CHECK 5 Is it true that if $f(x) > 0$ at a point, then $f'(x) > 0$ at that point? Is it true that if $f'(x) > 0$ at a point, then $f(x) > 0$ at that point? Explain. ◀

EXAMPLE 5 Graph of the derivative Sketch the graph of g' using the graph of g (Figure 3.20).

SOLUTION Without an equation for g , the best we can do is to find the general shape of the graph of g' . Here are the key observations.

1. Note that the lines tangent to the graph of g at $x = -3$, -1 , and 1 have a slope of 0. Therefore,

$$g'(-3) = g'(-1) = g'(1) = 0,$$

which means the graph of g' has x -intercepts at these points (Figure 3.21a).

2. For $x < -3$, the slopes of the tangent lines are positive and decrease to 0 as x approaches -3 from the left. Therefore, $g'(x)$ is positive for $x < -3$ and decreases to 0 as x approaches -3 .
3. For $-3 < x < -1$, $g'(x)$ is negative; it initially decreases as x increases and then increases to 0 at $x = -1$. For $-1 < x < 1$, $g'(x)$ is positive; it initially increases as x increases and then returns to 0 at $x = 1$.
4. Finally, $g'(x)$ is negative and decreasing for $x > 1$. Because the slope of g changes gradually, the graph of g' is continuous with no jumps or breaks (Figure 3.21b).

The slope of $y = g(x)$ is zero at $x = -3, -1$, and 1 ...

... so $g'(x) = 0$ at $x = -3, -1$, and 1 .

(a)

(b)

Figure 3.21

Related Exercises 48–50 ◀

Figure 3.22

► Although it is the case in Example 6, a function and its derivative do not always share the same vertical asymptotes.

EXAMPLE 6 Graphing the derivative with asymptotes The graph of the function f is shown in Figure 3.22. Sketch a graph of its derivative.

SOLUTION Identifying intervals on which the slopes of tangent lines are zero, positive, and negative, we make the following observations:

- A horizontal tangent line occurs at approximately $(-\frac{1}{3}, f(-\frac{1}{3}))$. Therefore, $f'(-\frac{1}{3}) = 0$.
- On the interval $(-\infty, -1)$, slopes of tangent lines are negative and increase in magnitude without bound as we approach -1 from the left.
- On the interval $(-1, -\frac{1}{3})$, slopes of tangent lines are negative and increase to zero at $-\frac{1}{3}$.
- On the interval $(-\frac{1}{3}, 1)$, slopes of tangent lines are positive and increase without bound as we approach 1 from the left.
- On the interval $(1, \infty)$, slopes of tangent lines are negative and increase to zero.

Assembling all this information, we obtain a graph of f' shown in Figure 3.23. Notice that f and f' have the same vertical asymptotes. However, as we pass through -1 , the sign of f changes, but the sign of f' does not change. As we pass through 1 , the sign of f does not change, but the sign of f' does change.

Figure 3.23

Related Exercises 51–52 ◀

Continuity

We now return to the discussion of continuity (Section 2.6) and investigate the relationship between continuity and differentiability. Specifically, we show that if a function is differentiable at a point, then it is also continuous at that point.

THEOREM 3.1 Differentiable Implies Continuous

If f is differentiable at a , then f is continuous at a .

Proof: Because f is differentiable at a point a , we know that

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$$

exists. To show that f is continuous at a , we must show that $\lim_{x \rightarrow a} f(x) = f(a)$. The key is the identity

$$f(x) = \frac{f(x) - f(a)}{x - a} (x - a) + f(a), \quad \text{for } x \neq a. \quad (1)$$

Taking the limit as x approaches a on both sides of (1) and simplifying, we have

$$\begin{aligned} \lim_{x \rightarrow a} f(x) &= \lim_{x \rightarrow a} \left(\frac{f(x) - f(a)}{x - a} (x - a) + f(a) \right) && \text{Use identity.} \\ &= \lim_{x \rightarrow a} \left(\underbrace{\frac{f(x) - f(a)}{x - a}}_{f'(a)} \underbrace{(x - a)}_0 + \underbrace{f(a)}_{f(a)} \right) && \text{Theorem 2.3} \\ &= f'(a) \cdot 0 + f(a) && \text{Evaluate limits.} \\ &= f(a). && \text{Simplify.} \end{aligned}$$

QUICK CHECK 6 Verify that the right-hand side of (1) equals $f(x)$ if $x \neq a$. ◀

Therefore, $\lim_{x \rightarrow a} f(x) = f(a)$, which means that f is continuous at a . ▶

Figure 3.24

- The alternative version of Theorem 3.1 is called the *contrapositive* of the first statement of Theorem 3.1. A statement and its contrapositive are two equivalent ways of expressing the same statement.

For example, the statement

If I live in Denver, then I live in

Colorado is logically equivalent to its contrapositive:

If I do not live in Colorado, then I do not live in Denver.

- To avoid confusion about continuity and differentiability, it helps to think about the function $f(x) = |x|$: It is continuous everywhere but not differentiable at 0.

- Continuity requires that $\lim_{x \rightarrow a} (f(x) - f(a)) = 0$.
Differentiability requires more:
 $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ must exist.

- See Exercises 73–76 for a formal definition of a vertical tangent line.

Theorem 3.1 tells us that if f is differentiable at a point, then it is necessarily continuous at that point. Therefore, if f is *not* continuous at a point, then f is *not* differentiable there (Figure 3.24). So Theorem 3.1 can be stated in another way.

THEOREM 3.1 (ALTERNATIVE VERSION) Not Continuous Implies Not Differentiable

If f is not continuous at a , then f is not differentiable at a .

It is tempting to read more into Theorem 3.1 than what it actually states. If f is continuous at a point, f is *not* necessarily differentiable at that point. For example, consider the continuous function in Figure 3.25 and note the **corner point** at a . Ignoring the portion of the graph for $x > a$, we might be tempted to conclude that ℓ_1 is the line tangent to the curve at a . Ignoring the part of the graph for $x < a$, we might incorrectly conclude that ℓ_2 is the line tangent to the curve at a . The slopes of ℓ_1 and ℓ_2 are not equal. Because of the abrupt change in the slope of the curve at a , f is not differentiable at a : The limit that defines f' does not exist at a .

Figure 3.25

Another common situation occurs when the graph of a function f has a vertical tangent line at a . In this case, $f'(a)$ is undefined because the slope of a vertical line is undefined. A vertical tangent line may occur at a sharp point on the curve called a **cusp** (for example, the function $f(x) = \sqrt{|x|}$ in Figure 3.26a). In other cases, a vertical tangent line may occur without a cusp (for example, the function $f(x) = \sqrt[3]{x}$ in Figure 3.26b).

Figure 3.26

When Is a Function Not Differentiable at a Point?

A function f is *not* differentiable at a if at least one of the following conditions holds:

- f is not continuous at a (Figure 3.24).
- f has a corner at a (Figure 3.25).
- f has a vertical tangent at a (Figure 3.26).

Figure 3.27

Figure 3.28

EXAMPLE 7 Continuous and differentiable Consider the graph of g in Figure 3.27.

- Find the values of x in the interval $(-4, 4)$ at which g is not continuous.
- Find the values of x in the interval $(-4, 4)$ at which g is not differentiable.
- Sketch a graph of the derivative of g .

SOLUTION

- The function g fails to be continuous at -2 (where the one-sided limits are not equal) and at 2 (where g is not defined).
- Because it is not continuous at ± 2 , g is not differentiable at those points. Furthermore, g is not differentiable at 0 , because the graph has a cusp at that point.
- A sketch of the derivative (Figure 3.28) has the following features:
 - $g'(x) > 0$, for $-4 < x < -2$ and $0 < x < 2$
 - $g'(x) < 0$, for $-2 < x < 0$ and $2 < x < 4$
 - $g'(x)$ approaches $-\infty$ as $x \rightarrow 0^-$ and as $x \rightarrow 4^-$, and $g'(x)$ approaches ∞ as $x \rightarrow 0^+$
 - $g'(x)$ approaches 0 as $x \rightarrow 2$ from either side, although $g'(2)$ does not exist.

Related Exercises 53–54 ◀

SECTION 3.2 EXERCISES

Getting Started

- For a given function f , what does f' represent?
- If $f'(x) = 3x + 2$, find the slope of the line tangent to the curve $y = f(x)$ at $x = 1, 2$, and 3 .
- Why is the notation $\frac{dy}{dx}$ used to represent the derivative?
- Give three different notations for the derivative of f with respect to x .
- Sketch a graph of a function f , where $f(x) < 0$ and $f'(x) > 0$ for all x in $(0, 1)$.
- Sketch a graph of a function f , where $f(x) > 0$ and $f'(x) < 0$ for all x in $(0, 2)$.
- If f is differentiable at a , must f be continuous at a ?
- If f is continuous at a , must f be differentiable at a ?
- Describe the graph of f if $f(0) = 1$ and $f'(x) = 3$, for $-\infty < x < \infty$.
- Use the graph of $f(x) = |x|$ to find $f'(x)$.
- Use limits to find $f'(x)$ if $f(x) = 7x$.
- Use limits to find $f'(x)$ if $f(x) = -3x$.
- Use limits to find $\frac{dy}{dx}$ if $y = x^2$. Then evaluate $\frac{dy}{dx}\bigg|_{x=3}$ and $\frac{dy}{dx}\bigg|_{x=-2}$.
- The weight $w(x)$ (in pounds) of an Atlantic salmon can be estimated from its length x (in inches). If $33 \leq x \leq 48$, the estimated weight is $w(x) = 1.5x - 35.8$. Use limits to find $w'(x)$ and interpret its meaning. (Source: www.atlanticsalmonfederation.org)

- Matching functions with derivatives** Match graphs a–d of functions with graphs A–C of their derivatives.

- 16. Matching derivatives with functions** Match graphs a–d of derivative functions with possible graphs A–D of the corresponding functions.

- 17–18. Sketching derivatives** Reproduce the graph of f and then sketch a graph of f' on the same axes.

17.

18.

- 19.** Use the graph of f in the figure to do the following.

- Find the values of x in $(-2, 2)$ at which f is not continuous.
- Find the values of x in $(-2, 2)$ at which f is not differentiable.

- 20.** Use the graph of g in the figure to do the following.

- Find the values of x in $(-2, 2)$ at which g is not continuous.
- Find the values of x in $(-2, 2)$ at which g is not differentiable.

Practice Exercises

21–30. Derivatives

- Use limits to find the derivative function f' for the following functions f .
- Evaluate $f'(a)$ for the given values of a .

- $f(x) = 5x + 2$; $a = 1, 2$
- $f(x) = 7$; $a = -1, 2$
- $f(x) = 4x^2 + 1$; $a = 2, 4$
- $f(x) = x^2 + 3x$; $a = -1, 4$
- $f(x) = \frac{1}{x+1}$; $a = -\frac{1}{2}, 5$
- $f(x) = \frac{x}{x+2}$; $a = -1, 0$
- $f(t) = \frac{1}{\sqrt{t}}$; $a = 9, \frac{1}{4}$
- $f(w) = \sqrt{4w-3}$; $a = 1, 3$
- $f(s) = 4s^3 + 3s$; $a = -3, -1$
- $f(t) = 3t^4$; $a = -2, 2$

31–32. Velocity functions A projectile is fired vertically upward into the air, and its position (in feet) above the ground after t seconds is given by the function $s(t)$.

- For the following functions $s(t)$, find the instantaneous velocity function $v(t)$. (Recall that the velocity function v is the derivative of the position function s .)
- Determine the instantaneous velocity of the projectile at $t = 1$ and $t = 2$ seconds.

- $s(t) = -16t^2 + 100t$
- $s(t) = -16t^2 + 128t + 192$

- Evaluate $\frac{dy}{dx}$ and $\frac{dy}{dx}\bigg|_{x=2}$ if $y = \frac{x+1}{x+2}$.

- Evaluate $\frac{ds}{dt}$ and $\frac{ds}{dt}\bigg|_{t=-1}$ if $s = 11t^3 + t + 1$.

35–40. Tangent lines

- Find the derivative function f' for the following functions f .
- Find an equation of the line tangent to the graph of f at $(a, f(a))$ for the given value of a .

- $f(x) = 3x^2 + 2x - 10$; $a = 1$
- $f(x) = 5x^2 - 6x + 1$; $a = 2$
- $f(x) = \sqrt{3x+1}$; $a = 8$
- $f(x) = \sqrt{x+2}$; $a = 7$
- $f(x) = \frac{2}{3x+1}$; $a = -1$
- $f(x) = \frac{1}{x}$; $a = -5$

41. Power and energy Energy is the capacity to do work, and power is the rate at which energy is used or consumed. Therefore, if $E(t)$ is the energy function for a system, then $P(t) = E'(t)$ is the power function. A unit of energy is the kilowatt-hour (1 kWh is the amount of energy needed to light ten 100-W light bulbs for an hour); the corresponding units for power are kilowatts. The following figure shows the energy demand function for a small community over a 25-hour period.

- Estimate the power at $t = 10$ and $t = 20$ hr. Be sure to include units in your calculation.
- At what times on the interval $[0, 25]$ is the power zero?
- At what times on the interval $[0, 25]$ is the power a maximum?

42. Slope of a line Consider the line $f(x) = mx + b$, where m and b are constants. Show that $f'(x) = m$ for all x . Interpret this result.

43. A derivative formula

- Use the definition of the derivative to determine $\frac{d}{dx}(ax^2 + bx + c)$, where a , b , and c are constants.
- Let $f(x) = 4x^2 - 3x + 10$ and use part (a) to find $f'(x)$.
- Use part (b) to find $f'(1)$.

44. A derivative formula

- Use the definition of the derivative to determine $\frac{d}{dx}(\sqrt{ax + b})$, where a and b are constants.
- Let $f(x) = \sqrt{5x + 9}$ and use part (a) to find $f'(x)$.
- Use part (b) to find $f'(-1)$.

45–46. Analyzing slopes Use the points A, B, C, D, and E in the following graphs to answer these questions.

- At which points is the slope of the curve negative?
- At which points is the slope of the curve positive?
- Using A–E, list the slopes in decreasing order.

47. Matching functions with derivatives Match the functions a–d in the first set of figures with the derivative functions A–D in the next set of figures.

48–52. Sketching derivatives Reproduce the graph of f and then plot a graph of f' on the same axes.

51.

52.

53. Where is the function continuous? Differentiable? Use the graph of f in the figure to do the following.

- Find the values of x in $(0, 3)$ at which f is not continuous.
- Find the values of x in $(0, 3)$ at which f is not differentiable.
- Sketch a graph of f' .

54. Where is the function continuous? Differentiable? Use the graph of g in the figure to do the following.

- Find the values of x in $(0, 4)$ at which g is not continuous.
- Find the values of x in $(0, 4)$ at which g is not differentiable.
- Sketch a graph of g' .

55. **Voltage on a capacitor** A capacitor is a device in an electrical circuit that stores charge. In one particular circuit, the charge on the capacitor Q varies in time as shown in the figure.

- At what time is the rate of change of the charge Q' the greatest?
- Is Q' positive or negative for $t \geq 0$?

- Is Q' an increasing or decreasing function of time (or neither)?
- Sketch the graph of Q' . You do not need a scale on the vertical axis.

56. **Logistic growth** A common model for population growth uses the logistic (or sigmoid) curve. Consider the logistic curve in the figure, where $P(t)$ is the population at time $t \geq 0$.

- At approximately what time is the rate of growth P' the greatest?
- Is P' positive or negative for $t \geq 0$?
- Is P' an increasing or decreasing function of time (or neither)?
- Sketch the graph of P' . You do not need a scale on the vertical axis.

57. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- If the function f is differentiable for all values of x , then f is continuous for all values of x .
- The function $f(x) = |x + 1|$ is continuous for all x , but not differentiable for all x .
- It is possible for the domain of f to be (a, b) and the domain of f' to be $[a, b]$.

Explorations and Challenges

58. **Looking ahead: Derivative of x^n** Use the definition

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \text{ to find } f'(x) \text{ for the following functions.}$$

- $f(x) = x^2$
- $f(x) = x^3$
- $f(x) = x^4$
- Based on your answers to parts (a)–(c), propose a formula for $f'(x)$ if $f(x) = x^n$, where n is a positive integer.

59. Determining the unknown constant Let

$$f(x) = \begin{cases} 2x^2 & \text{if } x \leq 1 \\ ax - 2 & \text{if } x > 1. \end{cases}$$

Determine a value of a (if possible) for which f' is continuous at $x = 1$.

60. Finding f from f' Sketch the graph of $f'(x) = 2$. Then sketch three possible graphs of f .

61. Finding f from f' Sketch the graph of $f'(x) = x$. Then sketch a possible graph of f . Is more than one graph possible?

62. Finding f from f' Create the graph of a continuous function f such that

$$f'(x) = \begin{cases} 1 & \text{if } x < 0 \\ 0 & \text{if } 0 < x < 1 \\ -1 & \text{if } x > 1. \end{cases}$$

Is more than one graph possible?

63–66. Normal lines A line perpendicular to another line or to a tangent line is often called a **normal line**. Find an equation of the line perpendicular to the line that is tangent to the following curves at the given point P .

63. $y = 3x - 4$; $P(1, -1)$ **64.** $y = \sqrt{x}$; $P(4, 2)$

65. $y = \frac{2}{x}$; $P(1, 2)$ **66.** $y = x^2 - 3x$; $P(3, 0)$

67–70. Aiming a tangent line Given the function f and the point Q , find all points P on the graph of f such that the line tangent to f at P passes through Q . Check your work by graphing f and the tangent lines.

67. $f(x) = x^2 + 1$; $Q(3, 6)$ **68.** $f(x) = -x^2 + 4x - 3$; $Q(0, 6)$

69. $f(x) = \frac{1}{x}$; $Q(-2, 4)$ **70.** $f(x) = 3\sqrt{4x + 1}$; $Q(0, 5)$

71–72. One-sided derivatives The **right-sided** and **left-sided derivatives** of a function at a point a are given by $f'_+(a) =$

$$\lim_{h \rightarrow 0^+} \frac{f(a+h) - f(a)}{h} \text{ and } f'_-(a) = \lim_{h \rightarrow 0^-} \frac{f(a+h) - f(a)}{h},$$

respectively, provided these limits exist. The derivative $f'(a)$ exists if and only if $f'_+(a) = f'_-(a)$.

a. Sketch the following functions.

b. Compute $f'_+(a)$ and $f'_-(a)$ at the given point a .

c. Is f continuous at a ? Is f differentiable at a ?

71. $f(x) = |x - 2|$; $a = 2$

72. $f(x) = \begin{cases} 4 - x^2 & \text{if } x \leq 1 \\ 2x + 1 & \text{if } x > 1 \end{cases}$; $a = 1$

73–76. Vertical tangent lines If a function f is continuous at a and $\lim_{x \rightarrow a} |f'(x)| = \infty$, then the curve $y = f(x)$ has a vertical tangent line at a , and the equation of the tangent line is $x = a$. If a is an endpoint of a domain, then the appropriate one-sided derivative (Exercises 71–72) is used. Use this information to answer the following questions.

73. Graph the following functions and determine the location of the vertical tangent lines.

a. $f(x) = (x - 2)^{1/3}$ **b.** $f(x) = (x + 1)^{2/3}$
c. $f(x) = \sqrt{|x - 4|}$ **d.** $f(x) = x^{5/3} - 2x^{1/3}$

74. The preceding definition of a vertical tangent line includes four cases: $\lim_{x \rightarrow a^+} f'(x) = \pm \infty$ combined with $\lim_{x \rightarrow a^-} f'(x) = \pm \infty$ (for example, one case is $\lim_{x \rightarrow a^+} f'(x) = -\infty$ and $\lim_{x \rightarrow a^-} f'(x) = \infty$).

Sketch a continuous function that has a vertical tangent line at a in each of the four cases.

75. Verify that $f(x) = x^{1/3}$ has a vertical tangent line at $x = 0$.

76. Graph the following curves and determine the location of any vertical tangent lines.

a. $x^2 + y^2 = 9$ **b.** $x^2 + y^2 + 2x = 0$

77. a. Graph the function $f(x) = \begin{cases} x & \text{if } x \leq 0 \\ x + 1 & \text{if } x > 0. \end{cases}$

b. For $x < 0$, what is $f'(x)$?

c. For $x > 0$, what is $f'(x)$?

d. Graph f' on its domain.

e. Is f differentiable at 0? Explain.

78. Is $f(x) = \frac{x^2 - 5x + 6}{x - 2}$ differentiable at $x = 2$? Justify your answer.

QUICK CHECK ANSWERS

- 1.** 2 **2.** $\frac{df}{dx}\bigg|_{x=3}, \frac{dy}{dx}\bigg|_{x=3}, y'(3)$ **3.** The slopes of the tangent lines decrease as x increases because the values of $f'(x) = \frac{1}{2\sqrt{x}}$ decrease as x increases. **4.** $\frac{dq}{dr}, \frac{dp}{dr}, D_r(q(r)), q'(r), p'(r)$ **5.** No; no ◀

3.3 Rules of Differentiation

If you always had to use limits to evaluate derivatives, as we did in Section 3.2, calculus would be a tedious affair. The goal of this chapter is to establish rules and formulas for quickly evaluating derivatives—not just for individual functions but for entire families of functions. By the end of the chapter, you will have learned many time-saving rules and formulas, all of which are listed in the endpapers of the text.

Figure 3.29

- The derivative of a constant function is 0 at every point because the values of a constant function do not change. This means the instantaneous rate of change is 0 at every point.

QUICK CHECK 1 Find the values of

$$\frac{d}{dx}(11) \text{ and } \frac{d}{dx}(\pi). \blacktriangleleft$$

- Note that this factoring formula agrees with familiar factoring formulas for differences of squares and cubes:

$$x^2 - a^2 = (x - a)(x + a)$$

$$x^3 - a^3 = (x - a)(x^2 + ax + a^2)$$

The Constant and Power Rules for Derivatives

The graph of the **constant function** $f(x) = c$ is a horizontal line with a slope of 0 at every point (Figure 3.29). It follows that $f'(x) = 0$ or, equivalently, $\frac{d}{dx}(c) = 0$ (Exercise 82). This observation leads to the *Constant Rule* for derivatives.

THEOREM 3.2 Constant Rule

If c is a real number, then $\frac{d}{dx}(c) = 0$.

Next, consider power functions of the form $f(x) = x^n$, where n is a nonnegative integer. If you completed Exercise 58 in Section 3.2, you used the limit definition of the derivative to discover that

$$\frac{d}{dx}(x^2) = 2x, \quad \frac{d}{dx}(x^3) = 3x^2, \quad \text{and} \quad \frac{d}{dx}(x^4) = 4x^3.$$

In each case, the derivative of x^n could be evaluated by placing the exponent n in front of x as a coefficient and decreasing the exponent by 1. Based on these observations, we state and prove the following theorem.

THEOREM 3.3 Power Rule

If n is a nonnegative integer, then $\frac{d}{dx}(x^n) = nx^{n-1}$.

Proof: We let $f(x) = x^n$ and use the definition of the derivative in the form

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}.$$

With $n = 1$ and $f(x) = x$, we have

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a} = \lim_{x \rightarrow a} \frac{x - a}{x - a} = 1,$$

as given by the Power Rule.

With $n \geq 2$ and $f(x) = x^n$, note that $f(x) - f(a) = x^n - a^n$. A factoring formula gives

$$x^n - a^n = (x - a)(x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1}).$$

Therefore,

$$\begin{aligned} f'(a) &= \lim_{x \rightarrow a} \frac{x^n - a^n}{x - a} && \text{Definition of } f'(a) \\ &= \lim_{x \rightarrow a} \frac{(x - a)(x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1})}{x - a} && \text{Factor } x^n - a^n. \\ &= \lim_{x \rightarrow a} (x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1}) && \text{Cancel common factors.} \\ &= \underbrace{a^{n-1} + a^{n-2} \cdot a + \cdots + a \cdot a^{n-2} + a^{n-1}}_{n \text{ terms}} = na^{n-1}. && \text{Evaluate the limit.} \end{aligned}$$

Replacing a with the variable x in $f'(a) = na^{n-1}$, we obtain the result given in the Power Rule for $n \geq 2$. Finally, note that the Constant Rule is consistent with the Power Rule with $n = 0$. ▶

EXAMPLE 1 Derivatives of power and constant functions Evaluate the following derivatives.

a. $\frac{d}{dx}(x^9)$ b. $\frac{d}{dx}(x)$ c. $\frac{d}{dx}(2^8)$

SOLUTION

a. $\frac{d}{dx}(x^9) = 9x^{9-1} = 9x^8$ **Power Rule**

b. $\frac{d}{dx}(x) = \frac{d}{dx}(x^1) = 1x^0 = 1$ **Power Rule**

c. You might be tempted to use the Power Rule here, but $2^8 = 256$ is a constant. So by the Constant Rule, $\frac{d}{dx}(2^8) = 0$.

Related Exercises 19–22 ◀

QUICK CHECK 2 Use the graph of $y = x$ to give a geometric explanation of why

$\frac{d}{dx}(x) = 1$. ◀

Constant Multiple Rule

Consider the problem of finding the derivative of a constant c multiplied by a function f (assuming f' exists). We apply the definition of the derivative in the form

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

to the function cf :

$$\begin{aligned} \frac{d}{dx}(cf(x)) &= \lim_{h \rightarrow 0} \frac{cf(x+h) - cf(x)}{h} && \text{Definition of the derivative of } cf \\ &= \lim_{h \rightarrow 0} \frac{c(f(x+h) - f(x))}{h} && \text{Factor out } c. \\ &= c \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} && \text{Theorem 2.3} \\ &= cf'(x). && \text{Definition of } f'(x) \end{aligned}$$

This calculation leads to the *Constant Multiple Rule* for derivatives.

► Theorem 3.4 says that the derivative of a constant multiplied by a function is the constant multiplied by the derivative of the function.

THEOREM 3.4 Constant Multiple Rule

If f is differentiable at x and c is a constant, then

$$\frac{d}{dx}(cf(x)) = cf'(x).$$

EXAMPLE 2 Derivatives of constant multiples of functions Evaluate the following derivatives.

a. $\frac{d}{dx}\left(-\frac{7x^{11}}{8}\right)$ b. $\frac{d}{dt}\left(\frac{3}{8}\sqrt{t}\right)$

SOLUTION

$$\begin{aligned} \text{a. } \frac{d}{dx}\left(-\frac{7x^{11}}{8}\right) &= -\frac{7}{8} \cdot \frac{d}{dx}(x^{11}) && \text{Constant Multiple Rule} \\ &= -\frac{7}{8} \cdot 11x^{10} && \text{Power Rule} \\ &= -\frac{77}{8}x^{10} && \text{Simplify.} \end{aligned}$$

► In Example 2 of Section 3.2, we proved

$$\text{that } \frac{d}{dt}(\sqrt{t}) = \frac{1}{2\sqrt{t}}.$$

$$\begin{aligned} \text{b. } \frac{d}{dt}\left(\frac{3}{8}\sqrt{t}\right) &= \frac{3}{8} \cdot \frac{d}{dt}(\sqrt{t}) && \text{Constant Multiple Rule} \\ &= \frac{3}{8} \cdot \frac{1}{2\sqrt{t}} && \frac{d}{dt}(\sqrt{t}) = \frac{1}{2\sqrt{t}} \\ &= \frac{3}{16\sqrt{t}} \end{aligned}$$

Related Exercises 23, 24, 28 ◀

Sum Rule

Many functions are sums of simpler functions. Therefore, it is useful to establish a rule for calculating the derivative of the sum of two or more functions.

► In words, Theorem 3.5 states that the derivative of a sum is the sum of the derivatives.

THEOREM 3.5 Sum Rule

If f and g are differentiable at x , then

$$\frac{d}{dx}(f(x) + g(x)) = f'(x) + g'(x).$$

Proof: Let $F = f + g$, where f and g are differentiable at x , and use the definition of the derivative:

$$\begin{aligned} \frac{d}{dx}(f(x) + g(x)) &= F'(x) \\ &= \lim_{h \rightarrow 0} \frac{F(x+h) - F(x)}{h} && \text{Definition of derivative} \\ &= \lim_{h \rightarrow 0} \frac{(f(x+h) + g(x+h)) - (f(x) + g(x))}{h} && F = f + g \\ &= \lim_{h \rightarrow 0} \left(\frac{f(x+h) - f(x)}{h} + \frac{g(x+h) - g(x)}{h} \right) && \text{Regroup.} \\ &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} + \lim_{h \rightarrow 0} \frac{g(x+h) - g(x)}{h} && \text{Theorem 2.3} \\ &= f'(x) + g'(x). && \text{Definition of } f' \text{ and } g' \end{aligned}$$

QUICK CHECK 3 If $f(x) = x^2$ and $g(x) = 2x$, what is the derivative of $f(x) + g(x)$? ◀

The Sum Rule can be extended to three or more differentiable functions, $f_1, f_2, \dots, f_n$, to obtain the **Generalized Sum Rule**:

$$\frac{d}{dx}(f_1(x) + f_2(x) + \cdots + f_n(x)) = f_1'(x) + f_2'(x) + \cdots + f_n'(x).$$

The difference of two functions $f - g$ can be rewritten as the sum $f + (-g)$. By combining the Sum Rule with the Constant Multiple Rule, the **Difference Rule** is established:

$$\frac{d}{dx}(f(x) - g(x)) = f'(x) - g'(x).$$

Let's put the Sum and Difference Rules to work on one of the more common problems: differentiating polynomials.

EXAMPLE 3 Derivative of a polynomial Determine $\frac{d}{dw}(2w^3 + 9w^2 - 6w + 4)$.

SOLUTION

$$\begin{aligned}
 & \frac{d}{dw}(2w^3 + 9w^2 - 6w + 4) \\
 &= \frac{d}{dw}(2w^3) + \frac{d}{dw}(9w^2) - \frac{d}{dw}(6w) + \frac{d}{dw}(4) && \text{Generalized Sum Rule and Difference Rule} \\
 &= 2\frac{d}{dw}(w^3) + 9\frac{d}{dw}(w^2) - 6\frac{d}{dw}(w) + \frac{d}{dw}(4) && \text{Constant Multiple Rule} \\
 &= 2 \cdot 3w^2 + 9 \cdot 2w - 6 \cdot 1 + 0 && \text{Power Rule and Constant Rule} \\
 &= 6w^2 + 18w - 6 && \text{Simplify.}
 \end{aligned}$$

Related Exercises 31–33 ◀

The technique used to differentiate the polynomial in Example 3 may be used for *any* polynomial. Much of the remainder of this chapter is devoted to discovering differentiation rules for rational, algebraic, and trigonometric functions.

Figure 3.30

EXAMPLE 4 Slope of a tangent line Let $f(x) = 2x^3 - 15x^2 + 24x$. For what values of x does the line tangent to the graph of f have a slope of 6?

SOLUTION The tangent line has a slope of 6 when

$$f'(x) = 6x^2 - 30x + 24 = 6.$$

Subtracting 6 from both sides of the equation and factoring, we have

$$6(x^2 - 5x + 3) = 0.$$

Using the quadratic formula, the roots are

$$x = \frac{5 - \sqrt{13}}{2} \approx 0.697 \quad \text{and} \quad x = \frac{5 + \sqrt{13}}{2} \approx 4.303.$$

Therefore, the slope of the curve at these points is 6 (Figure 3.30).

QUICK CHECK 4 Determine the point(s) at which $f(x) = x^3 - 12x$ has a horizontal tangent line. ◀

Higher-Order Derivatives

► The prime notation, f' , f'' , and f''' , is typically used only for the first, second, and third derivatives.

Because the derivative of a function f is a function in its own right, we can take the derivative of f' . The result is the *second derivative of f* , denoted f'' (read *f double prime*). The derivative of the second derivative is the *third derivative of f* , denoted f''' or (read *f triple prime*). In general, derivatives of order $n \geq 2$ are called *higher-order derivatives*.

- Parentheses are placed around n to distinguish a derivative from a power. Therefore, $f^{(n)}$ is the n th derivative of f , and f^n is the function f raised to the n th power. By convention, $f^{(0)}$ is the function f itself.

- The notation $\frac{d^2f}{dx^2}$ comes from $\frac{d}{dx}\left(\frac{df}{dx}\right)$ and is read $d^2 f dx$ squared.

DEFINITION Higher-Order Derivatives

Assuming $y = f(x)$ can be differentiated as often as necessary, the **second derivative** of f is

$$f''(x) = \frac{d}{dx}(f'(x)).$$

For integers $n \geq 1$, the **n th derivative** of f is

$$f^{(n)}(x) = \frac{d}{dx}(f^{(n-1)}(x)).$$

Other common notations for the second derivative of $y = f(x)$ include $\frac{d^2y}{dx^2}$ and $\frac{d^2f}{dx^2}$; the notations $\frac{d^n y}{dx^n}$, $\frac{d^n f}{dx^n}$, and $y^{(n)}$ are used for the n th derivative of f .

EXAMPLE 5 Finding higher-order derivatives Find the third derivative of the following functions.

a. $f(x) = 3x^3 - 5x + 12$

b. $y = 3t + 2t^{10}$

SOLUTION

a.

$$f'(x) = 9x^2 - 5$$

$$f''(x) = \frac{d}{dx}(9x^2 - 5) = 18x$$

$$f'''(x) = 18$$

b. Here we use an alternative notation for higher-order derivatives:

$$\frac{dy}{dt} = \frac{d}{dt}(3t + 2t^{10}) = 3 + 20t^9$$

$$\frac{d^2y}{dt^2} = \frac{d}{dt}(3 + 20t^9) = 180t^8$$

$$\frac{d^3y}{dt^3} = \frac{d}{dt}(180t^8) = 1440t^7.$$

QUICK CHECK 5 With $f(x) = x^5$, find $f^{(5)}(x)$ and $f^{(6)}(x)$. ◀

SECTION 3.3 EXERCISES

Getting Started

- If the limit definition of a derivative can be used to find f' , then what is the purpose of using other rules to find f' ?
- In this section, we showed that the rule $\frac{d}{dx}(x^n) = nx^{n-1}$ is valid for what values of n ?
- Why is the derivative of a constant function zero?
- How do you find the derivative of the sum of two functions $f + g$?
- How do you find the derivative of a constant multiplied by a function?
- How do you find the fifth derivative of a function?
- Given that $f'(3) = 6$ and $g'(3) = -2$, find $(f + g)'(3)$.
- If $f'(3) = 6$ and $g(x) = f(x) + x^2 + 1$, find $g'(3)$.

9–11. Let $F(x) = f(x) + g(x)$, $G(x) = f(x) - g(x)$, and $H(x) = 3f(x) + 2g(x)$, where the graphs of f and g are shown in the figure. Find each of the following.

9. $F'(2)$ 10. $G'(6)$ 11. $H'(2)$

12–14. Use the table to find the following derivatives.

x	1	2	3	4	5
$f'(x)$	3	5	2	1	4
$g'(x)$	2	4	3	1	5

12. $\left. \frac{d}{dx}(f(x) + g(x)) \right|_{x=1}$ 13. $\left. \frac{d}{dx}(1.5f(x)) \right|_{x=2}$
14. $\left. \frac{d}{dx}(2x - 3g(x)) \right|_{x=4}$
15. If $f(t) = t^{10}$, find $f'(t)$, $f''(t)$, and $f'''(t)$.
16. Find an equation of the line tangent to the graph of $y = x^2$ at $x = 3$.
17. The line tangent to the graph of f at $x = 5$ is $y = \frac{1}{10}x - 2$. Find $\left. \frac{d}{dx}(4f(x)) \right|_{x=5}$.
18. The line tangent to the graph of f at $x = 3$ is $y = 4x - 2$ and the line tangent to the graph of g at $x = 3$ is $y = -5x + 1$. Find the values of $(f + g)(3)$ and $(f + g)'(3)$.

Practice Exercises

19–38. Derivatives Find the derivative of the following functions. See Example 2 of Section 3.2 for the derivative of $\sqrt{x}$.

19. $y = x^5$ 20. $f(t) = t$
21. $f(x) = 5$ 22. $g(x) = 2^3$
23. $f(x) = 5x^3$ 24. $g(w) = \frac{5}{6}w^{12}$
25. $h(t) = \frac{t^2}{2} + 1$ 26. $f(v) = v^{100} + v + 10$
27. $p(x) = 8x$ 28. $g(t) = 6\sqrt{t}$
29. $g(t) = 100t^2$ 30. $f(s) = \frac{\sqrt{s}}{4}$
31. $f(x) = 3x^4 + 7x$ 32. $g(x) = 6x^5 - \frac{5}{2}x^2 + x + 5$
33. $f(x) = 10x^4 - 32x + 4^3$ 34. $f(t) = 6\sqrt{t} - 4t^3 + 9$

35. $g(w) = 2w^3 + 3w^2 + 10w$ 36. $s(t) = 4\sqrt{t} - \frac{1}{4}t^4 + t + 1$

37. $f(x) = \begin{cases} x^2 + 1 & \text{if } x \leq 0 \\ 2x^2 + x + 1 & \text{if } x > 0 \end{cases}$

38. $g(w) = \begin{cases} w & \text{if } w \leq 1 \\ 2w^3 + 4w + 5 & \text{if } w > 1 \end{cases}$

- 39. Height estimate** The distance an object falls (when released from rest, under the influence of Earth's gravity, and with no air resistance) is given by $d(t) = 16t^2$, where d is measured in feet and t is measured in seconds. A rock climber sits on a ledge on a vertical wall and carefully observes the time it takes for a small stone to fall from the ledge to the ground.

- Compute $d'(t)$. What units are associated with the derivative and what does it measure?
- If it takes 6 s for a stone to fall to the ground, how high is the ledge? How fast is the stone moving when it strikes the ground (in miles per hour)?

- 40. Projectile trajectory** The position of a small rocket that is launched vertically upward is given by $s(t) = -5t^2 + 40t + 100$, for $0 \leq t \leq 10$, where t is measured in seconds and s is measured in meters above the ground.

- Find the rate of change in the position (instantaneous velocity) of the rocket, for $0 \leq t \leq 10$.
- At what time is the instantaneous velocity zero?
- At what time does the instantaneous velocity have the greatest magnitude, for $0 \leq t \leq 10$?
- Graph the position and instantaneous velocity, for $0 \leq t \leq 10$.

- 41. City urbanization** City planners model the size of their city using the function $A(t) = -\frac{1}{50}t^2 + 2t + 20$, for $0 \leq t \leq 50$, where A is measured in square miles and t is the number of years after 2010.

- Compute $A'(t)$. What units are associated with this derivative and what does the derivative measure?
- How fast will the city be growing when it reaches a size of 38 mi²?
- Suppose the population density of the city remains constant from year to year at 1000 people/mi². Determine the growth rate of the population in 2030.

- 42. Cell growth** When observations begin at $t = 0$, a cell culture has 1200 cells and continues to grow according to the function $p(t) = 1200 + 24t^4$, where p is the number of cells and t is measured in days.

- Compute $p'(t)$. What units are associated with the derivative and what does it measure?
- On the interval $[0, 4]$, when is the growth rate $p'(t)$ the least? When is it the greatest?

- 43. Weight of Atlantic salmon** The weight $w(x)$ (in pounds) of an Atlantic salmon that is x inches long can be estimated by the function

$$w(x) = \begin{cases} 0.4x - 5 & \text{if } 19 \leq x \leq 21 \\ 0.8x - 13.4 & \text{if } 21 < x \leq 32 \\ 1.5x - 35.8 & \text{if } x > 32. \end{cases}$$

Calculate $w'(x)$ and explain the physical meaning of this derivative. (Source: www.atlanticsalmonfederation.org)

44–54. Derivatives of products and quotients Find the derivative of the following functions by first expanding or simplifying the expression. Simplify your answers.

44. $f(x) = (\sqrt{x} + 1)(\sqrt{x} - 1)$

45. $f(x) = (2x + 1)(3x^2 + 2)$

46. $g(r) = (5r^3 + 3r + 1)(r^2 + 3)$

47. $f(w) = \frac{w^3 - w}{w}$

48. $y = \frac{12s^3 - 8s^2 + 12s}{4s}$

49. $h(x) = (x^2 + 1)^2$

50. $h(x) = \sqrt{x}(\sqrt{x} - x^{3/2})$

51. $g(x) = \frac{x^2 - 1}{x - 1}$

52. $h(x) = \frac{x^3 - 6x^2 + 8x}{x^2 - 2x}$

53. $y = \frac{x - a}{\sqrt{x} - \sqrt{a}}$, where a is a positive constant

54. $y = \frac{x^2 - 2ax + a^2}{x - a}$, where a is a constant

55–58. Equations of tangent lines

- Find an equation of the line tangent to the given curve at a .
- Use a graphing utility to graph the curve and the tangent line on the same set of axes.

55. $y = -3x^2 + 2$; $a = 1$

56. $y = x^3 - 4x^2 + 2x - 1$; $a = 2$

57. $y = \sqrt{x}$; $a = 4$

58. $y = \frac{1}{2}x^4 + x$; $a = 2$

59. Finding slope locations Let $f(x) = x^2 - 6x + 5$.

- Find the values of x for which the slope of the curve $y = f(x)$ is 0.
- Find the values of x for which the slope of the curve $y = f(x)$ is 2.

60. Finding slope locations Let $f(t) = t^3 - 27t + 5$.

- Find the values of t for which the slope of the curve $y = f(t)$ is 0.
- Find the values of t for which the slope of the curve $y = f(t)$ is 21.

61. Finding slope locations Let $f(x) = 2x^3 - 3x^2 - 12x + 4$.

- Find all points on the graph of f at which the tangent line is horizontal.
- Find all points on the graph of f at which the tangent line has slope 60.

62. Finding slope locations Let $f(x) = \sqrt{x}$.

- Use $f'(x)$ to explain why the graph of f has no horizontal tangent line.
- Find all points on the graph of f at which the tangent line has slope $\frac{1}{4}$.

63. Finding slope locations Let $f(x) = 4\sqrt{x} - x$.

- Find all points on the graph of f at which the tangent line is horizontal.
- Find all points on the graph of f at which the tangent line has slope $-\frac{1}{2}$.

64–68. Higher-order derivatives Find $f'(x)$, $f''(x)$, and $f'''(x)$ for the following functions.

64. $f(x) = 3x^3 + 5x^2 + 6x$

65. $f(x) = 5x^4 + 10x^3 + 3x + 6$

66. $f(x) = 3x^{12} + 4x^3$

67. $f(x) = \frac{x^2 - 7x - 8}{x + 1}$

68. $f(x) = \frac{1}{8}x^4 - 3x^2 + 1$

69. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- $\frac{d}{dx}(10^5) = 5 \cdot 10^4$.
- The slope of a line tangent to $f(x) = 4x + 1$ is never 0.
- $\frac{d^n}{dx^n}(5x^3 + 2x + 5) = 0$, for any integer $n \geq 3$.

70. Tangent lines Suppose $f(3) = 1$ and $f'(3) = 4$. Let $g(x) = x^2 + f(x)$ and $h(x) = 3f(x)$.

- Find an equation of the line tangent to $y = g(x)$ at $x = 3$.
- Find an equation of the line tangent to $y = h(x)$ at $x = 3$.

71. Derivatives from tangent lines Suppose the line tangent to the graph of f at $x = 2$ is $y = 4x + 1$ and suppose the line tangent to the graph of g at $x = 2$ has slope 3 and passes through $(0, -2)$. Find an equation of the line tangent to the following curves at $x = 2$.

- $y = f(x) + g(x)$
- $y = f(x) - 2g(x)$
- $y = 4f(x)$

72. Tangent line Find the equation of the line tangent to the curve $y = x + \sqrt{x}$ that has slope 2.

73. Tangent line given Determine the constants b and c such that the line tangent to $f(x) = x^2 + bx + c$ at $x = 1$ is $y = 4x + 2$.

74–77. Derivatives from a graph Let $F = f + g$ and $G = 3f - g$, where the graphs of f and g are shown in the figure. Find the following derivatives.

74. $F'(2)$

75. $G'(2)$

76. $F'(5)$

77. $G'(5)$

78–81. Derivatives from limits The following limits represent $f'(a)$ for some function f and some real number a .

- Find a possible function f and number a .
- Evaluate the limit by computing $f'(a)$.

78. $\lim_{x \rightarrow 1} \frac{x^{100} - 1}{x - 1}$

79. $\lim_{x \rightarrow 1} \frac{x^7 + x^6 - 2}{x - 1}$

$$80. \lim_{h \rightarrow 0} \frac{(1+h)^8 + (1+h)^3 - 2}{h}$$

$$81. \lim_{h \rightarrow 0} \frac{\sqrt{9+h} - \sqrt{9}}{h}$$

Explorations and Challenges

82. Constant Rule proof For the constant function $f(x) = c$, use the definition of the derivative to show that $f'(x) = 0$.

83. Alternative proof of the Power Rule The Binomial Theorem states that for any positive integer n ,

$$(a+b)^n = a^n + na^{n-1}b + \frac{n(n-1)}{2 \cdot 1}a^{n-2}b^2 + \frac{n(n-1)(n-2)}{3 \cdot 2 \cdot 1}a^{n-3}b^3 + \cdots + nab^{n-1} + b^n.$$

Use this formula and the definition

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \text{ to show that } \frac{d}{dx}(x^n) = nx^{n-1}, \text{ for any positive integer } n.$$

84. Power Rule for negative integers Suppose n is a negative integer and $f(x) = x^n$. Use the following steps to prove that $f'(a) = na^{n-1}$, which means the Power Rule for positive integers extends to all integers. This result is proved in Section 3.4 by a different method.

a. Assume $m = -n$, so that $m > 0$. Use the definition

$$f'(a) = \lim_{x \rightarrow a} \frac{x^n - a^n}{x - a} = \lim_{x \rightarrow a} \frac{x^{-m} - a^{-m}}{x - a}.$$

Simplify using the factoring rule (which is valid for $n > 0$)

$$x^n - a^n = (x - a)(x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1})$$

until it is possible to take the limit.

b. Use this result to find $\frac{d}{dx}(x^{-7})$ and $\frac{d}{dx}\left(\frac{1}{x^{10}}\right)$.

85. Extending the Power Rule to $n = \frac{1}{2}, \frac{3}{2}$, and $\frac{5}{2}$ With

Theorem 3.3 and Exercise 84, we have shown that the Power Rule, $\frac{d}{dx}(x^n) = nx^{n-1}$, applies to any integer n . Later in the chapter, we extend this rule so that it applies to any real number n .

a. Explain why the Power Rule is consistent with the formula

$$\frac{d}{dx}(\sqrt{x}) = \frac{1}{2\sqrt{x}}.$$

b. Prove that the Power Rule holds for $n = \frac{3}{2}$. (Hint: Use the definition of the derivative: $\frac{d}{dx}(x^{3/2}) = \lim_{h \rightarrow 0} \frac{(x+h)^{3/2} - x^{3/2}}{h}$.)

$$\frac{d}{dx}(x^{3/2}) = \lim_{h \rightarrow 0} \frac{(x+h)^{3/2} - x^{3/2}}{h}.$$

c. Prove that the Power Rule holds for $n = \frac{5}{2}$.

d. Propose a formula for $\frac{d}{dx}(x^{n/2})$ for any positive integer n .

QUICK CHECK ANSWERS

1. $\frac{d}{dx}(11) = 0$ and $\frac{d}{dx}(\pi) = 0$ because 11 and π are constants.

2. The slope of the curve $y = x$ is 1 at any point; therefore,

$$\frac{d}{dx}(x) = 1. \quad 3. 2x + 2 \quad 4. x = 2 \text{ and } x = -2$$

$$5. f^{(5)}(x) = 120, f^{(6)}(x) = 0 \blacktriangleleft$$

3.4 The Product and Quotient Rules

The derivative of a sum of functions is the sum of the derivatives. So you might assume the derivative of a product of functions is the product of the derivatives. Consider, however, the functions $f(x) = x^3$ and $g(x) = x^4$. In this case, $\frac{d}{dx}(f(x)g(x)) = \frac{d}{dx}(x^7) = 7x^6$, but $f'(x)g'(x) = 3x^2 \cdot 4x^3 = 12x^5$. Therefore, $\frac{d}{dx}(f \cdot g) \neq f' \cdot g'$. Similarly, the derivative of a quotient is *not* the quotient of the derivatives. The purpose of this section is to develop rules for differentiating products and quotients of functions.

Product Rule

Here is an anecdote that suggests the formula for the Product Rule. Imagine running along a road at a constant speed. Your speed is determined by two factors: the length of your stride and the number of strides you take each second. Therefore,

$$\text{running speed} = \text{stride length} \cdot \text{stride rate}.$$

For example, if your stride length is 3 ft per stride and you take 2 strides/s, then your speed is 6 ft/s.

Now suppose your stride length increases by 0.5 ft, from 3 to 3.5 ft. Then the change in speed is calculated as follows:

$$\begin{aligned} \text{change in speed} &= \text{change in stride length} \cdot \text{stride rate} \\ &= 0.5 \cdot 2 = 1 \text{ ft/s.} \end{aligned}$$

Alternatively, suppose your stride length remains constant but your stride rate increases by 0.25 stride/s, from 2 to 2.25 strides/s. Then

$$\begin{aligned}\text{change in speed} &= \text{stride length} \cdot \text{change in stride rate} \\ &= 3 \cdot 0.25 = 0.75 \text{ ft/s}.\end{aligned}$$

If both your stride rate and stride length change simultaneously, we expect two contributions to the change in your running speed:

$$\begin{aligned}\text{change in speed} &= (\text{change in stride length} \cdot \text{stride rate}) \\ &\quad + (\text{stride length} \cdot \text{change in stride rate}) \\ &= 1 \text{ ft/s} + 0.75 \text{ ft/s} = 1.75 \text{ ft/s}.\end{aligned}$$

This argument correctly suggests that the derivative (or rate of change) of a product of two functions has *two components*, as shown by the following rule.

► In words, Theorem 3.6 states that the derivative of the product of two functions equals the derivative of the first function multiplied by the second function, plus the first function multiplied by the derivative of the second function.

THEOREM 3.6 Product Rule

If f and g are differentiable at x , then

$$\frac{d}{dx}(f(x)g(x)) = f'(x)g(x) + f(x)g'(x).$$

Proof: We apply the definition of the derivative to the function fg :

$$\frac{d}{dx}(f(x)g(x)) = \lim_{h \rightarrow 0} \frac{f(x+h)g(x+h) - f(x)g(x)}{h}.$$

A useful tactic is to add $-f(x)g(x+h) + f(x)g(x+h)$ (which equals 0) to the numerator, so that

$$\frac{d}{dx}(f(x)g(x)) = \lim_{h \rightarrow 0} \frac{f(x+h)g(x+h) - f(x)g(x+h) + f(x)g(x+h) - f(x)g(x)}{h}.$$

The fraction is now split and the numerators are factored:

$$\begin{aligned}\frac{d}{dx}(f(x)g(x)) &= \lim_{h \rightarrow 0} \frac{f(x+h)g(x+h) - f(x)g(x+h)}{h} + \lim_{h \rightarrow 0} \frac{f(x)g(x+h) - f(x)g(x)}{h} \\ &= \lim_{h \rightarrow 0} \left(\overbrace{\frac{f(x+h) - f(x)}{h}}^{\text{approaches } f'(x) \text{ as } h \rightarrow 0} \cdot \overbrace{g(x+h)}^{\text{approaches } g(x) \text{ as } h \rightarrow 0} \right) + \lim_{h \rightarrow 0} \left(\overbrace{f(x)}^{\text{equals } f(x) \text{ as } h \rightarrow 0} \cdot \overbrace{\frac{g(x+h) - g(x)}{h}}^{\text{approaches } g'(x) \text{ as } h \rightarrow 0} \right) \\ &= f'(x) \cdot g(x) + f(x) \cdot g'(x).\end{aligned}$$

► As $h \rightarrow 0$, $f(x)$ does not change in value because it is independent of h .

The continuity of g is used to conclude that $\lim_{h \rightarrow 0} g(x+h) = g(x)$. 

EXAMPLE 1 Using the Product Rule Find and simplify the following derivatives.

a. $\frac{d}{dv}(v^2(2\sqrt{v} + 1))$ b. $\frac{d}{dx}((x^3 - 8)(x^2 + 4))$

► In Example 2 of Section 3.2, we proved

$$\text{that } \frac{d}{dv}(\sqrt{v}) = \frac{1}{2\sqrt{v}}.$$

QUICK CHECK 1 Find the derivative of $f(x) = x^5$. Then find the same derivative using the Product Rule with $f(x) = x^2x^3$. ◀

SOLUTION

$$\begin{aligned} \text{a. } \frac{d}{dv}(v^2(2\sqrt{v} + 1)) &= \left(\frac{d}{dv}(v^2)\right)(2\sqrt{v} + 1) + v^2\left(\frac{d}{dv}(2\sqrt{v} + 1)\right) && \text{Product Rule} \\ &= 2v(2\sqrt{v} + 1) + v^2\left(2 \cdot \frac{1}{2\sqrt{v}}\right) && \text{Evaluate the derivatives.} \\ &= 4v^{3/2} + 2v + v^{3/2} = 5v^{3/2} + 2v && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{b. } \frac{d}{dx}((x^3 - 8)(x^2 + 4)) &= \underbrace{3x^2}_{\frac{d}{dx}(x^3 - 8)} \cdot (x^2 + 4) + (x^3 - 8) \cdot \underbrace{(2x)}_{\frac{d}{dx}(x^2 + 4)} = x(5x^3 + 12x - 16) \end{aligned}$$

Related Exercises 19–20 ◀

Quotient Rule

Consider the quotient $q(x) = \frac{f(x)}{g(x)}$ and note that $f(x) = g(x)q(x)$. By the Product Rule, we have

$$f'(x) = g'(x)q(x) + g(x)q'(x).$$

Solving for $q'(x)$, we find that

$$q'(x) = \frac{f'(x) - g'(x)q(x)}{g(x)}.$$

Substituting $q(x) = \frac{f(x)}{g(x)}$ produces a rule for finding $q'(x)$:

$$\begin{aligned} q'(x) &= \frac{f'(x) - g'(x) \frac{f(x)}{g(x)}}{g(x)} && \text{Replace } q(x) \text{ with } \frac{f(x)}{g(x)}. \\ &= \frac{g(x) \left(f'(x) - g'(x) \frac{f(x)}{g(x)} \right)}{g(x) \cdot g(x)} && \text{Multiply numerator and denominator by } g(x). \\ &= \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}. && \text{Simplify.} \end{aligned}$$

► In words, Theorem 3.7 states that the derivative of the quotient of two functions equals the denominator multiplied by the derivative of the numerator minus the numerator multiplied by the derivative of the denominator, all divided by the denominator squared. An easy way to remember the Quotient Rule is with

$$\frac{\text{LoD(Hi)} - \text{HiD(Lo)}}{(\text{Lo})^2}.$$

This calculation produces the correct result for the derivative of a quotient. However, there is one subtle point: How do we know that the derivative of f/g exists in the first place? A complete proof of the Quotient Rule is outlined in Exercise 92.

THEOREM 3.7 Quotient Rule

If f and g are differentiable at x and $g(x) \neq 0$, then the derivative of f/g at x exists and

$$\frac{d}{dx} \left(\frac{f(x)}{g(x)} \right) = \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}.$$

EXAMPLE 2 Using the Quotient Rule Find and simplify the following derivatives.

a. $\frac{d}{dx}\left(\frac{x^2 + 3x + 4}{x^2 - 1}\right)$ b. $\frac{d}{dx}(2x^{-3})$

SOLUTION

► The Product and Quotient Rules are used on a regular basis throughout this text. It is a good idea to memorize these rules (along with the other derivative rules and formulas presented in this chapter) so that you can evaluate derivatives quickly.

$$\begin{aligned} \text{a. } \frac{d}{dx}\left(\frac{x^2 + 3x + 4}{x^2 - 1}\right) &= \frac{\overbrace{(x^2 - 1) \cdot \text{the derivative of } (x^2 + 3x + 4)}^{\text{the denominator}} - \overbrace{(x^2 + 3x + 4) \cdot \text{the derivative of } (x^2 - 1)}^{\text{the denominator}}}{(x^2 - 1)^2} && \text{Quotient Rule} \\ &= \frac{2x^3 - 2x + 3x^2 - 3 - 2x^3 - 6x^2 - 8x}{(x^2 - 1)^2} && \text{Expand.} \\ &= -\frac{3x^2 + 10x + 3}{(x^2 - 1)^2} && \text{Simplify.} \end{aligned}$$

b. We rewrite $2x^{-3}$ as $\frac{2}{x^3}$ and use the Quotient Rule:

$$\frac{d}{dx}\left(\frac{2}{x^3}\right) = \frac{x^3 \cdot 0 - 2 \cdot 3x^2}{(x^3)^2} = -\frac{6}{x^4} = -6x^{-4}.$$

Related Exercises 22, 25 ◀

QUICK CHECK 2 Find the derivative of $f(x) = x^5$. Then find the same derivative using the Quotient Rule with $f(x) = x^8/x^3$. ◀

EXAMPLE 3 Finding tangent lines Find an equation of the line tangent to the graph of

$$f(x) = \frac{x^2 + 1}{x^2 - 4} \text{ at the point } (3, 2). \text{ Plot the curve and tangent line.}$$

SOLUTION To find the slope of the tangent line, we compute f' using the Quotient Rule:

$$\begin{aligned} f'(x) &= \frac{(x^2 - 4)2x - (x^2 + 1)2x}{(x^2 - 4)^2} && \text{Quotient Rule} \\ &= \frac{2x^3 - 8x - 2x^3 - 2x}{(x^2 - 4)^2} = -\frac{10x}{(x^2 - 4)^2}. && \text{Simplify.} \end{aligned}$$

The slope of the tangent line at $(3, 2)$ is

$$m_{\tan} = f'(3) = -\frac{10(3)}{(3^2 - 4)^2} = -\frac{6}{5}.$$

Therefore, an equation of the tangent line is

$$y - 2 = -\frac{6}{5}(x - 3), \quad \text{or} \quad y = -\frac{6}{5}x + \frac{28}{5}.$$

The graphs of f and the tangent line are shown in **Figure 3.31**.

Related Exercises 57–58 ◀

Figure 3.31

Extending the Power Rule to Negative Integers

The Power Rule in Section 3.3 says that $\frac{d}{dx}(x^n) = nx^{n-1}$, for nonnegative integers n . Using the Quotient Rule, we show that the Power Rule also holds if n is a negative integer. Assume n is a negative integer and let $m = -n$, so that $m > 0$. Then

$$\begin{aligned}
 \frac{d}{dx}(x^n) &= \frac{d}{dx}\left(\frac{1}{x^m}\right) & x^n &= \frac{1}{x^{-n}} = \frac{1}{x^m} \\
 &= \frac{\overbrace{x^m \left(\frac{d}{dx}(1)\right)}^{\text{derivative of a constant is 0}} - \overbrace{1 \left(\frac{d}{dx}x^m\right)}^{\text{equals } mx^{m-1}}}{(x^m)^2} & & \text{Quotient Rule} \\
 &= -\frac{mx^{m-1}}{x^{2m}} & & \text{Simplify.} \\
 &= -mx^{-m-1} & \frac{x^{m-1}}{x^{2m}} &= x^{m-1-2m} \\
 &= nx^{n-1}. & & \text{Replace } -m \text{ with } n.
 \end{aligned}$$

This calculation leads to the first extension of the Power Rule; the rule now applies to all integers. In Theorem 3.8, we assert that, in fact, the Power Rule is valid for all real powers. A proof of this theorem appears in Chapter 7.

► In Theorem 3.8, it is necessary to restrict the domain for some values of n . If n is irrational, then the Power Rule holds, provided that $x > 0$. If n is a rational number of the form p/q , where p and q are integers with no common factors and q is even, then the rule holds, provided that $x > 0$.

THEOREM 3.8 Power Rule (general form)

If n is any real number, then

$$\frac{d}{dx}(x^n) = nx^{n-1}.$$

QUICK CHECK 3 Find the derivative of $f(x) = 1/x^5$ in two different ways: using the Power Rule and using the Quotient Rule. ◀

EXAMPLE 4 Using the Power Rule Find the following derivatives.

$$\begin{array}{ll}
 \text{a. } \frac{d}{dx}\left(\frac{9}{x^5}\right) & \text{b. } \frac{d}{dt}\left(\frac{3t^{16} - 4}{t^6}\right) \\
 \text{c. } \frac{d}{dz}(6\sqrt[3]{z}) & \text{d. } \frac{d}{dx}\left(\frac{3x^{5/2}}{2x^2 + 4}\right)
 \end{array}$$

SOLUTION

$$\text{a. } \frac{d}{dx}\left(\frac{9}{x^5}\right) = \frac{d}{dx}(9x^{-5}) = 9(-5x^{-6}) = -45x^{-6} = -\frac{45}{x^6}$$

b. This derivative can be evaluated by the Quotient Rule, but an alternative method is to rewrite the expression using negative powers:

$$\frac{3t^{16} - 4}{t^6} = \frac{3t^{16}}{t^6} - \frac{4}{t^6} = 3t^{10} - 4t^{-6}.$$

We now differentiate using the Power Rule:

$$\frac{d}{dt}\left(\frac{3t^{16} - 4}{t^6}\right) = \frac{d}{dt}(3t^{10} - 4t^{-6}) = 30t^9 + 24t^{-7}.$$

- c. Express the cube root as a power and then apply the Constant Multiple and Power Rules:

$$\begin{aligned}\frac{d}{dz}(6\sqrt[3]{z}) &= \frac{d}{dz}(6z^{1/3}) && \sqrt[3]{z} = z^{1/3} \\ &= 6 \cdot \frac{1}{3} z^{-2/3} && \text{Constant Multiple and Power Rules} \\ &= 2z^{-2/3}. && \text{Simplify.}\end{aligned}$$

- d. The Quotient and Power Rules are required:

$$\begin{aligned}\frac{d}{dx}\left(\frac{3x^{5/2}}{2x^2 + 4}\right) &= \frac{(2x^2 + 4) \cdot \frac{15}{2}x^{3/2} - 3x^{5/2} \cdot 4x}{(2x^2 + 4)^2} && \text{Quotient and Power Rules} \\ &= \frac{15x^{7/2} + 30x^{3/2} - 12x^{7/2}}{(2(x^2 + 2))^2} && \text{Simplify.} \\ &= \frac{3x^{7/2} + 30x^{3/2}}{4(x^2 + 2)^2} && \text{Combine like terms.} \\ &= \frac{3x^{3/2}(x^2 + 10)}{4(x^2 + 2)^2}. && \text{Factor.}\end{aligned}$$

Related Exercises 37, 41, 49 ◀

Rates of Change

Remember that the derivative has multiple uses and interpretations. The following example illustrates the derivative as a rate of change of a population. Specifically, the derivative tells us when the population is growing most rapidly and how the population behaves in the long run.

EXAMPLE 5 Population growth rates The population of a culture of cells increases and approaches a constant level (called the *steady state* or *carrying capacity*). The population is modeled by the function $p(t) = 400\left(\frac{t^2 + 1}{t^2 + 4}\right)$, where $t \geq 0$ is measured in hours (Figure 3.32)

- Compute and graph the instantaneous growth rate of the population for $t \geq 0$.
- At approximately what time is the instantaneous growth rate the greatest?
- What is the steady-state population?

► Methods for determining exactly when the growth rate is a maximum are discussed in Chapter 4.

SOLUTION

- a. The instantaneous growth rate is given by the derivative of the population function:

$$\begin{aligned}p'(t) &= \frac{d}{dt}\left(400\left(\frac{t^2 + 1}{t^2 + 4}\right)\right) \\ &= 400 \frac{(t^2 + 4)(2t) - (t^2 + 1)(2t)}{(t^2 + 4)^2} && \text{Quotient Rule} \\ &= \frac{2400t}{(t^2 + 4)^2}. && \text{Simplify.}\end{aligned}$$

The growth rate has units of cells per hour; its graph is shown in Figure 3.32.

- The growth rate $p'(t)$ has a maximum value at the point at which the population curve is steepest. Using a graphing utility, this point corresponds to $t \approx 1.15$ hr and the growth rate has a value of $p'(1.15) \approx 97$ cells/hr.
- To determine whether the population approaches a fixed value after a long period of time (the steady-state population), we investigate the limit of the population function as $t \rightarrow \infty$. In this case, the steady-state population exists and is

$$\lim_{t \rightarrow \infty} p(t) = \lim_{t \rightarrow \infty} 400 \underbrace{\left(\frac{t^2 + 1}{t^2 + 4}\right)}_{\text{approaches 1}} = 400,$$

Figure 3.32

which is confirmed by the population curve in Figure 3.32. Notice that as the population approaches its steady state, the growth rate p' approaches zero.

Combining Derivative Rules

Some situations call for the use of multiple differentiation rules. This section concludes with one such example.

EXAMPLE 6 Combining derivative rules Find the derivative of

$$y = \frac{4x(2x^3 - 3x^{-1})}{x^2 + 1}.$$

SOLUTION In this case, we have the quotient of two functions, with a product in the numerator.

$$\begin{aligned} \frac{dy}{dx} &= \frac{(x^2 + 1) \cdot \frac{d}{dx}(4x(2x^3 - 3x^{-1})) - (4x(2x^3 - 3x^{-1})) \cdot \frac{d}{dx}(x^2 + 1)}{(x^2 + 1)^2} && \text{Quotient Rule} \\ &= \frac{(x^2 + 1)(4(2x^3 - 3x^{-1}) + 4x(6x^2 + 3x^{-2})) - (4x(2x^3 - 3x^{-1}))(2x)}{(x^2 + 1)^2} && \text{Product Rule in the numerator} \\ &= \frac{8x(2x^4 + 4x^2 + 3)}{(x^2 + 1)^2} && \text{Simplify.} \end{aligned}$$

Related Exercises 43–44 ◀

SECTION 3.4 EXERCISES

Getting Started

- How do you find the derivative of the product of two functions that are differentiable at a point?
- How do you find the derivative of the quotient of two functions that are differentiable at a point?
- Use the Product Rule to evaluate and simplify $\frac{d}{dx}((x + 1)(3x + 2))$.
- Use the Product Rule to find $f'(1)$ given that $f(x) = x^4(1 + \sqrt{x})$.
- Use the Quotient Rule to evaluate and simplify $\frac{d}{dx}\left(\frac{x - 1}{3x + 2}\right)$.
- Use the Quotient Rule to find $g'(1)$ given that $g(x) = \frac{x^2}{x + 1}$.

7–14. Find the derivative the following ways:

- Using the Product Rule (Exercises 7–10) or the Quotient Rule (Exercises 11–14). Simplify your result.
- By expanding the product first (Exercises 7–10) or by simplifying the quotient first (Exercises 11–14). Verify that your answer agrees with part (a).

- $f(x) = x(x - 1)$
- $g(t) = (t + 1)(t^2 - t + 1)$
- $f(x) = (x - 1)(3x + 4)$
- $h(z) = (z^3 + 4z^2 + z)(z - 1)$
- $f(t) = \frac{t^4 - 4t^2}{t^2}$
- $g(s) = \frac{6s^3 - 15s^2 + 9s}{3s}$
- $y = \frac{x^2 - a^2}{x - a}$, where a is a constant
- $y = \frac{ax^2 - x^3}{x - a}$, where a is a constant
- Given that $f(1) = 5$, $f'(1) = 4$, $g(1) = 2$, and $g'(1) = 3$, find $\frac{d}{dx}(f(x)g(x))\Big|_{x=1}$ and $\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right)\Big|_{x=1}$.
- Show two ways to differentiate $f(x) = \frac{1}{x^{10}}$.
- Find the slope of the line tangent to the graph of $f(x) = \frac{x}{x + 6}$ at the point $(3, 1/3)$ and at $(-2, -1/2)$.
- Given that $f(2) = 3$, $f'(2) = 4$, and $g(x) = xf(x)$, find $g(2)$ and $g'(2)$.

Practice Exercises

19–56. Derivatives Find and simplify the derivative of the following functions.

19. $f(x) = 3x^4(2x^2 - 1)$ 20. $g(x) = 6x - 2x(x^{10} - 3x^3)$

21. $f(x) = \frac{x}{x+1}$ 22. $f(x) = \frac{x^3 - 4x^2 + x}{x-2}$

23. $f(t) = t^5(\sqrt{t} + 1)$

24. $g(w) = (w^8 + 3)(5w^2 + 3w + 1)$

25. $y = (3t - 1)(2t - 2)^{-1}$ 26. $h(w) = \frac{w^2 - 1}{w^2 + 1}$

27. $g(w) = (w^3 + 4)(w^3 - 1)$ 28. $s(t) = 4(3t^2 + 2t - 1)\sqrt{t}$

29. $h(x) = (x - 1)(x^3 + x^2 + x + 1)$

30. $f(x) = \left(1 + \frac{1}{x^2}\right)(x^2 + 1)$ 31. $g(w) = \frac{w - 1}{\sqrt{w} + 1}$

32. $f(x) = \frac{2x + 1}{x - 1}$ 33. $h(t) = \frac{t}{t^2 + 1}$

34. $f(t) = \frac{t + \sqrt{t} + 1}{t - \sqrt{t} - 1}$ 35. $g(x) = \frac{x^4 + 1}{x^2 - 1}$

36. $y = (2\sqrt{x} - 1)(4x + 1)^{-1}$

37. $f(x) = 3x^{-9}$ 38. $y = \frac{4}{p^3}$

39. $g(t) = 3t^2 + \frac{6}{t^7}$ 40. $y = \frac{w^4 + 5w^2 + w}{w^2}$

41. $g(t) = \frac{t^3 + 3t^2 + t}{t^3}$ 42. $p(x) = \frac{4x^3 + 3x + 1}{2x^5}$

43. $g(x) = \frac{x(3 - x)}{2x^2}$ 44. $h(x) = \frac{(x - 1)(2x^2 - 1)}{(x^3 - 1)}$

45. $h(x) = \frac{4x}{(x^2 + x)(1 - x)}$ 46. $h(x) = \frac{x + 1}{x^2(2x^3 + 1)}$

47. $g(w) = \frac{\sqrt{w} + w}{\sqrt{w} - w}$ 48. $f(x) = \frac{4 - x^2}{x - 2}$

49. $h(w) = \frac{w^{5/3}}{w^{5/3} + 1}$ 50. $g(x) = \frac{x^{4/3} - 1}{x^{4/3} + 1}$

51. $f(x) = 4x^2 - \frac{2x}{5x + 1}$ 52. $f(w) = \frac{w + 2\sqrt{w} - 3}{\sqrt{w} + 3}$

53. $h(r) = \frac{2 - r - \sqrt{r}}{r + 1}$

54. $y = \frac{x - a}{\sqrt{x} - \sqrt{a}}$, where a is a positive constant

55. $h(x) = (5x^7 + 5x)(6x^3 + 3x^2 + 3)$

56. $s(t) = (t + 1)(t + 2)(t + 3)$

57–60. Equations of tangent lines

- a. Find an equation of the line tangent to the given curve at a .
b. Use a graphing utility to graph the curve and the tangent line on the same set of axes.

57. $y = \frac{x + 5}{x - 1}$; $a = 3$ 58. $y = \frac{2x^2}{3x - 1}$; $a = 1$

59. $y = x(2x^{-2} + 1)$; $a = -1$ 60. $y = \frac{x - 2}{x + 1}$; $a = 1$

61–62. Population growth Consider the following population functions.

- a. Find the instantaneous growth rate of the population, for $t \geq 0$.
b. What is the instantaneous growth rate at $t = 5$?
c. Estimate the time when the instantaneous growth rate is greatest.
d. Evaluate and interpret $\lim_{t \rightarrow \infty} p(t)$.
e. Use a graphing utility to graph the population and its growth rate.

61. $p(t) = \frac{200t}{t + 2}$

62. $p(t) = 600\left(\frac{t^2 + 3}{t^2 + 9}\right)$

63. Electrostatic force The magnitude of the electrostatic force between two point charges Q and q of the same sign is given by

$$F(x) = \frac{kQq}{x^2}, \text{ where } x \text{ is the distance (measured in meters)}$$

between the charges and $k = 9 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$ is a physical constant (C stands for coulomb, the unit of charge; N stands for newton, the unit of force).

- a. Find the instantaneous rate of change of the force with respect to the distance between the charges.
b. For two identical charges with $Q = q = 1 \text{ C}$, what is the instantaneous rate of change of the force at a separation of $x = 0.001 \text{ m}$?
c. Does the magnitude of the instantaneous rate of change of the force increase or decrease with the separation? Explain.

64. Gravitational force The magnitude of the gravitational force between two objects of mass M and m is given by $F(x) = -\frac{GMm}{x^2}$,

where x is the distance between the centers of mass of the objects and $G = 6.7 \times 10^{-11} \text{ N}\cdot\text{m}^2/\text{kg}^2$ is the gravitational constant (N stands for newton, the unit of force; the negative sign indicates an attractive force).

- a. Find the instantaneous rate of change of the force with respect to the distance between the objects.
b. For two identical objects of mass $M = m = 0.1 \text{ kg}$, what is the instantaneous rate of change of the force at a separation of $x = 0.01 \text{ m}$?
c. Does the magnitude of the instantaneous rate of change of the force increase or decrease with the separation? Explain.

65. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

a. $\frac{d}{dx}(\pi^5) = 5\pi^4$.

- b. The Quotient Rule must be used to evaluate

$$\frac{d}{dx}\left(\frac{x^2 + 3x + 2}{x}\right).$$

c. $\frac{d}{dx}\left(\frac{1}{x^5}\right) = \frac{1}{5x^4}$.

66–67. Higher-order derivatives Find $f'(x)$, $f''(x)$, and $f'''(x)$.

66. $f(x) = \frac{1}{x}$

67. $f(x) = x^2(2 + x^{-3})$

68–69. First and second derivatives Find $f'(x)$ and $f''(x)$.

68. $f(x) = \frac{x}{x + 2}$

69. $f(x) = \frac{x^2 - 7x}{x + 1}$

- 70. Tangent lines** Suppose $f(2) = 2$ and $f'(2) = 3$. Let

$$g(x) = x^2 f(x) \text{ and } h(x) = \frac{f(x)}{x-3}.$$

- a. Find an equation of the line tangent to $y = g(x)$ at $x = 2$.
 b. Find an equation of the line tangent to $y = h(x)$ at $x = 2$.

- 71. The Witch of Agnesi** The graph of $y = \frac{a^3}{x^2 + a^2}$, where a is a constant, is called the *witch of Agnesi* (named after the 18th-century Italian mathematician Maria Agnesi).

- a. Let $a = 3$ and find an equation of the line tangent to

$$y = \frac{27}{x^2 + 9} \text{ at } x = 2.$$

- b. Plot the function and the tangent line found in part (a).

72–77. Derivatives from a table Use the following table to find the given derivatives.

x	1	2	3	4
$f(x)$	5	4	3	2
$f'(x)$	3	5	2	1
$g(x)$	4	2	5	3
$g'(x)$	2	4	3	1

72. $\frac{d}{dx}(f(x)g(x)) \Big|_{x=1}$

73. $\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) \Big|_{x=2}$

74. $\frac{d}{dx}(xf(x)) \Big|_{x=3}$

75. $\frac{d}{dx}\left(\frac{f(x)}{x+2}\right) \Big|_{x=4}$

76. $\frac{d}{dx}\left(\frac{xf(x)}{g(x)}\right) \Big|_{x=4}$

77. $\frac{d}{dx}\left(\frac{f(x)g(x)}{x}\right) \Big|_{x=4}$

78–79. Flight formula for Indian spotted owlets The following table shows the average body mass $m(t)$ (in grams) and average wing chord length $w(t)$ (in millimeters), along with the derivatives $m'(t)$ and $w'(t)$, of t -week-old Indian spotted owlets. The **flight formula** function $f(t) = w(t)/m(t)$, which is the ratio of wing chord length to mass, is used to predict when these fledglings are old enough to fly. The values of f are less than 1, but approach 1 as t increases. When f is close to 1, the fledglings are capable of flying, which is important for determining when rescued fledglings can be released back into the wild.

(Source: ZooKeys, 132, 2011)

t	$m(t)$	$m'(t)$	$w(t)$	$w'(t)$

- 78.** State the units associated with the following derivatives and state the physical meaning of each derivative.

- a. $m'(t)$ b. $w'(t)$ c. $f'(t)$

- 79.** Complete the following steps to examine the behavior of the flight formula.

- a. Sketch an approximate graph of $y = f(t)$ by plotting and connecting the points $(1, f(1))$, $(1.5, f(1.5))$, $\dots$, $(6.5, f(6.5))$ with a smooth curve.
 b. For what value of t does f appear to be changing most rapidly? Round t to the nearest whole number.
 c. For the value of t found in part (b), use the table and the Quotient Rule to find $f'(t)$. Describe what is happening to the bird at this stage in its life.
 d. Use your graph of f to predict what happens to $f'(t)$ as t grows larger and confirm your prediction by evaluating $f'(6.5)$ using the Quotient Rule. Describe what is happening in the physical development of the fledglings as t grows larger.

80–81. Assume both the graphs of f and g pass through the point $(3, 2)$, $f'(3) = 5$, and $g'(3) = -10$. If $p(x) = f(x)g(x)$ and $q(x) = f(x)/g(x)$, find the following derivatives.

80. $p'(3)$

81. $q'(3)$

- 82.** Given that $f(1) = 2$ and $f'(1) = 2$, find the slope of the curve $y = xf(x)$ at the point $(1, 2)$.

83–86. Derivatives from graphs Use the figure to find the following derivatives.

83. $\frac{d}{dx}(f(x)g(x)) \Big|_{x=4}$

84. $\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) \Big|_{x=4}$

85. $\frac{d}{dx}(xg(x)) \Big|_{x=2}$

86. $\frac{d}{dx}\left(\frac{x^2}{f(x)}\right) \Big|_{x=2}$

- 87. Tangent lines** The line tangent to the curve $y = h(x)$ at $x = 4$ is $y = -3x + 14$. Find an equation of the line tangent to the following curves at $x = 4$.

- a. $y = (x^2 - 3x)h(x)$ b. $y = h(x)/(x + 2)$

- 88. Derivatives from tangent lines** Suppose the line tangent to the graph of f at $x = 2$ is $y = 4x + 1$ and suppose $y = 3x - 2$ is the line tangent to the graph of g at $x = 2$. Find an equation of the line tangent to the following curves at $x = 2$.

- a. $y = f(x)g(x)$ b. $y = f(x)/g(x)$

Explorations and Challenges

- 89. Avoiding tedious work** Given that

$$q(x) = \frac{5x^8 + 6x^5 + 5x^4 + 3x^2 + 20x + 100}{10x^{10} + 8x^9 + 6x^5 + 6x^2 + 4x + 2}, \text{ find } q'(0)$$

without computing $q'(x)$. (Hint: Evaluate $f(0)$, $f'(0)$, $g(0)$, and $g'(0)$ where f is the numerator of q and g is the denominator of q .)

- 90.** Given that $p(x) = (10x^5 + 20x^3 + 100x^2 + 5x + 20) \cdot (10x^5 + 40x^3 + 20x^2 + 4x + 10)$, find $p'(0)$ without computing $p'(x)$.

- 91. Means and tangents** Suppose f is differentiable on an interval containing a and b , and let $P(a, f(a))$ and $Q(b, f(b))$ be distinct points on the graph of f . Let c be the x -coordinate of the point at which the lines tangent to the curve at P and Q intersect, assuming the tangent lines are not parallel (see figure).

- If $f(x) = x^2$, show that $c = (a + b)/2$, the arithmetic mean of a and b , for real numbers a and b .
 - If $f(x) = \sqrt{x}$, show that $c = \sqrt{ab}$, the geometric mean of a and b , for $a > 0$ and $b > 0$.
 - If $f(x) = 1/x$, show that $c = 2ab/(a + b)$, the harmonic mean of a and b , for $a > 0$ and $b > 0$.
 - Find an expression for c in terms of a and b for any (differentiable) function f whenever c exists.
- 92. Proof of the Quotient Rule** Let $F = f/g$ be the quotient of two functions that are differentiable at x .
- Use the definition of F' to show that

$$\frac{d}{dx} \left(\frac{f(x)}{g(x)} \right) = \lim_{h \rightarrow 0} \frac{f(x+h)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}.$$
 - Now add $-f(x)g(x) + f(x)g(x)$ (which equals 0) to the numerator in the preceding limit to obtain

$$\lim_{h \rightarrow 0} \frac{f(x+h)g(x) - f(x)g(x) + f(x)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}.$$
 Use this limit to obtain the Quotient Rule.
 - Explain why $F' = (f/g)'$ exists, whenever $g(x) \neq 0$.

- 93. Product Rule for the second derivative** Assuming the first and second derivatives of f and g exist at x , find a formula for $d^2/dx^2(f(x)g(x))$.
- 94. One of the Leibniz Rules** One of several Leibniz Rules in calculus deals with higher-order derivatives of products. Let $(fg)^{(n)}$ denote the n th derivative of the product fg , for $n \geq 1$.
- Prove that $(fg)^{(2)} = f''g + 2f'g' + fg''$.
 - Prove that, in general,

$$(fg)^{(n)} = \sum_{k=0}^n \binom{n}{k} f^{(k)} g^{(n-k)},$$
 where $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ are the binomial coefficients.
 - Compare the result of (b) to the expansion of $(a + b)^n$.
- 95. Product Rule for three functions** Assume f , g , and h are differentiable at x .
- Use the Product Rule (twice) to find a formula for $d/dx(f(x)g(x)h(x))$.
 - Use the formula in (a) to find $d/dx(\sqrt{x}(x-1)(x+3))$.

QUICK CHECK ANSWERS

- $f'(x) = 5x^4$ by either method
- $f'(x) = 5x^4$ by either method
- $f'(x) = -5x^{-6}$ by either method ◀

3.5 Derivatives of Trigonometric Functions

► Results stated in this section assume angles are measured in *radians*.

Table 3.1

x	$\frac{\sin x}{x}$
± 0.1	0.9983341665
± 0.01	0.9999833334
± 0.001	0.999998333

From variations in market trends and ocean temperatures to daily fluctuations in tides and hormone levels, change is often cyclical or periodic. Trigonometric functions are well suited for describing such cyclical behavior. In this section, we investigate the derivatives of trigonometric functions and their many uses.

Two Special Limits

Our principal goal is to determine derivative formulas for $\sin x$ and $\cos x$. To do this, we use two special limits.

THEOREM 3.9 Trigonometric Limits

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \quad \lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$$

Figure 3.33

Figure 3.34

- Area of a sector of a circle of radius r formed by a central angle θ :

Note that these limits cannot be evaluated by direct substitution because in both cases, the numerator and denominator approach zero as $x \rightarrow 0$. We first examine numerical and graphical evidence supporting Theorem 3.9, and then we offer an analytic proof.

The values of $\frac{\sin x}{x}$, rounded to 10 digits, appear in Table 3.1. As x approaches zero from both sides, it appears that $\frac{\sin x}{x}$ approaches 1. Figure 3.33 shows a graph of $y = \frac{\sin x}{x}$, with a hole at $x = 0$, where the function is undefined. The graphical evidence also strongly suggests (but does not prove) that $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$. Similar evidence indicates that $\frac{\cos x - 1}{x}$ approaches 0 as x approaches 0.

Using a geometric argument and the methods of Chapter 2, we now prove that $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$. The proof that $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$ is found in Exercise 81.

Proof: Consider Figure 3.34, in which $\triangle OAD$, $\triangle OBC$, and the sector OAC of the unit circle (with central angle x) are shown. Observe that with $0 < x < \pi/2$,

$$\text{area of } \triangle OAD < \text{area of sector } OAC < \text{area of } \triangle OBC. \quad (1)$$

Because the circle in Figure 3.34 is a unit circle, $OA = OC = 1$. It follows that $\sin x = \frac{AD}{OA} = AD$, $\cos x = \frac{OD}{OA} = OD$, and $\tan x = \frac{BC}{OC} = BC$. From these observations, we conclude that

- the area of $\triangle OAD = \frac{1}{2} (OD)(AD) = \frac{1}{2} \cos x \sin x$,
- the area of sector $OAC = \frac{1}{2} \cdot 1^2 \cdot x = \frac{x}{2}$, and
- the area of $\triangle OBC = \frac{1}{2} (OC)(BC) = \frac{1}{2} \tan x$.

Substituting these results into (1), we have

$$\frac{1}{2} \cos x \sin x < \frac{x}{2} < \frac{1}{2} \tan x.$$

Replacing $\tan x$ with $\frac{\sin x}{\cos x}$ and multiplying the inequalities by $\frac{2}{\sin x}$ (which is positive) leads to the inequalities

$$\cos x < \frac{x}{\sin x} < \frac{1}{\cos x}.$$

When we take reciprocals and reverse the inequalities, we have

$$\cos x < \frac{\sin x}{x} < \frac{1}{\cos x}, \quad (2)$$

for $0 < x < \pi/2$.

A similar argument shows that the inequalities in (2) also hold for $-\pi/2 < x < 0$. Taking the limit as $x \rightarrow 0$ in (2), we find that

$$\underbrace{\lim_{x \rightarrow 0} \cos x}_1 \leq \lim_{x \rightarrow 0} \frac{\sin x}{x} \leq \underbrace{\lim_{x \rightarrow 0} \frac{1}{\cos x}}_1.$$

The Squeeze Theorem (Theorem 2.5) now implies that $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$.

- $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$ implies that if $|x|$ is small, then $\sin x \approx x$.

EXAMPLE 1 Calculating trigonometric limits Evaluate the following limits.

a. $\lim_{x \rightarrow 0} \frac{\sin 4x}{x}$ b. $\lim_{x \rightarrow 0} \frac{\sin 3x}{\sin 5x}$

SOLUTION

- a. To use the fact that $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$, the argument of the sine function in the numerator must be the same as in the denominator. Multiplying and dividing $\frac{\sin 4x}{x}$ by 4, we evaluate the limit as follows:

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sin 4x}{x} &= \lim_{x \rightarrow 0} \frac{4 \sin 4x}{4x} && \text{Multiply and divide by 4.} \\ &= 4 \lim_{t \rightarrow 0} \underbrace{\frac{\sin t}{t}}_1 && \text{Factor out 4 and let } t = 4x; t \rightarrow 0 \text{ as } x \rightarrow 0. \\ &= 4(1) = 4. && \text{Theorem 3.9} \end{aligned}$$

- b. The first step is to divide the numerator and denominator of $\frac{\sin 3x}{\sin 5x}$ by x :

$$\frac{\sin 3x}{\sin 5x} = \frac{(\sin 3x)/x}{(\sin 5x)/x}.$$

As in part (a), we now divide and multiply $\frac{\sin 3x}{x}$ by 3 and divide and multiply $\frac{\sin 5x}{x}$ by 5. In the numerator, we let $t = 3x$, and in the denominator, we let $u = 5x$. In each case, $t \rightarrow 0$ and $u \rightarrow 0$ as $x \rightarrow 0$. Therefore,

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sin 3x}{\sin 5x} &= \lim_{x \rightarrow 0} \frac{\frac{3 \sin 3x}{3x}}{\frac{5 \sin 5x}{5x}} && \text{Multiply and divide by 3 and 5.} \\ &= \frac{3 \lim_{t \rightarrow 0} (\sin t)/t}{5 \lim_{u \rightarrow 0} (\sin u)/u} && \text{Let } t = 3x \text{ in numerator and } u = 5x \text{ in denominator.} \\ &= \frac{3}{5} \cdot \frac{1}{1} = \frac{3}{5}. && \text{Both limits equal 1.} \end{aligned}$$

QUICK CHECK 1 Evaluate $\lim_{x \rightarrow 0} \frac{\tan 2x}{x}$. ◀

Related Exercises 12–13 ◀

We now use the important limits of Theorem 3.9 to establish the derivatives of $\sin x$ and $\cos x$.

Derivatives of Sine and Cosine Functions

We start with the definition of the derivative,

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h},$$

with $f(x) = \sin x$, and then appeal to the sine addition identity

$$\sin(x+h) = \sin x \cos h + \cos x \sin h.$$

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin x}{h} \\ &= \lim_{h \rightarrow 0} \frac{\sin x \cos h + \cos x \sin h - \sin x}{h} \\ &= \lim_{h \rightarrow 0} \frac{\sin x (\cos h - 1) + \cos x \sin h}{h} \\ &= \lim_{h \rightarrow 0} \frac{\sin x (\cos h - 1)}{h} + \lim_{h \rightarrow 0} \frac{\cos x \sin h}{h} \\ &= \sin x \underbrace{\left(\lim_{h \rightarrow 0} \frac{\cos h - 1}{h} \right)}_0 + \cos x \underbrace{\left(\lim_{h \rightarrow 0} \frac{\sin h}{h} \right)}_1 \\ &= (\sin x)(0) + \cos x(1) \\ &= \cos x. \end{aligned}$$

Simplify.

The fact that $\frac{d}{dx}(\cos x) = -\sin x$ is proved in a similar way using a cosine addition identity (Exercise 83).

$$\frac{d}{dx}(\sin x) = \cos x \qquad \frac{d}{dx}(\cos x) = -\sin x$$

EXAMPLE 2 Derivatives involving trigonometric functions Calculate dy/dx for the following functions.

a. $y = x^2 \cos x$ **b.** $y = \sin x - x \cos x$ **c.** $y = \frac{1 + \sin x}{1 - \sin x}$

$$\begin{aligned} \text{a. } \frac{dy}{dx} &= \frac{d}{dx} (x^2 \cos x) = \overbrace{2x \cos x}^{(\text{derivative of } x^2) \cdot \cos x} + \overbrace{x^2(-\sin x)}^{x^2 \cdot (\text{derivative of } \cos x)} && \text{Product Rule} \\ &= x(2 \cos x - x \sin x) && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{b. } \frac{dy}{dx} &= \frac{d}{dx}(\sin x) - \frac{d}{dx}(x \cos x) && \text{Difference Rule} \\ &= \cos x - ((1) \cos x + x(-\sin x)) && \text{Product Rule} \\ &\quad \underbrace{(1) \cos x}_{\text{derivative of } x} \quad \underbrace{x(-\sin x)}_{x \cdot (\text{derivative of } \cos x)} \\ &= x \sin x && \text{Simplify.} \end{aligned}$$

Figure 3.35

QUICK CHECK 2 At what points on the interval $[0, 2\pi]$ does the graph of $f(x) = \sin x$ have tangent lines with positive slopes? At what points on the interval $[0, 2\pi]$ is $\cos x > 0$? Explain the connection. ◀

$$\begin{aligned}
 \text{c. } \frac{dy}{dx} &= \frac{(1 - \sin x) \overbrace{(\cos x)}^{\text{derivative of } 1 + \sin x} - \overbrace{(1 + \sin x)}^{\text{derivative of } 1 - \sin x} (-\cos x)}{(1 - \sin x)^2} && \text{Quotient Rule} \\
 &= \frac{\cos x - \cos x \sin x + \cos x + \sin x \cos x}{(1 - \sin x)^2} && \text{Expand.} \\
 &= \frac{2 \cos x}{(1 - \sin x)^2} && \text{Simplify.}
 \end{aligned}$$

Related Exercises 25, 27, 29 ◀

Derivatives of Other Trigonometric Functions

The derivatives of $\tan x$, $\cot x$, $\sec x$, and $\csc x$ are obtained using the derivatives of $\sin x$ and $\cos x$ together with the Quotient Rule and trigonometric identities.

► Recall that $\tan x = \frac{\sin x}{\cos x}$, $\cot x = \frac{\cos x}{\sin x}$,
 $\sec x = \frac{1}{\cos x}$, and $\csc x = \frac{1}{\sin x}$.

EXAMPLE 3 Derivative of the tangent function Calculate $\frac{d}{dx}(\tan x)$.

SOLUTION Using the identity $\tan x = \frac{\sin x}{\cos x}$ and the Quotient Rule, we have

$$\begin{aligned}
 \frac{d}{dx}(\tan x) &= \frac{d}{dx} \left(\frac{\sin x}{\cos x} \right) \\
 &= \frac{\overbrace{\cos x \cos x}^{\text{derivative of } \sin x} - \overbrace{\sin x (-\sin x)}^{\text{derivative of } \cos x}}{\cos^2 x} && \text{Quotient Rule} \\
 &= \frac{\cos^2 x + \sin^2 x}{\cos^2 x} && \text{Simplify numerator.} \\
 &= \frac{1}{\cos^2 x} = \sec^2 x. && \cos^2 x + \sin^2 x = 1
 \end{aligned}$$

Therefore, $\frac{d}{dx}(\tan x) = \sec^2 x$.

Related Exercises 52–54 ◀

The derivatives of $\cot x$, $\sec x$, and $\csc x$ are given in Theorem 3.11 (Exercises 52–54).

► One way to remember Theorem 3.11 is to learn the derivatives of the sine, tangent, and secant functions. Then replace each function with its corresponding **cofunction** and put a negative sign on the right-hand side of the new derivative formula.

$$\frac{d}{dx}(\sin x) = \cos x \quad \leftrightarrow$$

$$\frac{d}{dx}(\cos x) = -\sin x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x \quad \leftrightarrow$$

$$\frac{d}{dx}(\cot x) = -\csc^2 x$$

$$\frac{d}{dx}(\sec x) = \sec x \tan x \quad \leftrightarrow$$

$$\frac{d}{dx}(\csc x) = -\csc x \cot x$$

QUICK CHECK 3 The formulas for $\frac{d}{dx}(\cot x)$, $\frac{d}{dx}(\sec x)$, and $\frac{d}{dx}(\csc x)$ can be determined using the Quotient Rule. Why? ◀

THEOREM 3.11 Derivatives of the Trigonometric Functions

$$\begin{aligned}
 \frac{d}{dx}(\sin x) &= \cos x & \frac{d}{dx}(\cos x) &= -\sin x \\
 \frac{d}{dx}(\tan x) &= \sec^2 x & \frac{d}{dx}(\cot x) &= -\csc^2 x \\
 \frac{d}{dx}(\sec x) &= \sec x \tan x & \frac{d}{dx}(\csc x) &= -\csc x \cot x
 \end{aligned}$$

EXAMPLE 4 Derivatives involving sec x and csc x Find the derivative of $y = \sec x \csc x$.

SOLUTION

$$\begin{aligned}
 \frac{dy}{dx} &= \frac{d}{dx} (\sec x \cdot \csc x) \\
 &= \underbrace{\sec x \tan x}_{\text{derivative of } \sec x} \csc x + \sec x \underbrace{(-\csc x \cot x)}_{\text{derivative of } \csc x} && \text{Product Rule} \\
 &= \underbrace{\frac{1}{\cos x}}_{\sec x} \cdot \underbrace{\frac{\sin x}{\cos x}}_{\tan x} \cdot \underbrace{\frac{1}{\sin x}}_{\csc x} - \underbrace{\frac{1}{\cos x}}_{\sec x} \cdot \underbrace{\frac{1}{\sin x}}_{\csc x} \cdot \underbrace{\frac{\cos x}{\sin x}}_{\cot x} && \text{Write functions in terms of } \sin x \text{ and } \cos x. \\
 &= \frac{1}{\cos^2 x} - \frac{1}{\sin^2 x} && \text{Cancel and simplify.} \\
 &= \sec^2 x - \csc^2 x && \text{Definition of } \sec x \text{ and } \csc x
 \end{aligned}$$

Related Exercises 43–44 ◀

Higher-Order Trigonometric Derivatives

Higher-order derivatives of the sine and cosine functions are important in many applications, particularly in problems that involve oscillations, vibrations, or waves. A few higher-order derivatives of $y = \sin x$ reveal a pattern.

$$\begin{aligned}
 \frac{dy}{dx} &= \cos x & \frac{d^2 y}{dx^2} &= \frac{d}{dx} (\cos x) = -\sin x \\
 \frac{d^3 y}{dx^3} &= \frac{d}{dx} (-\sin x) = -\cos x & \frac{d^4 y}{dx^4} &= \frac{d}{dx} (-\cos x) = \sin x
 \end{aligned}$$

We see that the higher-order derivatives of $\sin x$ cycle back periodically to $\pm \sin x$. In general, it can be shown that $\frac{d^{2n} y}{dx^{2n}} = (-1)^n \sin x$, with a similar result for $\cos x$ (Exercise 88). This cyclic behavior in the derivatives of $\sin x$ and $\cos x$ does not occur with the other trigonometric functions.

QUICK CHECK 4 Find $\frac{d^2 y}{dx^2}$ and $\frac{d^4 y}{dx^4}$ when $y = \cos x$. Find $\frac{d^{40} y}{dx^{40}}$ and $\frac{d^{42} y}{dx^{42}}$ when $y = \sin x$. ◀

EXAMPLE 5 Second-order derivatives Find the second derivative of $y = \csc x$.

SOLUTION By Theorem 3.11, $\frac{dy}{dx} = -\csc x \cot x$.

Applying the Product Rule gives the second derivative:

$$\begin{aligned}
 \frac{d^2 y}{dx^2} &= \frac{d}{dx} (-\csc x \cot x) \\
 &= \left(\frac{d}{dx} (-\csc x) \right) \cot x - \csc x \frac{d}{dx} (\cot x) && \text{Product Rule} \\
 &= (\csc x \cot x) \cot x - \csc x (-\csc^2 x) && \text{Calculate derivatives.} \\
 &= \csc x (\cot^2 x + \csc^2 x). && \text{Factor.}
 \end{aligned}$$

SECTION 3.5 EXERCISES

Getting Started

- Why is it not possible to evaluate $\lim_{x \rightarrow 0} \frac{\sin x}{x}$ by direct substitution?
- How is $\lim_{x \rightarrow 0} \frac{\sin x}{x}$ used in this section?

- Explain why the Quotient Rule is used to determine the derivative of $\tan x$ and $\cot x$.
- How can you use the derivatives $\frac{d}{dx}(\sin x) = \cos x$, $\frac{d}{dx}(\tan x) = \sec^2 x$, and $\frac{d}{dx}(\sec x) = \sec x \tan x$ to remember the derivatives of $\cos x$, $\cot x$, and $\csc x$?

5. Let $f(x) = \sin x$. What is the value of $f'(\pi)$?
6. Find the value of $\frac{d}{dx}(\tan x) \Big|_{x=\frac{\pi}{3}}$.
7. Find an equation of the line tangent to the curve $y = \sin x$ at $x = 0$.
8. Where does $\sin x$ have a horizontal tangent line? Where does $\cos x$ have a value of zero? Explain the connection between these two observations.
9. Find $\frac{d^2}{dx^2}(\sin x + \cos x)$. 10. Find $\frac{d^2}{dx^2}(\sec x)$.

Practice Exercises

11–22. Trigonometric limits Use Theorem 3.9 to evaluate the following limits.

11. $\lim_{x \rightarrow 0} \frac{\sin 3x}{x}$ 12. $\lim_{x \rightarrow 0} \frac{\sin 5x}{3x}$
13. $\lim_{x \rightarrow 0} \frac{\sin 7x}{\sin 3x}$ 14. $\lim_{x \rightarrow 0} \frac{\sin 3x}{\tan 4x}$
15. $\lim_{x \rightarrow 0} \frac{\tan 5x}{x}$ 16. $\lim_{\theta \rightarrow 0} \frac{\cos^2 \theta - 1}{\theta}$
17. $\lim_{x \rightarrow 0} \frac{\tan 7x}{\sin x}$ 18. $\lim_{\theta \rightarrow 0} \frac{\sec \theta - 1}{\theta}$
19. $\lim_{x \rightarrow 2} \frac{\sin(x-2)}{x^2 - 4}$ 20. $\lim_{x \rightarrow -3} \frac{\sin(x+3)}{x^2 + 8x + 15}$
21. $\lim_{x \rightarrow 0} \frac{\sin ax}{\sin bx}$, where a and b are constants with $b \neq 0$
22. $\lim_{x \rightarrow 0} \frac{\sin ax}{bx}$, where a and b are constants with $b \neq 0$

23–51. Calculating derivatives Find the derivative of the following functions.

23. $y = \sin x + \cos x$ 24. $y = 5x^2 + \cos x$
25. $y = 3x^4 \sin x$ 26. $y = \sin x + \frac{4 \cos x}{x}$
27. $y = x \sin x$ 28. $y = \frac{x}{\sin x + 1}$
29. $y = \frac{\cos x}{\sin x + 1}$ 30. $y = \frac{\sin x}{1 + \cos x}$
31. $y = \sin x \cos x$
32. $y = \frac{a \sin x + b \cos x}{a \sin x - b \cos x}$; a and b are nonzero constants
33. $y = \cos^2 x$ 34. $y = \frac{x \sin x}{1 + \cos x}$
35. $y = w^2 \sin w + 2w \cos w - 2 \sin w$
36. $y = -x^3 \cos x + 3x^2 \sin x + 6x \cos x - 6 \sin x$
37. $y = x \cos x \sin x$ 38. $y = \frac{1}{2 + \sin x}$
39. $y = \frac{1 - \cos x}{1 + \cos x}$ 40. $y = \frac{1 - \sin x}{1 + \sin x}$
41. $y = \frac{\sin x \cos x}{4 + \sin x \cos x}$ 42. $y = \tan x + \cot x$
43. $y = \sec x + \csc x$ 44. $y = \sec x \tan x$
45. $y = \sqrt{x} \csc x$ 46. $y = \frac{\tan w}{1 + \tan w}$

47. $y = \frac{\cot x}{1 + \csc x}$ 48. $y = \frac{\tan t}{1 + \sec t}$
49. $y = \tan x \sin x$ 50. $y = \csc^2 \theta - 1$
51. $y = x - \cos x \sin x$

52–54. Verifying derivative formulas Verify the following derivative formulas using the Quotient Rule.

52. $\frac{d}{dx}(\cot x) = -\csc^2 x$ 53. $\frac{d}{dx}(\sec x) = \sec x \tan x$
54. $\frac{d}{dx}(\csc x) = -\csc x \cot x$

55. Velocity of an oscillator An object oscillates along a vertical line, and its position in centimeters is given by $y(t) = 30(\sin t - 1)$, where $t \geq 0$ is measured in seconds and y is positive in the upward direction.

- Graph the position function, for $0 \leq t \leq 10$.
- Find the velocity of the oscillator, $v(t) = y'(t)$.
- Graph the velocity function, for $0 \leq t \leq 10$.
- At what times and positions is the velocity zero?
- At what times and positions is the velocity a maximum?
- The acceleration of the oscillator is $a(t) = v'(t)$. Find and graph the acceleration function.

56. Resonance An oscillator (such as a mass on a spring or a component in an electrical circuit) subject to external forces that have the same frequency as the oscillator itself may undergo motion called *resonance* (at least for short periods of time). The position function of an oscillator in resonance has the form $y(t) = At \sin t$, where A is a constant.

- Graph the position function with $A = \frac{1}{2}$, for $0 \leq t \leq 20$. How does the amplitude of the oscillation (the height of the peaks) change as t increases?
- Compute and graph the velocity of the object, $v(t) = y'(t)$ (with $A = \frac{1}{2}$), for $0 \leq t \leq 20$.
- Where do the zeros of the velocity function appear relative to the peaks and valleys of the position function?
- If the oscillator were a suspension bridge, explain why resonance could be catastrophic.

57–64. Second derivatives Find y'' for the following functions.

57. $y = x \sin x$ 58. $y = x^2 \cos x$
59. $y = \frac{\sin x}{x}$ 60. $y = \frac{x}{\cos x}$
61. $y = \cot x$ 62. $y = \tan x$
63. $y = \sec x \csc x$ 64. $y = \cos \theta \sin \theta$

65. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- $\frac{d}{dx}(\sin^2 x) = \cos^2 x$.
- $\frac{d^2}{dx^2}(\sin x) = \sin x$.
- $\frac{d^4}{dx^4}(\cos x) = \cos x$.
- The function $\sec x$ is not differentiable at $x = \pi/2$.

66–71. Trigonometric limits Evaluate the following limits or state that they do not exist. (Hint: Identify each limit as the derivative of a function at a point.)

66. $\lim_{x \rightarrow \pi/2} \frac{\cos x}{x - \pi/2}$ 67. $\lim_{x \rightarrow \pi/4} \frac{\tan x - 1}{x - \pi/4}$

$$68. \lim_{h \rightarrow 0} \frac{\sin\left(\frac{\pi}{6} + h\right) - \frac{1}{2}}{h}$$

$$69. \lim_{h \rightarrow 0} \frac{\cos\left(\frac{\pi}{6} + h\right) - \frac{\sqrt{3}}{2}}{h}$$

$$70. \lim_{x \rightarrow \pi/4} \frac{\cot x - 1}{x - \frac{\pi}{4}}$$

$$71. \lim_{h \rightarrow 0} \frac{\tan\left(\frac{5\pi}{6} + h\right) + \frac{1}{\sqrt{3}}}{h}$$

72–75. Equations of tangent lines

- a. Find an equation of the line tangent to the following curves at the given value of x .
b. Use a graphing utility to plot the curve and the tangent line.

$$72. y = 4 \sin x \cos x; x = \frac{\pi}{3} \quad 73. y = 1 + 2 \sin x; x = \frac{\pi}{6}$$

$$74. y = \csc x; x = \frac{\pi}{4} \quad 75. y = \frac{\cos x}{1 - \cos x}; x = \frac{\pi}{3}$$

76. Locations of tangent lines

- a. For what values of x does $g(x) = x - \sin x$ have a horizontal tangent line?
b. For what values of x does $g(x) = x - \sin x$ have a slope of 1?

77. **Locations of horizontal tangent lines** For what values of x does $f(x) = x - 2 \cos x$ have a horizontal tangent line?

78. **Matching** Match the graphs of the functions in a–d with the graphs of their derivatives in A–D.

79. **A differential equation** A differential equation is an equation involving an unknown function and its derivatives. Consider the differential equation $y''(t) + y(t) = 0$.

- a. Show that $y = A \sin t$ satisfies the equation for any constant A .
b. Show that $y = B \cos t$ satisfies the equation for any constant B .
c. Show that $y = A \sin t + B \cos t$ satisfies the equation for any constants A and B .

Explorations and Challenges

80. **Using identities** Use the identity $\sin 2x = 2 \sin x \cos x$ to find $\frac{d}{dx}(\sin 2x)$. Then use the identity $\cos 2x = \cos^2 x - \sin^2 x$ to express the derivative of $\sin 2x$ in terms of $\cos 2x$.

81. **Proof of $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$** Use the trigonometric identity $\cos^2 x + \sin^2 x = 1$ to prove that $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$. (Hint: Begin by multiplying the numerator and denominator by $\cos x + 1$.)

82. **Another method for proving $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$** Use the half-angle formula $\sin^2 x = \frac{1 - \cos 2x}{2}$ to prove that $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} = 0$.

83. **Proof of $\frac{d}{dx}(\cos x) = -\sin x$** Use the definition of the derivative and the trigonometric identity

$$\cos(x + h) = \cos x \cos h - \sin x \sin h$$

to prove that $\frac{d}{dx}(\cos x) = -\sin x$.

84. **Continuity of a piecewise function** Let

$$f(x) = \begin{cases} \frac{3 \sin x}{x} & \text{if } x \neq 0 \\ a & \text{if } x = 0. \end{cases}$$

For what values of a is f continuous?

85. **Continuity of a piecewise function** Let

$$g(x) = \begin{cases} \frac{1 - \cos x}{2x} & \text{if } x \neq 0 \\ a & \text{if } x = 0. \end{cases}$$

For what values of a is g continuous?

86. **Computing limits with angles in degrees** Suppose your graphing calculator has two functions, one called $\sin x$, which calculates the sine of x when x is in radians, and the other called $s(x)$, which calculates the sine of x when x is in degrees.

- a. Explain why $s(x) = \sin\left(\frac{\pi}{180}x\right)$.
b. Evaluate $\lim_{x \rightarrow 0} \frac{s(x)}{x}$. Verify your answer by estimating the limit on your calculator.

87. **Derivatives of $\sin^n x$** Calculate the following derivatives using the Product Rule.

- a. $\frac{d}{dx}(\sin^2 x)$ b. $\frac{d}{dx}(\sin^3 x)$ c. $\frac{d}{dx}(\sin^4 x)$

d. Based on your answers to parts (a)–(c), make a conjecture

about $\frac{d}{dx}(\sin^n x)$, where n is a positive integer. Then prove the result by induction.

88. Prove that

$$\frac{d^{2n}}{dx^{2n}}(\sin x) = (-1)^n \sin x \quad \text{and} \quad \frac{d^{2n}}{dx^{2n}}(\cos x) = (-1)^n \cos x.$$

89–90. Difference quotients Suppose f is differentiable for all x and consider the function

$$D(x) = \frac{f(x + 0.01) - f(x)}{0.01}.$$

For the following functions, graph D on the given interval, and explain why the graph appears as it does. What is the relationship between the functions f and D ?

89. $f(x) = \sin x$ on $[-\pi, \pi]$ 90. $f(x) = \frac{x^3}{3} + 1$ on $[-2, 2]$

QUICK CHECK ANSWERS

- 2
- $0 < x < \frac{\pi}{2}$ and $\frac{3\pi}{2} < x < 2\pi$. The value of $\cos x$ is the slope of the line tangent to the curve $y = \sin x$.
- The Quotient Rule is used because each function is a quotient when written in terms of the sine and cosine functions.
- $-\cos x$; $\cos x$; $\sin x$; $-\sin x$ ◀

3.6 Derivatives as Rates of Change

The theme of this section is the *derivative as a rate of change*. Observing the world around us, we see that almost everything is in a state of change: The size of the Internet is increasing; your blood pressure fluctuates; as supply increases, prices decrease; and the universe is expanding. This section explores a few of the many applications of this idea and demonstrates why calculus is called the mathematics of change.

- When describing the motion of objects, it is customary to use t as the independent variable to represent time. Generally, motion is assumed to begin at $t = 0$.

Figure 3.36

One-Dimensional Motion

Describing the motion of objects such as projectiles and planets was one of the challenges that led to the development of calculus in the 17th century. We begin by considering the motion of an object confined to one dimension; that is, the object moves along a line. This motion could be horizontal (for example, a car moving along a straight highway), or it could be vertical (such as a projectile launched vertically into the air).

Position and Velocity Suppose an object moves along a straight line and its location at time t is given by the **position function** $s = f(t)$. All positions are measured relative to a reference point $s = 0$. The **displacement** of the object between $t = a$ and $t = a + \Delta t$ is $\Delta s = f(a + \Delta t) - f(a)$, where the elapsed time is Δt units (Figure 3.36).

Recall from Section 2.1 that the *average velocity* of the object over the interval $[a, a + \Delta t]$ is the displacement Δs of the object divided by the elapsed time Δt :

$$v_{\text{av}} = \frac{\Delta s}{\Delta t} = \frac{f(a + \Delta t) - f(a)}{\Delta t}.$$

The average velocity is the slope of the secant line passing through the points $P(a, f(a))$ and $Q(a + \Delta t, f(a + \Delta t))$ (Figure 3.37).

As Δt approaches 0, the average velocity is calculated over smaller and smaller time intervals, and the limiting value of these average velocities, when it exists, is the *instantaneous velocity* at a . This is the same argument used to arrive at the derivative. The conclusion is that the instantaneous velocity at time a , denoted $v(a)$, is the derivative of the position function evaluated at a :

$$v(a) = \lim_{\Delta t \rightarrow 0} \frac{f(a + \Delta t) - f(a)}{\Delta t} = f'(a).$$

Equivalently, the instantaneous velocity at a is the rate of change in the position function at a ; it also equals the slope of the line tangent to the curve $s = f(t)$ at $P(a, f(a))$.

► Using the various derivative notations, the velocity is also written $v(t) = s'(t) = ds/dt$. If *average* or *instantaneous* is not specified, *velocity* is understood to mean instantaneous velocity.

QUICK CHECK 1 Does the speedometer in your car measure average or instantaneous velocity? ◀

DEFINITION Average and Instantaneous Velocity

Let $s = f(t)$ be the position function of an object moving along a line. The **average velocity** of the object over the time interval $[a, a + \Delta t]$ is the slope of the secant line between $(a, f(a))$ and $(a + \Delta t, f(a + \Delta t))$:

$$v_{\text{av}} = \frac{f(a + \Delta t) - f(a)}{\Delta t}.$$

The **instantaneous velocity** at a is the slope of the line tangent to the position curve, which is the derivative of the position function:

$$v(a) = \lim_{\Delta t \rightarrow 0} \frac{f(a + \Delta t) - f(a)}{\Delta t} = f'(a).$$

Figure 3.38

Figure 3.39

EXAMPLE 1 Position and velocity of a patrol car Assume a police station is located along a straight east-west freeway. At noon ($t = 0$), a patrol car leaves the station heading east. The position function of the car $s = f(t)$ gives the location of the car in miles east ($s > 0$) or west ($s < 0$) of the station t hours after noon (Figure 3.38).

- Describe the location of the patrol car during the first 3.5 hr of the trip.
- Calculate the displacement and average velocity of the car between 2:00 P.M. and 3:30 P.M. ($2 \leq t \leq 3.5$).
- At what time(s) is the instantaneous velocity greatest as the car travels east?

SOLUTION

- The graph of the position function indicates the car travels 80 miles east between $t = 0$ (noon) and $t = 1.5$ (1:30 P.M.). The car is at rest and its position does not change from $t = 1.5$ to $t = 2$ (that is, from 1:30 P.M. to 2:00 P.M.). Starting at $t = 2$, the car's distance from the station decreases, which means the car travels west, eventually ending up 20 miles west of the station at $t = 3.5$ (3:30 P.M.) (Figure 3.39).
- The position of the car at 3:30 P.M. is $f(3.5) = -20$ (Figure 3.38; the negative sign indicates the car is 20 miles west of the station), and the position of the car at 2:00 P.M. is $f(2) = 80$. Therefore, the displacement is

$$\Delta s = f(3.5) - f(2) = -20 \text{ mi} - 80 \text{ mi} = -100 \text{ mi}$$

during an elapsed time of $\Delta t = 3.5 - 2 = 1.5$ hr (the *negative* displacement indicates that the car moved 100 miles west). The average velocity is

$$v_{\text{av}} = \frac{\Delta s}{\Delta t} = \frac{-100 \text{ mi}}{1.5 \text{ hr}} \approx -66.7 \text{ mi/hr}.$$

- The greatest eastward instantaneous velocity corresponds to points at which the graph of the position function has the greatest positive slope. The greatest slope occurs between $t = 0.5$ and $t = 1$. During this time interval, the car also has a nearly constant velocity because the curve is approximately linear. We conclude that the eastward velocity is largest from 12:30 P.M. to 1:00 P.M.

Related Exercises 11–12 ◀

Speed and Acceleration When only the magnitude of the velocity is of interest, we use *speed*, which is the absolute value of the velocity:

$$\text{speed} = |v|.$$

For example, a car with an instantaneous velocity of -30 mi/hr has a speed of 30 mi/hr.

- Newton's First Law of Motion says that in the absence of external forces, a moving object has no acceleration, which means the magnitude and direction of the velocity are constant.

A more complete description of an object moving along a line includes its *acceleration*, which is the rate of change of the velocity; that is, acceleration is the derivative of the velocity function with respect to time t . If the acceleration is positive, the object's velocity increases; if it is negative, the object's velocity decreases. Because velocity is the derivative of the position function, acceleration is the second derivative of the position. Therefore,

$$a = \frac{dv}{dt} = \frac{d^2s}{dt^2}.$$

DEFINITION Velocity, Speed, and Acceleration

Suppose an object moves along a line with position $s = f(t)$. Then

the **velocity** at time t is $v = \frac{ds}{dt} = f'(t)$,

the **speed** at time t is $|v| = |f'(t)|$, and

the **acceleration** at time t is $a = \frac{dv}{dt} = \frac{d^2s}{dt^2} = f''(t)$.

QUICK CHECK 2 For an object moving along a line, is it possible for its velocity to increase while its speed decreases? Is it possible for its velocity to decrease while its speed increases? Give an example to support your answers. ◀

- The units of derivatives are consistent with the notation. If s is measured in meters and t is measured in seconds, the units of the velocity $\frac{ds}{dt}$ are m/s. The units of the acceleration $\frac{d^2s}{dt^2}$ are m/s².

Figure 3.40

- Figure 3.40 gives the graph of the position function, not the path of the object. The motion is along a horizontal line.

EXAMPLE 2 Velocity and acceleration Suppose the position (in feet) of an object moving horizontally along a line at time t (in seconds) is $s = t^2 - 5t$, for $0 \leq t \leq 5$ (Figure 3.40). Assume positive values of s correspond to positions to the right of $s = 0$.

- Graph the velocity function on the interval $0 \leq t \leq 5$ and determine when the object is stationary, moving to the left, and moving to the right.
- Graph the acceleration function on the interval $0 \leq t \leq 5$.
- Describe the motion of the object.

SOLUTION

- The velocity is $v = s'(t) = 2t - 5$. The object is stationary when $v = 2t - 5 = 0$, or at $t = 2.5$. Solving $v = 2t - 5 > 0$, the velocity is positive (motion to the right) for $\frac{5}{2} < t \leq 5$. Similarly, the velocity is negative (motion to the left) for $0 \leq t < \frac{5}{2}$. Though the velocity of the object is increasing at all times, its speed is decreasing for $0 \leq t < \frac{5}{2}$, and then increasing for $\frac{5}{2} < t \leq 5$. The graph of the velocity function (Figure 3.41) confirms these observations.
- The acceleration is the derivative of the velocity or $a = v'(t) = s''(t) = 2$. This means that the acceleration is 2 ft/s², for $0 \leq t \leq 5$ (Figure 3.42).
- Starting at an initial position of $s(0) = 0$, the object moves in the negative direction (to the left) with decreasing speed until it comes to rest momentarily at $s(\frac{5}{2}) = -\frac{25}{4}$. The object then moves in the positive direction (to the right) with increasing speed, reaching its initial position at $t = 5$. During this time interval, the acceleration is constant.

Figure 3.41

Figure 3.42

QUICK CHECK 3 Describe the velocity of an object that has a positive constant acceleration. Could an object have a positive acceleration and a decreasing speed? ◀

- The acceleration due to Earth's gravitational field is denoted g . In metric units, $g \approx 9.8 \text{ m/s}^2$ on the surface of Earth; in the U.S. Customary System (USCS), $g \approx 32 \text{ ft/s}^2$.

- The position function in Example 3 is derived in Section 6.1. Once again we mention that the graph of the position function is not the path of the stone.

Free Fall We now consider a problem in which an object moves vertically in Earth's gravitational field, assuming no other forces (such as air resistance) are at work.

EXAMPLE 3 Motion in a gravitational field Suppose a stone is thrown vertically upward with an initial velocity of 64 ft/s from a bridge 96 ft above a river. By Newton's laws of motion, the position of the stone (measured as the height above the river) after t seconds is

$$s(t) = -16t^2 + 64t + 96,$$

where $s = 0$ is the level of the river (Figure 3.43a).

- Find the velocity and acceleration functions.
- What is the highest point above the river reached by the stone?
- With what velocity will the stone strike the river?

SOLUTION

- a. The velocity of the stone is the derivative of the position function, and its acceleration is the derivative of the velocity function. Therefore,

$$v = \frac{ds}{dt} = -32t + 64 \quad \text{and} \quad a = \frac{dv}{dt} = -32.$$

- b. When the stone reaches its high point, its velocity is zero (Figure 3.43b). Solving $v(t) = -32t + 64 = 0$ yields $t = 2$; therefore, the stone reaches its maximum height 2 seconds after it is thrown. Its height (in feet) at that instant is

$$s(2) = -16(2)^2 + 64(2) + 96 = 160.$$

- c. To determine the velocity at which the stone strikes the river, we first determine *when* it reaches the river. The stone strikes the river when $s(t) = -16t^2 + 64t + 96 = 0$. Dividing both sides of the equation by -16 , we obtain $t^2 - 4t - 6 = 0$. Using the quadratic formula, the solutions are $t \approx 5.16$ and $t \approx -1.16$. Because the stone is thrown at $t = 0$, only positive values of t are of interest; therefore, the relevant root is $t \approx 5.16$. The velocity of the stone (in ft/s) when it strikes the river is approximately

$$v(5.16) = -32(5.16) + 64 = -101.12.$$

QUICK CHECK 4 In Example 3, does the rock have a greater speed at $t = 1$ or $t = 3$? ◀

Growth Models

Much of the change in the world around us can be classified as *growth*: Populations, prices, and computer networks all tend to increase in size. Modeling growth is important because it often leads to an understanding of underlying processes and allows for predictions.

We let $p = f(t)$ be the measure of a quantity of interest (for example, the population of a species or the consumer price index), where $t \geq 0$ represents time. The average growth rate of p between time $t = a$ and a later time $t = a + \Delta t$ is the change Δp divided by elapsed time Δt . Therefore, the **average growth rate** of p on the interval $[a, a + \Delta t]$ is

$$\frac{\Delta p}{\Delta t} = \frac{f(a + \Delta t) - f(a)}{\Delta t}.$$

If we now let $\Delta t \rightarrow 0$, then $\frac{\Delta p}{\Delta t}$ approaches the derivative $\frac{dp}{dt}$, which is the **instantaneous growth rate** (or simply **growth rate**) of p with respect to time:

$$\frac{dp}{dt} = \lim_{\Delta t \rightarrow 0} \frac{\Delta p}{\Delta t}.$$

Once again, we see the derivative appearing as an instantaneous rate of change. In the next example, a growth function and its derivative are approximated using real data.

EXAMPLE 4 Internet growth The number of worldwide Internet users between 2000 and 2015 is shown in Figure 3.44. A reasonable fit to the data is given by the function $p(t) = 6t^2 + 98t + 431.2$, where t is measured in years after 2000.

- Use the function p to approximate the average growth rate of Internet users from 2005 ($t = 5$) to 2010 ($t = 10$).
- What was the instantaneous growth rate of Internet users in 2011?
- Use a graphing utility to plot the growth rate dp/dt . What does the graph tell you about the growth rate between 2000 and 2015?
- Assuming the growth function can be extended beyond 2015, what is the predicted number of Internet users in 2020 ($t = 20$)?

SOLUTION

- a. The average growth rate over the interval $[5, 10]$ is

$$\frac{\Delta P}{\Delta t} = \frac{p(10) - p(5)}{10 - 5} \approx \frac{2011.2 - 1071.2}{5} = 188 \text{ million users/year.}$$

- b. The growth rate at time t is $p'(t) = 12t + 98$. In 2011 ($t = 11$), the growth rate was $p'(11) = 230$ million users per year.

- c. The graph of p' , for $0 \leq t \leq 15$, is shown in Figure 3.45. We see that the growth rate is positive and increasing, for $t \geq 0$.

- d. The number of Internet users in 2020 is predicted to be $p(20) \approx 4791$ million, or about 4.8 billion users, which is approximately 62% of the world's population, assuming a projected population of 7.7 billion people in 2020.

QUICK CHECK 5 Using the growth function in Example 4, compare the growth rates in 2001 and 2012. ◀

Economics and Business

Our final examples illustrate how derivatives arise in economics and business. As you will see, the mathematics of derivatives is the same as it is in other applications. However, the vocabulary and interpretation are quite different.

Figure 3.46

- Although x is a whole number of units, we treat it as a continuous variable, which is reasonable if x is large.

Figure 3.47

- The average describes the past; the marginal describes the future.
—Old saying

Figure 3.48

- The approximation $\Delta C/\Delta x \approx C'(x)$ says that the slope of the secant line between $(x, C(x))$ and $(x+1, C(x+1))$ is approximately equal to the slope of the tangent line at $(x, C(x))$. This approximation is good if the cost curve is nearly linear over a 1-unit interval.

Average and Marginal Cost Imagine a company that manufactures large quantities of a product such as mousetraps, DVD players, or snowboards. Associated with the manufacturing process is a *cost function* $C(x)$ that gives the cost of manufacturing the first x items of the product. A simple cost function might have the form $y = C(x) = 500 + 0.1x$, as shown in Figure 3.46. It includes a **fixed cost** of \$500 (setup costs and overhead) that is independent of the number of items produced. It also includes a **unit cost**, or **variable cost**, of \$0.10 per item produced. For example, the cost of producing the first 1000 items is $C(1000) = \$600$.

If the company produces x items at a cost of $C(x)$, then the *average cost* is $\frac{C(x)}{x}$ per item. For the cost function $C(x) = 500 + 0.1x$, the average cost is

$$\frac{C(x)}{x} = \frac{500 + 0.1x}{x} = \frac{500}{x} + 0.1.$$

For example, the average cost of manufacturing the first 1000 items is

$$\frac{C(1000)}{1000} = \frac{\$600}{1000} = \$0.60/\text{unit}.$$

Plotting $C(x)/x$, we see that the average cost decreases as the number of items produced increases (Figure 3.47).

The average cost gives the cost of items already produced. But what about the cost of producing additional items? Once x items have been produced, the cost of producing another Δx items is $C(x + \Delta x) - C(x)$. Therefore, the average cost per item of producing those Δx additional items is

$$\frac{C(x + \Delta x) - C(x)}{\Delta x} = \frac{\Delta C}{\Delta x}.$$

If we let $\Delta x \rightarrow 0$, we see that

$$\lim_{\Delta x \rightarrow 0} \frac{\Delta C}{\Delta x} = C'(x),$$

which is called the *marginal cost*. In reality, we cannot let $\Delta x \rightarrow 0$ because Δx represents whole numbers of items. However, there is a useful interpretation of the marginal cost. Suppose $\Delta x = 1$. Then $\Delta C = C(x + 1) - C(x)$ is the cost to produce *one* additional item. In this case, we write

$$\frac{\Delta C}{\Delta x} = \frac{C(x + 1) - C(x)}{1}.$$

If the *slope* of the cost curve does not vary significantly near the point x , then—as shown in Figure 3.48—we have

$$\frac{\Delta C}{\Delta x} \approx \lim_{\Delta x \rightarrow 0} \frac{\Delta C}{\Delta x} = C'(x).$$

Therefore, the cost of producing one additional item, having already produced x items, is approximated by the marginal cost $C'(x)$. In the preceding example, we have $C'(x) = 0.1$; so if $x = 1000$ items have been produced, then the cost of producing the 1001st item is approximately $C'(1000) = \$0.10$. With this simple linear cost function, the marginal cost tells us what we already know: The cost of producing one additional item is the variable cost of \$0.10. With more realistic cost functions, the marginal cost may be variable.

DEFINITION Average and Marginal Cost

The **cost function** $C(x)$ gives the cost to produce the first x items in a manufacturing process. The **average cost** to produce x items is $\bar{C}(x) = C(x)/x$. The **marginal cost** $C'(x)$ is the approximate cost to produce one additional item after producing x items.

Figure 3.49

EXAMPLE 5 Average and marginal costs Suppose the cost of producing x items is given by the function (Figure 3.49)

$$C(x) = -0.02x^2 + 50x + 100, \quad \text{for } 0 \leq x \leq 1000.$$

- Determine the average and marginal cost functions.
- Determine the average and marginal cost for the first 100 items and interpret these values.
- Determine the average and marginal cost for the first 900 items and interpret these values.

SOLUTION

- a. The average cost is

$$\bar{C}(x) = \frac{C(x)}{x} = \frac{-0.02x^2 + 50x + 100}{x} = -0.02x + 50 + \frac{100}{x}$$

and the marginal cost is

$$\frac{dC}{dx} = -0.04x + 50.$$

The average cost decreases as the number of items produced increases (Figure 3.50a).

The marginal cost decreases linearly with a slope of -0.04 (Figure 3.50b).

Figure 3.50

- b. To produce $x = 100$ items, the average cost is

$$\bar{C}(100) = \frac{C(100)}{100} = \frac{-0.02(100)^2 + 50(100) + 100}{100} = \$49/\text{item}$$

and the marginal cost is

$$C'(100) = -0.04(100) + 50 = \$46/\text{item}.$$

These results mean that the average cost of producing the first 100 items is \$49 per item, but the cost of producing one additional item (the 101st item) is approximately \$46. Therefore, producing one more item is less expensive than the average cost of producing the first 100 items.

- c. To produce $x = 900$ items, the average cost is

$$\bar{C}(900) = \frac{C(900)}{900} = \frac{-0.02(900)^2 + 50(900) + 100}{900} \approx \$32/\text{item}$$

and the marginal cost is

$$C'(900) = -0.04(900) + 50 = \$14/\text{item}.$$

The comparison with part (b) is revealing. The average cost of producing 900 items has dropped to \$32 per item. More striking is that the marginal cost (the cost of producing the 901st item) has dropped to \$14.

QUICK CHECK 6 In Example 5, what happens to the average cost as the number of items produced increases from $x = 1$ to $x = 100$? ◀

Figure 3.51

Elasticity in Economics Economists apply the term *elasticity* to prices, income, capital, labor, and other variables in systems with input and output. Elasticity describes how changes in the input to a system are related to changes in the output. Because elasticity involves change, it also involves derivatives.

A general rule is that as the price p of an item increases, the number of sales of that item decreases. This relationship is expressed in a demand function. For example, suppose sales at a gas station have the linear demand function $D(p) = 1200 - 200p$ (Figure 3.51), where $D(p)$ is the number of gallons sold per day at a price p (measured in dollars per gallon). According to this function, if gas sells at \$3.60/gal, then the owner can expect to sell $D(3.6) = 480$ gallons. If the price is increased, sales decrease.

Suppose the price of a gallon of gasoline increases from \$3.60 to \$3.96 per gallon; call this change $\Delta p = \$0.36$. The resulting change in the number of gallons sold is $\Delta D = D(3.96) - D(3.60) = -72$. (The change is a decrease, so it is negative.) Comparisons of the variables are more meaningful if we work with percentages. Increasing the

price from \$3.60 to \$3.96 per gallon is a percentage change of $\frac{\Delta p}{p} = \frac{\$0.36}{\$3.60} = 10\%$. Sim-

ilarly, the corresponding percentage change in the gallons sold is $\frac{\Delta D}{D} = \frac{-72}{480} = -15\%$.

The *price elasticity of the demand* (or simply, *elasticity*) is the ratio of the percentage change in demand to the percentage change in price; that is, $E = \frac{\Delta D/D}{\Delta p/p}$. In the case of the gas demand function, the elasticity of this particular price change is $\frac{-15\%}{10\%} = -1.5$.

The elasticity is more useful when it is expressed as a function of the price. To do this, we consider small changes in p and assume the corresponding changes in D are also small. Using the definition of the derivative, the elasticity function is

$$E(p) = \lim_{\Delta p \rightarrow 0} \frac{\Delta D/D}{\Delta p/p} = \lim_{\Delta p \rightarrow 0} \frac{\Delta D}{\Delta p} \left(\frac{p}{D} \right) = \frac{dD}{dp} \frac{p}{D}.$$

Applying this definition to the gas demand function, we find that

$$\begin{aligned} E(p) &= \frac{dD}{dp} \frac{p}{D} \\ &= \frac{d}{dp} \underbrace{(1200 - 200p)}_D \underbrace{\frac{p}{1200 - 200p}}_D && \text{Substitute } D = 1200 - 200p. \\ &= -200 \left(\frac{p}{1200 - 200p} \right) && \text{Differentiate.} \\ &= \frac{p}{p - 6}. && \text{Simplify.} \end{aligned}$$

Given a particular price, the elasticity is interpreted as the percentage change in the demand that results for every 1% change in the price. For example, in the gas demand case, with $p = \$3.60$, the elasticity is $E(3.6) = -1.5$; therefore, a 2% increase in the price results in a change of $-1.5 \cdot 2\% = -3\%$ (a decrease) in the number of gallons sold.

► Some texts define the elasticity as

$$E(p) = -\frac{dD}{dp} \frac{p}{D} \text{ to make } E(p) \text{ positive.}$$

DEFINITION Elasticity

If the demand for a product varies with the price according to the function

$$D = f(p), \text{ then the price elasticity of the demand is } E(p) = \frac{dD}{dp} \frac{p}{D}.$$

EXAMPLE 6 Elasticity in pork prices The demand for processed pork in Canada is described by the function $D(p) = 286 - 20p$. (Source: J. Perloff, *Microeconomics*, Prentice Hall, 2012)

- Compute and graph the price elasticity of the demand.
- When $-\infty < E < -1$, the demand is said to be **elastic**. When $-1 < E < 0$, the demand is said to be **inelastic**. Interpret these terms.
- For what prices is the demand for pork elastic? Inelastic?

SOLUTION

- Substituting the demand function into the definition of elasticity, we find that

$$\begin{aligned}
 E(p) &= \frac{dD}{dp} \frac{p}{D} \\
 &= \frac{d}{dp} \underbrace{(286 - 20p)}_D \underbrace{\frac{p}{286 - 20p}}_D && \text{Substitute } D = 286 - 20p. \\
 &= -20 \left(\frac{p}{286 - 20p} \right) && \text{Differentiate.} \\
 &= -\frac{10p}{143 - 10p}. && \text{Simplify.}
 \end{aligned}$$

Notice that the elasticity is undefined at $p = 14.3$, which is the price at which the demand reaches zero. (According to the model, no pork can be sold at prices above \$14.30.) Therefore, the domain of the elasticity function is $[0, 14.3)$, and on the interval $(0, 14.3)$, the elasticity is negative (Figure 3.52).

- For prices with an elasticity in the interval $-\infty < E(p) < -1$, a $P\%$ increase in the price results in *more* than a $P\%$ decrease in the demand; this is the case of elastic (sensitive) demand. If a price has an elasticity in the interval $-1 < E(p) < 0$, a $P\%$ increase in the price results in *less* than a $P\%$ decrease in the demand; this is the case of inelastic (insensitive) demand.

- Solving $E(p) = -\frac{10p}{143 - 10p} = -1$, we find that $E(p) < -1$, for $p > 7.15$.

For prices in this interval, the demand is elastic (Figure 3.52). For prices with $0 < p < 7.15$, the demand is inelastic.

Related Exercises 33–34 ◀

Figure 3.52

- When $E(p) = 0$, the demand for a good is said to be *perfectly inelastic*. In Example 6, this case occurs when $p = 0$.

SECTION 3.6 EXERCISES

Getting Started

- Explain the difference between the average rate of change and the instantaneous rate of change of a function f .
- Complete the following statement. If $\frac{dy}{dx}$ is large, then small changes in x will result in relatively _____ changes in the value of y .
- Complete the following statement. If $\frac{dy}{dx}$ is small, then small changes in x will result in relatively _____ changes in the value of y .
- Suppose the function $s(t)$ represents the position (in feet) of a stone t seconds after it is thrown directly upward from 6 feet above Earth's surface.
 - Is the stone's acceleration positive or negative when the stone is moving upward? Explain.
 - What is the value of the instantaneous velocity $v(t)$ when the stone reaches its highest point? Explain.
- Suppose $w(t)$ is the weight (in pounds) of a golden retriever puppy t weeks after it is born. Interpret the meaning of $w'(15) = 1.75$.
- What is the difference between the *velocity* and the *speed* of an object moving in a straight line?
- Define the acceleration of an object moving in a straight line.
- An object moving along a line has a constant negative acceleration. Describe the velocity of the object.
- The speed of sound (in m/s) in dry air is approximated by the function $v(T) = 331 + 0.6T$, where T is the air temperature (in degrees Celsius). Evaluate $v'(T)$ and interpret its meaning.

10. At noon, a city park manager starts filling a swimming pool. If $V(t)$ is the volume of water (in ft^3) in the swimming pool t hours after noon, then what does dV/dt represent?

11. **Highway travel** A state patrol station is located on a straight north-south freeway. A patrol car leaves the station at 9:00 A.M. heading north with position function $s = f(t)$ that gives its location in miles t hours after 9:00 A.M. (see figure). Assume s is positive when the car is north of the patrol station.

- Determine the average velocity of the car during the first 45 minutes of the trip.
- Determine the average velocity of the car over the interval $[0.25, 0.75]$. Is the average velocity a good estimate of the velocity at 9:30 A.M.?
- Find the average velocity of the car over the interval $[1.75, 2.25]$. Estimate the velocity of the car at 11:00 A.M. and determine the direction in which the patrol car is moving.
- Describe the motion of the patrol car relative to the patrol station between 9:00 A.M. and noon.

12. **Airline travel** The following figure shows the position function of an airliner on an out-and-back trip from Seattle to Minneapolis, where $s = f(t)$ is the number of ground miles from Seattle t hours after take-off at 6:00 A.M. The plane returns to Seattle 8.5 hours later at 2:30 P.M.

- Calculate the average velocity of the airliner during the first 1.5 hours of the trip ($0 \leq t \leq 1.5$).
- Calculate the average velocity of the airliner between 1:30 P.M. and 2:30 P.M. ($7.5 \leq t \leq 8.5$).
- At what time(s) is the velocity 0? Give a plausible explanation.
- Determine the velocity of the airliner at noon ($t = 6$) and explain why the velocity is negative.

13. Suppose the average cost of producing 200 gas stoves is \$70 per stove and the marginal cost at $x = 200$ is \$65 per stove. Interpret these costs.

14. Explain why a decreasing demand function has a negative elasticity function.

Practice Exercises

15–20. Position, velocity, and acceleration Suppose the position of an object moving horizontally along a line after t seconds is given by the following functions $s = f(t)$, where s is measured in feet, with $s > 0$ corresponding to positions right of the origin.

- Graph the position function.
- Find and graph the velocity function. When is the object stationary, moving to the right, and moving to the left?
- Determine the velocity and acceleration of the object at $t = 1$.
- Determine the acceleration of the object when its velocity is zero.
- On what intervals is the speed increasing?

15. $f(t) = t^2 - 4t$; $0 \leq t \leq 5$

16. $f(t) = -t^2 + 4t - 3$; $0 \leq t \leq 5$

17. $f(t) = 2t^2 - 9t + 12$; $0 \leq t \leq 3$

18. $f(t) = 18t - 3t^2$; $0 \leq t \leq 8$

19. $f(t) = 2t^3 - 21t^2 + 60t$; $0 \leq t \leq 6$

20. $f(t) = -6t^3 + 36t^2 - 54t$; $0 \leq t \leq 4$

21. **A dropped stone on Earth** The height (in feet) of a stone dropped from a bridge 64 feet above a river at $t = 0$ seconds is given by $s(t) = -16t^2 + 64$. Find the velocity of the stone and its speed when it hits the water.

22. **A dropped stone on Mars** A stone is dropped off the edge of a 54-ft cliff on Mars, where the acceleration due to gravity is about 12 ft/s^2 . The height (in feet) of the stone above the ground t seconds after it is dropped is $s(t) = -6t^2 + 54$. Find the velocity of the stone and its speed when it hits the ground.

23. **Throwing a stone** Suppose a stone is thrown vertically upward from the edge of a cliff on Earth with an initial velocity of 32 ft/s from a height of 48 ft above the ground. The height (in feet) of the stone above the ground t seconds after it is thrown is $s(t) = -16t^2 + 32t + 48$.

- Determine the velocity v of the stone after t seconds.
- When does the stone reach its highest point?
- What is the height of the stone at the highest point?
- When does the stone strike the ground?
- With what velocity does the stone strike the ground?
- On what intervals is the speed increasing?

24. Suppose a stone is thrown vertically upward from the edge of a cliff on Earth with an initial velocity of 19.6 m/s from a height of 24.5 m above the ground. The height (in meters) of the stone above the ground t seconds after it is thrown is $s(t) = -4.9t^2 + 19.6t + 24.5$.

- Determine the velocity v of the stone after t seconds.
- When does the stone reach its highest point?
- What is the height of the stone at the highest point?
- When does the stone strike the ground?
- With what velocity does the stone strike the ground?
- On what intervals is the speed increasing?

25. Suppose a stone is thrown vertically upward from the edge of a cliff on Earth with an initial velocity of 64 ft/s from a height of 32 ft above the ground. The height (in feet) of the stone above the ground t seconds after it is thrown is $s(t) = -16t^2 + 64t + 32$.

- Determine the velocity v of the stone after t seconds.
- When does the stone reach its highest point?

- c. What is the height of the stone at the highest point?
- d. When does the stone strike the ground?
- e. With what velocity does the stone strike the ground?
- f. On what intervals is the speed increasing?

26. Maximum height Suppose a baseball is thrown vertically upward from the ground with an initial velocity of v_0 ft/s. The approximate height of the ball (in feet) above the ground after t seconds is given by $s(t) = -16t^2 + v_0t$.

- a. What is the height of the ball at its highest point?
- b. With what velocity does the ball strike the ground?

27. Initial velocity Suppose a baseball is thrown vertically upward from the ground with an initial velocity of v_0 ft/s. Its height above the ground after t seconds is given by $s(t) = -16t^2 + v_0t$. Determine the initial velocity of the ball if it reaches a high point of 128 ft.

28. Population growth in Washington The population of the state of Washington (in millions) from 2010 ($t = 0$) to 2016 ($t = 6$) is modeled by the polynomial $p(t) = 0.0078t^2 + 0.028t + 6.73$.

- a. Determine the average growth rate from 2010 to 2016.
- b. What was the growth rate for Washington in 2011 ($t = 1$) and 2015 ($t = 5$)?
- c. Use a graphing utility to graph p' for $0 \leq t \leq 6$. What does this graph tell you about population growth in Washington during the period of time from 2010 to 2016?

29–32. Average and marginal cost Consider the following cost functions.

- a. Find the average cost and marginal cost functions.
- b. Determine the average cost and the marginal cost when $x = a$.
- c. Interpret the values obtained in part (b).

29. $C(x) = 1000 + 0.1x$, $0 \leq x \leq 5000$, $a = 2000$

30. $C(x) = 500 + 0.02x$, $0 \leq x \leq 2000$, $a = 1000$

31. $C(x) = -0.01x^2 + 40x + 100$, $0 \leq x \leq 1500$, $a = 1000$

32. $C(x) = -0.04x^2 + 100x + 800$, $0 \leq x \leq 1000$, $a = 500$

33. Demand and elasticity Based on sales data over the past year, the owner of a DVD store devises the demand function $D(p) = 40 - 2p$, where $D(p)$ is the number of DVDs that can be sold in one day at a price of p dollars.

- a. According to the model, how many DVDs can be sold in a day at a price of \$10?
- b. According to the model, what is the maximum price that can be charged (above which no DVDs can be sold)?
- c. Find the elasticity function for this demand function.
- d. For what prices is the demand elastic? Inelastic?
- e. If the price of DVDs is raised from \$10.00 to \$10.25, what is the exact percentage decrease in demand (using the demand function)?
- f. If the price of DVDs is raised from \$10.00 to \$10.25, what is the approximate percentage decrease in demand (using the elasticity function)?

34. Demand and elasticity The economic advisor of a large tire store proposes the demand function $D(p) = \frac{1800}{p - 40}$, where $D(p)$ is the number of tires of one brand and size that can be sold in one day at a price p .

- a. Recalling that the demand must be positive, what is the domain of this function?

- b. According to the model, how many tires can be sold in a day at a price of \$60 per tire?
- c. Find the elasticity function on the domain of the demand function.
- d. For what prices is the demand elastic? Inelastic?
- e. If the price of tires is raised from \$60 to \$62, what is the approximate percentage decrease in demand (using the elasticity function)?

35. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. If the acceleration of an object remains constant, then its velocity is constant.
- b. If the acceleration of an object moving along a line is always 0, then its velocity is constant.
- c. It is impossible for the instantaneous velocity at all times $a \leq t \leq b$ to equal the average velocity over the interval $a \leq t \leq b$.
- d. A moving object can have negative acceleration and increasing speed.

36. A feather dropped on the moon On the moon, a feather will fall to the ground at the same rate as a heavy stone. Suppose a feather is dropped from a height of 40 m above the surface of the moon. Its height (in meters) above the ground after t seconds is $s = 40 - 0.8t^2$. Determine the velocity and acceleration of the feather the moment it strikes the surface of the moon.

37. Comparing velocities A stone is thrown vertically into the air at an initial velocity of 96 ft/s. On Mars the height (in feet) of the stone above the ground after t seconds is $s = 96t - 6t^2$, and on Earth it is $s = 96t - 16t^2$. How much higher will the stone travel on Mars than on Earth?

38. Comparing velocities Two stones are thrown vertically upward, each with an initial velocity of 48 ft/s at time $t = 0$. One stone is thrown from the edge of a bridge that is 32 feet above the ground, and the other stone is thrown from ground level. The height above the ground of the stone thrown from the bridge after t seconds is $f(t) = -16t^2 + 48t + 32$, and the height of the stone thrown from the ground after t seconds is $g(t) = -16t^2 + 48t$.

- a. Show that the stones reach their high points at the same time.
- b. How much higher does the stone thrown from the bridge go than the stone thrown from the ground?
- c. When do the stones strike the ground and with what velocities?

39. Matching heights A stone is thrown with an initial velocity of 32 ft/s from the edge of a bridge that is 48 ft above the ground. The height of this stone above the ground t seconds after it is thrown is $f(t) = -16t^2 + 32t + 48$. If a second stone is thrown from the ground, then its height above the ground after t seconds is given by $g(t) = -16t^2 + v_0t$, where v_0 is the initial velocity of the second stone. Determine the value of v_0 such that both stones reach the same high point.

40. Velocity of a car The graph shows the position $s = f(t)$ of a car t hours after 5:00 P.M. relative to its starting point $s = 0$, where s is measured in miles.

- a. Describe the velocity of the car. Specifically, when is it speeding up and when is it slowing down?
- b. At approximately what time is the car traveling the fastest? The slowest?

- c. What is the approximate maximum velocity of the car? The approximate minimum velocity?

41. **Velocity from position** The graph of $s = f(t)$ represents the position of an object moving along a line at time $t \geq 0$.

- Assume the velocity of the object is 0 when $t = 0$. For what other values of t is the velocity of the object zero?
- When is the object moving in the positive direction and when is it moving in the negative direction?
- Sketch a graph of the velocity function.
- On what intervals is the speed increasing?

42. **Fish length** Assume the length L (in centimeters) of a particular species of fish after t years is modeled by the following graph.

- What does dL/dt represent and what happens to this derivative as t increases?
- What does the derivative tell you about how this species of fish grows?
- Sketch a graph of L' and L'' .

43–46. Average and marginal profit Let $C(x)$ represent the cost of producing x items and $p(x)$ be the sale price per item if x items are sold. The profit $P(x)$ of selling x items is $P(x) = xp(x) - C(x)$ (revenue minus costs). The **average profit per item** when x items are sold is $P(x)/x$ and the **marginal profit** is dP/dx . The marginal profit approximates the profit obtained by selling one more item, given that x

items have already been sold. Consider the following cost functions C and price functions p .

- Find the profit function P .
- Find the average profit function and the marginal profit function.
- Find the average profit and the marginal profit if $x = a$ units are sold.
- Interpret the meaning of the values obtained in part (c).

43. $C(x) = -0.02x^2 + 50x + 100$, $p(x) = 100$, $a = 500$

44. $C(x) = -0.02x^2 + 50x + 100$, $p(x) = 100 - 0.1x$, $a = 500$

45. $C(x) = -0.04x^2 + 100x + 800$, $p(x) = 200$, $a = 1000$

46. $C(x) = -0.04x^2 + 100x + 800$, $p(x) = 200 - 0.1x$, $a = 1000$

47. **U.S. population growth** The population $p(t)$ (in millions) of the United States t years after the year 1900 is shown in the figure. Approximately when (in what year) was the U.S. population growing most slowly between 1925 and 2020? Estimate the growth rate in that year.

48. **Average of marginal production** Economists use *production functions* to describe how the output of a system varies with respect to another variable such as labor or capital. For example, the production function $P(L) = 200L + 10L^2 - L^3$ gives the output of a system as a function of the number of laborers L . The *average product* $A(L)$ is the average output per laborer when L laborers are working; that is, $A(L) = P(L)/L$. The *marginal product* $M(L)$ is the approximate change in output when one additional laborer is added to L laborers; that is, $M(L) = dP/dL$.

- For the given production function, compute and graph P , A , and L .
- Suppose the peak of the average product curve occurs at $L = L_0$, so that $A'(L_0) = 0$. Show that for a general production function, $M(L_0) = A(L_0)$.

49. **Velocity of a marble** The position (in meters) of a marble, given an initial velocity and rolling up a long incline, is given by $s = \frac{100t}{t+1}$, where t is measured in seconds and $s = 0$ is the starting point.

- Graph the position function.
- Find the velocity function for the marble.
- Graph the velocity function and give a description of the motion of the marble.
- At what time is the marble 80 m from its starting point?
- At what time is the velocity 50 m/s?

50. **Tree growth** Let b represent the base diameter of a conifer tree and let h represent the height of the tree, where b is measured in centimeters and h is measured in meters. Assume the height is related to the base diameter by the function $h = 5.67 + 0.70b + 0.0067b^2$.

- Graph the height function.
- Plot and interpret the meaning of dh/db .

Explorations and Challenges

- 51. A different interpretation of marginal cost** Suppose a large company makes 25,000 gadgets per year in batches of x items at a time. After analyzing setup costs to produce each batch and taking into account storage costs, planners have determined that the total cost $C(x)$ of producing 25,000 gadgets in batches of x items at a time is given by

$$C(x) = 1,250,000 + \frac{125,000,000}{x} + 1.5x.$$

- Determine the marginal cost and average cost functions. Graph and interpret these functions.
 - Determine the average cost and marginal cost when $x = 5000$.
 - The meaning of average cost and marginal cost here is different from earlier examples and exercises. Interpret the meaning of your answer in part (b).
- 52. Diminishing returns** A cost function of the form $C(x) = \frac{1}{2}x^2$ reflects *diminishing returns to scale*. Find and graph the cost, average cost, and marginal cost functions. Interpret the graphs and explain the idea of diminishing returns.

- 53. Revenue function** A store manager estimates that the demand for an energy drink decreases with increasing price according to the function $d(p) = \frac{100}{p^2 + 1}$, which means that at price p (in dollars), $d(p)$ units can be sold. The revenue generated at price p is $R(p) = p \cdot d(p)$ (price multiplied by number of units).

- Find and graph the revenue function.
- Find and graph the marginal revenue $R'(p)$.
- From the graphs of R and R' , estimate the price that should be charged to maximize the revenue.

- 54. Fuel economy** Suppose you own a fuel-efficient hybrid automobile with a monitor on the dashboard that displays the mileage and gas consumption. The number of miles you can drive with g gallons of gas remaining in the tank on a particular stretch of highway is given by $m(g) = 50g - 25.8g^2 + 12.5g^3 - 1.6g^4$, for $0 \leq g \leq 4$.

- Graph and interpret the mileage function.
- Graph and interpret the gas mileage $m(g)/g$.
- Graph and interpret dm/dg .

- 55. Spring oscillations** A spring hangs from the ceiling at equilibrium with a mass attached to its end. Suppose you pull downward on the mass and release it 10 inches below its equilibrium position with an upward push. The distance x (in inches) of the mass from its equilibrium position after t seconds is given by the function $x(t) = 10 \sin t - 10 \cos t$, where x is positive when the mass is above the equilibrium position.

- Graph and interpret this function.
- Find dx/dt and interpret the meaning of this derivative.
- At what times is the velocity of the mass zero?
- The function given here is a model for the motion of an object on a spring. In what ways is this model unrealistic?

- 56. Power and energy** Power and energy are often used interchangeably, but they are quite different. **Energy** is what makes matter move or heat up. It is measured in units of **joules** or **Calories**, where $1 \text{ Cal} = 4184 \text{ J}$. One hour of walking consumes roughly 10^6 J , or 240 Cal . On the other hand, **power** is the rate at which energy is used, which is measured in **watts**, where $1 \text{ W} = 1 \text{ J/s}$. Other useful units of power are **kilowatts** ($1 \text{ kW} = 10^3 \text{ W}$) and **megawatts** ($1 \text{ MW} = 10^6 \text{ W}$). If energy is used at a rate of 1 kW for one hour, the total amount of energy used is **1 kilowatt-hour** ($1 \text{ kWh} = 3.6 \times 10^6 \text{ J}$). Suppose the cumulative energy used in a large building over a 24-hr period is given by $E(t) = 100t + 4t^2 - \frac{t^3}{9} \text{ kWh}$, where $t = 0$ corresponds to midnight.

- Graph the energy function.
- The power is the rate of energy consumption; that is, $P(t) = E'(t)$. Find the power over the interval $0 \leq t \leq 24$.
- Graph the power function and interpret the graph. What are the units of power in this case?

- 57. A race** Jean and Juan run a one-lap race on a circular track. Their angular positions on the track during the race are given by the functions $\theta(t)$ and $\varphi(t)$, respectively, where $0 \leq t \leq 4$ and t is measured in minutes (see figure). These angles are measured in radians, where $\theta = \varphi = 0$ represent the starting position and $\theta = \varphi = 2\pi$ represent the finish position. The angular velocities of the runners are $\theta'(t)$ and $\varphi'(t)$.

- Compare in words the angular velocity of the two runners and the progress of the race.
- Which runner has the greater average angular velocity?
- Who wins the race?
- Jean's position is given by $\theta(t) = \pi t^2/8$. What is her angular velocity at $t = 2$ and at what time is her angular velocity the greatest?
- Juan's position is given by $\varphi(t) = \pi t(8 - t)/8$. What is his angular velocity at $t = 2$ and at what time is his angular velocity the greatest?

- 58. Flow from a tank** A cylindrical tank is full at time $t = 0$ when a valve in the bottom of the tank is opened. By Torricelli's law, the volume of water in the tank after t hours is $V = 100(200 - t)^2$, measured in cubic meters.

- Graph the volume function. What is the volume of water in the tank before the valve is opened?
- How long does it take for the tank to empty?
- Find the rate at which water flows from the tank and plot the flow rate function.
- At what time is the magnitude of the flow rate a minimum? A maximum?

59. Temperature distribution A thin copper rod, 4 m in length, is heated at its midpoint, and the ends are held at a constant temperature of 0° . When the temperature reaches equilibrium, the temperature profile is given by $T(x) = 40x(4 - x)$, where $0 \leq x \leq 4$ is the position along the rod. The **heat flux** at a point on the rod equals $-kT'(x)$, where $k > 0$ is a constant. If the heat flux is positive at a point, heat moves in the positive x -direction at that point, and if the heat flux is negative, heat moves in the negative x -direction.

- With $k = 1$, what is the heat flux at $x = 1$? At $x = 3$?
- For what values of x is the heat flux negative? Positive?
- Explain the statement that heat flows out of the rod at its ends.

60. Spring runoff The flow of a small stream is monitored for 90 days between May 1 and August 1. The total water that flows past a gauging station is given by

$$V(t) = \begin{cases} \frac{4}{5}t^2 & \text{if } 0 \leq t < 45 \\ -\frac{4}{5}(t^2 - 180t + 4050) & \text{if } 45 \leq t < 90, \end{cases}$$

where V is measured in cubic feet and t is measured in days, with $t = 0$ corresponding to May 1.

- Graph the volume function.
- Find the flow rate function $V'(t)$ and graph it. What are the units of the flow rate?
- Describe the flow of the stream over the 3-month period. Specifically, when is the flow rate a maximum?

QUICK CHECK ANSWERS

1. Instantaneous velocity **2.** Yes; yes **3.** If an object has positive acceleration, then its velocity is increasing. If the velocity is negative but increasing, then the acceleration is positive and the speed is decreasing. For example, the velocity may increase from -2 m/s to -1 m/s to 0 m/s. **4.** $v(1) = 32$ ft/s and $v(3) = -32$ ft/s, so the speed is 32 ft/s at both times. **5.** The growth rate in 2001 ($t = 1$) is 110 million users/year. It is less than half of the growth rate in 2012 ($t = 12$), which is 242 million users/year. **6.** As x increases from 1 to 100, the average cost decreases from \$149.98/item to \$49/item. ◀

3.7 The Chain Rule

QUICK CHECK 1 Explain why it is not practical to calculate $\frac{d}{dx}(5x + 4)^{100}$ by first expanding $(5x + 4)^{100}$. ◀

The differentiation rules presented so far allow us to find derivatives of many functions. However, these rules are inadequate for finding the derivatives of most *composite functions*. Here is a typical situation. If $f(x) = x^3$ and $g(x) = 5x + 4$, then their composition is $f(g(x)) = (5x + 4)^3$. One way to find the derivative is by expanding $(5x + 4)^3$ and differentiating the resulting polynomial. Unfortunately, this strategy becomes prohibitive for functions such as $(5x + 4)^{100}$. We need a better approach.

Chain Rule Formulas

An efficient method for differentiating composite functions, called the *Chain Rule*, is motivated by the following example. Suppose Yancey, Uri, and Xan pick apples. Let y , u , and x represent the number of apples picked in some period of time by Yancey, Uri, and Xan, respectively. Yancey picks apples three times faster than Uri, which means the rate at which Yancey picks apples with respect to Uri is $dy/du = 3$. Uri picks apples twice as fast as Xan, so $du/dx = 2$. Therefore, Yancey picks apples at a rate that is $3 \cdot 2 = 6$ times greater than Xan's rate, which means that $dy/dx = 6$ (Figure 3.53). Observe that

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 3 \cdot 2 = 6.$$

The equation $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$ is one form of the Chain Rule.

Alternatively, the Chain Rule may be expressed in terms of composite functions. Let $y = f(u)$ and $u = g(x)$, which means y is related to x through the composite function $y = f(u) = f(g(x))$. The derivative $\frac{dy}{dx}$ is now expressed as the product

$$\frac{d}{dx}(f(g(x))) = \underbrace{f'(u)}_{\frac{dy}{du}} \cdot \underbrace{g'(x)}_{\frac{du}{dx}}.$$

► Expressions such as dy/dx should not be treated as fractions. Nevertheless, you can check symbolically that you have written the Chain Rule correctly by noting that du appears in the “numerator” and “denominator.” If it were “canceled,” the Chain Rule would have dy/dx on both sides.

Figure 3.53

Replacing u with $g(x)$ results in

$$\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x).$$

- The two equations in Theorem 3.12 differ only in notation (Leibniz notation for the derivative versus function notation). Mathematically, they are identical. The second equation states that the derivative of $y = f(g(x))$ is the derivative of f evaluated at $g(x)$ multiplied by the derivative of g evaluated at x .

- There may be several ways to choose an inner function $u = g(x)$ and an outer function $y = f(u)$. Nevertheless, we often refer to *the* inner and *the* outer function for the most obvious choices.

THEOREM 3.12 The Chain Rule

Suppose $y = f(u)$ is differentiable at $u = g(x)$ and $u = g(x)$ is differentiable at x . The composite function $y = f(g(x))$ is differentiable at x , and its derivative can be expressed in two equivalent ways.

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} \quad (1)$$

$$\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x) \quad (2)$$

A proof of the Chain Rule is given at the end of this section. For now, it's important to learn how to use it. With the composite function $f(g(x))$, we refer to g as the *inner function* and to f as the *outer function* of the composition. The key to using the Chain Rule is identifying the inner and outer functions. The following four steps outline the differentiation process, although you will soon find that the procedure can be streamlined.

PROCEDURE Using the Chain Rule

Assume the differentiable function $y = f(g(x))$ is given.

1. Identify an outer function f and an inner function g , and let $u = g(x)$.
2. Replace $g(x)$ with u to express y in terms of u :

$$y = f(\underbrace{g(x)}_u) \Rightarrow y = f(u).$$

3. Calculate the product $\frac{dy}{du} \cdot \frac{du}{dx}$.
4. Replace u with $g(x)$ in $\frac{dy}{du}$ to obtain $\frac{dy}{dx}$.

QUICK CHECK 2 Identify an inner function (call it g) of $y = (5x + 4)^3$. Let $u = g(x)$ and express the outer function f in terms of u . ◀

EXAMPLE 1 The Chain Rule For each of the following composite functions, find the inner function $u = g(x)$ and the outer function $y = f(u)$. Use equation (1) of the Chain Rule to find $\frac{dy}{dx}$.

- a. $y = (5x + 4)^{3/2}$ b. $y = \sin^3 x$ c. $y = \sin x^3$

SOLUTION

- a. The inner function of $y = (5x + 4)^{3/2}$ is $u = 5x + 4$, and the outer function is $y = u^{3/2}$. Using equation (1) of the Chain Rule, we have

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy}{du} \cdot \frac{du}{dx} \\ &= \frac{3}{2} u^{1/2} \cdot 5 && y = u^{3/2} \Rightarrow \frac{dy}{du} = \frac{3}{2} u^{1/2}; u = 5x + 4 \Rightarrow \frac{du}{dx} = 5 \\ &= \frac{3}{2} (5x + 4)^{1/2} \cdot 5 && \text{Replace } u \text{ with } 5x + 4. \\ &= \frac{15}{2} \sqrt{5x + 4}. \end{aligned}$$

- With trigonometric functions, expressions such as $\sin^n x$ always mean $(\sin x)^n$, except when $n = -1$. In Example 1, $\sin^3 x = (\sin x)^3$.

- b. Replacing the shorthand form $y = \sin^3 x$ with $y = (\sin x)^3$, we identify the inner function as $u = \sin x$. Letting $y = u^3$, we have

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 3u^2 \cdot \cos x = \underbrace{3 \sin^2 x}_{3u^2} \cos x.$$

- c. Although $y = \sin x^3$ appears to be similar to the function $y = \sin^3 x$ in part (b), the inner function in this case is $u = x^3$ and the outer function is $y = \sin u$. Therefore,

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = (\cos u) \cdot 3x^2 = 3x^2 \cos x^3.$$

Related Exercises 13–15 ◀

When using equation (2) of the Chain Rule, $\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x)$, we identify an outer function $y = f(u)$ and an inner function $u = g(x)$. Then $\frac{d}{dx}(f(g(x)))$ is the product of $f'(u)$ evaluated at $u = g(x)$ and $g'(x)$.

EXAMPLE 2 The Chain Rule Use equation (2) of the Chain Rule to calculate the derivatives of the following functions.

a. $(6x^3 + 3x + 1)^{10}$ b. $\sqrt{5x^2 + 1}$ c. $\left(\frac{5t^2}{3t^2 + 2}\right)^3$

SOLUTION

- a. The inner function of $(6x^3 + 3x + 1)^{10}$ is $g(x) = 6x^3 + 3x + 1$, and the outer function is $f(u) = u^{10}$. The derivative of the outer function is $f'(u) = 10u^9$, which, when evaluated at $g(x)$, is $10(6x^3 + 3x + 1)^9$. The derivative of the inner function is $g'(x) = 18x^2 + 3$. Multiplying the derivatives of the outer and inner functions, we have

$$\begin{aligned} \frac{d}{dx}((6x^3 + 3x + 1)^{10}) &= \underbrace{10(6x^3 + 3x + 1)^9}_{f'(u) \text{ evaluated at } g(x)} \cdot \underbrace{(18x^2 + 3)}_{g'(x)} \\ &= 30(6x^2 + 1)(6x^3 + 3x + 1)^9. \quad \text{Factor and simplify.} \end{aligned}$$

- b. The inner function of $\sqrt{5x^2 + 1}$ is $g(x) = 5x^2 + 1$, and the outer function is $f(u) = \sqrt{u}$. The derivatives of these functions are $f'(u) = \frac{1}{2\sqrt{u}}$ and $g'(x) = 10x$. Therefore,

$$\frac{d}{dx} \sqrt{5x^2 + 1} = \underbrace{\frac{1}{2\sqrt{5x^2 + 1}}}_{f'(u) \text{ evaluated at } g(x)} \cdot \underbrace{10x}_{g'(x)} = \frac{5x}{\sqrt{5x^2 + 1}}.$$

- c. The inner function of $\left(\frac{5t^2}{3t^2 + 2}\right)^3$ is $g(t) = \frac{5t^2}{3t^2 + 2}$. The outer function is $f(u) = u^3$, whose derivative is $f'(u) = 3u^2$. The derivative of the inner function requires the Quotient Rule. Applying the Chain Rule, we have

$$\frac{d}{dt} \left(\frac{5t^2}{3t^2 + 2} \right)^3 = \underbrace{3 \left(\frac{5t^2}{3t^2 + 2} \right)^2}_{f'(u) \text{ evaluated at } g(t)} \cdot \underbrace{\frac{(3t^2 + 2)10t - 5t^2(6t)}{(3t^2 + 2)^2}}_{g'(t) \text{ by the Quotient Rule}} = \frac{1500t^5}{(3t^2 + 2)^4}.$$

Related Exercises 26, 27, 31 ◀

The Chain Rule is also used to calculate the derivative of a composite function for a specific value of the variable. If $h(x) = f(g(x))$ and a is a real number, then $h'(a) = f'(g(a))g'(a)$, provided the necessary derivatives exist. Therefore, $h'(a)$ is the derivative of f evaluated at $g(a)$ multiplied by the derivative of g evaluated at a .

Table 3.2

x	$f'(x)$	$g(x)$	$g'(x)$
1	5	2	3
2	7	1	4

EXAMPLE 3 Calculating derivatives at a point Let $h(x) = f(g(x))$. Use the values in Table 3.2 to calculate $h'(1)$ and $h'(2)$.

SOLUTION We use $h'(a) = f'(g(a))g'(a)$ with $a = 1$:

$$h'(1) = f'(g(1))g'(1) = f'(2)g'(1) = 7 \cdot 3 = 21.$$

With $a = 2$, we have

$$h'(2) = f'(g(2))g'(2) = f'(1)g'(2) = 5 \cdot 4 = 20.$$

Related Exercises 23–24 ◀

EXAMPLE 4 Applying the Chain Rule A trail runner programs her GPS unit to record her altitude a (in feet) every 10 minutes during a training run in the mountains; the resulting data are shown in Table 3.3. Meanwhile, at a nearby weather station, a weather probe records the atmospheric pressure p (in hectopascals, or hPa) at various altitudes, shown in Table 3.4.

Table 3.3

t (minutes)	0	10	20	30	40	50	60	70	80
$a(t)$ (altitude)	10,000	10,220	10,510	10,980	11,660	12,330	12,710	13,330	13,440

Table 3.4

a (altitude)	5485	7795	10,260	11,330	12,330	13,330	14,330	15,830	16,230
$p(a)$ (pressure)	1000	925	840	821	793	765	738	700	690

Use the Chain Rule to estimate the rate of change in pressure per unit time experienced by the trail runner when she is 50 minutes into her run.

SOLUTION We seek the rate of change in the pressure $\frac{dp}{dt}$, which is given by the Chain Rule:

$$\frac{dp}{dt} = \frac{dp}{da} \frac{da}{dt}.$$

The runner is at an altitude of 12,330 feet 50 minutes into her run, so we must compute dp/da when $a = 12,330$ and da/dt when $t = 50$. These derivatives can be approximated using the following forward difference quotients.

$$\left. \frac{dp}{da} \right|_{a=12,330} \approx \frac{p(12,330 + 1000) - p(12,330)}{1000} \quad \left. \frac{da}{dt} \right|_{t=50} \approx \frac{a(50 + 10) - a(50)}{10}$$

$$= \frac{765 - 793}{1000} \quad = \frac{12,710 - 12,330}{10}$$

$$= -0.028 \frac{\text{hPa}}{\text{ft}} \quad = 38.0 \frac{\text{ft}}{\text{min}}$$

We now compute the rate of change of the pressure with respect to time:

$$\frac{dp}{dt} = \frac{dp}{da} \frac{da}{dt}$$

$$\approx -0.028 \frac{\text{hPa}}{\text{ft}} \cdot 38.0 \frac{\text{ft}}{\text{min}} = -1.06 \frac{\text{hPa}}{\text{min}}.$$

As expected, dp/dt is negative because the pressure decreases with increasing altitude (Table 3.4) as the runner ascends the trail. Note also that the units are consistent.

Related Exercises 72–73 ◀

► The difference quotient $\frac{p(a+h) - p(a)}{h}$ is a forward difference quotient when $h > 0$ (see Exercises 62–65 in Section 3.1)

Chain Rule for Powers

The Chain Rule leads to a general derivative rule for powers of differentiable functions. In fact, we have already used it in several examples. Consider the function $f(x) = (g(x))^p$, where p is a real number. Letting $f(u) = u^p$ be the outer function and $u = g(x)$ be the inner function, we obtain the Chain Rule for powers of functions.

THEOREM 3.13 Chain Rule for Powers

If g is differentiable for all x in its domain and p is a real number, then

$$\frac{d}{dx} ((g(x))^p) = p(g(x))^{p-1} g'(x).$$

EXAMPLE 5 Chain Rule for powers Find $\frac{d}{dx} (\tan x + 10)^{21}$.

SOLUTION With $g(x) = \tan x + 10$, the Chain Rule gives

$$\begin{aligned} \frac{d}{dx} (\tan x + 10)^{21} &= 21(\tan x + 10)^{20} \frac{d}{dx} (\tan x + 10) \\ &= 21(\tan x + 10)^{20} \sec^2 x. \end{aligned}$$

Related Exercises 43–44 ◀

The Composition of Three or More Functions

We can differentiate the composition of three or more functions by applying the Chain Rule repeatedly, as shown in the following example.

EXAMPLE 6 Composition of three functions Calculate the derivative of $\sin(\cos x^2)$.

SOLUTION The inner function of $\sin(\cos x^2)$ is $\cos x^2$. Because $\cos x^2$ is also a composition of two functions, the Chain Rule is used again to calculate $\frac{d}{dx}(\cos x^2)$, where x^2 is the inner function:

$$\frac{d}{dx} (\underbrace{\sin}_{\text{outer}}(\underbrace{\cos x^2}_{\text{inner}})) = \cos(\cos x^2) \frac{d}{dx}(\cos x^2) \quad \text{Chain Rule}$$

$$= \cos(\cos x^2)(-\sin x^2) \cdot \underbrace{\frac{d}{dx}(x^2)}_{\frac{d}{dx}(\cos x^2)} \quad \text{Chain Rule}$$

$$\begin{aligned} &= \cos(\cos x^2) \cdot (-\sin x^2) \cdot 2x \quad \text{Differentiate } x^2. \\ &= -2x \cos(\cos x^2) \sin x^2. \quad \text{Simplify.} \end{aligned}$$

Related Exercises 49–50 ◀

QUICK CHECK 3 Let $y = \tan^{10}(x^5)$. Find f , g , and h such that $y = f(u)$, where $u = g(v)$ and $v = h(x)$. ◀

The Chain Rule is often used together with other derivative rules. Example 7 illustrates how several differentiation rules are combined.

EXAMPLE 7 Combining rules Find $\frac{d}{dx}(x^2\sqrt{x^2+1})$.

SOLUTION The given function is the product of x^2 and $\sqrt{x^2+1}$, and $\sqrt{x^2+1}$ is a composite function. We apply the Product Rule and then the Chain Rule:

$$\begin{aligned}\frac{d}{dx}(x^2\sqrt{x^2+1}) &= \underbrace{\frac{d}{dx}(x^2)}_{2x} \cdot \sqrt{x^2+1} + x^2 \cdot \underbrace{\frac{d}{dx}(\sqrt{x^2+1})}_{\text{Use Chain Rule}} && \text{Product Rule} \\ &= 2x\sqrt{x^2+1} + x^2 \cdot \frac{1}{2\sqrt{x^2+1}} \cdot 2x && \text{Chain Rule} \\ &= 2x\sqrt{x^2+1} + \frac{x^3}{\sqrt{x^2+1}} && \text{Simplify.} \\ &= \frac{3x^3 + 2x}{\sqrt{x^2+1}}. && \text{Simplify.}\end{aligned}$$

Related Exercises 62–63 ◀

Proof of the Chain Rule

Suppose f is differentiable at $u = g(a)$, g is differentiable at a , and $h(x) = f(g(x))$. By the definition of the derivative of h ,

$$h'(a) = \lim_{x \rightarrow a} \frac{h(x) - h(a)}{x - a} = \lim_{x \rightarrow a} \frac{f(g(x)) - f(g(a))}{x - a}. \quad (3)$$

We assume $g(x) \neq g(a)$ for values of x near a but not equal to a . This assumption holds for most functions encountered in this text. For a proof of the Chain Rule without this assumption, see Exercise 101.

We multiply the right side of equation (3) by $\frac{g(x) - g(a)}{g(x) - g(a)}$, which equals 1, and let $v = g(x)$ and $u = g(a)$. The result is

$$\begin{aligned}h'(a) &= \lim_{x \rightarrow a} \frac{f(g(x)) - f(g(a))}{g(x) - g(a)} \cdot \frac{g(x) - g(a)}{x - a} \\ &= \lim_{x \rightarrow a} \frac{f(v) - f(u)}{v - u} \cdot \frac{g(x) - g(a)}{x - a}.\end{aligned}$$

By assumption, g is differentiable at a ; therefore, it is continuous at a . This means that $\lim_{x \rightarrow a} g(x) = g(a)$, so $v \rightarrow u$ as $x \rightarrow a$. Consequently,

$$h'(a) = \underbrace{\lim_{v \rightarrow u} \frac{f(v) - f(u)}{v - u}}_{f'(u)} \cdot \underbrace{\lim_{x \rightarrow a} \frac{g(x) - g(a)}{x - a}}_{g'(a)} = f'(u)g'(a).$$

Because f and g are differentiable at u and a , respectively, the two limits in this expression exist; therefore, $h'(a)$ exists. Noting that $u = g(a)$, we have $h'(a) = f'(g(a))g'(a)$. Replacing a with the variable x gives the Chain Rule: $h'(x) = f'(g(x))g'(x)$. ◀

SECTION 3.7 EXERCISES

Getting Started

- Two equivalent forms of the Chain Rule for calculating the derivative of $y = f(g(x))$ are presented in this section. State both forms.
- Identify the inner and outer functions in the composition $(x^2 + 10)^{-5}$.

- Identify an inner function $u = g(x)$ and an outer function $y = f(u)$ of $y = (x^3 + x + 1)^4$. Then calculate $\frac{dy}{dx}$ using $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$.

4. Identify an inner function $u = g(x)$ and an outer function $y = f(u)$ of $y = \sin(x^3 + 2x)$. Then calculate $\frac{dy}{dx}$ using $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$.
5. The two composite functions $y = \cos^3 x$ and $y = \cos x^3$ look similar, but in fact are quite different. For each function, identify the inner function $u = g(x)$ and the outer function $y = f(u)$; then evaluate $\frac{dy}{dx}$ using the Chain Rule.
6. Let $h(x) = f(g(x))$, where f and g are differentiable on their domains. If $g(1) = 3$ and $g'(1) = 5$, what else do you need to know to calculate $h'(1)$?
7. Fill in the blanks. The derivative of $f(g(x))$ equals f' evaluated at _____ multiplied by g' evaluated at _____.
8. Evaluate the derivative of $y = (x^2 + 2x + 1)^2$ using $d/dx(f(g(x))) = f'(g(x)) \cdot g'(x)$.
9. Evaluate the derivative of $y = \sqrt{4x + 1}$ using $d/dx(f(g(x))) = f'(g(x)) \cdot g'(x)$.
10. Express $Q(x) = \cos^4(x^2 + 1)$ as the composition of three functions; that is, identify f , g , and h such that $Q(x) = f(g(h(x)))$.
11. Given that $h(x) = f(g(x))$, find $h'(3)$ if $g(3) = 4$, $g'(3) = 5$, $f(4) = 9$, and $f'(4) = 10$.
12. Given that $h(x) = f(g(x))$, use the graphs of f and g to find $h'(4)$.

Practice Exercises

13–22. For each of the following composite functions, find an inner function $u = g(x)$ and an outer function $y = f(u)$ such that $y = f(g(x))$. Then calculate dy/dx .

13. $y = (3x + 7)^{10}$ 14. $y = (5x^2 + 11x)^{4/3}$
 15. $y = \sin^5 x$ 16. $y = \sin x^5$
 17. $y = \sqrt{x^2 + 1}$ 18. $y = \sqrt{7x - 1}$
 19. $y = \sqrt{2 + \sin x}$ 20. $y = (\cos x + \sin x)^2$
 21. $y = \tan 5x^2$ 22. $y = \sin \frac{x}{4}$

- 23. Derivatives using tables** Let $h(x) = f(g(x))$ and $p(x) = g(f(x))$. Use the table to compute the following derivatives.

a. $h'(3)$ b. $h'(2)$ c. $p'(4)$ d. $p'(2)$ e. $h'(5)$

x	1	2	3	4	5
$f(x)$	0	3	5	1	0
$f'(x)$	5	2	-5	-8	-10
$g(x)$	4	5	1	3	2
$g'(x)$	2	10	20	15	20

- 24. Derivatives using tables** Let $h(x) = f(g(x))$ and $k(x) = g(g(x))$. Use the table to compute the following derivatives.

a. $h'(1)$ b. $h'(2)$ c. $h'(3)$ d. $k'(3)$ e. $k'(1)$ f. $k'(5)$

x	1	2	3	4	5
$f'(x)$	-6	-3	8	7	2
$g(x)$	4	1	5	2	3
$g'(x)$	9	7	3	-1	-5

- 25–70.** Calculate the derivative of the following functions.

25. $y = (3x^2 + 7x)^{10}$ 26. $y = (x^2 + 2x + 7)^8$
 27. $y = \sqrt{10x + 1}$ 28. $y = \sqrt[3]{x^2 + 9}$
 29. $y = 5(7x^3 + 1)^{-3}$ 30. $y = \cos 5t$
 31. $y = \sec(3x + 1)$ 32. $y = \csc \sqrt{x}$
 33. $y = \tan \sqrt{w}$ 34. $y = \sin(\cos x)$
 35. $y = \sin(4x^3 + 3x + 1)$ 36. $y = \csc(t^2 + t)$
 37. $y = (5x + 1)^{2/3}$ 38. $y = x(x + 1)^{1/3}$
 39. $y = \sqrt[4]{\frac{2x}{4x - 3}}$ 40. $y = \cos^4 \theta + \sin^4 \theta$
 41. $y = (\sec x + \tan x)^5$ 42. $y = \sin(4 \cos z)$
 43. $y = (2x^6 - 3x^3 + 3)^{25}$ 44. $y = (\cos x + 2 \sin x)^8$
 45. $y = (1 + 2 \tan u)^{4.5}$ 46. $y = (1 - \sqrt{x})^4$
 47. $y = \sqrt{1 + \cot^2 x}$ 48. $y = \sqrt{(3x - 4)^2 + 3x}$
 49. $y = (\sin^2 x + 1)^4$ 50. $y = (\sin x^2 + 1)^4$
 51. $y = \sin^5(\cos 3x)$ 52. $y = \cos^{7/4}(4x^3)$
 53. $y = \sqrt{x + \sqrt{x}}$ 54. $y = \sqrt{x + \sqrt{x + \sqrt{x}}}$
 55. $y = f(g(x^2))$, where f and g are differentiable for all real numbers
 56. $y = (f(g(x^m)))^n$, where f and g are differentiable for all real numbers and m and n are constants
 57. $y = \left(\frac{x}{x + 1}\right)^5$ 58. $y = \left(\frac{x - 1}{x + 1}\right)^8$
 59. $y = x(x^2 + 1)^3$ 60. $y = \frac{x}{(x^2 + 1)^2}$
 61. $y = \theta^2 \sec 5\theta$ 62. $y = \left(\frac{3x}{4x + 2}\right)^5$
 63. $y = ((x + 2)(x^2 + 1))^4$ 64. $y = \left(\frac{\sin x}{\sin x + 1}\right)^2$
 65. $y = \sqrt[5]{x^4 + \cos 2x}$ 66. $y = \frac{x \cos x}{\sin x + 1}$
 67. $y = (p + 3)^2 \sin p^2$ 68. $y = (2z + 5)^{1.75} \tan z$
 69. $y = \sqrt{f(x)}$, where f is differentiable and nonnegative at x
 70. $y = \sqrt[5]{f(x)g(x)}$, where f and g are differentiable at x

- 71. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. The function $f(x) = x \sin x$ can be differentiated without using the Chain Rule.

- b. The function $f(x) = (x^2 + 1)^{-12}$ should be differentiated using the Chain Rule.
- c. The derivative of a product is *not* the product of the derivatives, but the derivative of a composition is a product of derivatives.
- d. $\frac{d}{dx}P(Q(x)) = P'(x)Q'(x)$

72. Changing temperature The *lapse rate* is the rate at which the temperature in Earth's atmosphere decreases with altitude. For example, a lapse rate of 6.5° Celsius/km means the temperature *decreases* at a rate of 6.5°C per kilometer of altitude. The lapse rate varies with location and with other variables such as humidity. However, at a given time and location, the lapse rate is often nearly constant in the first 10 kilometers of the atmosphere. A radiosonde (weather balloon) is released from Earth's surface, and its altitude (measured in kilometers above sea level) at various times (measured in hours) is given in the table below.

Time (hr)	0	0.5	1	1.5	2	2.5
Altitude (km)	0.5	1.2	1.7	2.1	2.5	2.9

- a. Assuming a lapse rate of $6.5^\circ\text{C}/\text{km}$, what is the approximate rate of change of the temperature with respect to time as the balloon rises 1.5 hours into the flight? Specify the units of your result and use a forward difference quotient when estimating the required derivative.
- b. How does an increase in lapse rate change your answer in part (a)?
- c. Is it necessary to know the actual temperature to carry out the calculation in part (a)? Explain.

73. Applying the Chain Rule Use the data in Tables 3.3 and 3.4 of Example 4 to estimate the rate of change in pressure with respect to time experienced by the runner when she is at an altitude of 13,330 ft. Make use of a forward difference quotient when estimating the required derivatives.

74–77. Second derivatives Find $\frac{d^2y}{dx^2}$ for the following functions.

74. $y = x \cos x^2$ 75. $y = \sin x^2$
76. $y = \sqrt{x^2 + 2}$ 77. $y = (x^2 + 1)^{-2}$

78. Derivatives by different methods

- a. Calculate $\frac{d}{dx}(x^2 + x)^2$ using the Chain Rule. Simplify your answer.
- b. Expand $(x^2 + x)^2$ first and then calculate the derivative. Verify that your answer agrees with part (a).

79. Tangent lines Determine an equation of the line tangent to the graph of $y = \frac{(x^2 - 1)^2}{x^3 - 6x - 1}$ at the point $(0, -1)$.

80. Tangent lines Determine equations of the lines tangent to the graph of $y = x\sqrt{5 - x^2}$ at the points $(1, 2)$ and $(-2, -2)$. Graph the function and the tangent lines.

- 81. Tangent lines** Assume f and g are differentiable on their domains with $h(x) = f(g(x))$. Suppose the equation of the line tangent to the graph of g at the point $(4, 7)$ is $y = 3x - 5$ and the equation of the line tangent to the graph of f at $(7, 9)$ is $y = -2x + 23$.
- a. Calculate $h(4)$ and $h'(4)$.
- b. Determine an equation of the line tangent to the graph of h at $(4, h(4))$.

82. Tangent lines Assume f is a differentiable function whose graph passes through the point $(1, 4)$. Suppose $g(x) = f(x^2)$ and the line tangent to the graph of f at $(1, 4)$ is $y = 3x + 1$. Find each of the following.

- a. $g(1)$ b. $g'(x)$ c. $g'(1)$
- d. An equation of the line tangent to the graph of g when $x = 1$

83. Tangent lines Find the equation of the line tangent to $y = \sec 2x$ at $x = \frac{\pi}{6}$. Graph the function and the tangent line.

84. Composition containing sin x Suppose f is differentiable on $[-2, 2]$ with $f'(0) = 3$ and $f'(1) = 5$. Let $g(x) = f(\sin x)$. Evaluate the following expressions.

- a. $g'(0)$ b. $g'\left(\frac{\pi}{2}\right)$ c. $g'(\pi)$

85. Composition containing sin x Suppose f is differentiable for all real numbers with $f(0) = -3$, $f(1) = 3$, $f'(0) = 3$, and $f'(1) = 5$. Let $g(x) = \sin(\pi f(x))$. Evaluate the following expressions.

- a. $g'(0)$ b. $g'(1)$

86–88. Vibrations of a spring Suppose an object of mass m is attached to the end of a spring hanging from the ceiling. The mass is at its equilibrium position $y = 0$ when the mass hangs at rest. Suppose you push the mass to a position y_0 units above its equilibrium position and release it. As the mass oscillates up and down (neglecting any friction in the system), the position y of the mass after t seconds is

$$y = y_0 \cos\left(t \sqrt{\frac{k}{m}}\right), \quad (4)$$

where $k > 0$ is a constant measuring the stiffness of the spring (the larger the value of k , the stiffer the spring) and y is positive in the upward direction.

86. Use equation (4) to answer the following questions.

- a. Find dy/dt , the velocity of the mass. Assume k and m are constant.
- b. How would the velocity be affected if the experiment were repeated with four times the mass on the end of the spring?
- c. How would the velocity be affected if the experiment were repeated with a spring having four times the stiffness (k is increased by a factor of 4)?
- d. Assume y has units of meters, t has units of seconds, m has units of kg, and k has units of kg/s^2 . Show that the units of the velocity in part (a) are consistent.

87. Use equation (4) to answer the following questions.

- a. Find the second derivative $\frac{d^2y}{dt^2}$.
- b. Verify that $\frac{d^2y}{dt^2} = -\frac{k}{m}y$.

88. Use equation (4) to answer the following questions.

- a. The *period* T is the time required by the mass to complete one oscillation. Show that $T = 2\pi\sqrt{\frac{m}{k}}$.
- b. Assume k is constant and calculate $\frac{dT}{dm}$.
- c. Give a physical explanation of why $\frac{dT}{dm}$ is positive.

- 89. Hours of daylight** The number of hours of daylight at any point on Earth fluctuates throughout the year. In the Northern Hemisphere, the shortest day is on the winter solstice and the longest day is on the summer solstice. At 40° north latitude, the length of a day is approximated by

$$D(t) = 12 - 3 \cos\left(\frac{2\pi(t + 10)}{365}\right),$$

where D is measured in hours and $0 \leq t \leq 365$ is measured in days, with $t = 0$ corresponding to January 1.

- Approximately how much daylight is there on March 1 ($t = 59$)?
- Find the rate at which the daylight function changes.
- Find the rate at which the daylight function changes on March 1. Convert your answer to units of min/day and explain what this result means.
- Graph the function $y = D'(t)$ using a graphing utility.
- At what times of the year is the length of day changing most rapidly? Least rapidly?

Explorations and Challenges

- 90. A mixing tank** A 500-liter (L) tank is filled with pure water. At time $t = 0$, a salt solution begins flowing into the tank at a rate of 5 L/min. At the same time, the (fully mixed) solution flows out of the tank at a rate of 5.5 L/min. The mass of salt in grams in the tank at any time $t \geq 0$ is given by

$$M(t) = 250(1000 - t)(1 - 10^{-30}(1000 - t)^{10})$$

and the volume of solution in the tank is given by

$$V(t) = 500 - 0.5t.$$

- Graph the mass function and verify that $M(0) = 0$.
- Graph the volume function and verify that the tank is empty when $t = 1000$ min.
- The concentration of the salt solution in the tank (in g/L) is given by $C(t) = M(t)/V(t)$. Graph the concentration function and comment on its properties. Specifically, what are $C(0)$ and $\lim_{t \rightarrow 1000} C(t)$?
- Find the rate of change of the mass $M'(t)$, for $0 \leq t \leq 1000$.
- Find the rate of change of the concentration $C'(t)$, for $0 \leq t \leq 1000$.
- For what times is the concentration of the solution increasing? Decreasing?

- 91. Power and energy** The total energy in megawatt-hr (MWh) used by a town is given by

$$E(t) = 400t + \frac{2400}{\pi} \sin \frac{\pi t}{12},$$

where $t \geq 0$ is measured in hours, with $t = 0$ corresponding to noon.

- Find the power, or rate of energy consumption, $P(t) = E'(t)$ in units of megawatts (MW).
- At what time of day is the rate of energy consumption a maximum? What is the power at that time of day?
- At what time of day is the rate of energy consumption a minimum? What is the power at that time of day?
- Sketch a graph of the power function reflecting the times when energy use is a minimum or a maximum.

92. Deriving trigonometric identities

- Differentiate both sides of the identity $\cos 2t = \cos^2 t - \sin^2 t$ to prove that $\sin 2t = 2 \sin t \cos t$.
- Verify that you obtain the same identity for $\sin 2t$ as in part (a) if you differentiate the identity $\cos 2t = 2 \cos^2 t - 1$.
- Differentiate both sides of the identity $\sin 2t = 2 \sin t \cos t$ to prove that $\cos 2t = \cos^2 t - \sin^2 t$.

- 93. Quotient Rule derivation** Suppose you forgot the Quotient Rule

for calculating $\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right)$. Use the Chain Rule and Product Rule

with the identity $\frac{f(x)}{g(x)} = f(x)(g(x))^{-1}$ to derive the Quotient Rule.

94. The Chain Rule for second derivatives

- Derive a formula for the second derivative, $\frac{d^2}{dx^2}(f(g(x)))$.
- Use the formula in part (a) to calculate $\frac{d^2}{dx^2}(\sin(3x^4 + 5x^2 + 2))$.

- 95–98. Calculating limits** The following limits are the derivatives of a composite function g at a point a .

- Find a possible function g and number a .
- Use the Chain Rule to find each limit. Verify your answer by using a calculator.

95. $\lim_{x \rightarrow 2} \frac{(x^2 - 3)^5 - 1}{x - 2}$

96. $\lim_{x \rightarrow 0} \frac{\sqrt{4 + \sin x} - 2}{x}$

97. $\lim_{h \rightarrow 0} \frac{\sin(\pi/2 + h)^2 - \sin(\pi^2/4)}{h}$

98. $\lim_{h \rightarrow 0} \frac{\frac{1}{3((1+h)^5 + 7)^{10}} - \frac{1}{3(8)^{10}}}{h}$

- 99. Limit of a difference quotient** Assuming f is differentiable for all x , simplify $\lim_{x \rightarrow 5} \frac{f(x^2) - f(25)}{x - 5}$.

- 100. Derivatives of even and odd functions** Recall that f is even if $f(-x) = f(x)$, for all x in the domain of f , and f is odd if $f(-x) = -f(x)$, for all x in the domain of f .

- If f is a differentiable, even function on its domain, determine whether f' is even, odd, or neither.
- If f is a differentiable, odd function on its domain, determine whether f' is even, odd, or neither.

- 101. A general proof of the Chain Rule** Let f and g be differentiable functions with $h(x) = f(g(x))$. For a given constant a , let $u = g(a)$ and $v = g(x)$, and define

$$H(v) = \begin{cases} \frac{f(v) - f(u)}{v - u} - f'(u) & \text{if } v \neq u \\ 0 & \text{if } v = u. \end{cases}$$

- Show that $\lim_{v \rightarrow u} H(v) = 0$.
- For any value of u , show that $f(v) - f(u) = (H(v) + f'(u))(v - u)$.
- Show that

$$h'(a) = \lim_{x \rightarrow a} \left((H(g(x)) + f'(g(a))) \cdot \frac{g(x) - g(a)}{x - a} \right).$$

- Show that $h'(a) = f'(g(a))g'(a)$.

QUICK CHECK ANSWERS

- The expansion of $(5x + 4)^{100}$ contains 101 terms. It would take too much time to calculate the expansion and the derivative.
- The inner function is $u = 5x + 4$, and the outer function is $y = u^3$.
- $f(u) = u^{10}$; $u = g(v) = \tan v$; $v = h(x) = x^5$ ◀

3.8 Implicit Differentiation

This chapter has been devoted to calculating derivatives of functions of the form $y = f(x)$, where y is defined *explicitly* as a function of x . However, relations between variables are often expressed *implicitly*. For example, the equation of the unit circle $x^2 + y^2 = 1$ does not specify y directly, but rather defines y implicitly. This equation does not represent a single function because its graph fails the vertical line test (Figure 3.54a). If, however, the equation $x^2 + y^2 = 1$ is solved for y , then *two* functions emerge: $y = -\sqrt{1 - x^2}$ and $y = \sqrt{1 - x^2}$ (Figure 3.54b). Having identified two explicit functions that describe the circle, we can find their derivatives using the Chain Rule.

$$\text{If } y = \sqrt{1 - x^2}, \text{ then } \frac{dy}{dx} = -\frac{x}{\sqrt{1 - x^2}}. \quad (1)$$

$$\text{If } y = -\sqrt{1 - x^2}, \text{ then } \frac{dy}{dx} = \frac{x}{\sqrt{1 - x^2}}. \quad (2)$$

We use equation (1) to find the slope of the curve at any point on the upper half of the unit circle and equation (2) to find the slope of the curve at any point on the lower half of the circle.

Figure 3.54

QUICK CHECK 1 The equation $x - y^2 = 0$ implicitly defines what two functions? ◀

Figure 3.55

Although it is straightforward to solve some implicit equations for y (such as $x^2 + y^2 = 1$ or $x - y^2 = 0$), it is difficult or impossible to solve other equations for y . For example, the graph of $x + y^3 - xy = 1$ (Figure 3.55a) represents three functions: the upper half of a parabola $y = f_1(x)$, the lower half of a parabola $y = f_2(x)$, and the horizontal line $y = f_3(x)$ (Figure 3.55b). Solving for y to obtain these three functions is challenging (Exercise 69), and even after solving for y , we would have to calculate derivatives for each of the three functions separately. The goal of this section is to find a *single* expression for the derivative

directly from an equation without first solving for y . This technique, called **implicit differentiation**, is demonstrated through examples.

EXAMPLE 1 Implicit differentiation

- Calculate $\frac{dy}{dx}$ directly from the equation for the unit circle $x^2 + y^2 = 1$.
- Find the slope of the unit circle at $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ and $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$.

SOLUTION

- a. To indicate the choice of x as the independent variable, it is helpful to replace the variable y with $y(x)$:

$$x^2 + (y(x))^2 = 1. \quad \text{Replace } y \text{ with } y(x).$$

We now take the derivative of each term in the equation *with respect to* x :

$$\underbrace{\frac{d}{dx}(x^2)}_{2x} + \underbrace{\frac{d}{dx}(y(x))^2}_{\text{Use the Chain Rule}} = \underbrace{\frac{d}{dx}(1)}_0.$$

By the Chain Rule, $\frac{d}{dx}(y(x))^2 = 2y(x)y'(x)$, or $\frac{d}{dx}(y^2) = 2y \frac{dy}{dx}$. Substituting this result, we have

$$2x + 2y \frac{dy}{dx} = 0.$$

The last step is to solve for $\frac{dy}{dx}$:

$$2y \frac{dy}{dx} = -2x \quad \text{Subtract } 2x \text{ from both sides.}$$

$$\frac{dy}{dx} = -\frac{x}{y}. \quad \text{Divide by } 2y \text{ and simplify.}$$

This result holds provided $y \neq 0$. At the points $(1, 0)$ and $(-1, 0)$, the circle has vertical tangent lines.

- b. Notice that the derivative $\frac{dy}{dx} = -\frac{x}{y}$ depends on *both* x and y . Therefore, to find the slope of the circle at $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$, we substitute both $x = 1/2$ and $y = \sqrt{3}/2$ into the derivative formula. The result is

$$\left. \frac{dy}{dx} \right|_{\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)} = -\frac{1/2}{\sqrt{3}/2} = -\frac{1}{\sqrt{3}}.$$

The slope of the curve at $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ is

$$\left. \frac{dy}{dx} \right|_{\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)} = -\frac{1/2}{-\sqrt{3}/2} = \frac{1}{\sqrt{3}}.$$

The curve and tangent lines are shown in [Figure 3.56](#).

Related Exercises 13, 15 ◀

► Implicit differentiation usually produces an expression for dy/dx in terms of both x and y . The notation $\left. \frac{dy}{dx} \right|_{(a,b)}$ tells us to replace x with a and y with b in the expression for dy/dx .

Figure 3.56

Example 1 illustrates the technique of implicit differentiation. It is done without solving for y , and it produces dy/dx in terms of both x and y . The derivative obtained in Example 1 is consistent with the derivatives calculated explicitly in equations (1) and (2). For the upper half of the circle, substituting $y = \sqrt{1 - x^2}$ into the implicit derivative $dy/dx = -x/y$ gives

$$\frac{dy}{dx} = -\frac{x}{y} = -\frac{x}{\sqrt{1 - x^2}},$$

which agrees with equation (1). For the lower half of the circle, substituting $y = -\sqrt{1 - x^2}$ into $dy/dx = -x/y$ gives

$$\frac{dy}{dx} = -\frac{x}{y} = \frac{x}{\sqrt{1 - x^2}},$$

which is consistent with equation (2). Therefore, implicit differentiation gives a single unified derivative $dy/dx = -x/y$.

EXAMPLE 2 Implicit differentiation Find $y'(x)$ when $\sin xy = x^2 + y$.

SOLUTION It is impossible to solve this equation for y in terms of x , so we differentiate implicitly. Differentiating both sides of the equation with respect to x , using the Chain Rule and the Product Rule on the left side, gives

$$(\cos xy)(y + xy') = 2x + y'.$$

We now solve for y' :

$$\begin{aligned} xy' \cos xy - y' &= 2x - y \cos xy && \text{Rearrange terms.} \\ y'(x \cos xy - 1) &= 2x - y \cos xy && \text{Factor on left side.} \\ y' &= \frac{2x - y \cos xy}{x \cos xy - 1}. && \text{Solve for } y'. \end{aligned}$$

Notice that the final result gives y' in terms of both x and y . *Related Exercises 31, 33* ◀

QUICK CHECK 2 Use implicit differentiation to find $\frac{dy}{dx}$ for $x - y^2 = 3$. ◀

QUICK CHECK 3 If a function is defined explicitly in the form $y = f(x)$, which coordinates are needed to find the slope of a tangent line—the x -coordinate, the y -coordinate, or both? ◀

► Because y is a function of x , we have

$$\frac{d}{dx}(x) = 1 \quad \text{and}$$

$$\frac{d}{dx}(y) = y'.$$

To differentiate y^3 with respect to x , we need the Chain Rule.

Figure 3.57

Slopes of Tangent Lines

Derivatives obtained by implicit differentiation typically depend on x and y . Therefore, the slope of a curve at a particular point (a, b) requires both the x - and y -coordinates of the point. These coordinates are also needed to find an equation of the tangent line at that point.

EXAMPLE 3 Finding tangent lines with implicit functions Find an equation of the line tangent to the curve $x^2 + xy - y^3 = 7$ at $(3, 2)$.

SOLUTION We calculate the derivative of each term of the equation $x^2 + xy - y^3 = 7$ with respect to x :

$$\begin{aligned} \frac{d}{dx}(x^2) + \frac{d}{dx}(xy) - \frac{d}{dx}(y^3) &= \frac{d}{dx}(7) && \text{Differentiate each term.} \\ 2x + \underbrace{y + xy'}_{\text{Product Rule}} - \underbrace{3y^2 y'}_{\text{Chain Rule}} &= 0 && \text{Calculate the derivatives.} \end{aligned}$$

$$3y^2 y' - xy' = 2x + y \quad \text{Group the terms containing } y'.$$

$$y' = \frac{2x + y}{3y^2 - x}. \quad \text{Factor and solve for } y'.$$

To find the slope of the tangent line at $(3, 2)$, we substitute $x = 3$ and $y = 2$ into the derivative formula:

$$\left. \frac{dy}{dx} \right|_{(3,2)} = \left. \frac{2x + y}{3y^2 - x} \right|_{(3,2)} = \frac{8}{9}.$$

An equation of the line passing through $(3, 2)$ with slope $\frac{8}{9}$ is

$$y - 2 = \frac{8}{9}(x - 3) \quad \text{or} \quad y = \frac{8}{9}x - \frac{2}{3}.$$

Figure 3.57 shows the graphs of the curve $x^2 + xy - y^3 = 7$ and the tangent line.

Related Exercises 47–48 ◀

EXAMPLE 4 Slope of a curve Find the slope of the curve $2(x + y)^{1/3} = y$ at the point $(4, 4)$.

SOLUTION We begin by differentiating both sides of the given equation with respect to x :

$$\begin{aligned} \frac{2}{3}(x + y)^{-2/3} \left(1 + \frac{dy}{dx} \right) &= \frac{dy}{dx} && \text{Implicit differentiation, Chain Rule, Power Rule} \\ \frac{2}{3}(x + y)^{-2/3} &= \frac{dy}{dx} - \frac{2}{3}(x + y)^{-2/3} \frac{dy}{dx} && \text{Expand and collect like terms.} \\ \frac{2}{3}(x + y)^{-2/3} &= \frac{dy}{dx} \left(1 - \frac{2}{3}(x + y)^{-2/3} \right). && \text{Factor out } \frac{dy}{dx}. \end{aligned}$$

Figure 3.58

- The procedure outlined in Example 4 for simplifying dy/dx is a useful trick. When computing derivatives using implicit differentiation, look back to the original equation to determine whether a substitution can be made to simplify the derivative. This technique is illustrated again in Example 5.

Solving for dy/dx , we find that

$$\begin{aligned}\frac{dy}{dx} &= \frac{\frac{2}{3}(x+y)^{-2/3}}{1 - \frac{2}{3}(x+y)^{-2/3}} && \text{Divide by } 1 - \frac{2}{3}(x+y)^{-2/3} \\ \frac{dy}{dx} &= \frac{2}{3(x+y)^{2/3} - 2} && \text{Multiply by } 3(x+y)^{2/3} \text{ and simplify.}\end{aligned}$$

At this stage, we could evaluate dy/dx at the point $(4, 4)$ to determine the slope of the curve. However, the derivative can be simplified by employing a subtle maneuver. The original equation $2(x+y)^{1/3} = y$ implies that $(x+y)^{2/3} = y^2/4$. Therefore,

$$\frac{dy}{dx} = \frac{2}{\underbrace{3(x+y)^{2/3} - 2}_{y^2/4}} = \frac{8}{3y^2 - 8}.$$

With this simplified formula, finding the slope of the curve at the point $(4, 4)$ (Figure 3.58) requires only the y -coordinate:

$$\left. \frac{dy}{dx} \right|_{(4,4)} = \left. \frac{8}{3y^2 - 8} \right|_{y=4} = \frac{8}{3(4)^2 - 8} = \frac{1}{5}.$$

Related Exercises 25–26 ◀

Higher-Order Derivatives of Implicit Functions

In previous sections of this chapter, we found higher-order derivatives $\frac{d^n y}{dx^n}$ by first calculating $\frac{dy}{dx}$, $\frac{d^2 y}{dx^2}$, $\dots$, and $\frac{d^{n-1} y}{dx^{n-1}}$. The same approach is used with implicit differentiation.

EXAMPLE 5 A second derivative Find $\frac{d^2 y}{dx^2}$ if $x^2 + y^2 = 1$.

SOLUTION The first derivative $\frac{dy}{dx} = -\frac{x}{y}$ was computed in Example 1.

We now calculate the derivative of each side of this equation and simplify the right side:

$$\begin{aligned}\frac{d}{dx} \left(\frac{dy}{dx} \right) &= \frac{d}{dx} \left(-\frac{x}{y} \right) && \text{Take derivatives with respect to } x. \\ \frac{d^2 y}{dx^2} &= -\frac{y \cdot 1 - x \frac{dy}{dx}}{y^2} && \text{Quotient Rule} \\ &= -\frac{y - x \left(-\frac{x}{y} \right)}{y^2} && \text{Substitute for } \frac{dy}{dx}. \\ &= -\frac{x^2 + y^2}{y^3} && \text{Simplify.} \\ &= -\frac{1}{y^3}. && x^2 + y^2 = 1\end{aligned}$$

In the last step of this calculation we used the original equation $x^2 + y^2 = 1$ to simplify the formula for $d^2 y/dx^2$.

Related Exercises 51–52 ◀

SECTION 3.8 EXERCISES

Getting Started

- For some equations, such as $x^2 + y^2 = 1$ or $x - y^2 = 0$, it is possible to solve for y and then calculate $\frac{dy}{dx}$. Even in these cases, explain why implicit differentiation is usually a more efficient method for calculating the derivative.
- Explain the differences between computing the derivatives of functions that are defined implicitly and explicitly.
- Why are both the x -coordinate and the y -coordinate generally needed to find the slope of the tangent line at a point for an implicitly defined function?
- Identify and correct the error in the following argument. Suppose $y^2 + 2y = 2x^3 - 7$. Differentiating both sides with respect to x to find $\frac{dy}{dx}$, we have $2y + 2\frac{dy}{dx} = 6x^2$, which implies that $\frac{dy}{dx} = 3x^2 - y$.

5–8. Calculate $\frac{dy}{dx}$ using implicit differentiation.

- $x = y^2$
- $3x + 4y^3 = 7$
- $\sin y + 2 = x$
- $\sqrt{y} = \sqrt{x}$
- Consider the curve defined by $2x - y + y^3 = 0$ (see figure).
 - Find the coordinates of the y -intercepts of the curve.
 - Verify that $\frac{dy}{dx} = \frac{2}{1 - 3y^2}$.
 - Find the slope of the curve at each point where $x = 0$.

- Find the slope of the curve $x^2 + y^3 = 2$ at each point where $y = 1$ (see figure).

- Consider the curve $x = y^3$. Use implicit differentiation to verify that $\frac{dy}{dx} = \frac{1}{3y^2}$ and then find $\frac{d^2y}{dx^2}$.
- Consider the curve $x = \sin y$. Use implicit differentiation to verify that $\frac{dy}{dx} = \sec y$ and then find $\frac{d^2y}{dx^2}$.

Practice Exercises

13–26. **Implicit differentiation** Carry out the following steps.

- Use implicit differentiation to find $\frac{dy}{dx}$.
 - Find the slope of the curve at the given point.
- $x^4 + y^4 = 2$; $(1, -1)$
 - $y^2 + 1 = 2x$; $(1, 1)$
 - $y^2 = 4x$; $(1, 2)$
 - $y^2 + 3x = 8$; $(1, \sqrt{5})$
 - $\sin y = 5x^4 - 5$; $(1, \pi)$
 - $\sqrt{x} - 2\sqrt{y} = 0$; $(4, 1)$
 - $\cos y = x$; $(0, \frac{\pi}{2})$
 - $\tan xy = x + y$; $(0, 0)$
 - $xy = 7$; $(1, 7)$
 - $\frac{x}{y^2 + 1} = 1$; $(10, 3)$
 - $\sqrt[3]{x} + \sqrt[3]{y^4} = 2$; $(1, 1)$
 - $x^{2/3} + y^{2/3} = 2$; $(1, 1)$
 - $x\sqrt[3]{y} + y = 10$; $(1, 8)$
 - $(x + y)^{2/3} = y$; $(4, 4)$

27–40. **Implicit differentiation** Use implicit differentiation to find $\frac{dy}{dx}$.

- $\sin x + \sin y = y$
- $y = x \sin y$
- $x + y = \cos y$
- $x + 2y = \sqrt{y}$
- $\sin xy = x + y$
- $\tan(x + y) = 2y$
- $\cos y^2 + x = y^2$
- $y = \frac{x + 1}{y - 1}$
- $x^3 = \frac{x + y}{x - y}$
- $(xy + 1)^3 = x - y^2 + 8$
- $6x^3 + 7y^3 = 13xy$
- $\sin x \cos y = \sin x + \cos y$
- $\sqrt{x^4 + y^2} = 5x + 2y^3$
- $\sqrt{x + y^2} = \sin y$

41. **Cobb-Douglas production function** The output of an economic system Q , subject to two inputs, such as labor L and capital K , is often modeled by the Cobb-Douglas production function $Q = cL^aK^b$. When $a + b = 1$, the case is called *constant returns to scale*. Suppose $Q = 1280$, $a = \frac{1}{3}$, $b = \frac{2}{3}$, and $c = 40$.

- Find the rate of change of capital with respect to labor, dK/dL .
- Evaluate the derivative in part (a) with $L = 8$ and $K = 64$.

42. **Surface area of a cone** The lateral surface area of a cone of radius r and height h (the surface area excluding the base) is $A = \pi r \sqrt{r^2 + h^2}$.

- Find dr/dh for a cone with a lateral surface area of $A = 1500\pi$.
- Evaluate this derivative when $r = 30$ and $h = 40$.

43. Volume of a spherical cap Imagine slicing through a sphere with a plane (sheet of paper). The smaller piece produced is called a spherical cap. Its volume is $V = \pi h^2(3r - h)/3$, where r is the radius of the sphere and h is the thickness of the cap.

- Find dr/dh for a spherical cap with a volume of $5\pi/3$.
- Evaluate this derivative when $r = 2$ and $h = 1$.

44. Volume of a torus The volume of a torus (doughnut or bagel) with an inner radius of a and an outer radius of b is $V = \pi^2(b + a)(b - a)^2/4$.

- Find db/da for a torus with a volume of $64\pi^2$.
- Evaluate this derivative when $a = 6$ and $b = 10$.

45–50. Tangent lines Carry out the following steps.

- Verify that the given point lies on the curve.
- Determine an equation of the line tangent to the curve at the given point.

45. $\sin y + 5x = y^2$; $(0, 0)$

46. $x^3 + y^3 = 2xy$; $(1, 1)$

47. $x^2 + xy + y^2 = 7$; $(2, 1)$

48. $x^4 - x^2y + y^4 = 1$; $(-1, 1)$

49. $\cos(x - y) + \sin y = \sqrt{2}$; $\left(\frac{\pi}{2}, \frac{\pi}{4}\right)$

50. $(x^2 + y^2)^2 = \frac{25}{4}xy^2$; $(1, 2)$

51–56. Second derivatives Find d^2y/dx^2 .

51. $x + y^2 = 1$

52. $2x^2 + y^2 = 4$

53. $x + y = \sin y$

54. $x^4 + y^4 = 64$

55. $\cos y + x = y$

56. $\sin x + x^2y = 10$

57. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- For any equation containing the variables x and y , the derivative dy/dx can be found by first using algebra to rewrite the equation in the form $y = f(x)$.
- For the equation of a circle of radius r , $x^2 + y^2 = r^2$, we have $\frac{dy}{dx} = -\frac{x}{y}$, for $y \neq 0$ and any real number $r > 0$.
- If $x = 1$, then by implicit differentiation, $1 = 0$.
- If $xy = 1$, then $y' = 1/x$.

58–59. Carry out the following steps.

- Use implicit differentiation to find $\frac{dy}{dx}$.
- Find the slope of the curve at the given point.

58. $xy^{5/2} + x^{3/2}y = 12$; $(4, 1)$ **59.** $xy + x^{3/2}y^{-1/2} = 2$; $(1, 1)$

60–62. Multiple tangent lines Complete the following steps.

- Find equations of all lines tangent to the curve at the given value of x .
- Graph the tangent lines on the given graph.

60. $x + y^3 - y = 1$; $x = 1$

61. $x + y^2 - y = 1$; $x = 1$

62. $4x^3 = y^2(4 - x)$; $x = 2$
(cissoid of Diocles)

63. Witch of Agnesi Let $y(x^2 + 4) = 8$ (see figure).

- Use implicit differentiation to find $\frac{dy}{dx}$.
- Find equations of all lines tangent to the curve $y(x^2 + 4) = 8$ when $y = 1$.
- Solve the equation $y(x^2 + 4) = 8$ for y to find an explicit expression for y and then calculate $\frac{dy}{dx}$.
- Verify that the results of parts (a) and (c) are consistent.

64. Vertical tangent lines

- a. Determine the points where the curve $x + y^3 - y = 1$ has a vertical tangent line (see Exercise 60).
 b. Does the curve have any horizontal tangent lines? Explain.

65. Vertical tangent lines

- a. Determine the points where the curve $x + y^2 - y = 1$ has a vertical tangent line (Exercise 61).
 b. Does the curve have any horizontal tangent lines? Explain.

66–67. Tangent lines for ellipses Find the equations of the vertical and horizontal tangent lines of the following ellipses.

66. $x^2 + 4y^2 + 2xy = 12$

67. $9x^2 + y^2 - 36x + 6y + 36 = 0$

Explorations and Challenges

68–72. Identifying functions from an equation The following equations implicitly define one or more functions.

- a. Find $\frac{dy}{dx}$ using implicit differentiation.
 b. Solve the given equation for y to identify the implicitly defined functions $y = f_1(x)$, $y = f_2(x)$, ...
 c. Use the functions found in part (b) to graph the given equation.

68. $y^3 = ax^2$ (Neile's semicubical parabola)

69. $x + y^3 - xy = 1$ (Hint: Rewrite as $y^3 - 1 = xy - x$ and then factor both sides.)

70. $y^2 = \frac{x^2(4-x)}{4+x}$ (right strophoid)

71. $x^4 = 2(x^2 - y^2)$ (eight curve)

72. $y^2(x+2) = x^2(6-x)$ (trisectrix)

73–78. Normal lines A normal line at a point P on a curve passes through P and is perpendicular to the line tangent to the curve at P (see figure). Use the following equations and graphs to determine an equation of the normal line at the given point. Illustrate your work by graphing the curve with the normal line.

73. Exercise 45

74. Exercise 46

75. Exercise 47

76. Exercise 48

77. Exercise 49

78. Exercise 50

79–82. Visualizing tangent and normal lines

- a. Determine an equation of the tangent line and the normal line at the given point (x_0, y_0) on the following curves. (See instructions for Exercises 73–78.)
 b. Graph the tangent and normal lines on the given graph.

79. $3x^3 + 7y^3 = 10y$;
 $(x_0, y_0) = (1, 1)$

80. $x^4 = 2x^2 + 2y^2$;
 $(x_0, y_0) = (2, 2)$ (kampyle of Eudoxus)

81. $(x^2 + y^2 - 2x)^2 = 2(x^2 + y^2)$; $(x_0, y_0) = (2, 2)$
 (limaçon of Pascal)

82. $(x^2 + y^2)^2 = \frac{25}{3}(x^2 - y^2)$;
 $(x_0, y_0) = (2, -1)$ (lemniscate of Bernoulli)

83–85. Orthogonal trajectories Two curves are orthogonal to each other if their tangent lines are perpendicular at each point of intersection (recall that two lines are perpendicular to each other if their slopes are negative reciprocals). A family of curves forms **orthogonal trajectories** with another family of curves if each curve in one family is orthogonal to each curve in the other family. For example, the parabolas $y = cx^2$ form orthogonal trajectories with the family of ellipses $x^2 + 2y^2 = k$, where c and k are constants (see figure).

Find dy/dx for each equation of the following pairs. Use the derivatives to explain why the families of curves form orthogonal trajectories.

83. $y = mx$; $x^2 + y^2 = a^2$, where m and a are constants

84. $y = cx^2$; $x^2 + 2y^2 = k$, where c and k are constants

85. $xy = a$; $x^2 - y^2 = b$, where a and b are constants

86. Finding slope Find the slope of the curve $5\sqrt{x} - 10\sqrt{y} = \sin x$ at the point $(4\pi, \pi)$.

87. A challenging derivative Find dy/dx , where $(x^2 + y^2)(x^2 + y^2 + x) = 8xy^2$.

88. A challenging derivative Find dy/dx , where $\sqrt{3x^7 + y^2} = \sin^2 y + 100xy$.

89. A challenging second derivative Find d^2y/dx^2 , where $\sqrt{y} + xy = 1$.

90–92. Work carefully Proceed with caution when using implicit differentiation to find points at which a curve has a specified slope. For the following curves, find the points on the curve (if they exist) at which

the tangent line is horizontal or vertical. Once you have found possible points, make sure that they actually lie on the curve. Confirm your results with a graph.

90. $y^2 - 3xy = 2$

91. $x^2(3y^2 - 2y^3) = 4$

92. $x(1 - y^2) + y^3 = 0$

QUICK CHECK ANSWERS

1. $y = \sqrt{x}$ and $y = -\sqrt{x}$ **2.** $\frac{dy}{dx} = \frac{1}{2y}$

3. Only the x -coordinate is needed. ◀

3.9 Related Rates

We now return to the theme of derivatives as rates of change in problems in which the variables change with respect to *time*. The essential feature of these problems is that two or more variables, which are related in a known way, are themselves changing in time. Here are two examples illustrating this type of problem.

- An oil rig springs a leak and the oil spreads in a (roughly) circular patch around the rig. If the radius of the oil patch increases at a known rate, how fast is the area of the patch changing (Example 1)?
- Two airliners approach an airport with known speeds, one flying west and one flying north. How fast is the distance between the airliners changing (Example 2)?

In the first problem, the two related variables are the radius and the area of the oil patch. Both are changing in time. The second problem has three related variables: the positions of the two airliners and the distance between them. Again, the three variables change in time. The goal in both problems is to determine the rate of change of one of the variables at a specific moment of time—hence the name *related rates*.

We present a progression of examples in this section. After the first example, a general procedure is given for solving related-rate problems.

Figure 3.59

EXAMPLE 1 Spreading oil An oil rig springs a leak in calm seas, and the oil spreads in a circular patch around the rig. If the radius of the oil patch increases at a rate of 30 m/hr, how fast is the area of the patch increasing when the patch has a radius of 100 meters (Figure 3.59)?

SOLUTION Two variables change simultaneously: the radius of the circle and its area. The key relationship between the radius and area is $A = \pi r^2$. It helps to rewrite the basic relationship showing explicitly which quantities vary in time. In this case, we rewrite A and r as $A(t)$ and $r(t)$ to emphasize that they change with respect to t (time). The general expression relating the radius and area at any time t is $A(t) = \pi r(t)^2$.

The goal is to find the rate of change of the area of the circle, which is $A'(t)$, given that $r'(t) = 30$ m/hr. To introduce derivatives into the problem, we differentiate the area relation $A(t) = \pi r(t)^2$ with respect to t :

$$\begin{aligned} A'(t) &= \frac{d}{dt} (\pi r(t)^2) \\ &= \pi \frac{d}{dt} (r(t)^2) \\ &= \pi (2r(t)) r'(t) && \text{Chain Rule} \\ &= 2\pi r(t) r'(t). && \text{Simplify.} \end{aligned}$$

- It is important to remember that substitution of specific values of the variables occurs *after* differentiating.

QUICK CHECK 1 In Example 1, what is the rate of change of the area when the radius is 200 m? 300 m? ◀

Substituting the given values $r(t) = 100$ m and $r'(t) = 30$ m/hr, we have (including units)

$$\begin{aligned} A'(t) &= 2\pi r(t) r'(t) \\ &= 2\pi(100 \text{ m}) \left(30 \frac{\text{m}}{\text{hr}} \right) \\ &= 6000\pi \frac{\text{m}^2}{\text{hr}}. \end{aligned}$$

We see that the area of the oil spill increases at a rate of $6000\pi \approx 18,850$ m²/hr. Including units is a simple way to check your work. In this case, we expect an answer with units of area per unit time, so m²/hr makes sense. Notice that the rate of change of the area depends on the radius of the spill. As the radius increases, the rate of change of the area also increases.

Related Exercises 5, 15 ◀

Using Example 1 as a template, we offer a general procedure for solving related-rate problems with the understanding that there are always variations that arise for individual problems.

PROCEDURE Steps for Related-Rate Problems

1. Read the problem carefully, making a sketch to organize the given information. Identify the rates that are given and the rate that is to be determined.
2. Write one or more equations that express the basic relationships among the variables.
3. Introduce rates of change by differentiating the appropriate equation(s) with respect to time t .
4. Substitute known values and solve for the desired quantity.
5. Check that units are consistent and the answer is reasonable. (For example, does it have the correct sign?)

Figure 3.60

EXAMPLE 2 Converging airplanes Two small planes approach an airport, one flying due west at 120 mi/hr and the other flying due north at 150 mi/hr. Assuming they fly at the same constant elevation, how fast is the distance between the planes changing when the westbound plane is 180 miles from the airport and the northbound plane is 225 miles from the airport?

SOLUTION A sketch such as Figure 3.60 helps us visualize the problem and organize the information. Let $x(t)$ and $y(t)$ denote the distance from the airport to the westbound and northbound planes, respectively. The paths of the two planes form the legs of a right triangle, and the distance between them, denoted $z(t)$, is the hypotenuse. By the Pythagorean theorem, $z^2 = x^2 + y^2$.

Our aim is to find dz/dt , the rate of change of the distance between the planes. We first differentiate both sides of $z^2 = x^2 + y^2$ with respect to t :

$$\frac{d}{dt}(z^2) = \frac{d}{dt}(x^2 + y^2) \Rightarrow 2z \frac{dz}{dt} = 2x \frac{dx}{dt} + 2y \frac{dy}{dt}.$$

Notice that the Chain Rule is needed because x , y , and z are functions of t . Solving for dz/dt results in

$$\frac{dz}{dt} = \frac{2x \frac{dx}{dt} + 2y \frac{dy}{dt}}{2z} = \frac{x \frac{dx}{dt} + y \frac{dy}{dt}}{z}.$$

This equation relates the unknown rate dz/dt to the known quantities x , y , z , dx/dt , and dy/dt . For the westbound plane, $dx/dt = -120$ mi/hr (negative because the distance is decreasing), and for the northbound plane, $dy/dt = -150$ mi/hr. At the moment of interest, when $x = 180$ mi and $y = 225$ mi, the distance between the planes is

$$z = \sqrt{x^2 + y^2} = \sqrt{180^2 + 225^2} \approx 288 \text{ mi}.$$

- In Example 1, we replaced A and r with $A(t)$ and $r(t)$, respectively, to remind us of the independent variable. After some practice, this replacement is not necessary.

- One could solve the equation $z^2 = x^2 + y^2$ for z , with the result $z = \sqrt{x^2 + y^2}$, and then differentiate. However, it is easier to differentiate implicitly as shown in the example.

Substituting these values gives

$$\begin{aligned}\frac{dz}{dt} &= \frac{x \frac{dx}{dt} + y \frac{dy}{dt}}{z} \approx \frac{(180 \text{ mi})(-120 \text{ mi/hr}) + (225 \text{ mi})(-150 \text{ mi/hr})}{288 \text{ mi}} \\ &\approx -192 \text{ mi/hr}.\end{aligned}$$

Notice that $dz/dt < 0$, which means the distance between the planes is *decreasing* at a rate of about 192 mi/hr.

Related Exercises 22–23 ◀

QUICK CHECK 2 Assuming the same plane speeds as in Example 2, how fast is the distance between the planes changing if $x = 60$ mi and $y = 75$ mi? ◀

► Because coffee is draining out of the filter, the volume of coffee in the filter is decreasing, which implies that dV/dt is negative.

EXAMPLE 3 Morning coffee Coffee is draining out of a conical filter at a rate of $2.25 \text{ in}^3/\text{min}$. If the cone is 5 in tall and has a radius of 2 in, how fast is the coffee level dropping when the coffee is 3 in deep?

SOLUTION A sketch of the problem (Figure 3.61a) shows the three relevant variables: the volume V , the radius r , and the height h of the coffee in the filter. The aim is to find the rate of change of the height dh/dt at the instant that $h = 3$ in, given that $dV/dt = -2.25 \text{ in}^3/\text{min}$.

Figure 3.61

The volume formula for a cone, $V = \frac{1}{3} \pi r^2 h$, expresses the basic relationship among the relevant variables. Using similar triangles (Figure 3.61b), we see that the ratio of the radius of the coffee in the cone to the height of the coffee is $2/5$ at all times; that is,

$$\frac{r}{h} = \frac{2}{5} \quad \text{or} \quad r = \frac{2}{5} h.$$

Substituting $r = \frac{2}{5} h$ into the volume formula gives V in terms of h :

$$V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi \left(\frac{2}{5} h \right)^2 h = \frac{4\pi}{75} h^3.$$

Rates of change are introduced by differentiating both sides of $V = \frac{4\pi}{75} h^3$ with respect to t :

$$\frac{dV}{dt} = \frac{4\pi}{25} h^2 \frac{dh}{dt}.$$

Now we find dh/dt at the instant when $h = 3$, given that $dV/dt = -2.25 \text{ in}^3/\text{min}$. Solving for dh/dt and substituting these values, we have

$$\begin{aligned}\frac{dh}{dt} &= \frac{25 \, dV/dt}{4\pi h^2} && \text{Solve for } \frac{dh}{dt}. \\ &= \frac{25(-2.25 \text{ in}^3/\text{min})}{4\pi(3 \text{ in})^2} \approx -0.497 \frac{\text{in}}{\text{min}}. && \text{Substitute for } \frac{dV}{dt} \text{ and } h.\end{aligned}$$

At the instant that the coffee is 3 inches deep, the height decreases at a rate of 0.497 in/min (almost half an inch per minute). Notice that the units work out consistently.

Related Exercises 36–37 ◀

QUICK CHECK 3 In Example 3, what is the rate of change of the height when $h = 2$ in? ◀

Figure 3.62

- The solution to Example 4 is reported in units of rad/s. Where did radians come from? Because a radian has no physical dimension (it is the ratio of an arc length to a radius), no unit appears. We write rad/s for clarity because $d\theta/dt$ is the rate of change of an angle.

Figure 3.63

- Recall that to convert radians to degrees, we use

$$\text{degrees} = \frac{180}{\pi} \cdot \text{radians}.$$

EXAMPLE 4 Observing a launch An observer stands 200 meters from the launch site of a hot-air balloon at an elevation equal to the elevation of the launch site. The balloon rises vertically at a constant rate of 4 m/s. How fast is the angle of elevation of the balloon increasing 30 seconds after the launch? (The angle of elevation is the angle between the ground and the observer's line of sight to the balloon.)

SOLUTION Figure 3.62 shows the geometry of the launch. As the balloon rises, its distance from the ground y and its angle of elevation θ change simultaneously. An equation expressing the relationship between these variables is $\tan \theta = y/200$. To find $d\theta/dt$, we differentiate both sides of this relationship using the Chain Rule:

$$\sec^2 \theta \frac{d\theta}{dt} = \frac{1}{200} \frac{dy}{dt}.$$

Next we solve for $\frac{d\theta}{dt}$:

$$\frac{d\theta}{dt} = \frac{dy/dt}{200 \sec^2 \theta} = \frac{(dy/dt) \cdot \cos^2 \theta}{200}.$$

The rate of change of the angle of elevation depends on the angle of elevation and the speed of the balloon. Thirty seconds after the launch, the balloon has risen $y = (4 \text{ m/s})(30 \text{ s}) = 120 \text{ m}$. To complete the problem, we need the value of $\cos \theta$. Note that when $y = 120 \text{ m}$, the distance between the observer and the balloon is

$$d = \sqrt{120^2 + 200^2} \approx 233.24 \text{ m}.$$

Therefore, $\cos \theta \approx 200/233.24 \approx 0.86$ (Figure 3.63), and the rate of change of the angle of elevation is

$$\frac{d\theta}{dt} = \frac{(dy/dt) \cdot \cos^2 \theta}{200} \approx \frac{(4 \text{ m/s})(0.86^2)}{200 \text{ m}} = 0.015 \text{ rad/s}.$$

At this instant, the balloon is rising at an angular rate of 0.015 rad/s, or slightly less than $1^\circ/\text{s}$, as seen by the observer.

Related Exercise 46 ◀

QUICK CHECK 4 In Example 4, notice that as the balloon rises (as θ increases), the rate of change of the angle of elevation decreases to zero. When does the maximum value of $\theta'(t)$ occur, and what is it? ◀

SECTION 3.9 EXERCISES

Getting Started

1. Give an example in which one dimension of a geometric figure changes and produces a corresponding change in the area or volume of the figure.
2. Charles' law states that for a fixed mass of gas under constant pressure, the volume V and temperature T of the gas (in kelvins) satisfy the equation $V = kT$, where k is constant. Find an equation relating dV/dt to dT/dt .
3. If two opposite sides of a rectangle increase in length, how must the other two opposite sides change if the area of the rectangle is to remain constant?
4. The temperature F in degrees Fahrenheit is related to the temperature C in degrees Celsius by the equation $F = \frac{9}{5}C + 32$.
 - a. Find an equation relating dF/dt to dC/dt .
 - b. How fast is the temperature in an oven changing in degrees Fahrenheit per minute if it is rising at 10° Celsius per min?
5. A rectangular swimming pool 10 ft wide by 20 ft long and of uniform depth is being filled with water.
 - a. If t is elapsed time, h is the height of the water, and V is the volume of the water, find equations relating V to h and dV/dt to dh/dt .
 - b. At what rate is the volume of the water increasing if the water level is rising at $\frac{1}{4}$ ft/min?
 - c. At what rate is the water level rising if the pool is filled at a rate of $10 \text{ ft}^3/\text{min}$?
6. At all times, the length of a rectangle is twice the width w of the rectangle as the area of the rectangle changes with respect to time t .
 - a. Find an equation relating A to w .
 - b. Find an equation relating dA/dt to dw/dt .
7. The volume V of a sphere of radius r changes over time t .
 - a. Find an equation relating dV/dt to dr/dt .
 - b. At what rate is the volume changing if the radius increases at 2 in/min when the radius is 4 inches?
 - c. At what rate is the radius changing if the volume increases at $10 \text{ in}^3/\text{min}$ when the radius is 5 inches?
8. At all times, the length of the long leg of a right triangle is 3 times the length x of the short leg of the triangle. If the area of the triangle changes with respect to time t , find equations relating the area A to x and dA/dt to dx/dt .
9. Assume x , y , and z are functions of t with $z = x + y^3$. Find dz/dt when $dx/dt = -1$, $dy/dt = 5$, and $y = 2$.
10. Assume $w = x^2y^4$, where x and y are functions of t . Find dw/dt when $x = 3$, $dx/dt = 2$, $dy/dt = 4$, and $y = 1$.

Practice Exercises

11. **Expanding square** The sides of a square increase in length at a rate of 2 m/s.
 - a. At what rate is the area of the square changing when the sides are 10 m long?
 - b. At what rate is the area of the square changing when the sides are 20 m long?
12. **Shrinking square** The sides of a square decrease in length at a rate of 1 m/s.
 - a. At what rate is the area of the square changing when the sides are 5 m long?
 - b. At what rate are the lengths of the diagonals of the square changing?
13. **Expanding isosceles triangle** The legs of an isosceles right triangle increase in length at a rate of 2 m/s.
 - a. At what rate is the area of the triangle changing when the legs are 2 m long?
 - b. At what rate is the area of the triangle changing when the hypotenuse is 1 m long?
 - c. At what rate is the length of the hypotenuse changing?
14. **Shrinking isosceles triangle** The hypotenuse of an isosceles right triangle decreases in length at a rate of 4 m/s.
 - a. At what rate is the area of the triangle changing when the legs are 5 m long?
 - b. At what rate are the lengths of the legs of the triangle changing?
 - c. At what rate is the area of the triangle changing when the area is 4 m^2 ?
15. **Expanding circle** The area of a circle increases at a rate of $1 \text{ cm}^2/\text{s}$.
 - a. How fast is the radius changing when the radius is 2 cm?
 - b. How fast is the radius changing when the circumference is 2 cm?
16. **Expanding cube** The edges of a cube increase at a rate of 2 cm/s. How fast is the volume changing when the length of each edge is 50 cm?
17. **Shrinking circle** A circle has an initial radius of 50 ft when the radius begins decreasing at a rate of 2 ft/min. What is the rate of change of the area at the instant the radius is 10 ft?
18. **Shrinking cube** The volume of a cube decreases at a rate of $0.5 \text{ ft}^3/\text{min}$. What is the rate of change of the side length when the side lengths are 12 ft?
19. **Balloons** A spherical balloon is inflated and its volume increases at a rate of $15 \text{ in}^3/\text{min}$. What is the rate of change of its radius when the radius is 10 in?
20. **Expanding rectangle** A rectangle initially has dimensions 2 cm by 4 cm. All sides begin increasing in length at a rate of 1 cm/s. At what rate is the area of the rectangle increasing after 20 s?
21. **Melting snowball** A spherical snowball melts at a rate proportional to its surface area. Show that the rate of change of the radius is constant. (*Hint:* Surface area $= 4\pi r^2$.)
22. **Divergent paths** Two boats leave a port at the same time; one travels west at 20 mi/hr and the other travels south at 15 mi/hr.
 - a. After 30 minutes, how far is each boat from port?
 - b. At what rate is the distance between the boats changing 30 minutes after they leave the port?
23. **Time-lagged flights** An airliner passes over an airport at noon traveling 500 mi/hr due west. At 1:00 P.M., another airliner passes over the same airport at the same elevation traveling due north at 550 mi/hr. Assuming both airliners maintain their (equal) elevations, how fast is the distance between them changing at 2:30 P.M.?

- 24. Flying a kite** Once Kate's kite reaches a height of 50 ft (above her hands), it rises no higher but drifts due east in a wind blowing 5 ft/s. How fast is the string running through Kate's hands at the moment when she has released 120 ft of string?
- 25. Rope on a boat** A rope passing through a capstan on a dock is attached to a boat offshore. The rope is pulled in at a constant rate of 3 ft/s and the capstan is 5 ft vertically above the water. How fast is the boat traveling when it is 10 ft from the dock?
- 26. Bug on a parabola** A bug is moving along the right side of the parabola $y = x^2$ at a rate such that its distance from the origin is increasing at 1 cm/min.
- At what rate is the x -coordinate of the bug increasing at the point $(2, 4)$?
 - Use the equation $y = x^2$ to find an equation relating $\frac{dy}{dt}$ to $\frac{dx}{dt}$.
 - At what rate is the y -coordinate of the bug increasing at the point $(2, 4)$?
- 27. Balloons and motorcycles** A hot-air balloon is 150 ft above the ground when a motorcycle (traveling in a straight line on a horizontal road) passes directly beneath it going 40 mi/hr (58.67 ft/s). If the balloon rises vertically at a rate of 10 ft/s, what is the rate of change of the distance between the motorcycle and the balloon 10 seconds later?
- 28. Baseball runners** Runners stand at first and second base in a baseball game. At the moment a ball is hit, the runner at first base runs to second base at 18 ft/s; simultaneously, the runner on second runs to third base at 20 ft/s. How fast is the distance between the runners changing 1 s after the ball is hit (see figure)? (*Hint:* The distance between consecutive bases is 90 ft and the bases lie at the corners of a square.)

- 29. Fishing story** An angler hooks a trout and reels in his line at 4 in/s. Assume the tip of the fishing rod is 12 ft above the water and directly above the angler, and the fish is pulled horizontally directly toward the angler (see figure). Find the horizontal speed of the fish when it is 20 ft from the angler.

- 30. Parabolic motion** An arrow is shot into the air and moves along the parabolic path $y = x(50 - x)$ (see figure). The horizontal

component of velocity is always 30 ft/s. What is the vertical component of velocity when (a) $x = 10$ and (b) $x = 40$?

- 31. Draining a water heater** A water heater that has the shape of a right cylindrical tank with a radius of 1 ft and a height of 4 ft is being drained. How fast is water draining out of the tank (in ft^3/min) if the water level is dropping at 6 in/min?
- 32. Drinking a soda** At what rate (in in^3/s) is soda being sucked out of a cylindrical glass that is 6 in tall and has a radius of 2 in? The depth of the soda decreases at a constant rate of 0.25 in/s.
- 33. Piston compression** A piston is seated at the top of a cylindrical chamber with radius 5 cm when it starts moving into the chamber at a constant speed of 3 cm/s (see figure). What is the rate of change of the volume of the cylinder when the piston is 2 cm from the base of the chamber?

- 34. Filling two pools** Two cylindrical swimming pools are being filled simultaneously at the same rate (in m^3/min ; see figure). The smaller pool has a radius of 5 m, and the water level rises at a rate of 0.5 m/min. The larger pool has a radius of 8 m. How fast is the water level rising in the larger pool?

- 35. Growing sandpile** Sand falls from an overhead bin and accumulates in a conical pile with a radius that is always three times its height. Suppose the height of the pile increases at a rate of 2 cm/s when the pile is 12 cm high. At what rate is the sand leaving the bin at that instant?

- 36. Draining a tank** An inverted conical water tank with a height of 12 ft and a radius of 6 ft is drained through a hole in the vertex at a rate of $2 \text{ ft}^3/\text{s}$ (see figure). What is the rate of change of the water depth when the water depth is 3 ft? (*Hint:* Use similar triangles.)

- 37. Draining a cone** Water is drained out of an inverted cone that has the same dimensions as the cone depicted in Exercise 36. If the water level drops at $1 \text{ ft}/\text{min}$, at what rate is water (in ft^3/min) draining from the tank when the water depth is 6 ft?
- 38. Two tanks** A conical tank with an upper radius of 4 m and a height of 5 m drains into a cylindrical tank with a radius of 4 m and a height of 5 m (see figure). If the water level in the conical tank drops at a rate of $0.5 \text{ m}/\text{min}$, at what rate does the water level in the cylindrical tank rise when the water level in the conical tank is 3 m? 1 m?

- 39. Filling a hemispherical tank** A hemispherical tank with a radius of 10 m is filled from an inflow pipe at a rate of $3 \text{ m}^3/\text{min}$ (see figure). How fast is the water level rising when the water level is 5 m from the bottom of the tank? (*Hint:* The volume of a cap of thickness h sliced from a sphere of radius r is $\pi h^2(3r - h)/3$.)

- 40. Surface area of hemispherical tank** For the situation described in Exercise 39, what is the rate of change of the area of the exposed surface of the water when the water is 5 m deep?
- 41. Ladder against the wall** A 13-ft ladder is leaning against a vertical wall (see figure) when Jack begins pulling the foot of the ladder away from the wall at a rate of $0.5 \text{ ft}/\text{s}$. How fast is the top of the ladder sliding down the wall when the foot of the ladder is 5 ft from the wall?

- 42. Ladder against the wall again** A 12-ft ladder is leaning against a vertical wall when Jack begins pulling the foot of the ladder away from the wall at a rate of $0.2 \text{ ft}/\text{s}$. What is the configuration of the ladder at the instant when the vertical speed of the top of the ladder equals the horizontal speed of the foot of the ladder?
- 43. Moving shadow** A 5-ft-tall woman walks at $8 \text{ ft}/\text{s}$ toward a streetlight that is 20 ft above the ground. What is the rate of change of the length of her shadow when she is 15 ft from the streetlight? At what rate is the tip of her shadow moving?
- 44. Another moving shadow** A landscape light at ground level lights up the side of a tall building that is 15 feet from the light. A 6-ft-tall man starts walking (on flat terrain) from the light directly toward the building. How fast is he walking when he is 9 feet from the light if his shadow on the building is shrinking at $2 \text{ ft}/\text{s}$ at that instant?
- 45. Watching an elevator** An observer is 20 m above the ground floor of a large hotel atrium looking at a glass-enclosed elevator shaft that is 20 m horizontally from the observer (see figure). The angle of elevation of the elevator is the angle that the observer's line of sight makes with the horizontal (it may be positive or negative). Assuming the elevator rises at a rate of $5 \text{ m}/\text{s}$, what is the rate of change of the angle of elevation when the elevator is 10 m above the ground? When the elevator is 40 m above the ground?

- 46. Observing a launch** An observer stands 300 ft from the launch site of a hot-air balloon at an elevation equal to the elevation of the launch site. The balloon is launched vertically and maintains a constant upward velocity of $20 \text{ ft}/\text{s}$. What is the rate of change of the angle of elevation of the balloon when it is 400 ft from the ground? (*Hint:* The angle of elevation is the angle θ between the observer's line of sight to the balloon and the ground.)

- 47. Viewing angle** The bottom of a large theater screen is 3 ft above your eye level and the top of the screen is 10 ft above your eye level. Assume you walk away from the screen (perpendicular to the screen) at a rate of 3 ft/s while looking at the screen. What is the rate of change of the viewing angle θ when you are 30 ft from the wall on which the screen hangs, assuming the floor is horizontal (see figure)?

- 48. Altitude of a jet** A jet ascends at a 10° angle from the horizontal with an airspeed of 550 mi/hr (its speed along its line of flight is 550 mi/hr). How fast is the altitude of the jet increasing? If the sun is directly overhead, how fast is the shadow of the jet moving on the ground?
- 49. Rate of dive of a submarine** A surface ship is moving (horizontally) in a straight line at 10 km/hr. At the same time, an enemy submarine maintains a position directly below the ship while diving at an angle that is 20° below the horizontal. How fast is the submarine's altitude decreasing?
- 50. Revolving light beam** A lighthouse stands 500 m off a straight shore, and the focused beam of its light revolves (at a constant rate) four times each minute. As shown in the figure, P is the point on shore closest to the lighthouse and Q is a point on the shore 200 m from P . What is the speed of the beam along the shore when it strikes the point Q ? Describe how the speed of the beam along the shore varies with the distance between P and Q . Neglect the height of the lighthouse.

- 51. Filming a race** A camera is set up at the starting line of a drag race 50 ft from a dragster at the starting line (camera 1 in the figure). Two seconds after the start of the race, the dragster has traveled 100 ft and the camera is turning at 0.75 rad/s while filming the dragster.
- What is the speed of the dragster at this point?
 - A second camera (camera 2 in the figure) filming the dragster is located on the starting line 100 ft away from the dragster at the start of the race. How fast is this camera turning 2 s after the start of the race?

- 52. Fishing reel** An angler hooks a trout and begins turning her circular reel at 1.5 rev/s. Assume the radius of the reel (and the fishing line on it) is 2 inches.
- Let R equal the number of revolutions the angler has turned her reel and suppose L is the amount of line that she has reeled in. Find an equation for L as a function of R .
 - How fast is she reeling in her fishing line?
- 53. Wind energy** The kinetic energy E (in joules) of a mass in motion satisfies the equation $E = \frac{1}{2}mv^2$, where mass m is measured in kg and velocity v is measured in m/s.
- Power P is defined to be dE/dt , the rate of change in energy with respect to time. Power is measured in units of watts (W), where $1 \text{ W} = 1 \text{ joule/s}$. If the velocity v is constant, use implicit differentiation to find an equation for power P in terms of the derivative dm/dt .
 - Wind turbines use kinetic energy in the wind to create electrical power. In this case, the derivative dm/dt is called the **mass flow rate** and it satisfies the equation $\frac{dm}{dt} = \rho Av$, where ρ is the density of the air in kg/m^3 , A is the sweep area in m^2 of the wind turbine (see figure), and v is the velocity of the wind in m/s. Show that $P = \frac{1}{2} \rho A v^3$.
 - Suppose a blade on a small wind turbine has a length of 3 m. Find the available power P if the wind is blowing at 10 m/s. (Hint: Use $\rho = 1.23 \text{ kg/m}^3$ for the density of air. The density of air varies, but this is a reasonable average value.)
 - Wind turbines convert only a small percentage of the available wind power into electricity. Assume the wind turbine described in this exercise converts only 25% of the available wind power into electricity. How much electrical power is produced?

- 54. Boyle's law** Robert Boyle (1627–1691) found that for a given quantity of gas at a constant temperature, the pressure P (in kPa) and volume V of the gas (in m^3) are accurately approximated by the equation $V = k/P$, where $k > 0$ is constant. Suppose the volume of an expanding gas is increasing at a rate of $0.15 \text{ m}^3/\text{min}$ when the volume $V = 0.5 \text{ m}^3$ and the pressure is $P = 50 \text{ kPa}$. At what rate is pressure changing at this moment?

Explorations and Challenges

- 55. Clock hands** The hands of the clock in the tower of the Houses of Parliament in London are approximately 3 m and 2.5 m in length. How fast is the distance between the tips of the hands changing at 9:00? (*Hint:* Use the Law of Cosines.)
- 56. Divergent paths** Two boats leave a port at the same time, one traveling west at 20 mi/hr and the other traveling southwest (45° south of west) at 15 mi/hr. After 30 minutes, how far apart are the boats and at what rate is the distance between them changing? (*Hint:* Use the Law of Cosines.)
- 57. Filling a pool** A swimming pool is 50 m long and 20 m wide. Its depth decreases linearly along the length from 3 m to 1 m (see figure). It was initially empty and is being filled at a rate of $1 \text{ m}^3/\text{min}$. How fast is the water level rising 250 min after the filling begins? How long will it take to fill the pool?

- 58. Disappearing triangle** An equilateral triangle initially has sides of length 20 ft when each vertex moves toward the midpoint of the opposite side at a rate of 1.5 ft/min. Assuming the triangle remains equilateral, what is the rate of change of the area of the triangle at the instant the triangle disappears?
- 59. Oblique tracking** A port and a radar station are 2 mi apart on a straight shore running east and west (see figure). A ship leaves the port at noon traveling northeast at a rate of 15 mi/hr. If the ship maintains its speed and course, what is the rate of change of the tracking angle θ between the shore and the line between the radar station and the ship at 12:30 P.M.? (*Hint:* Use the Law of Sines.)

- 60. Oblique tracking** A ship leaves port traveling southwest at a rate of 12 mi/hr. At noon, the ship reaches its closest approach to a radar station, which is on the shore 1.5 mi from the port. If the

ship maintains its speed and course, what is the rate of change of the tracking angle θ between the radar station and the ship at 1:30 P.M. (see figure)? (*Hint:* Use the Law of Sines.)

- 61. Navigation** A boat leaves a port traveling due east at 12 mi/hr. At the same time, another boat leaves the same port traveling north-east at 15 mi/hr. The angle θ of the line between the boats is measured relative to due north (see figure). What is the rate of change of this angle 30 min after the boats leave the port? 2 hr after the boats leave the port?

- 62. Watching a Ferris wheel** An observer stands 20 m from the bottom of a 10-m-tall Ferris wheel on a line that is perpendicular to the face of the Ferris wheel. The wheel revolves at a rate of $\pi \text{ rad/min}$ and the observer's line of sight with a specific seat on the wheel makes an angle θ with the ground (see figure). Forty seconds after that seat leaves the lowest point on the wheel, what is the rate of change of θ ? Assume the observer's eyes are level with the bottom of the wheel.

- 63. Draining a trough** A trough in the shape of a half cylinder has length 5 m and radius 1 m. The trough is full of water when a valve is opened, and water flows out of the bottom of the trough at a rate of $1.5 \text{ m}^3/\text{hr}$ (see figure). (*Hint:* The area of a sector of a circle of radius r subtended by an angle θ is $r^2\theta/2$.)

- a. How fast is the water level changing when the water level is 0.5 m from the bottom of the trough?

- b. What is the rate of change of the surface area of the water when the water is 0.5 m deep?

64. **Searchlight—wide beam** A revolving searchlight, which is 100 m from the nearest point on a straight highway, casts a horizontal beam along a highway (see figure). The beam leaves the spotlight at an angle of $\pi/16$ rad and revolves at a rate $\pi/6$ rad/s. Let w be the width of the beam as it sweeps along the highway

and let θ be the angle that the center of the beam makes with the perpendicular to the highway. What is the rate of change of w when $\theta = \pi/3$? Neglect the height of the searchlight.

QUICK CHECK ANSWERS

1. $12,000\pi$ m²/hr, $18,000\pi$ m²/hr 2. -192 mi/hr
3. -1.12 in/min 4. $t = 0, \theta = 0, \theta'(0) = 0.02$ rad/s

CHAPTER 3 REVIEW EXERCISES

- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - The function $f(x) = |2x + 1|$ is continuous for all x ; therefore, it is differentiable for all x .
 - If $\frac{d}{dx}(f(x)) = \frac{d}{dx}(g(x))$, then $f = g$.
 - For any function f , $\frac{d}{dx}|f(x)| = |f'(x)|$.
 - The value of $f'(a)$ fails to exist only if the curve $y = f(x)$ has a vertical tangent line at $x = a$.
 - An object can have negative acceleration and increasing speed.

2–4. Evaluate the derivative of each of the following functions using a limit definition of the derivative. Check your work by evaluating the derivatives using the derivative rules given in this chapter.

2. $f(x) = x^2 + 2x + 9$ 3. $g(x) = \frac{1}{x^2 + 5}$

4. $h(t) = \sqrt{3t + 5}$

5–8. Use differentiation to verify each equation.

5. $\frac{d}{dx}(\tan^3 x - 3 \tan x + 3x) = 3 \tan^4 x$

6. $\frac{d}{dx}\left(\frac{x}{\sqrt{1-x^2}}\right) = \frac{1}{(1-x^2)^{3/2}}$

7. $\frac{d}{d\theta}(\sec^3 \theta - 3 \sec \theta) = \tan^3 \theta \sec \theta$

8. $\frac{d}{dv}(6v - 4)(v + 1)^{3/2} = 15v\sqrt{v + 1}$

9–46. Evaluate and simplify y' .

9. $y = \frac{2}{3}x^3 + \pi x^2 + 7x + 1$ 10. $y = (t + 1)^{10}(t + 2)$

- $y = \sqrt{2 + \sin w} + \cos w$
- $y = 2x^{\sqrt{2}}$
- $y = (\tan w + 10)^5$
- $y = (2x - 3)x^{3/2}$
- $y = (1 + x^4)^{3/2}$
- $y = 2x\sqrt{x^2 - 2x + 2}$
- $y = 5t^2 \sin t$
- $y = 5x + \sin^3 x + \sin x^3$
- $y = \frac{v^{100}}{v + 1}$
- $y = \frac{\cos u + u}{\cos u - u}$
- $y = \frac{\sec 2w}{\sec 2w + 1}$
- $y = \left(\frac{\sin x}{\cos x + 1}\right)^{1/3}$
- $y = \sin^{10}(5t^2 + 1)$
- $y = \sqrt{10 + \cot^2 x}$
- $y = (5t^2 + 10)^{100}$
- $y = \frac{\csc 2\theta}{1 + \csc 2\theta}$
- $y = 4 \tan(\theta^2 + 3\theta + 2)$
- $y = \csc^5 3x$
- $y = \frac{4u^2 + u}{8u + 1}$
- $y = \left(\frac{3t^2 - 1}{3t^2 + 1}\right)^{-3}$
- $y = \tan(\sin \theta)$
- $y = \left(\frac{v}{v + 1}\right)^{4/3}$
- $y = \sin \sqrt{\cos^2 x + 1}$
- $y = \sin(\sin(3\theta + 2))$
- $y = -x^2 \cos x + 2x \sin x + 2 \cos x$
- $y = \sin^{10} \theta^{10}$
- $y = \frac{5}{12}(x + 1)^{12/5} - \frac{5}{7}(x + 1)^{7/5}$
- $y = |2x - 6|$
- $y = \sin\left(\frac{x}{x + 1}\right)$
- $y = \left(\frac{v}{3v^2 + 2v + 1}\right)^{1/3}$
- $y = \frac{\tan^2 w}{\sec w + 1}$
- $y = \frac{(2u + 1)^{20}}{(2u + 1)^{20} + 1}$

43. $x = \cos(x - y)$

44. $xy^4 + x^4y = 1$

45. $y\sqrt{x^2 + y^2} = 15$

46. $\sin x \cos(y - 1) = \frac{1}{2}$

47. Evaluate $\frac{d}{dx}(x \sec x) \Big|_{x=\frac{\pi}{4}}$.

48. Find $f'(1)$ when $f(\theta) = \sin(\pi\theta)$.

49–52. **Higher-order derivatives** Find and simplify y'' .

49. $y = (x - 3)\sqrt{x + 2}$

50. $y = \frac{3x - 1}{x + 1}$

51. $xy + y^2 = 1$

52. $x + \sin y = y$

53–56. **Tangent lines** Find an equation of the line tangent to each of the following curves at the given point.

53. $y = 3x^3 + \sin x; (0, 0)$

54. $y = \frac{4x}{x^2 + 3}; (1, 1)$

55. $y + \sqrt{xy} = 6; (1, 4)$

56. $x^2y + y^3 = 5; (2, 1)$

57–60. **Derivative formulas** Evaluate the following derivatives. Express your answers in terms of f , g , f' , and g' .

57. $\frac{d}{dx}(x^2f(x))$

58. $\frac{d}{dx} \sqrt{\frac{f(x)}{g(x)}}, \frac{f(x)}{g(x)} \geq 0$

59. $\frac{d}{dx} \left(\frac{xf(x)}{g(x)} \right)$

60. $\frac{d}{dx} f(\sqrt{g(x)}), g(x) \geq 0$

61. **Matching functions and derivatives** Match the functions a–d with the derivatives A–D.62. Sketch a graph of f' for the function f shown in the figure.63. Sketch a graph of g' for the function g shown in the figure.64. Use the given graphs of f and g to find each derivative.

a. $\frac{d}{dx}(5f(x) + 3g(x)) \Big|_{x=1}$

b. $\frac{d}{dx}(f(x)g(x)) \Big|_{x=1}$

c. $\frac{d}{dx} \left(\frac{f(x)}{g(x)} \right) \Big|_{x=3}$

d. $\frac{d}{dx}(f(f(x))) \Big|_{x=4}$

e. $\frac{d}{dx}(g(f(x))) \Big|_{x=1}$

- 65. Finding derivatives from a table** Find the values of the following derivatives using the table.

x	1	3	5	7	9
$f(x)$	3	1	9	7	5
$f'(x)$	7	9	5	1	3
$g(x)$	9	7	5	3	1
$g'(x)$	5	9	3	1	7

- a. $\left. \frac{d}{dx}(f(x) + 2g(x)) \right|_{x=3}$ b. $\left. \frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) \right|_{x=1}$
 c. $\left. \frac{d}{dx}(f(x)g(x)) \right|_{x=3}$ d. $\left. \frac{d}{dx}(f(x)^3) \right|_{x=5}$

- 66–67. Derivatives from a graph** If possible, evaluate the following derivatives using the graphs of f and f' .

66. a. $\left. \frac{d}{dx}(xf(x)) \right|_{x=2}$ b. $\left. \frac{d}{dx}(f(x^2)) \right|_{x=1}$
 c. $\left. \frac{d}{dx}(f(f(x))) \right|_{x=1}$
 67. a. $\left. \frac{d}{dx}\left(\frac{x^3}{f(x)}\right) \right|_{x=2}$ b. $\left. \frac{d}{dx}(\sqrt{f(x)}) \right|_{x=1}$
 c. $\left. \frac{d}{dx}(\cos(\pi f(x))) \right|_{x=3}$

- 68–69.** The line tangent to $y = f(x)$ at $x = 3$ is $y = 4x - 10$ and the line tangent to $y = g(x)$ at $x = 5$ is $y = 6x - 27$.

- 68.** Compute $f(3)$, $f'(3)$, $g(5)$, and $g'(5)$.

- 69.** Find an equation of the line tangent to the graph of $y = f(g(x))$ at $x = 5$.

- 70. Horizontal motion** The position of an object moving horizontally after t seconds is given by the function $s = 27t - t^3$, for $t > 0$, where s is measured in feet, with $s > 0$ corresponding to positions right of the origin.

- a. When is the object stationary, moving to the right, and moving to the left?
 b. Determine the velocity and acceleration of the object at $t = 2$.

- c. Determine the acceleration of the object when its velocity is zero.
 d. On what time intervals is the speed decreasing?

- 71. Projectile on Mars** Suppose an object is fired vertically upward from the ground on Mars with an initial velocity of 96 ft/s. The height s (in feet) of the object above the ground after t seconds is given by $s = 96t - 6t^2$.

- a. Determine the instantaneous velocity of the object at $t = 1$.
 b. When will the object have an instantaneous velocity of 12 ft/s?
 c. What is the height of the object at the highest point of its trajectory?
 d. With what speed does the object strike the ground?

- 72. Growth rate of bacteria** Suppose the following graph represents the number of bacteria in a culture t hours after the start of an experiment.

- a. At approximately what time is the instantaneous growth rate the greatest, for $0 \leq t \leq 36$? Estimate the growth rate at this time.
 b. At approximately what time in the interval $0 \leq t \leq 36$ is the instantaneous growth rate the least? Estimate the instantaneous growth rate at this time.
 c. What is the average growth rate over the interval $0 \leq t \leq 36$?

- 73. Population of the United States** The population of the United States (in millions) by decade is given in the table, where t is the number of years after 1910. These data are plotted and fitted with a smooth curve $y = p(t)$ in the figure.

- a. Compute the average rate of population growth from 1950 to 1960.
 b. Explain why the average rate of growth from 1950 to 1960 is a good approximation to the (instantaneous) rate of growth in 1955.
 c. Estimate the instantaneous rate of growth in 1985.

Year	1910	1920	1930	1940	1950	1960
t	0	10	20	30	40	50
$p(t)$	92	106	123	132	152	179
Year	1970	1980	1990	2000	2010	2020
t	60	70	80	90	100	110
$p(t)$	203	227	249	281	309	335

74. Velocity of a skydiver Assume the graph represents the distance (in meters) that a skydiver has fallen t seconds after jumping out of a plane.

- Estimate the velocity of the skydiver at $t = 15$.
- Estimate the velocity of the skydiver at $t = 70$.
- Estimate the average velocity of the skydiver between $t = 20$ and $t = 90$.
- Sketch a graph of the velocity function, for $0 \leq t \leq 120$.
- What significant event occurred at $t = 30$?

75. For what value(s) of x is the line tangent to the curve $y = x\sqrt{6-x}$ horizontal? Vertical?

76–77. Limits The following limits represent the derivative of a function f at a point a . Find a possible f and a , and then evaluate the limit.

$$76. \lim_{h \rightarrow 0} \frac{\sin^2\left(\frac{\pi}{4} + h\right) - \frac{1}{2}}{h} \quad 77. \lim_{x \rightarrow 5} \frac{\tan(\pi\sqrt{3x-11})}{x-5}$$

78. Velocity of a probe A small probe is launched vertically from the ground. After it reaches its high point, a parachute deploys and the probe descends to Earth. The height of the probe above ground is $s(t) = \frac{300t - 50t^2}{t^3 + 2}$, for $0 \leq t \leq 6$.

- Graph the height function and describe the motion of the probe.
- Find the velocity of the probe.
- Graph the velocity function and determine the approximate time at which the velocity is a maximum.

79. Marginal and average cost Suppose the cost of producing x lawn mowers is $C(x) = -0.02x^2 + 400x + 5000$.

- Determine the average and marginal costs for $x = 3000$ lawn mowers.
- Interpret the meaning of your results in part (a).

80. Marginal and average cost Assume $C(x) = -0.0001x^3 + 0.05x^2 + 60x + 800$ is the cost of making x fly rods.

- Determine the average and marginal costs for $x = 400$ fly rods.
- Interpret the meaning of your results in part (a).

81. Population growth Suppose $p(t) = -1.7t^3 + 72t^2 + 7200t + 80,000$ is the population of a city t years after 1950.

- Determine the average rate of growth of the city from 1950 to 2000.
- What was the rate of growth of the city in 1990?

82. Position of a piston The distance between the head of a piston and the end of a cylindrical chamber is given by $x(t) = \frac{8t}{t+1}$ cm, for $t \geq 0$ (measured in seconds). The radius of the cylinder is 4 cm.

- Find the volume of the chamber, for $t \geq 0$.
- Find the rate of change of the volume $V'(t)$, for $t \geq 0$.
- Graph the derivative of the volume function. On what intervals is the volume increasing? Decreasing?

83. Boat rates Two boats leave a dock at the same time. One boat travels south at 30 mi/hr and the other travels east at 40 mi/hr. After half an hour, how fast is the distance between the boats increasing?

84. Rate of inflation of a balloon A spherical balloon is inflated at a rate of $10 \text{ cm}^3/\text{min}$. At what rate is the diameter of the balloon increasing when the balloon has a diameter of 5 cm?

85. Rate of descent of a hot-air balloon A rope is attached to the bottom of a hot-air balloon that is floating above a flat field. If the angle of the rope to the ground remains 65° and the rope is pulled in at 5 ft/s, how quickly is the elevation of the balloon changing?

86. Filling a tank Water flows into a conical tank at a rate of $2 \text{ ft}^3/\text{min}$. If the radius of the top of the tank is 4 ft and the height is 6 ft, determine how quickly the water level is rising when the water is 2 ft deep in the tank.

87. Angle of elevation A jet flying at 450 mi/hr and traveling in a straight line at a constant elevation of 500 ft passes directly over a spectator at an air show. How quickly is the angle of elevation (between the ground and the line from the spectator to the jet) changing 2 seconds later?

88. Viewing angle A man whose eye level is 6 ft above the ground walks toward a billboard at a rate of 2 ft/s. The bottom of the billboard is 10 ft above the ground, and it is 15 ft high. The man's viewing angle is the angle formed by the lines between the man's eyes and the top and bottom of the billboard. At what rate is the viewing angle changing when the man is 30 ft from the billboard?

89. Shadow length A street light is fastened to the top of a 15-ft-high pole. If a 5-ft-tall woman walks away from the pole in a straight line over level ground at a rate of 3 ft/s, how fast is the length of her shadow changing when she is 10 ft away from the pole?

90. A parabola property Let $f(x) = x^2$.

- a. Show that $\frac{f(x) - f(y)}{x - y} = f'\left(\frac{x + y}{2}\right)$, for all $x \neq y$.
- b. Is this property true for $f(x) = ax^2$, where a is a nonzero real number?
- c. Give a geometrical interpretation of this property.
- d. Is this property true for $f(x) = ax^3$?

Chapter Preview Much of the previous chapter was devoted to the basic mechanics of derivatives: evaluating them and interpreting them as rates of change. We now apply derivatives to a variety of mathematical questions, many of which concern properties of functions and their graphs. One outcome of this work is a set of analytical curve-sketching methods that produce accurate graphs of functions. Equally important, derivatives allow us to formulate and solve a wealth of practical problems. For example, an asteroid passes perilously close to Earth: At what point along their trajectories is the distance separating them smallest, and what is the minimum distance? An economist has a mathematical model that relates the demand for a product to its price: What price maximizes the revenue? In this chapter, we develop the tools needed to answer such questions. In addition, we begin an ongoing discussion about approximating functions, we present an important result called the Mean Value Theorem, and we work with a powerful method that enables us to evaluate a new kind of limit. The chapter concludes with two important topics: a numerical approach to approximating roots of functions, called Newton's method, and a preview of integral calculus, which is the subject of Chapter 5.

4.1 Maxima and Minima

With a working understanding of derivatives, we now undertake one of the fundamental tasks of calculus: analyzing the behavior of functions and producing accurate graphs of them. An important question associated with any function concerns its maximum and minimum values: On a given interval (perhaps the entire domain), where does the function assume its largest and smallest values? Questions about maximum and minimum values take on added significance when a function represents a practical quantity, such as the profits of a company, the surface area of a container, or the speed of a space vehicle.

Absolute Maxima and Minima

Imagine taking a long hike through varying terrain from west to east. Your elevation changes as you walk over hills, through valleys, and across plains, and you reach several high and low points along the journey. Analogously, when we examine a function f over an interval on the x -axis, its values increase and decrease, reaching high points and low points (Figure 4.1). You can view our study of functions in this chapter as an exploratory hike along the x -axis.

Figure 4.1

DEFINITION Absolute Maximum and Minimum

Let f be defined on a set D containing c . If $f(c) \geq f(x)$ for every x in D , then $f(c)$ is an **absolute maximum** value of f on D . If $f(c) \leq f(x)$ for every x in D , then $f(c)$ is an **absolute minimum** value of f on D . An **absolute extreme value** is either an absolute maximum value or an absolute minimum value.

The existence and location of absolute extreme values depend on both the function and the interval of interest. Figure 4.2 shows various cases for the function $f(x) = 4 - x^2$. Notice that if the interval of interest is not closed, a function might not attain absolute extreme values (Figure 4.2a, c, and d).

➤ Absolute maximum and minimum values are also called *global* maximum and minimum values. The plural of *maximum* is *maxima*; the plural of *minimum* is *minima*.

Figure 4.2

However, defining a function on a closed interval is not enough to guarantee the existence of absolute extreme values. Both functions in Figure 4.3 are defined at every point of a closed interval, but neither function attains an absolute maximum—the discontinuity in each function prevents it from happening.

Figure 4.3

It turns out that *two* conditions ensure the existence of absolute maximum and minimum values on an interval: The function must be continuous on the interval, and the interval must be closed and bounded.

- The proof of the Extreme Value Theorem relies on properties of the real numbers, found in advanced books.

QUICK CHECK 1 Sketch the graph of a function that is continuous on an interval but does not have an absolute minimum value. Sketch the graph of a function that is defined on a closed interval but does not have an absolute minimum value. ◀

THEOREM 4.1 Extreme Value Theorem

A function that is continuous on a closed interval $[a, b]$ has an absolute maximum value and an absolute minimum value on that interval.

EXAMPLE 1 Locating absolute maximum and minimum values For the functions in Figure 4.4, identify the location of the absolute maximum value and the absolute minimum value on the interval $[a, b]$. Do the functions meet the conditions of the Extreme Value Theorem?

Figure 4.4

SOLUTION

- The function f is continuous on the closed interval $[a, b]$, so the Extreme Value Theorem guarantees an absolute maximum (which occurs at a) and an absolute minimum (which occurs at c).
- The function g does not satisfy the conditions of the Extreme Value Theorem because it is not continuous, and it is defined only on the open interval (a, b) . It does not have an absolute minimum value. It does, however, have an absolute maximum at c . Therefore, a function may violate the conditions of the Extreme Value Theorem and still have an absolute maximum or minimum (or both).

Related Exercises 11–14 ◀

Local Maxima and Minima

Figure 4.5 shows a function f defined on the interval $[a, b]$. It has an absolute minimum at the endpoint b and an absolute maximum at the interior point s . In addition, the function has

Figure 4.5

special behavior at q , where its value is greatest *among values at nearby points*, and at p and r , where its value is least *among values at nearby points*. A point at which a function takes on the maximum or minimum value among values at nearby points is important.

- Local maximum and minimum values are also called *relative maximum* and *minimum values*. *Local extrema* (plural) and *local extremum* (singular) refer to either local maxima or local minima.

DEFINITION Local Maximum and Minimum Values

Suppose c is an interior point of some interval I on which f is defined. If $f(c) \geq f(x)$ for all x in I , then $f(c)$ is a **local maximum** value of f . If $f(c) \leq f(x)$ for all x in I , then $f(c)$ is a **local minimum** value of f .

In this text, we adopt the convention that local maximum values and local minimum values occur only at interior points of the interval(s) of interest. For example, in Figure 4.5, the minimum value that occurs at the endpoint b is not a local minimum. However, it is the absolute minimum of the function on $[a, b]$.

EXAMPLE 2 Locating various maxima and minima Figure 4.6 shows the graph of a function defined on $[a, b]$. Identify the location of the various maxima and minima using the terms *absolute* and *local*.

SOLUTION The function f is continuous on a closed interval; by Theorem 4.1, it has absolute maximum and minimum values on $[a, b]$. The function has a local minimum value and its absolute minimum value at p . It has another local minimum value at r . The absolute maximum value of f occurs at both q and s (which also correspond to local maximum values).

Related Exercises 15–18 ◀

Figure 4.6

Figure 4.7

Critical Points Another look at Figure 4.6 shows that local maxima and minima occur at points in the open interval (a, b) where the derivative is zero ($x = q, r$, and s) and at points where the derivative fails to exist ($x = p$). We now make this observation precise.

Figure 4.7 illustrates a function that is differentiable at c with a local maximum at c . For x near c with $x < c$, the secant lines through $(x, f(x))$ and $(c, f(c))$ have nonnegative slopes. For x near c with $x > c$, the secant lines through $(x, f(x))$ and $(c, f(c))$ have nonpositive slopes. As $x \rightarrow c$, the slopes of these secant lines approach the slope of the tangent line at $(c, f(c))$. These observations imply that the slope of the tangent line must be both nonnegative and nonpositive, which happens only if $f'(c) = 0$. Similar reasoning leads to the same conclusion for a function with a local minimum at c : if $f'(c)$ exists, then $f'(c)$ must be zero. This argument is an outline of the proof (Exercise 85) of the following theorem.

THEOREM 4.2 Local Extreme Value Theorem

If f has a local maximum or minimum value at c and $f'(c)$ exists, then $f'(c) = 0$.

Local extrema can also occur at points c where $f'(c)$ does not exist. Figure 4.8 shows two such cases, one in which c is a point of discontinuity and one in which f has a corner point at c . Because local extrema may occur at points c where $f'(c) = 0$ or where $f'(c)$ does not exist, we make the following definition.

DEFINITION Critical Point

An interior point c of the domain of f at which $f'(c) = 0$ or $f'(c)$ fails to exist is called a **critical point** of f .

- Theorem 4.2, often attributed to Fermat, is one of the clearest examples in mathematics of a necessary, but not sufficient, condition. A local maximum (or minimum) at c necessarily implies a critical point at c , but a critical point at c is not sufficient to imply a local maximum (or minimum).

Figure 4.8

Note that the converse of Theorem 4.2 is not necessarily true. It is possible that $f'(c) = 0$ at a point without a local maximum or local minimum value occurring there (Figure 4.9a). It is also possible that $f'(c)$ fails to exist, with no local extreme value occurring at c (Figure 4.9b). Therefore, critical points are *candidates* for the location of local extreme values, but you must determine whether they actually correspond to local maxima or minima. This procedure is discussed in Section 4.3.

Figure 4.9

Figure 4.10

EXAMPLE 3 Locating critical points Find the critical points of $f(x) = \frac{x}{x^2 + 1}$.

SOLUTION Note that f is differentiable on its domain, which is $(-\infty, \infty)$. By the Quotient Rule,

$$f'(x) = \frac{(x^2 + 1) - 2x^2}{(x^2 + 1)^2} = \frac{1 - x^2}{(x^2 + 1)^2}.$$

Setting $f'(x) = 0$ and noting that $x^2 + 1 > 0$ for all x , the critical points satisfy the equation $1 - x^2 = 0$. Therefore, the critical points are $x = 1$ and $x = -1$. The graph of f (Figure 4.10) shows that f has a local (and absolute) maximum at $(1, \frac{1}{2})$ and a local (and absolute) minimum at $(-1, -\frac{1}{2})$.

Related Exercises 30–31 ◀

QUICK CHECK 2 Consider the function $f(x) = x^3$. Where is the critical point of f ? Does f have a local maximum or minimum at the critical point? ◀

Locating Absolute Maxima and Minima

Theorem 4.1 guarantees the existence of absolute extreme values of a continuous function on a closed interval $[a, b]$, but it doesn't say where these values are located. Two observations lead to a procedure for locating absolute extreme values.

- An absolute extreme value in the interior of an interval is also a local extreme value, and we know that local extreme values occur at the critical points of f .
- Absolute extreme values may also occur at the endpoints of the interval of interest.

These two facts suggest the following procedure for locating the absolute extreme values of a continuous function on a closed interval.

PROCEDURE Locating Absolute Extreme Values on a Closed Interval

Assume the function f is continuous on the closed interval $[a, b]$.

1. Locate the critical points c in (a, b) , where $f'(c) = 0$ or $f'(c)$ does not exist. These points are candidates for absolute maxima and minima.
2. Evaluate f at the critical points and at the endpoints of $[a, b]$.
3. Choose the largest and smallest values of f from Step 2 for the absolute maximum and minimum values, respectively.

Note that the preceding procedure box does not address the case in which f is continuous on an open interval. If the interval of interest is an open interval, then absolute extreme values—if they exist—occur at interior points.

EXAMPLE 4 Absolute extreme values Find the absolute maximum and minimum values of the following functions.

- a. $f(x) = x^4 - 2x^3$ on the interval $[-2, 2]$
- b. $g(x) = x^{2/3}(2 - x)$ on the interval $[-1, 2]$

SOLUTION

- a. Because f is a polynomial, its derivative exists everywhere. So if f has critical points, they are points at which $f'(x) = 0$. Computing f' and setting it equal to zero, we have

$$f'(x) = 4x^3 - 6x^2 = 2x^2(2x - 3) = 0.$$

Solving this equation gives the critical points $x = 0$ and $x = \frac{3}{2}$, both of which lie in the interval $[-2, 2]$; these points and the endpoints are *candidates* for the location of absolute extrema. Evaluating f at each of these points, we have

$$f(-2) = 32, \quad f(0) = 0, \quad f\left(\frac{3}{2}\right) = -\frac{27}{16}, \quad \text{and} \quad f(2) = 0.$$

The largest of these function values is $f(-2) = 32$, which is the absolute maximum of f on $[-2, 2]$. The smallest of these values is $f\left(\frac{3}{2}\right) = -\frac{27}{16}$, which is the absolute minimum of f on $[-2, 2]$. The graph of f (Figure 4.11) shows that the critical point $x = 0$ corresponds to neither a local maximum nor a local minimum.

- b. Differentiating $g(x) = x^{2/3}(2 - x) = 2x^{2/3} - x^{5/3}$, we have

$$g'(x) = \frac{4}{3}x^{-1/3} - \frac{5}{3}x^{2/3} = \frac{4 - 5x}{3x^{1/3}}.$$

Because $g'(0)$ is undefined and 0 is in the domain of g , $x = 0$ is a critical point. In addition, $g'(x) = 0$ when $4 - 5x = 0$, so $x = \frac{4}{5}$ is also a critical point. These two critical points and the endpoints are *candidates* for the location of absolute extrema. The next step is to evaluate g at the critical points and endpoints:

$$g(-1) = 3, \quad g(0) = 0, \quad g\left(\frac{4}{5}\right) \approx 1.03, \quad \text{and} \quad g(2) = 0.$$

The largest of these function values is $g(-1) = 3$, which is the absolute maximum value of g on $[-1, 2]$. The least of these values is 0, which occurs twice. Therefore, g has its absolute minimum value on $[-1, 2]$ at the critical point $x = 0$ and the endpoint $x = 2$ (Figure 4.12).

Related Exercises 44, 50 ◀

Figure 4.11

Figure 4.12

► The derivation of the position function for an object moving in a gravitational field is given in Section 6.1.

We now apply these ideas to a practical situation.

EXAMPLE 5 Trajectory high point A stone is launched vertically upward from a bridge 80 ft above the ground at a speed of 64 ft/s. Its height above the ground t seconds after the launch is given by

$$f(t) = -16t^2 + 64t + 80, \quad \text{for } 0 \leq t \leq 5.$$

When does the stone reach its maximum height?

SOLUTION We must evaluate the height function at the critical points and at the endpoints. The critical points satisfy the equation

$$f'(t) = -32t + 64 = -32(t - 2) = 0,$$

so the only critical point is $t = 2$. We now evaluate f at the endpoints and at the critical point:

$$f(0) = 80, \quad f(2) = 144, \quad \text{and} \quad f(5) = 0.$$

On the interval $[0, 5]$, the absolute maximum occurs at $t = 2$, at which time the stone reaches a height of 144 ft. Because $f'(t)$ is the velocity of the stone, the maximum height occurs at the instant the velocity is zero.

Related Exercise 67 ◀

SECTION 4.1 EXERCISES

Getting Started

1. What does it mean for a function to have an absolute extreme value at a point c of an interval $[a, b]$?
2. What are local maximum and minimum values of a function?
3. What conditions must be met to ensure that a function has an absolute maximum value and an absolute minimum value on an interval?
4. Sketch the graph of a function that is continuous on an open interval (a, b) but has neither an absolute maximum nor an absolute minimum value on (a, b) .
5. Sketch the graph of a function that has an absolute maximum, a local minimum, but no absolute minimum on $[0, 3]$.
6. What is a critical point of a function?
7. Sketch the graph of a function f that has a local maximum value at a point c where $f'(c) = 0$.
8. Sketch the graph of a function f that has a local minimum value at a point c where $f'(c)$ is undefined.
9. How do you determine the absolute maximum and minimum values of a continuous function on a closed interval?
10. Explain how a function can have an absolute minimum value at an endpoint of an interval.

11–14. Use the following graphs to identify the points (if any) on the interval $[a, b]$ at which the function has an absolute maximum or an absolute minimum value.

15–18. Use the following graphs to identify the points on the interval $[a, b]$ at which local and absolute extreme values occur.

19–22. Sketch the graph of a continuous function f on $[0, 4]$ satisfying the given properties.

19. $f'(x) = 0$ for $x = 1$ and 2 ; f has an absolute maximum at $x = 4$; f has an absolute minimum at $x = 0$; and f has a local minimum at $x = 2$.
20. $f'(x) = 0$ for $x = 1, 2$, and 3 ; f has an absolute minimum at $x = 1$; f has no local extremum at $x = 2$; and f has an absolute maximum at $x = 3$.

21. $f'(1)$ and $f'(3)$ are undefined; $f'(2) = 0$; f has a local maximum at $x = 1$; f has a local minimum at $x = 2$; f has an absolute maximum at $x = 3$; and f has an absolute minimum at $x = 4$.
22. $f'(x) = 0$ at $x = 1$ and 3 ; $f'(2)$ is undefined; f has an absolute maximum at $x = 2$; f has neither a local maximum nor a local minimum at $x = 1$; and f has an absolute minimum at $x = 3$.

Practice Exercises

23–40. Locating critical points Find the critical points of the following functions. Assume a is a nonzero constant.

23. $f(x) = 3x^2 - 4x + 2$ 24. $f(x) = \frac{1}{8}x^3 - \frac{1}{2}x$
25. $f(x) = \frac{x^3}{3} - 9x$ 26. $f(x) = \frac{x^4}{4} - \frac{x^3}{3} - 3x^2 + 10$
27. $f(x) = 3x^3 + \frac{3x^2}{2} - 2x$ 28. $f(x) = \frac{4x^5}{5} - 3x^3 + 5$
29. $f(x) = x^3 - 4a^2x$ 30. $f(x) = \frac{(x+1)^2}{x^2+1}$
31. $f(t) = \frac{4t}{4t^3+1}$ 32. $f(x) = 12x^5 - 20x^3$
33. $f(x) = 2\sqrt{x} - x$ on $[0, 4]$ 34. $f(x) = \sin x \cos x$
35. $f(x) = x^2\sqrt{x+5}$ 36. $f(t) = (x-6)\sqrt{x}$ on $[0, 4]$
37. $f(x) = x\sqrt{x-a}$ 38. $f(x) = \frac{x}{\sqrt{x-a}}$
39. $f(t) = \frac{1}{5}t^5 - a^4t$
40. $f(x) = x^3 - 3ax^2 + 3a^2x - a^3$

41–62. Absolute maxima and minima Determine the location and value of the absolute extreme values of f on the given interval, if they exist.

41. $f(x) = x^2 - 10$ on $[-2, 3]$
42. $f(x) = (x+1)^{4/3}$ on $[-9, 7]$
43. $f(x) = x^3 - 3x^2$ on $[-1, 3]$
44. $f(x) = x^4 - 4x^3 + 4x^2$ on $[-1, 3]$
45. $f(x) = 3x^5 - 25x^3 + 60x$ on $[-2, 3]$
46. $f(x) = \sin 2x - \sqrt{3}x$ on $[0, \pi]$
47. $f(x) = \cos^2 x$ on $[0, \pi]$
48. $f(x) = \frac{x}{(x^2+3)^2}$ on $[-2, 2]$
49. $f(x) = \sin 3x$ on $[-\pi/4, \pi/3]$
50. $f(x) = 3x^{2/3} - x$ on $[0, 27]$
51. $f(x) = x + \sin 2x$ on $[0, \pi/2]$
52. $f(x) = x\sqrt{2-x^2}$ on $[-\sqrt{2}, \sqrt{2}]$
53. $f(x) = 2x^3 - 15x^2 + 24x$ on $[0, 5]$
54. $f(x) = 4x^3 - 21x^2 + 36x$ on $[1, 3]$
55. $f(x) = \frac{4x^3}{3} + 5x^2 - 6x$ on $[-4, 1]$

56. $f(x) = 2x^6 - 15x^4 + 24x^2$ on $[-2, 2]$

57. $f(x) = \frac{x}{(x^2+9)^5}$ on $[-2, 2]$

58. $f(x) = x^{1/2}\left(\frac{x^2}{5} - 4\right)$ on $[0, 4]$

59. $f(x) = \sec x$ on $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$

60. $f(x) = x^{1/3}(x+4)$ on $[-27, 27]$

61. $f(x) = x^{2/3}(4-x^2)$ on $[-2, 2]$

62. $f(t) = \frac{3t}{t^2+1}$ on $[-2, 2]$

- 63. Efficiency of wind turbines** A wind turbine converts wind energy into electrical power. Let v_1 equal the upstream velocity of the wind before it encounters the wind turbine, and let v_2 equal the downstream velocity of the wind after it passes through the area swept out by the turbine blades.

- a. Assuming that $v_1 > 0$, give a physical explanation to show that $0 \leq \frac{v_2}{v_1} \leq 1$.
- b. The amount of power extracted from the wind depends on the ratio $r = \frac{v_2}{v_1}$, the ratio of the downstream velocity to upstream velocity. Let $R(r)$ equal the fraction of power that is extracted from the total available power in the wind stream, for a given value of r . In about 1920, the German physicist Albert Betz showed that $R(r) = \frac{1}{2}(1+r)(1-r^2)$, where $0 \leq r \leq 1$ (a derivation of R is outlined in Exercise 64). Calculate $R(1)$ and explain how you could have arrived at this value without using the formula for R . Give a physical explanation of why it is unlikely or impossible for it to be the case that $r = 1$.
- c. Calculate $R(0)$ and give a physical explanation of why it is unlikely or impossible for it to be the case that $r = 0$.
- d. The maximum value of R is called the *Betz limit*. It represents the theoretical maximum amount of power that can be extracted from the wind. Find this value and explain its physical meaning.
- 64. Derivation of wind turbine formula** A derivation of the function R in Exercise 63, based on three equations from physics, is outlined here. Consider again the figure given in Exercise 63, where v_1 equals the upstream velocity of the wind just before the wind stream encounters the wind turbine, and v_2 equals the downstream

velocity of the wind just after the wind stream passes through the area swept out by the turbine blades. An equation for the power extracted by the rotor blades, based on conservation of momentum, is $P = v^2 \rho A (v_1 - v_2)$, where v is the velocity of the wind (in m/s) as it passes through the turbine blades, ρ is the density of air (in kg/m³), and A is the area (in m²) of the circular region swept out by the rotor blades.

- a. Another expression for the power extracted by the rotor blades,

based on conservation of energy, is $P = \frac{1}{2} \rho v A (v_1^2 - v_2^2)$.

Equate the two power equations and solve for v .

- b. Show that $P = \frac{\rho A}{4} (v_1 + v_2)(v_1^2 - v_2^2)$.

- c. If the wind were to pass through the same area A without being disturbed by rotor blades, the amount of available power would be $P_0 = \frac{\rho A v_1^3}{2}$. Let $r = \frac{v_2}{v_1}$ and simplify the ratio $\frac{P}{P_0}$ to obtain the function $R(r)$ given in Exercise 63. (Source: *Journal of Applied Physics*, 105, 2009)

65. **Maximum distance from origin** Suppose the position of an object moving horizontally after t seconds is given by the function $s(t) = 32t - t^4$, where $0 \leq t \leq 3$ and s is measured in feet, with $s > 0$ corresponding to positions to the right of the origin. When is the object farthest to the right?

66. **Minimum-surface-area box** All boxes with a square base and a volume of 50 ft³ have a surface area given by $S(x) = 2x^2 + \frac{200}{x}$, where x is the length of the sides of the base. Find the absolute minimum of the surface area function on the interval $(0, \infty)$. What are the dimensions of the box with minimum surface area?

67. **Trajectory high point** A stone is launched vertically upward from a cliff 192 ft above the ground at a speed of 64 ft/s. Its height above the ground t seconds after the launch is given by $s = -16t^2 + 64t + 192$, for $0 \leq t \leq 6$. When does the stone reach its maximum height?

68. **Maximizing revenue** A sales analyst determines that the revenue from sales of fruit smoothies is given by $R(x) = -60x^2 + 300x$, where x is the price in dollars charged per item, for $0 \leq x \leq 5$.

- a. Find the critical points of the revenue function.
b. Determine the absolute maximum value of the revenue function and the price that maximizes the revenue.

69. **Maximizing profit** Suppose a tour guide has a bus that holds a maximum of 100 people. Assume his profit (in dollars) for taking n people on a city tour is $P(n) = n(50 - 0.5n) - 100$. (Although P is defined only for positive integers, treat it as a continuous function.)

- a. How many people should the guide take on a tour to maximize the profit?
b. Suppose the bus holds a maximum of 45 people. How many people should be taken on a tour to maximize the profit?

70. **Minimizing rectangle perimeters** All rectangles with an area of 64 have a perimeter given by $P(x) = 2x + \frac{128}{x}$, where x is the length of one side of the rectangle. Find the absolute minimum value of the perimeter function on the interval $(0, \infty)$. What are the dimensions of the rectangle with minimum perimeter?

71. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- a. The function $f(x) = \sqrt{x}$ has a local maximum on the interval $[0, \infty)$.
b. If a function has an absolute maximum on a closed interval, then the function must be continuous on that interval.
c. A function f has the property that $f'(2) = 0$. Therefore, f has a local extreme value at $x = 2$.
d. Absolute extreme values of a function on a closed interval always occur at a critical point or an endpoint of the interval.

Explorations and Challenges

72–73. Absolute maxima and minima

- a. Find the critical points of f on the given interval.
b. Determine the absolute extreme values of f on the given interval. Use a graphing utility to confirm your conclusions.

72. $f(x) = \frac{x}{\sqrt{x-4}}$ on $[6, 12]$ 73. $f(x) = |2x - x^2|$ on $[-2, 3]$

74–77. Critical points and extreme values

- a. Find the critical points of the following functions on the given interval. Use a root finder, if necessary.
b. Use a graphing utility to determine whether the critical points correspond to local maxima, local minima, or neither.
c. Find the absolute maximum and minimum values on the given interval, if they exist.

74. $f(x) = 6x^4 - 16x^3 - 45x^2 + 54x + 23$ on $[-5, 5]$

75. $f(\theta) = 2 \sin \theta + \cos \theta$ on $[-2\pi, 2\pi]$

76. $g(x) = (x-3)^{5/3}(x+2)$ on $[-4, 4]$

77. $h(x) = \frac{5-x}{x^2+2x-3}$ on $[-10, 10]$

78–79. Absolute value functions

Graph the following functions and determine the local and absolute extreme values on the given interval.

78. $f(x) = |x-3| + |x+2|$ on $[-4, 4]$

79. $g(x) = |x-3| - 2|x+1|$ on $[-2, 3]$

80. **Dancing on a parabola** Two people, A and B , walk along the parabola $y = x^2$ in such a way that the line segment L between them is always perpendicular to the line tangent to the parabola at A 's position. The goal of this exercise is to determine the positions of A and B when L has minimum length. Assume the coordinates of A are (a, a^2) .

- Find the slope of the line tangent to the parabola at A , and find the slope of the line that is perpendicular to the tangent line at A .
- Find the equation of the line joining A and B .
- Find the position of B on the parabola.
- Write the function $F(a)$ that gives the *square* of the distance between A and B as it varies with a . (The square of the distance is minimized at the same point that the distance is minimized; it is easier to work with the square of the distance.)
- Find the critical point of F on the interval $a > 0$.
- Evaluate F at the critical point and verify that it corresponds to an absolute minimum. What are the positions of A and B that minimize the length of L ? What is the minimum length?
- Graph the function F to check your work.

81. Every second counts You must get from a point P on the straight shore of a lake to a stranded swimmer who is 50 m from a point Q on the shore that is 50 m from you (see figure). Assuming that you can swim at a speed of 2 m/s and run at a speed of 4 m/s, the goal of this exercise is to determine the point along the shore, x meters from Q , where you should stop running and start swimming to reach the swimmer in the minimum time.

- Find the function T that gives the travel time as a function of x , where $0 \leq x \leq 50$.
- Find the critical point of T on $(0, 50)$.
- Evaluate T at the critical point and the endpoints ($x = 0$ and $x = 50$) to verify that the critical point corresponds to an absolute minimum. What is the minimum travel time?
- Graph the function T to check your work.

- 82. Extreme values of parabolas** Consider the function $f(x) = ax^2 + bx + c$, with $a \neq 0$. Explain geometrically why f has exactly one absolute extreme value on $(-\infty, \infty)$. Find the critical point to determine the value of x at which f has an extreme value.

- 83. Values of related functions** Suppose f is differentiable on $(-\infty, \infty)$ and assume it has a local extreme value at the point $x = 2$, where $f(2) = 0$. Let $g(x) = xf(x) + 1$ and let $h(x) = xf(x) + x + 1$, for all values of x .
- Evaluate $g(2)$, $h(2)$, $g'(2)$, and $h'(2)$.
 - Does either g or h have a local extreme value at $x = 2$? Explain.

84. A family of double-humped functions Consider the functions

$$f(x) = \frac{x}{(x^2 + 1)^n}, \text{ where } n \text{ is a positive integer.}$$

- Show that these functions are odd for all positive integers n .
- Show that the critical points of these functions are $x = \pm \frac{1}{\sqrt{2n-1}}$, for all positive integers n . (Start with the special cases $n = 1$ and $n = 2$.)
- Show that as n increases, the absolute maximum values of these functions decrease.
- Use a graphing utility to verify your conclusions.

85. Proof of the Local Extreme Value Theorem Prove Theorem 4.2 for a local maximum: If f has a local maximum value at the point c and $f'(c)$ exists, then $f'(c) = 0$. Use the following steps.

- Suppose f has a local maximum at c . What is the sign of $f(x) - f(c)$ if x is near c and $x > c$? What is the sign of $f(x) - f(c)$ if x is near c and $x < c$?
- If $f'(c)$ exists, then it is defined by $\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$. Examine this limit as $x \rightarrow c^+$ and conclude that $f'(c) \leq 0$.
- Examine the limit in part (b) as $x \rightarrow c^-$ and conclude that $f'(c) \geq 0$.
- Combine parts (b) and (c) to conclude that $f'(c) = 0$.

86. Even and odd functions

- Suppose a nonconstant even function f has a local minimum at c . Does f have a local maximum or minimum at $-c$? Explain. (An even function satisfies $f(-x) = f(x)$.)
- Suppose a nonconstant odd function f has a local minimum at c . Does f have a local maximum or minimum at $-c$? Explain. (An odd function satisfies $f(-x) = -f(x)$.)

QUICK CHECK ANSWERS

- The continuous function $f(x) = x$ does not have an absolute minimum on the open interval $(0, 1)$. The function $f(x) = -x$ on $[0, \frac{1}{2}]$ and $f(x) = 0$ on $[\frac{1}{2}, 1]$ does not have an absolute minimum on $[0, 1]$.
- The critical point is $x = 0$. Although $f'(0) = 0$, the function has neither a local maximum nor minimum at $x = 0$. ◀

4.2 Mean Value Theorem

In Section 4.1, we learned how to find the absolute extrema of a function. This information is needed to produce an accurate graph of a function (Sections 4.3 and 4.4) and to solve optimization problems (Section 4.5). The procedures used to solve these types of problems depend on several results developed over the next two sections.

We begin with the *Mean Value Theorem*, a cornerstone in the theoretical framework of calculus. Several critical theorems rely on the Mean Value Theorem; this theorem also appears in practical applications. The proof of the Mean Value Theorem relies on a preliminary result known as Rolle's Theorem.

Figure 4.13

- The Extreme Value Theorem, discussed in Section 4.1, states that a function that is continuous on a closed bounded interval attains its absolute maximum and minimum values on that interval.

Rolle's Theorem

Consider a function f that is continuous on a closed interval $[a, b]$ and differentiable on the open interval (a, b) . Furthermore, assume f has the special property that $f(a) = f(b)$ (Figure 4.13). The statement of Rolle's Theorem is not surprising: It says that somewhere between a and b , there is at least one point at which f has a horizontal tangent line.

THEOREM 4.3 Rolle's Theorem

Let f be continuous on a closed interval $[a, b]$ and differentiable on (a, b) with $f(a) = f(b)$. There is at least one point c in (a, b) such that $f'(c) = 0$.

Proof: The function f satisfies the conditions of Theorem 4.1 (Extreme Value Theorem); therefore, it attains its absolute maximum and minimum values on $[a, b]$. Those values are attained either at an endpoint or at an interior point c .

Case 1: First suppose f attains both its absolute maximum and minimum values at the endpoints. Because $f(a) = f(b)$, the maximum and minimum values are equal, and it follows that f is a constant function on $[a, b]$. Therefore, $f'(x) = 0$ for all x in (a, b) , and the conclusion of the theorem holds.

Case 2: Assume at least one of the absolute extreme values of f does not occur at an endpoint. Then f must attain an absolute extreme value at an interior point of $[a, b]$; therefore, f must have either a local maximum or a local minimum at a point c in (a, b) . We know from Theorem 4.2 that at a local extremum, the derivative is zero. Therefore, $f'(c) = 0$ for at least one point c of (a, b) , and again the conclusion of the theorem holds. ◀

Why does Rolle's Theorem require continuity? A function that is not continuous on $[a, b]$ may have identical values at both endpoints and still not have a horizontal tangent line at any point on the interval (Figure 4.14a). Similarly, a function that is continuous on $[a, b]$ but not differentiable at a point of (a, b) may also fail to have a horizontal tangent line (Figure 4.14b).

Figure 4.14

QUICK CHECK 1 Where on the interval $[0, 4]$ does $f(x) = 4x - x^2$ have a horizontal tangent line? ◀

Figure 4.15

EXAMPLE 1 Verifying Rolle's Theorem Find an interval I on which Rolle's Theorem applies to $f(x) = x^3 - 7x^2 + 10x$. Then find all points c in I at which $f'(c) = 0$.

SOLUTION Because f is a polynomial, it is everywhere continuous and differentiable. We need an interval $[a, b]$ with the property that $f(a) = f(b)$. Noting that $f(x) = x(x - 2)(x - 5)$, we choose the interval $[0, 5]$, because $f(0) = f(5) = 0$ (other intervals are possible). The goal is to find points c in the interval $(0, 5)$ at which $f'(c) = 0$, which amounts to the familiar task of finding the critical points of f . The critical points satisfy

$$f'(x) = 3x^2 - 14x + 10 = 0.$$

Using the quadratic formula, the roots are

$$x = \frac{7 \pm \sqrt{19}}{3}, \quad \text{or} \quad x \approx 0.88 \quad \text{and} \quad x \approx 3.79.$$

As shown in Figure 4.15, the graph of f has two points at which the tangent line is horizontal.

Related Exercises 11, 16 ◀

These lines are parallel and their slopes are equal, that is...

Figure 4.16

Figure 4.17

- The proofs of Rolle's Theorem and the Mean Value Theorem are nonconstructive: The theorems claim that a certain point exists, but their proofs do not say how to find it.

QUICK CHECK 2 Sketch the graph of a function that illustrates why the continuity condition of the Mean Value Theorem is needed. Sketch the graph of a function that illustrates why the differentiability condition of the Mean Value Theorem is needed. ◀

Mean Value Theorem

The Mean Value Theorem is easily understood with the aid of a picture. **Figure 4.16** shows a function f differentiable on (a, b) with a secant line passing through $(a, f(a))$ and $(b, f(b))$; the slope of the secant line is the average rate of change of f over $[a, b]$. The Mean Value Theorem claims that there exists a point c in (a, b) at which the slope of the tangent line at c is equal to the slope of the secant line. In other words, we can find a point on the graph of f where the tangent line is parallel to the secant line.

THEOREM 4.4 Mean Value Theorem

If f is continuous on the closed interval $[a, b]$ and differentiable on (a, b) , then there is at least one point c in (a, b) such that

$$\frac{f(b) - f(a)}{b - a} = f'(c).$$

Proof: The strategy of the proof is to use the function f of the Mean Value Theorem to form a new function g that satisfies Rolle's Theorem. Notice that the continuity and differentiability conditions of Rolle's Theorem and the Mean Value Theorem are the same. We devise g so that it satisfies the conditions $g(a) = g(b) = 0$.

As shown in **Figure 4.17**, the secant line passing through $(a, f(a))$ and $(b, f(b))$ is described by a function ℓ . We now define a new function g that measures the difference between the function values of f and ℓ . This function is simply $g(x) = f(x) - \ell(x)$. Because f and ℓ are continuous on $[a, b]$ and differentiable on (a, b) , it follows that g is also continuous on $[a, b]$ and differentiable on (a, b) . Furthermore, because the graphs of f and ℓ intersect at $x = a$ and $x = b$, we have $g(a) = f(a) - \ell(a) = 0$ and $g(b) = f(b) - \ell(b) = 0$.

We now have a function g that satisfies the conditions of Rolle's Theorem. By that theorem, we are guaranteed the existence of at least one point c in the interval (a, b) such that $g'(c) = 0$. By the definition of g , this condition implies that $f'(c) - \ell'(c) = 0$, or $f'(c) = \ell'(c)$.

We are almost finished. What is $\ell'(c)$? It is just the slope of the secant line, which is

$$\frac{f(b) - f(a)}{b - a}.$$

Therefore, $f'(c) = \ell'(c)$ implies that

$$\frac{f(b) - f(a)}{b - a} = f'(c).$$

The following situation offers an interpretation of the Mean Value Theorem. Imagine driving for 2 hours to a town 100 miles away. While your average speed is $100 \text{ mi} / 2 \text{ hr} = 50 \text{ mi/hr}$, your instantaneous speed (measured by the speedometer) almost certainly varies. The Mean Value Theorem says that at some point during the trip, your instantaneous speed equals your average speed, which is 50 mi/hr. In Example 2, we apply these ideas to the science of weather forecasting.

EXAMPLE 2 Mean Value Theorem in action The *lapse rate* is the rate at which the temperature T decreases in the atmosphere with respect to increasing altitude z . It is typically reported in units of $^{\circ}\text{C}/\text{km}$ and is defined by $\gamma = -dT/dz$. When the lapse rate rises above $7^{\circ}\text{C}/\text{km}$ in a certain layer of the atmosphere, it indicates favorable conditions for thunderstorm and tornado formation, provided other atmospheric conditions are also present.

Suppose the temperature at $z = 2.9 \text{ km}$ is $T = 7.6^{\circ}\text{C}$ and the temperature at $z = 5.6 \text{ km}$ is $T = -14.3^{\circ}\text{C}$. Assume also that the temperature function is continuous and differentiable at all altitudes of interest. What can a meteorologist conclude from these data?

- Meteorologists look for “steep” lapse rates in the layer of the atmosphere where the pressure is between 700 and 500 hPa (hectopascals). This range of pressure typically corresponds to altitudes between 3 km and 5.5 km. The data in Example 2 were recorded in Denver at nearly the same time a tornado struck 50 mi to the north.

SOLUTION Figure 4.18 shows the two data points plotted on a graph of altitude and temperature. The slope of the line joining these points is

$$\frac{-14.3^{\circ}\text{C} - 7.6^{\circ}\text{C}}{5.6 \text{ km} - 2.9 \text{ km}} = -8.1^{\circ}\text{C}/\text{km},$$

which means, on average, the temperature is decreasing at $8.1^{\circ}\text{C}/\text{km}$ in the layer of air between 2.9 km and 5.6 km. With only two data points, we cannot know the entire temperature profile. The Mean Value Theorem, however, guarantees that there is at least one altitude at which $dT/dz = -8.1^{\circ}\text{C}/\text{km}$. At each such altitude, the lapse rate is $\gamma = -dT/dz = 8.1^{\circ}\text{C}/\text{km}$. Because this lapse rate is above the $7^{\circ}\text{C}/\text{km}$ threshold associated with unstable weather, the meteorologist might expect an increased likelihood of severe storms.

Figure 4.18

Related Exercises 19, 40 ◀

EXAMPLE 3 Verifying the Mean Value Theorem Determine whether the function $f(x) = 2x^3 - 3x + 1$ satisfies the conditions of the Mean Value Theorem on the interval $[-2, 2]$. If so, find the point(s) guaranteed to exist by the theorem.

SOLUTION The polynomial f is everywhere continuous and differentiable, so it satisfies the conditions of the Mean Value Theorem. The average rate of change of the function on the interval $[-2, 2]$ is

$$\frac{f(2) - f(-2)}{2 - (-2)} = \frac{11 - (-9)}{4} = 5.$$

The goal is to find points in $(-2, 2)$ at which the line tangent to the curve has a slope of 5—that is, to find points at which $f'(x) = 5$. Differentiating f , this condition becomes

$$f'(x) = 6x^2 - 3 = 5 \quad \text{or} \quad x^2 = \frac{4}{3}.$$

Therefore, the points guaranteed to exist by the Mean Value Theorem are $x = \pm 2/\sqrt{3} \approx \pm 1.15$. The tangent lines have slope 5 at the corresponding points on the curve (Figure 4.19).

Related Exercises 21–22 ◀

Figure 4.19

Consequences of the Mean Value Theorem

We close with two results that follow from the Mean Value Theorem.

We already know that the derivative of a constant function is zero; that is, if $f(x) = C$, then $f'(x) = 0$ (Theorem 3.2). Theorem 4.5 states the converse of this result.

THEOREM 4.5 Zero Derivative Implies Constant Function

If f is differentiable and $f'(x) = 0$ at all points of an open interval I , then f is a constant function on I .

Proof: Suppose $f'(x) = 0$ on $[a, b]$, where a and b are distinct points of I . By the Mean Value Theorem, there exists a point c in (a, b) such that

$$\frac{f(b) - f(a)}{b - a} = \underbrace{f'(c)}_{\substack{f'(x) = 0 \text{ for} \\ \text{all } x \text{ in } I}} = 0.$$

Multiplying both sides of this equation by $b - a \neq 0$, it follows that $f(b) = f(a)$, and this is true for every pair of points a and b in I . If $f(b) = f(a)$ for every pair of points in an interval, then f is a constant function on that interval. $\blacktriangleleft$

Theorem 4.6 builds on the conclusion of Theorem 4.5.

THEOREM 4.6 Functions with Equal Derivatives Differ by a Constant

If two functions have the property that $f'(x) = g'(x)$, for all x of an open interval I , then $f(x) - g(x) = C$ on I , where C is a constant; that is, f and g differ by a constant.

Proof: The fact that $f'(x) = g'(x)$ on I implies that $f'(x) - g'(x) = 0$ on I . Recall that the derivative of a difference of two functions equals the difference of the derivatives, so we can write

$$f'(x) - g'(x) = (f - g)'(x) = 0.$$

QUICK CHECK 3 Give two distinct linear functions f and g that satisfy $f'(x) = g'(x)$; that is, the lines have equal slopes. Show that f and g differ by a constant. $\blacktriangleleft$

Now we have a function $f - g$ whose derivative is zero on I . By Theorem 4.5, $f(x) - g(x) = C$, for all x in I , where C is a constant; that is, f and g differ by a constant. $\blacktriangleleft$

The utility of Theorems 4.5 and 4.6 will become apparent in Section 4.9, where we establish a pivotal result that has far-reaching consequences.

SECTION 4.2 EXERCISES

Getting Started

1. Explain Rolle's Theorem with a sketch.
2. Draw the graph of a function for which the conclusion of Rolle's Theorem does not hold.
3. Explain why Rolle's Theorem cannot be applied to the function $f(x) = |x|$ on the interval $[-a, a]$ for any $a > 0$.
4. Explain the Mean Value Theorem with a sketch.

5–7. For each function f and interval $[a, b]$, a graph of f is given along with the secant line that passes through the graph of f at $x = a$ and $x = b$.

- a. Use the graph to make a conjecture about the value(s) of c satisfying the equation $\frac{f(b) - f(a)}{b - a} = f'(c)$.
- b. Verify your answer to part (a) by solving the equation $\frac{f(b) - f(a)}{b - a} = f'(c)$ for c .

5. $f(x) = \frac{x^2}{4} + 1; [-2, 4]$

6. $f(x) = 2\sqrt{x}; [0, 4]$

7. $f(x) = \frac{x^5}{16}; [-2, 2]$

8. At what points c does the conclusion of the Mean Value Theorem hold for $f(x) = x^3$ on the interval $[-10, 10]$?
9. Draw the graph of a function for which the conclusion of the Mean Value Theorem does not hold.
10. Let $f(x) = x^{2/3}$. Show that there is no value of c in the interval $(-1, 8)$ for which $f'(c) = \frac{f(8) - f(-1)}{8 - (-1)}$ and explain why this does not violate the Mean Value Theorem.

Practice Exercises

11–18. Rolle's Theorem Determine whether Rolle's Theorem applies to the following functions on the given interval. If so, find the point(s) guaranteed to exist by Rolle's Theorem.

11. $f(x) = x(x-1)^2; [0, 1]$ 12. $f(x) = \sin 2x; [0, \pi/2]$

13. $f(x) = \cos 4x; [\pi/8, 3\pi/8]$ 14. $f(x) = 1 - |x|; [-1, 1]$

15. $f(x) = 1 - x^{2/3}; [-1, 1]$

16. $f(x) = x^3 - 2x^2 - 8x; [-2, 4]$

17. $g(x) = x^3 - x^2 - 5x - 3; [-1, 3]$

18. $h(x) = \sqrt{x}; [0, a]$, where $a > 0$

19. **Lapse rates in the atmosphere** Refer to Example 2. Concurrent measurements indicate that at an elevation of 6.1 km, the temperature is -10.3°C , and at an elevation of 3.2 km, the temperature is 8.0°C . Based on the Mean Value Theorem, can you conclude that the lapse rate exceeds the threshold value of $7^\circ\text{C}/\text{km}$ at some intermediate elevation? Explain.

20. **Drag racer acceleration** The fastest drag racers can reach a speed of 330 mi/hr over a quarter-mile strip in 4.45 seconds (from a standing start). Complete the following sentence about such a drag racer: At some point during the race, the maximum acceleration of the drag racer is at least _____ mi/hr/s.

21–32. Mean Value Theorem Consider the following functions on the given interval $[a, b]$.

a. Determine whether the Mean Value Theorem applies to the following functions on the given interval $[a, b]$.

b. If so, find the point(s) that are guaranteed to exist by the Mean Value Theorem.

21. $f(x) = 7 - x^2; [-1, 2]$ 22. $f(x) = x^3 - 2x^2; [0, 1]$

23. $f(x) = \begin{cases} -2x & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases}; [-1, 1]$

24. $f(x) = \frac{1}{(x-1)^2}; [0, 2]$ 25. $f(x) = \sqrt{x}; [1, 4]$

26. $f(x) = |x-1|; [-1, 4]$ 27. $f(x) = \sin x; \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

28. $f(x) = \tan x; \left[0, \frac{\pi}{4}\right]$ 29. $f(x) = x^{-1/3}; \left[\frac{1}{8}, 8\right]$

30. $f(x) = x + \frac{1}{x}; [1, 3]$ 31. $f(x) = 2x^{1/3}; [-8, 8]$

32. $f(x) = \frac{x}{x+2}; [-1, 2]$

33. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. The continuous function $f(x) = 1 - |x|$ satisfies the conditions of the Mean Value Theorem on the interval $[-1, 1]$.

b. Two differentiable functions that differ by a constant always have the same derivative.

c. If $f'(x) = 0$, then $f(x) = 10$.

34. Without evaluating derivatives, determine which of the functions $f(x) = \sin^2 x$, $g(x) = -\cos^2 x$, $h(x) = 2 \sin^2 x$, and $p(x) = 1/\csc^2 x$ have the same derivative.

35. Without evaluating derivatives, determine which of the functions $g(x) = 2x^{10}$, $h(x) = x^{10} + 2$, and $p(x) = x^{10} - \sin 2$ have the same derivative as $f(x) = x^{10}$.

36. Find all functions f whose derivative is $f'(x) = x + 1$.

37. **Mean Value Theorem and graphs** By visual inspection, locate all points on the interval $(-4, 4)$ at which the slope of the tangent line equals the average rate of change of the function on the interval $[-4, 4]$.

- 38–39. **Mean Value Theorem and graphs** Find all points on the interval $(1, 3)$ at which the slope of the tangent line equals the average rate of change of f on $[1, 3]$. Reconcile your results with the Mean Value Theorem.

- 40. Avalanche forecasting** Avalanche forecasters measure the temperature gradient $\frac{dT}{dh}$, which is the rate at which the temperature in a snowpack T changes with respect to its depth h . A large temperature gradient may lead to a weak layer in the snowpack. When these weak layers collapse, avalanches occur. Avalanche forecasters use the following rule of thumb: If $\frac{dT}{dh}$ exceeds $10^\circ\text{C}/\text{m}$ anywhere in the snowpack, conditions are favorable for weak-layer formation, and the risk of avalanche increases. Assume the temperature function is continuous and differentiable.

- An avalanche forecaster digs a snow pit and takes two temperature measurements. At the surface ($h = 0$), the temperature is -16°C . At a depth of 1.1 m, the temperature is -2°C . Using the Mean Value Theorem, what can he conclude about the temperature gradient? Is the formation of a weak layer likely?
 - One mile away, a skier finds that the temperature at a depth of 1.4 m is -1°C , and at the surface it is -12°C . What can be concluded about the temperature gradient? Is the formation of a weak layer in her location likely?
 - Because snow is an excellent insulator, the temperature of snow-covered ground is near 0°C . Furthermore, the surface temperature of snow in a particular area does not vary much from one location to the next. Explain why a weak layer is more likely to form in places where the snowpack is not too deep.
 - The term *isothermal* is used to describe the situation where all layers of the snowpack are at the same temperature (typically near the freezing point). Is a weak layer likely to form in isothermal snow? Explain.
- 41. Mean Value Theorem and the police** A state patrol officer saw a car start from rest at a highway on-ramp. She radioed ahead to a patrol officer 30 mi along the highway. When the car reached the location of the second officer 28 min later, it was clocked going 60 mi/hr. The driver of the car was given a ticket for exceeding the 60-mi/hr speed limit. Why can the officer conclude that the driver exceeded the speed limit?
- 42. Mean Value Theorem and the police again** Compare carefully to Exercise 41. A state patrol officer saw a car start from rest at a highway on-ramp. She radioed ahead to another officer 30 mi along the highway. When the car reached the location of the second officer 30 min later, it was clocked going 60 mi/hr. Can the patrol officer conclude that the driver exceeded the speed limit?

- 43. Running pace** Explain why if a runner completes a 6.2-mi (10-km) race in 32 min, then he must have been running at exactly 11 mi/hr at least twice in the race. Assume the runner's speed at the finish line is zero.
- 44. Mean Value Theorem for linear functions** Interpret the Mean Value Theorem when it is applied to any linear function.
- 45. Mean Value Theorem for quadratic functions** Consider the quadratic function $f(x) = Ax^2 + Bx + C$, where A , B , and C are real numbers with $A \neq 0$. Show that when the Mean Value Theorem is applied to f on the interval $[a, b]$, the number c guaranteed by the theorem is the midpoint of the interval.
- 46. Means**
- Show that the point c guaranteed to exist by the Mean Value Theorem for $f(x) = x^2$ on $[a, b]$ is the arithmetic mean of a and b ; that is, $c = \frac{a+b}{2}$.
 - Show that the point c guaranteed to exist by the Mean Value Theorem for $f(x) = \frac{1}{x}$ on $[a, b]$, where $0 < a < b$, is the geometric mean of a and b ; that is, $c = \sqrt{ab}$.
- 47. Equal derivatives** Verify that the functions $f(x) = \tan^2 x$ and $g(x) = \sec^2 x$ have the same derivative. What can you say about the difference $f - g$? Explain.
- 48. Equal derivatives** Verify that the functions $f(x) = \sin^2 x$ and $g(x) = -\cos^2 x$ have the same derivative. What can you say about the difference $f - g$? Explain.
- 49. 100-m speed** The Jamaican sprinter Usain Bolt set a world record of 9.58 s in the 100-meter dash in the summer of 2009. Did his speed ever exceed 37 km/hr during the race? Explain.

Explorations and Challenges

- Suppose $f'(x) > 1$, for all $x > 0$, and $f(0) = 0$. Show that $f(x) > x$, for all $x > 0$.
- Suppose $f'(x) < 2$, for all $x \geq 2$, and $f(2) = 7$. Show that $f(4) < 11$.
- Use the Mean Value Theorem to prove that $1 + \frac{a}{2} > \sqrt{1+a}$, for $a > 0$. (Hint: For a given value of $a > 0$, let $f(x) = \sqrt{1+x}$ on $[0, a]$ and use the fact that $\sqrt{1+c} > 1$, for $c > 0$.)
- Prove the following statements.
 - $|\sin a - \sin b| \leq |a - b|$, for any real numbers a and b
 - $|\sin a| \leq |a|$, for any real number a
- Condition for nondifferentiability** Suppose $f'(x) < 0 < f''(x)$, for $x < a$, and $f'(x) > 0 > f''(x)$, for $x > a$. Prove that f is not differentiable at a . (Hint: Assume f is differentiable at a , and apply the Mean Value Theorem to f' .) More generally, show that if f' and f'' change sign at the same point, then f is not differentiable at that point.

- 55. Generalized Mean Value Theorem** Suppose the functions f and g are continuous on $[a, b]$ and differentiable on (a, b) , where $g(a) \neq g(b)$. Then there is a point c in (a, b) at which

$$\frac{f(b) - f(a)}{g(b) - g(a)} = \frac{f'(c)}{g'(c)}.$$

This result is known as the **Generalized (or Cauchy's) Mean Value Theorem**.

- If $g(x) = x$, then show that the Generalized Mean Value Theorem reduces to the Mean Value Theorem.
- Suppose $f(x) = x^2 - 1$, $g(x) = 4x + 2$, and $[a, b] = [0, 1]$. Find a value of c satisfying the Generalized Mean Value Theorem.

QUICK CHECK ANSWERS

- $x = 2$
- The functions shown in Figure 4.14 provide examples.
- The graphs of $f(x) = 3x$ and $g(x) = 3x + 2$ have the same slope. Note that $f(x) - g(x) = -2$, a constant. ◀

4.3 What Derivatives Tell Us

In Section 4.1, we saw that the derivative is a tool for finding critical points, which are related to local maxima and minima. As we show in this section, derivatives (first *and* second derivatives) tell us much more about the behavior of functions.

Increasing and Decreasing Functions

We have used the terms *increasing* and *decreasing* informally in earlier sections to describe a function or its graph. For example, the graph in **Figure 4.20a** rises as x increases, so the corresponding function is increasing. In **Figure 4.20b**, the graph falls as x increases, so the corresponding function is decreasing. The following definition makes these ideas precise.

- A function is called **monotonic** if it is either increasing or decreasing. We can make a further distinction by defining **nondecreasing** ($f(x_2) \geq f(x_1)$) whenever $x_2 > x_1$) and **nonincreasing** ($f(x_2) \leq f(x_1)$) whenever $x_2 > x_1$).

DEFINITION Increasing and Decreasing Functions

Suppose a function f is defined on an interval I . We say that f is **increasing** on I if $f(x_2) > f(x_1)$ whenever x_1 and x_2 are in I and $x_2 > x_1$. We say that f is **decreasing** on I if $f(x_2) < f(x_1)$ whenever x_1 and x_2 are in I and $x_2 > x_1$.

Figure 4.20

Intervals of Increase and Decrease The graph of a function f gives us an idea of the intervals on which f is increasing and decreasing. But how do we determine those intervals precisely? This question is answered by making a connection to the derivative.

Recall that the derivative of a function gives the slopes of tangent lines. If the derivative is positive on an interval, the tangent lines on that interval have positive slopes, and

the function is increasing on the interval (Figure 4.21a). Said differently, positive derivatives on an interval imply positive rates of change on the interval, which, in turn, indicate an increase in function values.

Similarly, if the derivative is negative on an interval, the tangent lines on that interval have negative slopes, and the function is decreasing on that interval (Figure 4.21b). These observations lead to Theorem 4.7, whose proof relies on the Mean Value Theorem.

Figure 4.21

► The converse of Theorem 4.7 may not be true. According to the definition, $f(x) = x^3$ is increasing on $(-\infty, \infty)$ but it is not true that $f'(x) > 0$ on $(-\infty, \infty)$ (because $f'(0) = 0$).

THEOREM 4.7 Test for Intervals of Increase and Decrease

Suppose f is continuous on an interval I and differentiable at all interior points of I . If $f'(x) > 0$ at all interior points of I , then f is increasing on I . If $f'(x) < 0$ at all interior points of I , then f is decreasing on I .

Proof: Let a and b be any two distinct points in the interval I with $b > a$. By the Mean Value Theorem,

$$\frac{f(b) - f(a)}{b - a} = f'(c),$$

for some c between a and b . Equivalently,

$$f(b) - f(a) = f'(c)(b - a).$$

Notice that $b - a > 0$ by assumption. So if $f'(c) > 0$, then $f(b) - f(a) > 0$. Therefore, for all a and b in I with $b > a$, we have $f(b) > f(a)$, which implies that f is increasing on I . Similarly, if $f'(c) < 0$, then $f(b) - f(a) < 0$ or $f(b) < f(a)$. It follows that f is decreasing on I . ◀

QUICK CHECK 1 Explain why a positive derivative on an interval implies that the function is increasing on the interval. ◀

EXAMPLE 1 Sketching a function Sketch a graph of a function f that is continuous on $(-\infty, \infty)$ and satisfies the following conditions.

1. $f' > 0$ on $(-\infty, 0)$, $(4, 6)$, and $(6, \infty)$.
2. $f' < 0$ on $(0, 4)$.
3. $f'(0)$ is undefined.
4. $f'(4) = f'(6) = 0$.

SOLUTION By condition (1), f is increasing on the intervals $(-\infty, 0)$, $(4, 6)$, and $(6, \infty)$. By condition (2), f is decreasing on $(0, 4)$. Continuity of f and condition (3) imply that f has a cusp or corner at $x = 0$, and by condition (4), the graph has a horizontal tangent line at $x = 4$ and $x = 6$. It is useful to summarize these results using a *sign graph* (Figure 4.22).

Figure 4.22

One possible graph satisfying these conditions is shown in **Figure 4.23**. Notice that the graph has a cusp at $x = 0$. Furthermore, although $f'(4) = f'(6) = 0$, f has a local minimum at $x = 4$ but no local extremum at $x = 6$.

Figure 4.23

Related Exercises 9–10 ◀

EXAMPLE 2 Intervals of increase and decrease Find the intervals on which the function $f(x) = 2x^3 + 3x^2 + 1$ is increasing and the intervals on which it is decreasing.

SOLUTION Note that $f'(x) = 6x^2 + 6x = 6x(x + 1)$. To find the intervals of increase, we first solve $6x(x + 1) = 0$ and determine that the critical points are $x = 0$ and $x = -1$. If f' changes sign, then it does so at these points and nowhere else; that is, f' has the same sign throughout each of the intervals $(-\infty, -1)$, $(-1, 0)$, and $(0, \infty)$. Evaluating f' at selected points of each interval determines the sign of f' on that interval.

- At $x = -2$, $f'(-2) = 12 > 0$, so $f' > 0$ and f is increasing on $(-\infty, -1)$.
- At $x = -\frac{1}{2}$, $f'(-\frac{1}{2}) = -\frac{3}{2} < 0$, so $f' < 0$ and f is decreasing on $(-1, 0)$.
- At $x = 1$, $f'(1) = 12 > 0$, so $f' > 0$ and f is increasing on $(0, \infty)$.

The graph of f has a horizontal tangent line at $x = -1$ and $x = 0$. **Figure 4.24** shows the graph of f superimposed on the graph of f' , confirming our conclusions.

► Appendix B, online at bit.ly/2y3Nck3, shows how to solve inequalities using test values.

Figure 4.25

QUICK CHECK 2 Sketch a function f that is differentiable on $(-\infty, \infty)$ with the following properties: (i) $x = 0$ and $x = 2$ are critical points; (ii) f is increasing on $(-\infty, 2)$; (iii) f is decreasing on $(2, \infty)$. ◀

Identifying Local Maxima and Minima

Using what we know about increasing and decreasing functions, we can now identify local extrema. Suppose $x = c$ is a critical point of f , where $f'(c) = 0$. Suppose also that f' changes sign at c with $f'(x) < 0$ on an interval (a, c) to the left of c and $f'(x) > 0$ on an interval (c, b) to the right of c . In this case f' is decreasing to the left of c and increasing to the right of c , which means that f has a local minimum at c , as shown in Figure 4.25a.

Similarly, suppose f' changes sign at c with $f'(x) > 0$ on an interval (a, c) to the left of c and $f'(x) < 0$ on an interval (c, b) to the right of c . Then f is increasing to the left of c and decreasing to the right of c , so f has a local maximum at c , as shown in Figure 4.25b.

Figure 4.26 shows typical features of a function on an interval $[a, b]$. At local maxima (c_2 , c_3 , and c_4), f' changes sign. Although c_1 and c_5 are critical points, the sign of f' is the same on both sides near these points, so there is no local maximum or minimum at these points. As emphasized earlier, *critical points do not always correspond to local extreme values*.

Figure 4.26

First Derivative Test The observations used to interpret Figure 4.26 are summarized in a powerful test for identifying local maxima and minima.

THEOREM 4.8 First Derivative Test

Assume f is continuous on an interval that contains a critical point c , and assume f is differentiable on an interval containing c , except perhaps at c itself.

- If f' changes sign from positive to negative as x increases through c , then f has a **local maximum** at c .
- If f' changes sign from negative to positive as x increases through c , then f has a **local minimum** at c .
- If f' is positive on both sides near c or negative on both sides near c , then f has no local extreme value at c .

Proof: Suppose $f'(x) > 0$ on an interval (a, c) . By Theorem 4.7, we know that f is increasing on (a, c) , which implies that $f(x) < f(c)$ for all x in (a, c) . Similarly, suppose $f'(x) < 0$ on an interval (c, b) . This time Theorem 4.7 says that f is decreasing on (c, b) , which implies that $f(x) > f(c)$ for all x in (c, b) . Therefore, $f(x) \leq f(c)$ for all x in (a, b) and f has a local maximum at c . The proofs of the other two cases are similar. ◀

EXAMPLE 3 Using the First Derivative Test Consider the function

$$f(x) = 3x^4 - 4x^3 - 6x^2 + 12x + 1.$$

- Find the intervals on which f is increasing and those on which it is decreasing.
- Identify the local extrema of f .

SOLUTION

a. Differentiating f , we find that

$$\begin{aligned} f'(x) &= 12x^3 - 12x^2 - 12x + 12 \\ &= 12(x^3 - x^2 - x + 1) \\ &= 12(x + 1)(x - 1)^2. \end{aligned}$$

Solving $f'(x) = 0$ gives the critical points $x = -1$ and $x = 1$. The critical points determine the intervals $(-\infty, -1)$, $(-1, 1)$, and $(1, \infty)$ on which f' does not change sign. Choosing a test point in each interval, a sign graph of f' is constructed (Figure 4.27) that summarizes the behavior of f .

Figure 4.28

Figure 4.27

b. Note that f is a polynomial, so it is continuous on $(-\infty, \infty)$. Because f' changes sign from negative to positive as x passes through the critical point $x = -1$, it follows by the First Derivative Test that f has a local minimum value of $f(-1) = -10$ at $x = -1$. Observe that f' is positive on both sides near $x = 1$, so f does not have a local extreme value at $x = 1$ (Figure 4.28).

Related Exercises 45–46 ◀

EXAMPLE 4 Extreme values Find the local extrema of the function

$$g(x) = x^{2/3}(2 - x).$$

SOLUTION In Example 4b of Section 4.1, we found that

$$g'(x) = \frac{4}{3}x^{-1/3} - \frac{5}{3}x^{2/3} = \frac{4 - 5x}{3x^{1/3}}$$

and that the critical points of g are $x = 0$ and $x = \frac{4}{5}$. These two critical points are *candidates* for local extrema, and Theorem 4.8 is used to classify each as a local maximum, local minimum, or neither.

On the interval $(-\infty, 0)$, the numerator of g' is positive and the denominator is negative (Figure 4.29). Therefore, $g'(x) < 0$ on $(-\infty, 0)$. On the interval $(0, \frac{4}{5})$, the numerator of g' is positive, as is the denominator. Therefore, $g'(x) > 0$ on $(0, \frac{4}{5})$. We see that as x passes through 0, g' changes sign from negative to positive, which means g has a local minimum at 0. A similar argument shows that g' changes sign from positive to negative as x passes through $\frac{4}{5}$, so g has a local maximum at $\frac{4}{5}$. These observations are confirmed by the graphs of g and g' (Figure 4.30).

QUICK CHECK 3 Explain how the First Derivative Test determines whether $f(x) = x^2$ has a local maximum or local minimum at the critical point $x = 0$. ◀

Figure 4.29

Figure 4.30

Related Exercise 47 ◀

Absolute Extreme Values on Any Interval Theorem 4.1 guarantees the existence of absolute extreme values only on closed intervals. What can be said about absolute extrema on intervals that are not closed? The following theorem provides a valuable test.

Figure 4.31

THEOREM 4.9 One Local Extremum Implies Absolute Extremum

Suppose f is continuous on an interval I that contains exactly one local extremum at c .

- If a local maximum occurs at c , then $f(c)$ is the absolute maximum of f on I .
- If a local minimum occurs at c , then $f(c)$ is the absolute minimum of f on I .

The proof of Theorem 4.9 is beyond the scope of this text, although Figure 4.31 illustrates why the theorem is plausible. Assume f has exactly one local minimum on I at c . Notice that there can be no other point on the graph at which f has a value less than $f(c)$. If such a point did exist, the graph would have to bend downward to drop below $f(c)$, which, by the continuity of f , cannot happen as it implies additional local extreme values on I . A similar argument applies to a solitary local maximum.

Figure 4.32

EXAMPLE 5 Finding an absolute extremum

Verify that $f(x) = \frac{1}{4}x^4 - x^3 + \frac{3}{2}x^2 - 9x + 2$ has an absolute extreme value on its domain.

SOLUTION As a polynomial, f is differentiable on its domain $(-\infty, \infty)$ with

$$f'(x) = x^3 - 3x^2 + 3x - 9 = (x - 3)(x^2 + 3).$$

Solving $f'(x) = 0$ and noting that $x^2 + 3 > 0$ for all x gives the single critical point $x = 3$. It may be verified that $f'(x) < 0$ for $x < 3$ and $f'(x) > 0$ for $x > 3$. Therefore, by Theorem 4.8, f has a local minimum at $x = 3$. Because it is the only local extremum on $(-\infty, \infty)$, it follows from Theorem 4.9 that the absolute minimum value of f occurs at $x = 3$, where $f(3) = -\frac{73}{4}$ (Figure 4.32).

Related Exercises 49–51 ◀

Concavity and Inflection Points

Just as the first derivative is related to the slope of tangent lines, the second derivative also has geometric meaning. Consider $f(x) = \sin x$, shown in Figure 4.33. Its graph bends upward for $-\pi < x < 0$, reflecting the fact that the slopes of the tangent lines increase as x increases. It follows that the first derivative is increasing for $-\pi < x < 0$. A function with the property that f' is increasing on an interval is *concave up* on that interval.

Similarly, $f(x) = \sin x$ bends downward for $0 < x < \pi$ because it has a decreasing first derivative on that interval. A function with the property that f' is decreasing as x increases on an interval is *concave down* on that interval.

Here is another useful characterization of concavity. If a function is concave up at a point (any point in $(-\pi, 0)$, Figure 4.33), then its graph near that point lies *above* the tangent line at that point. Similarly, if a function is concave down at a point (any point in $(0, \pi)$, Figure 4.33), then its graph near that point lies *below* the tangent line at that point (Exercise 102).

Finally, imagine a function f that changes concavity (from up to down, or vice versa) at a point c in the domain of f . For example, $f(x) = \sin x$ in Figure 4.33 changes from concave up to concave down as x passes through $x = 0$. A point on the graph of f at which f changes concavity is called an *inflection point*.

Figure 4.33

DEFINITION Concavity and Inflection Point

Let f be differentiable on an open interval I . If f' is increasing on I , then f is **concave up** on I . If f' is decreasing on I , then f is **concave down** on I .

If f is continuous at c and f changes concavity at c (from up to down, or vice versa), then f has an **inflection point** at c .

Applying Theorem 4.7 to f' leads to a test for concavity in terms of the second derivative. Specifically, if $f'' > 0$ on an interval I , then f' is increasing on I and f is concave up on I . Similarly, if $f'' < 0$ on I , then f is concave down on I . In addition, if the values of f'' change sign at a point c (from positive to negative, or vice versa), then the concavity of f changes at c and f has an inflection point at c (Figure 4.34a). We now have a useful interpretation of the second derivative: It measures *concavity*.

THEOREM 4.10 Test for Concavity

Suppose f'' exists on an open interval I .

- If $f'' > 0$ on I , then f is concave up on I .
- If $f'' < 0$ on I , then f is concave down on I .
- If c is a point of I at which f'' changes sign at c (from positive to negative, or vice versa), then f has an inflection point at c .

There are a few important but subtle points here. The fact that $f''(c) = 0$ does not necessarily imply that f has an inflection point at c . A good example is $f(x) = x^4$. Although $f''(0) = 0$, the concavity does not change at $x = 0$ (a similar function is shown in Figure 4.34b).

Typically, if f has an inflection point at c , then $f''(c) = 0$, reflecting the smooth change in concavity. However, an inflection point may also occur at a point where f'' does not exist. For example, the function $f(x) = x^{1/3}$ has a vertical tangent line and an inflection point at $x = 0$ (a similar function is shown in Figure 4.34c). Finally, note that the function shown in Figure 4.34d, with behavior similar to that of $f(x) = x^{2/3}$, does not have an inflection point at c despite the fact that $f''(c)$ does not exist. In summary, if $f''(c) = 0$ or $f''(c)$ does not exist, then $(c, f(c))$ is a candidate for an inflection point. To be certain an inflection point occurs at c , we must show that the concavity of f changes at c .

QUICK CHECK 4 Verify that the function $f(x) = x^4$ is concave up for $x > 0$ and for $x < 0$. Is $x = 0$ an inflection point? Explain. ◀

Figure 4.34

Figure 4.35

EXAMPLE 6 Interpreting concavity Sketch a function satisfying each set of conditions on some interval.

- a. $f'(t) > 0$ and $f''(t) > 0$ b. $g'(t) > 0$ and $g''(t) < 0$
 c. Which of the functions, f or g , could describe a population that increases and approaches a steady state as $t \rightarrow \infty$?

SOLUTION

- a. Figure 4.35a shows the graph of a function that is increasing ($f'(t) > 0$) and concave up ($f''(t) > 0$).
 b. Figure 4.35b shows the graph of a function that is increasing ($g'(t) > 0$) and concave down ($g''(t) < 0$).
 c. Because f increases at an *increasing* rate, the graph of f could not approach a horizontal asymptote, so f could not describe a population that approaches a steady state. On the other hand, g increases at a *decreasing* rate, so its graph could approach a horizontal asymptote, depending on the rate at which g increases.

Related Exercises 53–56 ◀

EXAMPLE 7 Detecting concavity Identify the intervals on which the function $f(x) = 3x^4 - 4x^3 - 6x^2 + 12x + 1$ is concave up or concave down. Then locate the inflection points.

SOLUTION This function was considered in Example 3, where we found that

$$f'(x) = 12(x + 1)(x - 1)^2.$$

It follows that

$$f''(x) = 12(x - 1)(3x + 1).$$

We see that $f''(x) = 0$ at $x = 1$ and $x = -\frac{1}{3}$. These points are *candidates* for inflection points; to be certain that they are inflection points, we must determine whether the concavity changes at these points. The sign graph in Figure 4.36 shows the following:

- $f''(x) > 0$ and f is concave up on $(-\infty, -\frac{1}{3})$ and $(1, \infty)$.
- $f''(x) < 0$ and f is concave down on $(-\frac{1}{3}, 1)$.

Figure 4.36

Figure 4.37

We see that the sign of f'' changes at $x = -\frac{1}{3}$ and at $x = 1$, so the concavity of f also changes at these points. Therefore, inflection points occur at $x = -\frac{1}{3}$ and $x = 1$. The graphs of f and f'' (Figure 4.37) show that the concavity of f changes at the zeros of f'' .

Related Exercises 58–59 ◀

Second Derivative Test It is now a short step to a test that uses the second derivative to identify local maxima and minima.

THEOREM 4.11 Second Derivative Test for Local Extrema

Suppose f'' is continuous on an open interval containing c with $f'(c) = 0$.

- If $f''(c) > 0$, then f has a local minimum at c (Figure 4.38a).
- If $f''(c) < 0$, then f has a local maximum at c (Figure 4.38b).
- If $f''(c) = 0$, then the test is inconclusive; f may have a local maximum, a local minimum, or neither at c .

Figure 4.38

QUICK CHECK 5 Sketch a graph of a function with $f'(x) > 0$ and $f''(x) > 0$ on an interval. Sketch a graph of a function with $f'(x) < 0$ and $f''(x) < 0$ on an interval. ◀

Proof: Assume $f''(c) > 0$. Because f'' is continuous on an interval containing c , it follows that $f'' > 0$ on some open interval I containing c and that f' is increasing on I . Because $f'(c) = 0$, it follows that f' changes sign at c from negative to positive, which, by the First Derivative Test, implies that f has a local minimum at c . The proofs of the second and third statements are similar. ▶

EXAMPLE 8 The Second Derivative Test Use the Second Derivative Test to locate the local extrema of the following functions.

a. $f(x) = 3x^4 - 4x^3 - 6x^2 + 12x + 1$ on $[-2, 2]$

b. $f(x) = \sin^2 x$

SOLUTION

a. This function was considered in Examples 3 and 7, where we found that

$$f'(x) = 12(x+1)(x-1)^2 \quad \text{and} \quad f''(x) = 12(x-1)(3x+1).$$

Therefore, the critical points of f are $x = -1$ and $x = 1$. Evaluating f'' at the critical points, we find that $f''(-1) = 48 > 0$. By the Second Derivative Test, f has a local minimum at $x = -1$. At the other critical point, $f''(1) = 0$, so the test is inconclusive. You can check that the first derivative does not change sign at $x = 1$, which means f does not have a local maximum or minimum at $x = 1$ (Figure 4.39).

Figure 4.39

b. Using the Chain Rule and a trigonometric identity, we have $f'(x) = 2 \sin x \cos x = \sin 2x$ and $f''(x) = 2 \cos 2x$. The critical points occur when $f'(x) = \sin 2x = 0$, or when $x = 0, \pm \pi/2, \pm \pi, \dots$. To apply the Second Derivative Test, we evaluate f'' at the critical points:

- $f''(0) = 2 > 0$, so f has a local minimum at $x = 0$.
- $f''(\pm \pi/2) = -2 < 0$, so f has a local maximum at $x = \pm \pi/2$.
- $f''(\pm \pi) = 2 > 0$, so f has a local minimum at $x = \pm \pi$.

This pattern continues, and we see that f has alternating local maxima and minima, evenly spaced every $\pi/2$ units (Figure 4.40).

Figure 4.40

Recap of Derivative Properties

This section has demonstrated that the first and second derivatives of a function provide valuable information about its graph. The relationships among a function's derivatives and its extreme values and concavity are summarized in Figure 4.41.

Figure 4.41

SECTION 4.3 EXERCISES

Getting Started

- Explain how the first derivative of a function determines where the function is increasing or decreasing.
- Explain how to apply the First Derivative Test.
- Suppose the derivative of f is $f'(x) = x - 3$.
 - Find the critical points of f .
 - On what intervals is f increasing and on what intervals is f decreasing?
- Suppose the derivative of f is $f'(x) = (x - 1)(x - 2)$.
 - Find the critical points of f .
 - On what intervals is f increasing and on what intervals is f decreasing?
- Sketch the graph of a function that has neither a local maximum nor a local minimum at a point where $f'(x) = 0$.
- The following graph of the derivative g' has exactly two roots.
 - Find the critical points of g .
 - For what values of x in $(0, 3)$ is g increasing? Decreasing?
 - For what values of x in $(0, 3)$ does g have a local maximum? A local minimum?

7–8. The following figures give the graph of the derivative of a continuous function f that passes through the origin. Sketch a possible graph of f on the same set of axes.

9–12. Sketch a graph of a function f that is continuous on $(-\infty, \infty)$ and has the following properties. Use a sign graph to summarize information about the function.

- $f'(x) < 0$ on $(-\infty, 2)$; $f'(x) > 0$ on $(2, 5)$; $f'(x) < 0$ on $(5, \infty)$
- $f'(-1)$ is undefined; $f'(x) > 0$ on $(-\infty, -1)$; $f'(x) < 0$ on $(-1, \infty)$
- $f(0) = f(4) = f'(0) = f'(2) = f'(4) = 0$; $f(x) \geq 0$ on $(-\infty, \infty)$
- $f'(-2) = f'(2) = f'(6) = 0$; $f'(x) \geq 0$ on $(-\infty, \infty)$

- Suppose $g''(x) = 2 - x$.
 - On what intervals is g concave up and on what intervals is g concave down?
 - State the inflection points of g .
- The following graph of g'' has exactly three x -intercepts.
 - For what values of x in $(-4, 3)$ is the graph of g concave up? Concave down?
 - State the inflection points of g that lie in $(-4, 3)$.

- Is it possible for a function to satisfy $f(x) > 0$, $f'(x) > 0$, and $f''(x) < 0$ on an interval? Explain.
- Sketch a graph of a function that changes from concave up to concave down as x increases. Describe how the second derivative of this function changes.
- Give a function that does not have an inflection point at a point where $f''(x) = 0$.
- Suppose f is continuous on an interval containing a critical point c and $f''(c) = 0$. How do you determine whether f has a local extreme value at $x = c$?

Practice Exercises

19–40. **Increasing and decreasing functions** Find the intervals on which f is increasing and the intervals on which it is decreasing.

- $f(x) = 4 - x^2$
- $f(x) = x^2 - 16$
- $f(x) = (x - 1)^2$
- $f(x) = x^3 + 4x$
- $f(x) = \frac{x^3}{3} - \frac{5x^2}{2} + 4x$
- $f(x) = -\frac{x^3}{3} + \frac{x^2}{2} + 2x$
- $f(x) = 12 + x - x^2$
- $f(x) = x^4 - 4x^3 + 4x^2$
- $f(x) = -\frac{x^4}{4} + x^3 - x^2$
- $f(x) = 2x^5 - \frac{15x^4}{4} + \frac{5x^3}{3}$
- $f(x) = -2 \cos x - x$ on $[0, 2\pi]$
- $f(x) = \sqrt{2} \sin x - x$ on $[0, 2\pi]$
- $f(x) = 3 \cos 3x$ on $[-\pi, \pi]$
- $f(x) = \cos^2 x$ on $[-\pi, \pi]$
- $f(x) = x^{2/3}(x^2 - 4)$
- $f(x) = x^2 \sqrt{9 - x^2}$ on $(-3, 3)$
- $f(x) = -12x^5 + 75x^4 - 80x^3$
- $f(x) = 3x^4 - 16x^3 + 24x^2$
- $f(x) = -2x^4 + x^2 + 10$

$$38. f(x) = \frac{x^4}{4} - \frac{8x^3}{3} + \frac{15x^2}{2} + 8$$

$$39. f(x) = \sin x - x \cos x \text{ on } (0, 2\pi)$$

$$40. f(x) = x^2 \sin x - 2 \sin x + 2x \cos x \text{ on } (0, 2\pi)$$

41–48. First Derivative Test

- a. Locate the critical points of f .
 b. Use the First Derivative Test to locate the local maximum and minimum values.
 c. Identify the absolute maximum and minimum values of the function on the given interval (when they exist).

$$41. f(x) = x^2 + 3 \text{ on } [-3, 2]$$

$$42. f(x) = -x^2 - x + 2 \text{ on } [-4, 4]$$

$$43. f(x) = x\sqrt{4 - x^2} \text{ on } [-2, 2]$$

$$44. f(x) = 2x^3 + 3x^2 - 12x + 1 \text{ on } [-2, 4]$$

$$45. f(x) = -x^3 + 9x \text{ on } [-4, 3]$$

$$46. f(x) = 2x^5 - 5x^4 - 10x^3 + 4 \text{ on } [-2, 4]$$

$$47. f(x) = x^{2/3}(x - 5) \text{ on } [-5, 5]$$

$$48. f(x) = \frac{x^2}{x^2 - 1} \text{ on } [-4, 4]$$

49–52. Absolute extreme values Verify that the following functions satisfy the conditions of Theorem 4.9 on their domains. Then find the location and value of the absolute extrema guaranteed by the theorem.

$$49. f(x) = -3x^2 + 2x - 5 \quad 50. f(x) = 4x + 1/\sqrt{x}$$

$$51. A(r) = 24/r + 2\pi r^2, r > 0$$

$$52. f(x) = x\sqrt{3 - x}$$

53–56. Sketching curves Sketch a graph of a function f that is continuous on $(-\infty, \infty)$ and has the following properties.

$$53. f'(x) > 0, f''(x) > 0$$

$$54. f'(x) < 0 \text{ and } f''(x) > 0 \text{ on } (-\infty, 0); f'(x) > 0 \text{ and } f''(x) > 0 \text{ on } (0, \infty)$$

$$55. f'(x) < 0 \text{ and } f''(x) < 0 \text{ on } (-\infty, 0); f'(x) < 0 \text{ and } f''(x) > 0 \text{ on } (0, \infty)$$

$$56. f'(x) < 0 \text{ and } f''(x) > 0 \text{ on } (-\infty, 0); f'(x) < 0 \text{ and } f''(x) < 0 \text{ on } (0, \infty)$$

57–68. Concavity Determine the intervals on which the following functions are concave up or concave down. Identify any inflection points.

$$57. f(x) = x^4 - 2x^3 + 1 \quad 58. f(x) = -x^4 - 2x^3 + 12x^2$$

$$59. f(x) = 5x^4 - 20x^3 + 10 \quad 60. f(x) = \frac{1}{1 + x^2}$$

$$61. g(t) = \frac{t - 2}{t + 3} \quad 62. g(x) = \sqrt[3]{x - 4}$$

$$63. f(\theta) = \theta \sin \theta + 2 \cos \theta \text{ on } (0, 2\pi)$$

$$64. f(x) = x^2 + 4 \sin x \text{ on } [0, \pi]$$

$$65. f(x) = 4(x + 1)^{5/2}(3x - 4) \text{ on } [-1, \infty)$$

$$66. h(t) = 2 + \cos 2t \text{ on } [0, \pi]$$

$$67. g(t) = 3t^5 - 30t^4 + 80t^3 + 100$$

$$68. f(x) = 2x^4 + 8x^3 + 12x^2 - x - 2$$

69–84. Second Derivative Test Locate the critical points of the following functions. Then use the Second Derivative Test to determine (if possible) whether they correspond to local maxima or local minima.

$$69. f(x) = x^3 - 3x^2$$

$$70. f(x) = 6x^2 - x^3$$

$$71. f(x) = 4 - x^2$$

$$72. f(x) = x^3 - \frac{3}{2}x^2 - 36x$$

$$73. f(x) = 2x^3 - 3x^2 + 12$$

$$74. p(x) = \frac{x - 4}{x^2 + 20}$$

$$75. f(x) = 3x^4 - 4x^3 + 2$$

$$76. g(x) = \frac{x^4}{2 - 12x^2}$$

$$77. f(x) = x^3 + \cos x \quad 78. f(x) = \sqrt{x} \left(\frac{12}{7}x^3 - 4x^2 \right)$$

$$79. p(t) = 2t^3 + 3t^2 - 36t$$

$$80. f(x) = \frac{x^4}{4} - \frac{5x^3}{3} - 4x^2 + 48x$$

$$81. h(x) = (x + a)^4; a \text{ constant}$$

$$82. f(x) = x^3 - 13x^2 - 9x$$

$$83. f(\theta) = 2 \sin 3\theta - 3\theta \text{ on } [0, \pi]$$

$$84. f(x) = 2x^{-3} - x^{-2}$$

85. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. If $f'(x) > 0$ and $f''(x) < 0$ on an interval, then f is increasing at a decreasing rate on the interval.
 b. If $f'(c) > 0$ and $f''(c) = 0$, then f has a local maximum at c .
 c. Two functions that differ by an additive constant both increase and decrease on the same intervals.
 d. If f and g increase on an interval, then the product fg also increases on that interval.
 e. There exists a function f that is continuous on $(-\infty, \infty)$ with exactly three critical points, all of which correspond to local maxima.

86–87. Functions from derivatives Consider the following graphs of f' and f'' . On the same set of axes, sketch the graph of a possible function f . The graphs of f are not unique.

86.

87.

88. Is it possible? Determine whether the following properties can be satisfied by a function that is continuous on $(-\infty, \infty)$. If such a function is possible, provide an example or a sketch of the function. If such a function is not possible, explain why.

- A function f is concave down and positive everywhere.
- A function f is increasing and concave down everywhere.
- A function f has exactly two local extrema and three inflection points.
- A function f has exactly four zeros and two local extrema.

89. Matching derivatives and functions The following figures show the graphs of three functions (graphs a–c). Match each function with its first derivative (graphs A–C) and its second derivative (graphs i–iii).

(a)

(b)

(c)

(A)

(B)

(C)

(i)

(ii)

(iii)

90. Graphical analysis The figure shows the graphs of f , f' , and f'' . Which curve is which?

91. Sketching graphs Sketch the graph of a function f that is continuous on $[a, b]$ such that f , f' , and f'' have the signs indicated in the following table on $[a, b]$. There are eight different cases lettered A–H that correspond to eight different graphs.

Case	A	B	C	D	E	F	G	H
f	+	+	+	+	–	–	–	–
f'	+	+	–	–	+	+	–	–
f''	+	–	+	–	+	–	+	–

92–95. Designer functions Sketch the graph of a function f that is continuous on $(-\infty, \infty)$ and satisfies the following sets of conditions.

- $f''(x) > 0$ on $(-\infty, -2)$; $f''(-2) = 0$; $f'(-1) = f'(1) = 0$; $f''(2) = 0$; $f'(3) = 0$; $f''(x) > 0$ on $(4, \infty)$
- $f(-2) = f''(-1) = 0$; $f'(-\frac{3}{2}) = 0$; $f(0) = f'(0) = 0$; $f(1) = f'(1) = 0$
- $f'(x) > 0$, for all x in the domain of f' ; $f'(-2)$ and $f'(1)$ do not exist; $f''(0) = 0$
- $f''(x) > 0$ on $(-\infty, -2)$; $f''(x) < 0$ on $(-2, 1)$; $f''(x) > 0$ on $(1, 3)$; $f''(x) < 0$ on $(3, \infty)$

96. Graph carefully Graph the function $f(x) = 60x^5 - 901x^3 + 27x$ in the window $[-4, 4] \times [-10,000, 10,000]$. How many extreme values do you see? Locate *all* the extreme values by analyzing f' .

97. Interpreting the derivative The graph of f' on the interval $[-3, 2]$ is shown in the figure.

- On what interval(s) is f increasing? Decreasing?
- Find the critical points of f . Which critical points correspond to local maxima? Local minima? Neither?
- At what point(s) does f have an inflection point?
- On what interval(s) is f concave up? Concave down?

- e. Sketch the graph of f'' .
f. Sketch one possible graph of f .

98. **Concavity of parabolas** Consider the general parabola described by the function $f(x) = ax^2 + bx + c$. For what values of a , b , and c is f concave up? For what values of a , b , and c is f concave down?

Explorations and Challenges

99. **Demand functions and elasticity** Economists use *demand functions* to describe how much of a commodity can be sold at varying prices. For example, the demand function $D(p) = 500 - 10p$ says that at a price of $p = 10$, a quantity of $D(10) = 400$ units of the commodity can be sold. The elasticity $E = \frac{dD}{D} \frac{p}{D}$ of the demand gives the approximate percent change in the demand for every 1% change in the price. (See Section 3.6 or the Guided Project *Elasticity in Economics* for more on demand functions and elasticity.)
- Compute the elasticity of the demand function $D(p) = 500 - 10p$.
 - If the price is \$12 and increases by 4.5%, what is the approximate percent change in the demand?
 - Show that for the linear demand function $D(p) = a - bp$, where a and b are positive real numbers, the elasticity is a decreasing function, for $p \geq 0$ and $p \neq a/b$.
 - Show that the demand function $D(p) = a/p^b$, where a and b are positive real numbers, has a constant elasticity for all positive prices.

100. **Population models** A typical population curve is shown in the figure. The population is small at $t = 0$ and increases toward a steady-state level called the *carrying capacity*. Explain why the maximum growth rate occurs at an inflection point of the population curve.

101. **Population models** The population of a species is given by the function $P(t) = \frac{Kt^2}{t^2 + b}$, where $t \geq 0$ is measured in years and K and b are positive real numbers.

- With $K = 300$ and $b = 30$, what is $\lim_{t \rightarrow \infty} P(t)$, the carrying capacity of the population?
- With $K = 300$ and $b = 30$, when does the maximum growth rate occur?
- For arbitrary positive values of K and b , when does the maximum growth rate occur (in terms of K and b)?

102. **Tangent lines and concavity** Give an argument to support the claim that if a function is concave up at a point, then the tangent line at that point lies below the curve near that point.

103. **General quartic** Show that the general quartic (fourth-degree) polynomial $f(x) = x^4 + ax^3 + bx^2 + cx + d$, where a , b , c , and d are real numbers, has either zero or two inflection points, and the latter case occurs provided $b < \frac{3a^2}{8}$.

104. **First Derivative Test is not exhaustive** Sketch the graph of a (simple) nonconstant function f that has a local maximum at $x = 1$, with $f'(1) = 0$, where f' does not change sign from positive to negative as x increases through 1. Why can't the First Derivative Test be used to classify the critical point at $x = 1$ as a local maximum? How could the test be rephrased to account for such a critical point?

105. **Properties of cubics** Consider the general cubic polynomial $f(x) = x^3 + ax^2 + bx + c$, where a , b , and c are real numbers.

- Prove that f has exactly one local maximum and one local minimum provided $a^2 > 3b$.
- Prove that f has no extreme values if $a^2 < 3b$.

QUICK CHECK ANSWERS

1. Positive derivatives on an interval mean the curve is rising on the interval, which means the function is increasing on the interval. 2.

3. $f'(x) < 0$ on $(-\infty, 0)$ and $f'(x) > 0$ on $(0, \infty)$. Therefore, f has a local minimum at $x = 0$ by the First Derivative Test. 4. $f''(x) = 12x^2$, so $f''(x) > 0$ for $x < 0$ and for $x > 0$. There is no inflection point at $x = 0$ because the second derivative does not change sign. 5. The first curve should be rising and concave up. The second curve should be falling and concave down.

4.4 Graphing Functions

Figure 4.42

QUICK CHECK 1 Graph

$f(x) = x^3/3 - 400x$ using various windows on a graphing calculator.

Find a window that gives a better graph of f than those in Figure 4.42. ◀

We have now collected the tools required for a comprehensive approach to graphing functions. These *analytical methods* are indispensable, even with the availability of powerful graphing utilities, as illustrated by the following example.

Calculators and Analysis

Suppose you want to graph the harmless-looking function $f(x) = x^3/3 - 400x$. The result of plotting f using a graphing calculator with a default window of $[-10, 10] \times [-10, 10]$ is shown in Figure 4.42a; one vertical line appears on the screen. Zooming out to the window $[-100, 100] \times [-100, 100]$ produces three vertical lines (Figure 4.42b); it is still difficult to understand the behavior of the function using only this graph. Expanding the window even more to $[-1000, 1000] \times [-1000, 1000]$ is no better. So what do we do?

The function $f(x) = x^3/3 - 400x$ has a reasonable graph (see Example 2), but it cannot be found automatically by letting technology do all the work. Here is the message of this section: Graphing utilities are valuable for exploring functions, producing preliminary graphs, and checking your work. But they should not be relied on exclusively because they cannot explain *why* a graph has its shape. Rather, graphing utilities should be used in an interactive way with the analytical methods presented in this chapter.

Graphing Guidelines

The following set of guidelines need not be followed exactly for every function, and you will find that several steps can often be done at once. Depending on the specific problem, some of the steps are best done analytically, while other steps can be done with a graphing utility. Experiment with both approaches and try to find a good balance. We also present a schematic record-keeping procedure to keep track of discoveries as they are made.

Graphing Guidelines for $y = f(x)$

- 1. Identify the domain or interval of interest.** On what interval(s) should the function be graphed? It may be the domain of the function or some subset of the domain.
- 2. Exploit symmetry.** Take advantage of symmetry. For example, is the function *even* ($f(-x) = f(x)$), *odd* ($f(-x) = -f(x)$), or neither?
- 3. Find the first and second derivatives.** They are needed to determine extreme values, concavity, inflection points, and the intervals on which f is increasing or decreasing. Computing derivatives—particularly second derivatives—may not be practical, so some functions may need to be graphed without complete derivative information.
- 4. Find critical points and possible inflection points.** Determine points at which $f'(x) = 0$ or f' is undefined. Determine points at which $f''(x) = 0$ or f'' is undefined.
- 5. Find intervals on which the function is increasing/decreasing and concave up/down.** The first derivative determines the intervals on which f is increasing or decreasing. The second derivative determines the intervals on which the function is concave up or concave down.
- 6. Identify extreme values and inflection points.** Use either the First or Second Derivative Test to classify the critical points. Both x - and y -coordinates of maxima, minima, and inflection points are needed for graphing.
- 7. Locate all asymptotes and determine end behavior.** Vertical asymptotes often occur at zeros of denominators. Horizontal asymptotes require examining limits as $x \rightarrow \pm \infty$; these limits determine end behavior. Slant asymptotes occur with rational functions in which the degree of the numerator is one more than the degree of the denominator.
- 8. Find the intercepts.** The y -intercept of the graph is found by setting $x = 0$. The x -intercepts are found by solving $f(x) = 0$; they are the real zeros (or roots) of f .
- 9. Choose an appropriate graphing window and plot a graph.** Use the results of the previous steps to graph the function. If you use graphing software, check for consistency with your analytical work. Is your graph *complete*—that is, does it show all the essential details of the function?

► Limits at infinity determine the end behavior of many functions, though a modification is required for some functions. For example, the end behavior of $f(x) = \frac{1+x}{x+\sqrt{x}}$ is found by computing $\lim_{x \rightarrow 0^+} f(x)$ and $\lim_{x \rightarrow \infty} f(x)$ because the domain of f is $(0, \infty)$.

EXAMPLE 1 A warm-up Given the following information about the first and second derivatives of a function f that is continuous on $(-\infty, \infty)$, summarize the information using a sign graph, and then sketch a possible graph of f .

$$\begin{array}{llll} f' < 0, f'' > 0 \text{ on } (-\infty, 0) & f' > 0, f'' > 0 \text{ on } (0, 1) & f' > 0, f'' < 0 \text{ on } (1, 2) \\ f' < 0, f'' < 0 \text{ on } (2, 3) & f' < 0, f'' > 0 \text{ on } (3, 4) & f' > 0, f'' > 0 \text{ on } (4, \infty) \end{array}$$

SOLUTION Figure 4.43 uses the given information to determine the behavior of f and its graph. For example, on the interval $(-\infty, 0)$, f is decreasing and concave up, so we sketch a segment of a curve with these properties on this interval. Continuing in this manner, we obtain a useful summary of the properties of f .

Figure 4.43

Assembling the information shown in Figure 4.43, a possible graph of f is produced (Figure 4.44). Notice that derivative information is not sufficient to determine the y -coordinates of points on the curve.

Figure 4.44

Related Exercises 7–8 ◀

QUICK CHECK 2 Explain why the functions f and $f + C$, where C is a constant, have the same derivative properties. ◀

EXAMPLE 2 A deceptive polynomial Use the graphing guidelines to graph

$$f(x) = \frac{x^3}{3} - 400x \text{ on its domain.}$$

SOLUTION

- Domain** The domain of any polynomial is $(-\infty, \infty)$.
- Symmetry** Because f consists of odd powers of the variable, it is an odd function. Its graph is symmetric about the origin.
- Derivatives** The derivatives of f are

$$f'(x) = x^2 - 400 \quad \text{and} \quad f''(x) = 2x.$$

- Critical points and possible inflection points** Solving $f'(x) = 0$, we find that the critical points are $x = \pm 20$. Solving $f''(x) = 0$, we see that a possible inflection point occurs at $x = 0$.

► Notice that the first derivative of an odd polynomial is an even polynomial and the second derivative is an odd polynomial (assuming the original polynomial is of degree 3 or greater).

- See Appendix B, online at bit.ly/2y3Nck3, for solving inequalities using test values.

5. Increasing/decreasing and concavity

Note that

$$f'(x) = x^2 - 400 = (x - 20)(x + 20).$$

Solving the inequality $f'(x) < 0$, we find that f is decreasing on the interval $(-20, 20)$. Solving the inequality $f'(x) > 0$ reveals that f is increasing on the intervals $(-\infty, -20)$ and $(20, \infty)$ (Figure 4.45). By the First Derivative Test, we have enough information to conclude that f has a local maximum at $x = -20$ and a local minimum at $x = 20$.

Figure 4.45

Furthermore, $f''(x) = 2x < 0$ on $(-\infty, 0)$, so f is concave down on this interval. Also, $f''(x) > 0$ on $(0, \infty)$, so f is concave up on $(0, \infty)$ (Figure 4.46).

Figure 4.46

The evidence obtained so far is summarized in Figure 4.47.

Figure 4.47

- 6. Extreme values and inflection points** In this case, the Second Derivative Test is easily applied and it confirms what we have already learned. Because $f''(-20) < 0$ and $f''(20) > 0$, f has a local maximum at $x = -20$ and a local minimum at $x = 20$. The corresponding function values are $f(-20) = 16,000/3 = 5333\frac{1}{3}$ and $f(20) = -f(-20) = -5333\frac{1}{3}$. Finally, we see that f'' changes sign at $x = 0$, making $(0, 0)$ an inflection point.

Figure 4.48

7. Asymptotes and end behavior Polynomials have neither vertical nor horizontal asymptotes. Because the highest-power term in the polynomial is x^3 (an odd power) and the leading coefficient is positive, we have the end behavior

$$\lim_{x \rightarrow \infty} f(x) = \infty \quad \text{and} \quad \lim_{x \rightarrow -\infty} f(x) = -\infty.$$

8. Intercepts The y-intercept is $(0, 0)$. We solve the equation $f(x) = 0$ to find the x-intercepts:

$$\frac{x^3}{3} - 400x = x \left(\frac{x^2}{3} - 400 \right) = 0.$$

The roots of this equation are $x = 0$ and $x = \pm \sqrt{1200} \approx \pm 34.6$.

9. Graph the function Using the information found in Steps 1–8, we choose the graphing window $[-40, 40] \times [-6000, 6000]$ and produce the graph shown in Figure 4.48. Notice that the symmetry detected in Step 2 is evident in this graph.

Related Exercises 17–18 ◀

EXAMPLE 3 The surprises of a rational function Use the graphing guidelines to graph $f(x) = \frac{10x^3}{x^2 - 1}$ on its domain.

SOLUTION

1. Domain The zeros of the denominator are $x = \pm 1$, so the domain is $\{x: x \neq \pm 1\}$.

2. Symmetry This function consists of an odd function divided by an even function. The product or quotient of an even function and an odd function is odd. Therefore, the graph is symmetric about the origin.

3. Derivatives The Quotient Rule is used to find the first and second derivatives:

$$f'(x) = \frac{10x^2(x^2 - 3)}{(x^2 - 1)^2} \quad \text{and} \quad f''(x) = \frac{20x(x^2 + 3)}{(x^2 - 1)^3}.$$

4. Critical points and possible inflection points The solutions of $f'(x) = 0$ occur where the numerator equals 0, provided the denominator is nonzero at those points. Solving $10x^2(x^2 - 3) = 0$ gives the critical points $x = 0$ and $x = \pm \sqrt{3}$. The solutions of $f''(x) = 0$ are found by solving $20x(x^2 + 3) = 0$; we see that the only possible inflection point occurs at $x = 0$.

5. Increasing/decreasing and concavity To find the sign of f' , first note that the denominator of f' is nonnegative, as is the factor $10x^2$ in the numerator. So the sign of f' is determined by the sign of the factor $x^2 - 3$, which is negative on $(-\sqrt{3}, \sqrt{3})$ (excluding $x = \pm 1$) and positive on $(-\infty, -\sqrt{3})$ and $(\sqrt{3}, \infty)$. Therefore, f is decreasing on $(-\sqrt{3}, \sqrt{3})$ (excluding $x = \pm 1$) and increasing on $(-\infty, -\sqrt{3})$ and $(\sqrt{3}, \infty)$.

The sign of f'' is a bit trickier. Because $x^2 + 3$ is positive, the sign of f'' is determined by the sign of $20x$ in the numerator and $(x^2 - 1)^3$ in the denominator. When $20x$ and $(x^2 - 1)^3$ have the same sign, $f''(x) > 0$; when $20x$ and $(x^2 - 1)^3$ have opposite signs, $f''(x) < 0$ (Table 4.1). The results of this analysis are shown in

Figure 4.49.

Table 4.1

	$20x$	$x^2 + 3$	$(x^2 - 1)^3$	Sign of f''
$(-\infty, -1)$	–	+	+	–
$(-1, 0)$	–	+	–	+
$(0, 1)$	+	+	–	–
$(1, \infty)$	+	+	+	+

► Sign charts and sign graphs (Table 4.1 and Figure 4.49) must be constructed carefully when vertical asymptotes are involved: The sign of f' and f'' may or may not change at an asymptote.

Figure 4.49

6. Extreme values and inflection points The First Derivative Test is easily applied by looking at Figure 4.49. The function is increasing on $(-\infty, -\sqrt{3})$ and decreasing on $(-\sqrt{3}, -1)$; therefore, f has a local maximum at $x = -\sqrt{3}$, where $f(-\sqrt{3}) = -15\sqrt{3}$. Similarly, f has a local minimum at $x = \sqrt{3}$, where $f(\sqrt{3}) = 15\sqrt{3}$. (These results could also be obtained with the Second Derivative Test.) There is no local extreme value at the critical point $x = 0$, only a horizontal tangent line.

Using Table 4.1 from Step 5, we see that f'' changes sign at $x = \pm 1$ and at $x = 0$. The points $x = \pm 1$ are not in the domain of f , so they cannot correspond to inflection points. However, there is an inflection point at $(0, 0)$.

7. Asymptotes and end behavior Recall from Section 2.4 that zeros of the denominator, which in this case are $x = \pm 1$, are candidates for vertical asymptotes. Checking the behavior of f on either side of $x = \pm 1$, we find

$$\begin{aligned}\lim_{x \rightarrow -1^-} f(x) &= -\infty, & \lim_{x \rightarrow -1^+} f(x) &= \infty, \\ \lim_{x \rightarrow 1^-} f(x) &= -\infty, & \lim_{x \rightarrow 1^+} f(x) &= \infty.\end{aligned}$$

It follows that f has vertical asymptotes at $x = \pm 1$. The degree of the numerator is greater than the degree of the denominator, so there is no horizontal asymptote. Using long division, it can be shown that

$$f(x) = 10x + \frac{10x}{x^2 - 1}.$$

Therefore, as $x \rightarrow \pm \infty$, the graph of f approaches the line $y = 10x$. This line is a slant asymptote (Section 2.5).

8. Intercepts The zeros of a rational function coincide with the zeros of the numerator, provided those points are not also zeros of the denominator. In this case, the zeros of f satisfy $10x^3 = 0$, or $x = 0$ (which is not a zero of the denominator). Therefore, $(0, 0)$ is both the x -intercept and the y -intercept.

9. Graphing We now assemble an accurate graph of f , as shown in Figure 4.50. A window of $[-3, 3] \times [-40, 40]$ gives a complete graph of the function. Notice that the symmetry about the origin deduced in Step 2 is apparent in the graph.

Related Exercises 30–31 ◀

Figure 4.50

QUICK CHECK 3 Verify that the function f in Example 3 is symmetric about the origin by showing that $f(-x) = -f(x)$. ◀

EXAMPLE 4 Roots and cusps Graph $f(x) = \frac{1}{8}x^{2/3}(9x^2 - 8x - 16)$ on its domain.

SOLUTION The domain of f is $(-\infty, \infty)$. The polynomial factor in f consists of both even and odd powers, so f has no special symmetry. Computing the first derivative is straightforward if you first expand f as a sum of three terms:

Table 4.2

	$3x^{1/3}$	$9x + 4$	$x - 1$	Sign of f'
$(-\infty, -\frac{4}{9})$	—	—	—	—
$(-\frac{4}{9}, 0)$	—	+	—	+
$(0, 1)$	+	+	—	—
$(1, \infty)$	+	+	+	+

$$\begin{aligned}
 f'(x) &= \frac{d}{dx} \left(\frac{9x^{8/3}}{8} - x^{5/3} - 2x^{2/3} \right) && \text{Expand } f. \\
 &= 3x^{5/3} - \frac{5}{3}x^{2/3} - \frac{4}{3}x^{-1/3} && \text{Differentiate.} \\
 &= \frac{(x-1)(9x+4)}{3x^{1/3}}. && \text{Simplify.}
 \end{aligned}$$

The critical points are now identified: f' is undefined at $x = 0$ (because $x^{-1/3}$ is undefined there) and $f'(x) = 0$ at $x = 1$ and $x = -\frac{4}{9}$. So we have three critical points to analyze. Table 4.2 tracks the signs of the factors in the numerator and denominator of f' and shows the sign of f' on the relevant intervals; this information is recorded in Figure 4.51.

Figure 4.51

- To show that $f''(x) > 0$ (for $x \neq 0$), analyze its numerator and denominator.
- The graph of $45x^2 - 10x + 4$ is a parabola that opens upward (its leading coefficient is positive) with no x -intercepts (verified by the quadratic formula). Therefore, the numerator is always positive.
 - The denominator is nonnegative because $9x^{4/3} = 9(x^{1/3})^4$ (even powers are nonnegative).

We use the second line in the calculation of f' to compute the second derivative:

$$\begin{aligned}
 f''(x) &= \frac{d}{dx} \left(3x^{5/3} - \frac{5}{3}x^{2/3} - \frac{4}{3}x^{-1/3} \right) \\
 &= 5x^{2/3} - \frac{10}{9}x^{-1/3} + \frac{4}{9}x^{-4/3} && \text{Differentiate.} \\
 &= \frac{45x^2 - 10x + 4}{9x^{4/3}}. && \text{Simplify.}
 \end{aligned}$$

Solving $f''(x) = 0$, we discover that $f''(x) > 0$, for all x except $x = 0$, where it is undefined. Therefore, f is concave up on $(-\infty, 0)$ and $(0, \infty)$ (Figure 4.51).

By the Second Derivative Test, because $f''(x) > 0$, for $x \neq 0$, the critical points $x = -\frac{4}{9}$ and $x = 1$ correspond to local minima; their y -coordinates are $f(-\frac{4}{9}) \approx -0.78$ and $f(1) = -\frac{15}{8} = -1.875$.

What about the third critical point, $x = 0$? Note that $f(0) = 0$, and f is increasing just to the left of 0 and decreasing just to the right. By the First Derivative Test, f has a local maximum at $x = 0$. Furthermore, $f'(x) \rightarrow \infty$ as $x \rightarrow 0^-$ and $f'(x) \rightarrow -\infty$ as $x \rightarrow 0^+$, so the graph of f has a cusp at $x = 0$.

As $x \rightarrow \pm\infty$, f is dominated by its highest-power term, which is $9x^{8/3}/8$. This term becomes large and positive as $x \rightarrow \pm\infty$; therefore, f has no absolute maximum. Its absolute minimum occurs at $x = 1$ because, comparing the two local minima, $f(1) < f(-\frac{4}{9})$.

The roots of f satisfy $\frac{1}{8}x^{2/3}(9x^2 - 8x - 16) = 0$, which gives $x = 0$ and

$$x = \frac{4}{9}(1 \pm \sqrt{10}) \approx -0.96 \quad \text{and} \quad 1.85. \quad \text{Use the quadratic formula.}$$

With the information gathered in this analysis, we obtain the graph shown in

Figure 4.52.

Figure 4.52

SECTION 4.4 EXERCISES

Getting Started

- Why is it important to determine the domain of f before graphing f ?
- Explain why it is useful to know about symmetry in a function.
- Can the graph of a polynomial have vertical or horizontal asymptotes? Explain.
- Where are the vertical asymptotes of a rational function located?
- How do you find the absolute maximum and minimum values of a function that is continuous on a closed interval?
- Describe the possible end behavior of a polynomial.

7–8. Sketch a graph of a function f with the following properties.

- $f' < 0$ and $f'' < 0$, for $x < 3$
 $f' < 0$ and $f'' > 0$, for $x > 3$
- $f' < 0$ and $f'' < 0$, for $x < -1$
 $f' < 0$ and $f'' > 0$, for $-1 < x < 2$
 $f' > 0$ and $f'' > 0$, for $2 < x < 8$
 $f' > 0$ and $f'' < 0$, for $8 < x < 10$
 $f' > 0$ and $f'' > 0$, for $x > 10$

9–12. Sketch a continuous function f on some interval that has the properties described. Answers will vary.

- The function f has one inflection point but no local extrema.
- The function f has three real zeros and exactly two local minima.
- The function f satisfies $f'(-2) = 2$, $f'(0) = 0$, $f'(1) = -3$, and $f'(4) = 1$.
- The function f has the same finite limit as $x \rightarrow \pm \infty$ and has exactly one local minimum and one local maximum.

Practice Exercises

- Let $f(x) = (x - 3)(x + 3)^2$.
 - Verify that $f'(x) = 3(x - 1)(x + 3)$ and $f''(x) = 6(x + 1)$.
 - Find the critical points and possible inflection points of f .
 - Find the intervals on which f is increasing or decreasing.
 - Determine the intervals on which f is concave up or concave down.
 - Identify the local extreme values and inflection points of f .
 - State the x - and y -intercepts of the graph of f .
 - Use your work in parts (a) through (f) to sketch a graph of f .
- If $f(x) = \frac{1}{3x^4 + 5}$, it can be shown that $f'(x) = -\frac{12x^3}{(3x^4 + 5)^2}$ and $f''(x) = \frac{180x^2(x^2 + 1)(x + 1)(x - 1)}{(3x^4 + 5)^3}$. Use these functions to complete the following steps.
 - Find the critical points and possible inflection points of f .
 - Find the intervals on which f is increasing or decreasing.
 - Determine the intervals on which f is concave up or concave down.
 - Identify the local extreme values and inflection points of f .
 - State the x - and y -intercepts of the graph of f .
 - Find the asymptotes of f .
 - Use your work in parts (a) through (f) to sketch a graph of f .

15–46. **Graphing functions** Use the guidelines of this section to make a complete graph of f .

- $f(x) = x^2 - 6x$
- $f(x) = x^3 - 6x^2 + 9x$
- $f(x) = x^4 - 6x^2$
- $f(x) = (x - 6)(x + 6)^2$
- $f(x) = x^3 - 6x^2 - 135x$
- $f(x) = x^4 + 8x^3 - 270x^2 + 1$
- $f(x) = x^3 - 3x^2 - 144x - 140$
- $f(x) = x^3 - 147x + 286$
- $f(x) = 3\sqrt{x} - x^{3/2}$
- $f(x) = \frac{2x - 3}{2x - 8}$
- $f(x) = \frac{x^2}{x^2 - 4}$
- $f(x) = \frac{4x}{x^2 + 3}$
- $f(x) = x^{1/3}(4 - x)$
- $f(x) = x + 2 \cos x$ on $[-2\pi, 2\pi]$
- $f(x) = x - 3x^{2/3}$
- $f(x) = 2 - 2x^{2/3} + x^{4/3}$
- $f(x) = x\sqrt{x + 3}$
- $f(x) = x + \cos 2x$ on $[0, \pi]$
- $f(x) = x + \tan x$ on $(-\frac{\pi}{2}, \frac{\pi}{2})$
- $f(x) = \frac{3}{x^2} - \frac{54}{x^4}$
- $f(x) = x - x^2$
- $f(x) = 3x - x^3$
- $f(x) = x^4 + 4x^3$
- $f(x) = 27(x - 2)^2(x + 2)$
- $f(x) = x - 2\sqrt{x}$
- $f(x) = \frac{3x}{x^2 - 1}$
- $f(x) = \frac{x^2}{x - 2}$
- $f(x) = \frac{x^2 + 12}{2x + 1}$
- $f(x) = \sqrt{x}(x - 3)$
- $f(x) = \sin x - x$ on $[0, 2\pi]$
- $f(x) = \frac{1 + x}{\sqrt{x}}$

47–48. Use the graphs of f' and f'' to find the critical points and inflection points of f , the intervals on which f is increasing or decreasing, and the intervals of concavity. Then graph f assuming $f(0) = 0$.

48.

T 49–54. Graphing with technology Make a complete graph of the following functions. A graphing utility is useful in locating intercepts, local extreme values, and inflection points.

49. $f(x) = \frac{1}{3}x^3 - 2x^2 - 5x + 2$

50. $f(x) = \frac{1}{15}x^3 - x + 1$

51. $f(x) = 3x^4 + 4x^3 - 12x^2$

52. $f(x) = x^3 - 33x^2 + 216x - 2$

53. $f(x) = \frac{3x - 5}{x^2 - 1}$

54. $f(x) = x^{1/3}(x - 2)^2$

55. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- If the zeros of f' are -3 , 1 , and 4 , then the local extrema of f are located at these points.
- If the zeros of f'' are -2 and 4 , then the inflection points of f are located at these points.
- If the zeros of the denominator of f are -3 and 4 , then f has vertical asymptotes at these points.
- If a rational function has a finite limit as $x \rightarrow \infty$, then it must have a finite limit as $x \rightarrow -\infty$.

56–59. Functions from derivatives Use the derivative f' to determine the x -coordinates of the local maxima and minima of f , and the intervals on which f is increasing or decreasing. Sketch a possible graph of f (f is not unique).

56. $f'(x) = (x - 1)(x + 2)(x + 4)$

57. $f'(x) = 10 \sin 2x$ on $[-2\pi, 2\pi]$

58. $f'(x) = \frac{1}{6}(x + 1)(x - 2)^2(x - 3)$

59. $f'(x) = x^2(x + 2)(x - 1)$

Explorations and Challenges

60. Derivative information Suppose a continuous function f is concave up on $(-\infty, 0)$ and $(0, \infty)$. Assume f has a local maximum at $x = 0$. What, if anything, do you know about $f'(0)$? Explain with an illustration.

61. Height functions The figure shows six containers, each of which is filled from the top. Assume water is poured into the containers at a constant rate and each container is filled in 10 s. Assume also that the horizontal cross sections of the containers are always circles. Let $h(t)$ be the depth of water in the container at time t , for $0 \leq t \leq 10$.

- For each container, sketch a graph of the function $y = h(t)$, for $0 \leq t \leq 10$.

b. Explain why h is an increasing function.

c. Describe the concavity of the function. Identify inflection points when they occur.

d. For each container, where does h' (the derivative of h) have an absolute maximum on $[0, 10]$?

(A)

(B)

(C)

(D)

(E)

(F)

T 62. A pursuit curve A man stands 1 mi east of a crossroads. At noon, a dog starts walking north from the crossroads at 1 mi/hr (see figure). At the same instant, the man starts walking and at all times walks directly toward the dog at $s > 1$ mi/hr. The path in the xy -plane followed by the man as he pursues the dog is given by the function

$$y = f(x) = \frac{s}{2} \left(\frac{x^{(s+1)/s}}{s+1} - \frac{x^{(s-1)/s}}{s-1} \right) + \frac{s}{s^2 - 1}.$$

Select various values of $s > 1$ and graph this pursuit curve. Comment on the changes in the curve as s increases.

T 63–66. Combining technology with analytical methods Use a graphing utility together with analytical methods to create a complete graph of the following functions. Be sure to find and label the intercepts, local extrema, inflection points, and asymptotes, and find the intervals on which the function is increasing or decreasing, and the intervals on which the function is concave up or concave down.

63. $f(x) = \frac{x \sin x}{x^2 + 1}$ on $[-2\pi, 2\pi]$

64. $f(x) = 3\sqrt[4]{x} - \sqrt{x} - 2$

65. $f(x) = 3x^4 - 44x^3 + 60x^2$ (Hint: Two different graphing windows may be needed.)

66. $f(x) = \frac{\sqrt{4x^2 + 1}}{x^2 + 1}$

T 67–71. Special curves The following classical curves have been studied by generations of mathematicians. Use analytical methods (including implicit differentiation) and a graphing utility to graph the curves. Include as much detail as possible.

67. $x^{2/3} + y^{2/3} = 1$ (Astroid or hypocycloid with four cusps)

68. $y = \frac{8}{x^2 + 4}$ (Witch of Agnesi)

69. $x^3 + y^3 = 3xy$ (Folium of Descartes)

70. $y^2 = x^3(1 - x)$ (Pear curve)

71. $x^4 - x^2 + y^2 = 0$ (Figure-8 curve)

T 72. Elliptic curves The equation $y^2 = x^3 - ax + 3$, where a is a parameter, defines a well-known family of *elliptic curves*.

a. Plot a graph of the curve when $a = 3$.

b. Plot a graph of the curve when $a = 4$.

c. By experimentation, determine the approximate value of a ($3 < a < 4$) at which the graph separates into two curves.

T 73. Lamé curves The equation $|y/a|^n + |x/a|^n = 1$, where n and a are positive real numbers, defines the family of Lamé curves. Make a complete graph of this function with $a = 1$, for $n = \frac{2}{3}$, 1, 2, and 3. Describe the progression that you observe as n increases.

QUICK CHECK ANSWERS

1. Make the window larger in the y -direction.
2. Notice that f and $f + C$ have the same derivatives.
3. $f(-x) = \frac{10(-x)^3}{(-x)^2 - 1} = -\frac{10x^3}{x^2 - 1} = -f(x)$ ◀

4.5 Optimization Problems

The theme of this section is *optimization*, a topic arising in many disciplines that rely on mathematics. A structural engineer may seek the dimensions of a beam that maximize strength for a specified cost. A packaging designer may seek the dimensions of a container that maximize the volume of the container for a given surface area. Airline strategists need to find the best allocation of airliners among several hubs to minimize fuel costs and maximize passenger miles. In all these examples, the challenge is to find an *efficient* way to carry out a task, where “efficient” could mean least expensive, most profitable, least time consuming, or, as you will see, many other measures.

To introduce the ideas behind optimization problems, think about pairs of nonnegative real numbers x and y between 0 and 20 with the property that their sum is 20, that is, $x + y = 20$. Of all possible pairs, which has the greatest product?

Table 4.3 displays a few cases showing how the product of two nonnegative numbers varies while their sum remains constant. The condition that $x + y = 20$ is called a **constraint**. It tells us to consider only (nonnegative) values of x and y satisfying this equation.

The quantity that we wish to maximize (or minimize in other cases) is called the **objective function**; in this case, the objective function is the product $P = xy$. From Table 4.3, it appears that the product is greatest if both x and y are near the middle of the interval $[0, 20]$.

This simple problem has all the essential features of optimization problems. At their heart, optimization problems take the following form:

What is the maximum (minimum) value of an objective function subject to the given constraint(s)?

For the problem at hand, this question would be stated as, “What pair of nonnegative numbers maximizes $P = xy$ subject to the constraint $x + y = 20$?” The first step is to use the constraint to express the objective function $P = xy$ in terms of a single variable. In this case, the constraint is

$$x + y = 20, \quad \text{or} \quad y = 20 - x.$$

Substituting for y , the objective function becomes

$$P = xy = x(20 - x) = 20x - x^2,$$

which is a function of the single variable x . Notice that the values of x lie in the interval $0 \leq x \leq 20$ with $P(0) = P(20) = 0$.

Table 4.3

x	y	$x + y$	$P = xy$
1	19	20	19
5.5	14.5	20	79.75
9	11	20	99
13	7	20	91
18	2	20	36

► In this problem, it is just as easy to eliminate x as y . In other problems, eliminating one variable may result in less work than eliminating other variables.

Figure 4.53

QUICK CHECK 1 Verify that in the previous example, the same result is obtained if the constraint $x + y = 20$ is used to eliminate x rather than y . ◀

Figure 4.54

► Recall from Section 4.1 that, when they exist, the absolute extreme values occur at critical points or endpoints.

QUICK CHECK 2 Find the objective function in Example 1 (in terms of x) (i) if there is no interior fence and (ii) if there is one interior fence that forms a right angle with the barn, as in Figure 4.54. ◀

To maximize P , we first find the critical points by solving

$$P'(x) = 20 - 2x = 0$$

to obtain the solution $x = 10$. To find the absolute maximum value of P on the interval $[0, 20]$, we check the endpoints and the critical points. Because $P(0) = P(20) = 0$ and $P(10) = 100$, we conclude that P has its absolute maximum value at $x = 10$. By the constraint $x + y = 20$, the numbers with the greatest product are $x = y = 10$, and their product is $P = 100$.

Figure 4.53 summarizes this problem. We see the constraint line $x + y = 20$ in the xy -plane. Above the line is the objective function $P = xy$. As x and y vary along the constraint line, the objective function changes, reaching a maximum value of 100 when $x = y = 10$.

Most optimization problems have the same basic structure as the preceding example: There is an objective function, which may involve several variables, and one or more constraints. The methods of calculus (Sections 4.1 and 4.3) are used to find the minimum or maximum values of the objective function.

EXAMPLE 1 Rancher's dilemma A rancher has 400 ft of fence for constructing a rectangular corral. One side of the corral will be formed by a barn and requires no fence. Three exterior fences and two interior fences partition the corral into three rectangular regions as shown in Figure 4.54. What are the dimensions of the corral that maximize the enclosed area? What is the area of that corral?

SOLUTION We first sketch the corral (Figure 4.54), where $x \geq 0$ is the width and $y \geq 0$ is the length of the corral. The amount of fence required is $4x + y$, so the constraint is $4x + y = 400$, or $y = 400 - 4x$.

The objective function to be maximized is the area of the corral, $A = xy$. Using $y = 400 - 4x$, we eliminate y and express A as a function of x :

$$A = xy = x(400 - 4x) = 400x - 4x^2.$$

Notice that the width of the corral must be at least $x = 0$, and it cannot exceed $x = 100$ (because 400 ft of fence are available). Therefore, we maximize $A(x) = 400x - 4x^2$, for $0 \leq x \leq 100$. The critical points of the objective function satisfy

$$A'(x) = 400 - 8x = 0,$$

which has the solution $x = 50$. To find the absolute maximum value of A , we check the endpoints of $[0, 100]$ and the critical point $x = 50$. Because $A(0) = A(100) = 0$ and $A(50) = 10,000$, the absolute maximum value of A occurs when $x = 50$. Using the constraint, the optimal length of the corral is $y = 400 - 4(50) = 200$. Therefore, the maximum area of 10,000 ft² is achieved with dimensions $x = 50$ ft and $y = 200$ ft. The objective function A is shown in Figure 4.55.

QUICK CHECK 3 Find the objective function in Example 2 (in terms of w) if the constraint is that the sum of length and width and height cannot exceed 108 in. ◀

Figure 4.58

- To show that the chord length of a circle is $2r \sin(\theta/2)$, draw a line from the center of the circle to the midpoint of the chord (Figure 4.59). This line bisects the angle θ . Using a right triangle, half the length of the chord is $r \sin(\theta/2)$.

EXAMPLE 2 Airline regulations Suppose an airline policy states that all baggage must be box-shaped with a sum of length, width, and height not exceeding 64 in. What are the dimensions and volume of a square-based box with the greatest volume under these conditions?

SOLUTION We sketch a square-based box whose length and width are w and whose height is h (Figure 4.56). By the airline policy, the constraint is $2w + h = 64$. The objective function is the volume, $V = w^2h$. Either w or h may be eliminated from the objective function; the constraint $h = 64 - 2w$ implies that the volume is

$$V = w^2h = w^2(64 - 2w) = 64w^2 - 2w^3.$$

The objective function has now been expressed in terms of a single variable. Notice that w is nonnegative and cannot exceed 32, so the domain of V is $0 \leq w \leq 32$. The critical points satisfy

$$V'(w) = 128w - 6w^2 = 2w(64 - 3w) = 0,$$

which has roots $w = 0$ and $w = \frac{64}{3}$. By the First (or Second) Derivative Test, $w = \frac{64}{3}$ corresponds to a local maximum. At the endpoints, $V(0) = V(32) = 0$. Therefore, the volume function has an absolute maximum of $V(64/3) \approx 9709 \text{ in}^3$. The dimensions of the optimal box are $w = 64/3$ in and $h = 64 - 2w = 64/3$ in, so the optimal box is a cube. A graph of the volume function is shown in Figure 4.57.

Optimization Guidelines With two examples providing some insight, we present a procedure for solving optimization problems. These guidelines provide a general framework, but the details may vary depending on the problem.

Guidelines for Optimization Problems

1. Read the problem carefully, identify the variables, and organize the given information with a picture.
2. Identify the objective function (the function to be optimized). Write it in terms of the variables of the problem.
3. Identify the constraint(s). Write them in terms of the variables of the problem.
4. Use the constraint(s) to eliminate all but one independent variable of the objective function.
5. With the objective function expressed in terms of a single variable, find the interval of interest for that variable.
6. Use methods of calculus to find the absolute maximum or minimum value of the objective function on the interval of interest. If necessary, check the endpoints.

EXAMPLE 3 Walking and swimming Suppose you are standing on the shore of a circular pond with a radius of 1 mile and you want to get to a point on the shore directly opposite your position (on the other end of a diameter). You plan to swim at 2 mi/hr from your current position to another point P on the shore and then walk at 3 mi/hr along the shore to the terminal point (Figure 4.58). How should you choose P to minimize the total time for the trip?

SOLUTION As shown in Figure 4.58, the initial point is chosen arbitrarily, and the terminal point is at the other end of a diameter. The easiest way to describe the transition point P is to refer to the central angle θ . If $\theta = 0$, then the entire trip is done by walking; if $\theta = \pi$, the entire trip is done by swimming. So the interval of interest is $0 \leq \theta \leq \pi$.

The objective function is the total travel time as it varies with θ . For each leg of the trip (swim and walk), the travel time is the distance traveled divided by the speed. We need a few facts from circular geometry. The length of the swimming leg is the length of the chord of the circle corresponding to the angle θ . For a circle of radius r , this chord

Figure 4.59

- You can check two special cases: If the entire trip is done walking, the travel time is $(\pi \text{ mi})/(3 \text{ mi/hr}) \approx 1.05 \text{ hr}$. If the entire trip is done swimming, the travel time is $(2 \text{ mi})/(2 \text{ mi/hr}) = 1 \text{ hr}$.

Figure 4.60

Figure 4.61

length is given by $2r \sin(\theta/2)$ (Figure 4.59). So the time for the swimming leg (with $r = 1$ and a speed of 2 mi/hr) is

$$\text{time} = \frac{\text{distance}}{\text{rate}} = \frac{2 \sin(\theta/2)}{2} = \sin \frac{\theta}{2}.$$

The length of the walking leg is the length of the arc of the circle corresponding to the angle $\pi - \theta$. For a circle of radius r , the arc length corresponding to an angle θ is $r\theta$ (Figure 4.59). Therefore, the time for the walking leg (with an angle $\pi - \theta$, $r = 1$, and a speed of 3 mi/hr) is

$$\text{time} = \frac{\text{distance}}{\text{rate}} = \frac{\pi - \theta}{3}.$$

The total travel time for the trip (in hours) is the objective function

$$T(\theta) = \sin \frac{\theta}{2} + \frac{\pi - \theta}{3}, \quad \text{for } 0 \leq \theta \leq \pi.$$

We now analyze the objective function. The critical points of T satisfy

$$\frac{dT}{d\theta} = \frac{1}{2} \cos \frac{\theta}{2} - \frac{1}{3} = 0 \quad \text{or} \quad \cos \frac{\theta}{2} = \frac{2}{3}.$$

Using a calculator, the only solution in the interval $[0, \pi]$ is $\theta \approx 1.68 \text{ rad} \approx 96^\circ$, which is the critical point.

Evaluating the objective function at the critical point and at the endpoints, we find that $T(1.68) \approx 1.23 \text{ hr}$, $T(0) = \pi/3 \approx 1.05 \text{ hr}$, and $T(\pi) = 1 \text{ hr}$. We conclude that the minimum travel time is $T(\pi) = 1 \text{ hr}$ when the entire trip is done swimming. The maximum travel time, corresponding to $\theta \approx 96^\circ$, is $T \approx 1.23 \text{ hr}$.

The objective function is shown in Figure 4.60. In general, the maximum and minimum travel times depend on the walking and swimming speeds (Exercise 26).

Related Exercises 26–27 ◀

EXAMPLE 4 Ladder over the fence An 8-foot-tall fence runs parallel to the side of a house 3 feet away (Figure 4.61a). What is the length of the shortest ladder that clears the fence and reaches the house? Assume the vertical wall of the house and the horizontal ground have infinite extent (see Exercise 31 for more realistic assumptions).

SOLUTION Let's first ask why we expect a minimum ladder length. You could put the foot of the ladder far from the fence so that it clears the fence at a shallow angle, but the ladder would be long. Or you could put the foot of the ladder close to the fence so that it clears the fence at a steep angle, but again, the ladder would be long. Somewhere between these extremes is a ladder position that minimizes the ladder length.

The objective function in this problem is the ladder length L . The position of the ladder is specified by x , the distance between the foot of the ladder and the fence (Figure 4.61b). The goal is to express L as a function of x , where $x > 0$.

The Pythagorean theorem gives the relationship

$$L^2 = (x + 3)^2 + b^2,$$

where b is the height of the top of the ladder above the ground. Similar triangles give the constraint $8/x = b/(3 + x)$. We now solve the constraint equation for b and substitute to express L^2 in terms of x :

$$L^2 = (x + 3)^2 + \underbrace{\left(\frac{8(x + 3)}{x}\right)^2}_b = (x + 3)^2 \left(1 + \frac{64}{x^2}\right).$$

At this juncture, we could find the critical points of L by first solving the preceding equation for L and then solving $L' = 0$. However, the solution is simplified considerably

if we note that L is a nonnegative function. Therefore, L and L^2 have local extrema at the same points, so we choose to minimize L^2 . The derivative of L^2 is

$$\begin{aligned}\frac{d}{dx} \left((x+3)^2 \left(1 + \frac{64}{x^2} \right) \right) &= 2(x+3) \left(1 + \frac{64}{x^2} \right) + (x+3)^2 \left(-\frac{128}{x^3} \right) && \text{Chain Rule and Product Rule} \\ &= 2(x+3) \left(1 + \frac{64}{x^2} - (x+3) \frac{64}{x^3} \right) && \text{Factor.} \\ &= \frac{2(x+3)(x^3 - 192)}{x^3}. && \text{Simplify.}\end{aligned}$$

Because $x > 0$, we have $x + 3 \neq 0$; therefore, the condition $\frac{d}{dx}(L^2) = 0$ becomes $x^3 - 192 = 0$, or $x = 4\sqrt[3]{3} \approx 5.77$. By the First Derivative Test, this critical point corresponds to a local minimum. By Theorem 4.11, this solitary local minimum is also the absolute minimum on the interval $(0, \infty)$. Therefore, the minimum ladder length occurs when the foot of the ladder is approximately 5.77 ft from the fence. We find that $L^2(5.77) \approx 224.77$ and the minimum ladder length is $\sqrt{224.77} \approx 15$ ft.

Related Exercises 30–31 ◀

EXAMPLE 5 Water tower A water storage tank in a small community is built in the shape of a right circular cylinder with a capacity of 32,000 ft³ (about 240,000 gallons). The interior wall and floor of the tank must be cleaned and treated annually. Labor costs for cleaning the wall are twice as high per square foot as the cost to clean the floor. Find the radius and height of the tank that minimize the cleaning cost.

SOLUTION Figure 4.62 shows a water tank with radius r and height h . The objective function describes the cost to clean the tank, which depends on the interior surface area of the tank. The area of the tank's circular floor is πr^2 . Because the circumference of the tank is $2\pi r$, the lateral surface area of the wall is $2\pi rh$. Therefore, the cost to clean the tank is proportional to

$$C = 2 \cdot \underbrace{2\pi rh}_{\text{area of wall}} + \underbrace{\pi r^2}_{\text{area of floor}}. \quad \text{It costs twice as much per square foot to clean the wall, so the area of the wall is multiplied by 2.}$$

To find a constraint equation, we start with the volume of a cylinder $V = \pi r^2 h$ and replace V with 32,000 to obtain $\pi r^2 h = 32,000$, or $h = 32,000/(\pi r^2)$. Substituting this expression for h into the cost equation, we obtain a function of the radius:

$$C(r) = 4\pi r \frac{32,000}{\pi r^2} + \pi r^2 = \frac{128,000}{r} + \pi r^2.$$

To minimize C , we find its critical points on the interval $0 < r < \infty$:

$$C'(r) = -\frac{128,000}{r^2} + 2\pi r = 0 \quad \text{Set the derivative equal to 0.}$$

$$2\pi r = \frac{128,000}{r^2} \quad \text{Rearrange equation.}$$

$$r^3 = \frac{64,000}{\pi} \quad \text{Multiply by } r^2 (r > 0) \text{ and divide by } 2\pi.$$

$$r = \frac{40}{\sqrt[3]{\pi}} \approx 27.3 \text{ ft.} \quad \text{Solve for } r.$$

This solitary critical point corresponds to a local minimum (confirm that $C''(r) > 0$ and use the Second Derivative Test), so by Theorem 4.9, it also corresponds to the absolute minimum. Because $h = 32,000/(\pi r^2)$, the dimensions of the tank that minimize the cleaning cost are

$$r \approx 27.3 \text{ ft} \quad \text{and} \quad h = 32,000/(\pi r^2) \approx 13.7 \text{ ft.}$$

A bit of algebra shows that r is exactly twice as large as h , so the optimal tank is 4 times as wide as it is high.

Related Exercises 21, 35, 42 ◀

Figure 4.62

- We don't need to know the actual cost to clean the tank. Whatever it costs (per square foot) to clean the floor, it costs twice as much to clean the wall, which implies that the objective function in Example 5 is a constant multiple of the actual cleaning cost. Because $\frac{d}{dx}(kf(x)) = k \frac{d}{dx}(f(x))$, both $f(x)$ and $kf(x)$ share the same critical points, so either function yields the solution.

SECTION 4.5 EXERCISES

Getting Started

- Fill in the blanks: The goal of an optimization problem is to find the maximum or minimum value of the _____ function subject to the _____.
- If the objective function involves more than one independent variable, how are the extra variables eliminated?
- Suppose the objective function is $Q = x^2y$ and you know that $x + y = 10$. Write the objective function first in terms of x and then in terms of y .
- Suppose you wish to minimize a continuous objective function on a closed interval, but you find that it has only a single local maximum. Where should you look for the solution to the problem?
- Suppose the objective function $P = xy$ is subject to the constraint $10x + y = 100$, where x and y are real numbers.
 - Eliminate the variable y from the objective function so that P is expressed as a function of one variable x .
 - Find the absolute maximum value of P subject to the given constraint.
- Suppose $S = x + 2y$ is an objective function subject to the constraint $xy = 50$, for $x > 0$ and $y > 0$.
 - Eliminate the variable y from the objective function so that S is expressed as a function of one variable x .
 - Find the absolute minimum value of S subject to the given constraint.
- What two nonnegative real numbers with a sum of 23 have the largest possible product?
- What two nonnegative real numbers a and b whose sum is 23 maximize $a^2 + b^2$? Minimize $a^2 + b^2$?
- What two positive real numbers whose product is 50 have the smallest possible sum?
- Find numbers x and y satisfying the equation $3x + y = 12$ such that the product of x and y is as large as possible.

Practice Exercises

- Maximum-area rectangles** Of all rectangles with a perimeter of 10, which one has the maximum area? (Give the dimensions.)
- Maximum-area rectangles** Of all rectangles with a fixed perimeter of P , which one has the maximum area? (Give the dimensions in terms of P .)
- Minimum-perimeter rectangles** Of all rectangles of area 100, which one has the minimum perimeter?
- Minimum-perimeter rectangles** Of all rectangles with a fixed area A , which one has the minimum perimeter? (Give the dimensions in terms of A .)
- Minimum sum** Find positive numbers x and y satisfying the equation $xy = 12$ such that the sum $2x + y$ is as small as possible.
- Pen problems**
 - A rectangular pen is built with one side against a barn. Two hundred meters of fencing are used for the other three sides of the pen. What dimensions maximize the area of the pen?

- A rancher plans to make four identical and adjacent rectangular pens against a barn, each with an area of 100 m^2 (see figure). What are the dimensions of each pen that minimize the amount of fence that must be used?

- Rectangles beneath a semicircle** A rectangle is constructed with its base on the diameter of a semicircle with radius 5 and its two other vertices on the semicircle. What are the dimensions of the rectangle with maximum area?
- Rectangles beneath a parabola** A rectangle is constructed with its base on the x -axis and two of its vertices on the parabola $y = 48 - x^2$. What are the dimensions of the rectangle with the maximum area? What is the area?
- Minimum-surface-area box** Of all boxes with a square base and a volume of 8 m^3 , which one has the minimum surface area? (Give its dimensions.)
- Maximum-volume box** Suppose an airline policy states that all baggage must be box-shaped with a sum of length, width, and height not exceeding 108 in. What are the dimensions and volume of a square-based box with the greatest volume under these conditions?
- Shipping crates** A square-based, box-shaped shipping crate is designed to have a volume of 16 ft^3 . The material used to make the base costs twice as much (per square foot) as the material in the sides, and the material used to make the top costs half as much (per square foot) as the material in the sides. What are the dimensions of the crate that minimize the cost of materials?
- Closest point on a line** What point on the line $y = 3x + 4$ is closest to the origin?
- Closest point on a curve** What point on the parabola $y = 1 - x^2$ is closest to the point $(1, 1)$?
- Minimum distance** Find the point P on the curve $y = x^2$ that is closest to the point $(18, 0)$. What is the least distance between P and $(18, 0)$? (*Hint:* Use synthetic division.)
- Minimum distance** Find the point P on the line $y = 3x$ that is closest to the point $(50, 0)$. What is the least distance between P and $(50, 0)$?
- Walking and swimming** A man wishes to get from an initial point on the shore of a circular pond with radius 1 mi to a point on the shore directly opposite (on the other end of the diameter). He plans to swim from the initial point to another point on the shore and then walk along the shore to the terminal point.
 - If he swims at 2 mi/hr and walks at 4 mi/hr, what are the maximum and minimum times for the trip?
 - If he swims at 2 mi/hr and walks at 1.5 mi/hr, what are the maximum and minimum times for the trip?
 - If he swims at 2 mi/hr, what is the minimum walking speed for which it is quickest to walk the entire distance?

- 27. Walking and rowing** A boat on the ocean is 4 mi from the nearest point on a straight shoreline; that point is 6 mi from a restaurant on the shore (see figure). A woman plans to row the boat straight to a point on the shore and then walk along the shore to the restaurant.

- If she walks at 3 mi/hr and rows at 2 mi/hr, at which point on the shore should she land to minimize the total travel time?
- If she walks at 3 mi/hr, what is the minimum speed at which she must row so that the quickest way to the restaurant is to row directly (with no walking)?

- 28. Laying cable** An island is 3.5 mi from the nearest point on a straight shoreline; that point is 8 mi from a power station (see figure). A utility company plans to lay electrical cable underwater from the island to the shore and then underground along the shore to the power station. Assume it costs \$2400/mi to lay underwater cable and \$1200/mi to lay underground cable. At what point should the underwater cable meet the shore in order to minimize the cost of the project?

- 29. Laying cable again** Solve the problem in Exercise 28, but this time minimize the cost with respect to the smaller angle θ between the underwater cable and the shore. (You should get the same answer.)
- 30. Shortest ladder** A 10-ft-tall fence runs parallel to the wall of a house at a distance of 4 ft. Find the length of the shortest ladder that extends from the ground to the house without touching the fence. Assume the vertical wall of the house and the horizontal ground have infinite extent.
- 31. Shortest ladder—more realistic** An 8-ft-tall fence runs parallel to the wall of a house at a distance of 5 ft. Find the length of the shortest ladder that extends from the ground to the house without touching the fence. Assume the vertical wall of the house is 20 ft high and the horizontal ground extends 20 ft from the fence.
- 32. Circle and square** A piece of wire of length 60 is cut, and the resulting two pieces are formed to make a circle and a square. Where should the wire be cut to (a) maximize and (b) minimize the combined area of the circle and the square?
- 33. Maximum-volume cone** A cone is constructed by cutting a sector from a circular sheet of metal with radius 20. The cut sheet is then folded up and welded (see figure). Find the radius and height of the cone with maximum volume that can be formed in this way.

- 34. Slant height and cones** Among all right circular cones with a slant height of 3, what are the dimensions (radius and height) that maximize the volume of the cone? The slant height of a cone is the distance from the outer edge of the base to the vertex.
- 35. Optimal soda can**
- Classical problem** Find the radius and height of a cylindrical soda can with a volume of 354 cm^3 that minimize the surface area.
 - Real problem** Compare your answer in part (a) to a real soda can, which has a volume of 354 cm^3 , a radius of 3.1 cm, and a height of 12.0 cm, to conclude that real soda cans do not seem to have an optimal design. Then use the fact that real soda cans have a double thickness in their top and bottom surfaces to find the radius and height that minimize the surface area of a real can (the surface areas of the top and bottom are now twice their values in part (a)). Are these dimensions closer to the dimensions of a real soda can?
- 36. Covering a marble** Imagine a flat-bottomed cylindrical pot with a circular cross section of radius 4. A marble with radius $0 < r < 4$ is placed in the bottom of the pot. What is the radius of the marble that requires the most water to cover it completely?
- 37. Optimal garden** A rectangular flower garden with an area of 30 m^2 is surrounded by a grass border 1 m wide on two sides and 2 m wide on the other two sides (see figure). What dimensions of the garden minimize the combined area of the garden and borders?

- 38. Rectangles beneath a line**
- A rectangle is constructed with one side on the positive x -axis, one side on the positive y -axis, and the vertex opposite the origin on the line $y = 10 - 2x$. What dimensions maximize the area of the rectangle? What is the maximum area?
 - Is it possible to construct a rectangle with a greater area than that found in part (a) by placing one side of the rectangle on the line $y = 10 - 2x$ and the two vertices not on that line on the positive x - and y -axes? Find the dimensions of the rectangle of maximum area that can be constructed in this way.
- 39. Designing a box** Two squares of length x are cut out of adjacent corners of an $18'' \times 18''$ piece of cardboard and two rectangles of length 9'' and width x are cut out of the other two corners of the cardboard (see figure). The resulting piece of cardboard is then folded along the dashed lines to form an enclosed box.

Find the dimensions and volume of the largest box that can be formed in this way.

40. Folded boxes

- Squares with sides of length x are cut out of each corner of a rectangular piece of cardboard measuring 5 ft by 8 ft. The resulting piece of cardboard is then folded into a box without a lid. Find the volume of the largest box that can be formed in this way.
- Squares with sides of length x are cut out of each corner of a square piece of cardboard with sides of length ℓ . Find the volume of the largest open box that can be formed in this way.

41. **Norman window** A window consists of rectangular pane of glass surmounted by a semicircular pane of glass (see figure). If the perimeter of the window is 20 feet, determine the dimensions of the window that maximize the area of the window.

42. **Light transmission** A window consists of a rectangular pane of clear glass surmounted by a semicircular pane of tinted glass. The clear glass transmits twice as much light per unit of surface area as the tinted glass. Of all such windows with a fixed perimeter P , what are the dimensions of the window that transmits the most light?
43. **Kepler's wine barrel** Several mathematical stories originated with the second wedding of the mathematician and astronomer Johannes Kepler. Here is one: While shopping for wine for his wedding, Kepler noticed that the price of a barrel of wine (here assumed to be a cylinder) was determined solely by the length d of a dipstick that was inserted diagonally through a centered hole in the top of the barrel to the edge of the base of the barrel (see figure). Kepler realized that this measurement does not determine the volume of the barrel and that for a fixed value of d , the volume varies with the radius r and height h of the barrel. For a fixed value of d , what is the ratio r/h that maximizes the volume of the barrel?

44. **Maximizing profit** Suppose you own a tour bus and you book groups of 20 to 70 people for a day tour. The cost per person is \$30 minus \$0.25 for every ticket sold. If gas and other miscellaneous costs are \$200, how many tickets should you sell to maximize your profit? Treat the number of tickets as a nonnegative real number.
45. **Maximum-volume cylinder in a sphere** Find the dimensions of the right circular cylinder of maximum volume that can be placed inside of a sphere of radius R .
46. **Cone in a sphere** Find the height h , radius r , and volume of a right circular cone with maximum volume that is inscribed in a sphere of radius R .
47. **Cone in a cone** A right circular cone is inscribed inside a larger right circular cone with a volume of 150 cm^3 . The axes of the cones coincide, and the vertex of the inner cone touches the center of the base of the outer cone. Find the ratio of the heights of the cones that maximizes the volume of the inner cone.
48. **Do dogs know calculus?** A mathematician stands on a beach with his dog at point A . He throws a tennis ball so that it hits the water at point B . The dog, wanting to get to the tennis ball as quickly as possible, runs along the straight beach line to point D and then swims from point D to point B to retrieve his ball. Assume C is the point on the edge of the beach closest to the tennis ball (see figure).
- Assume the dog runs at speed r and swims at speed s , where $r > s$ and both are measured in meters per second. Also assume the lengths of BC , CD , and AC are x , y , and z , respectively. Find a function $T(y)$ representing the total time it takes for the dog to get to the ball.

- Verify that the value of y that minimizes the time it takes to retrieve the ball is $y = \frac{x}{\sqrt{r/s} + 1\sqrt{r/s} - 1}$.
- If the dog runs at 8 m/s and swims at 1 m/s, what ratio y/x produces the fastest retrieving time?
- A dog named Elvis who runs at 6.4 m/s and swims at 0.910 m/s was found to use an average ratio of y/x of 0.144 to retrieve his ball. Does Elvis appear to know calculus?

(Source: T. Pennings, *Do Dogs Know Calculus?* *The College Mathematics Journal*, 34, 3, May 2003)

49. **Travel costs** A simple model for travel costs involves the cost of gasoline and the cost of a driver. Specifically, assume gasoline costs $\$p/\text{gallon}$ and the vehicle gets g miles per gallon. Also assume the driver earns $\$w/\text{hour}$.
- A plausible function to describe how gas mileage (in mi/gal) varies with speed is $g(v) = v(85 - v)/60$. Evaluate $g(0)$, $g(40)$, and $g(60)$ and explain why these values are reasonable.
 - At what speed does the gas mileage function have its maximum?

- c. Explain why $C(v) = Lp/g(v) + Lw/v$ gives the cost of the trip in dollars, where L is the length of the trip and v is the constant speed. Show that the dimensions are consistent.
- d. Let $L = 400$ mi, $p = \$4/\text{gal}$, and $w = \$20/\text{hr}$. At what (constant) speed should the vehicle be driven to minimize the cost of the trip?
- e. Should the optimal speed be increased or decreased (compared with part (d)) if L is increased from 400 mi to 500 mi? Explain.
- f. Should the optimal speed be increased or decreased (compared with part (d)) if p is increased from $\$4/\text{gal}$ to $\$4.20/\text{gal}$? Explain.
- g. Should the optimal speed be increased or decreased (compared with part (d)) if w is decreased from $\$20/\text{hr}$ to $\$15/\text{hr}$? Explain.

- 50. Suspension system** A load must be suspended 6 m below a high ceiling using cables attached to two supports that are 2 m apart (see figure). How far below the ceiling (x in the figure) should the cables be joined to minimize the total length of cable used?

- 51. Viewing angles** An auditorium with a flat floor has a large screen on one wall. The lower edge of the screen is 3 ft above eye level and the upper edge of the screen is 10 ft above eye level (see figure). How far from the screen should you stand to maximize your viewing angle? (Hint: Use the identity

$$\tan(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}.)$$

- 52. Basketball shot** A basketball is shot with an initial velocity of v ft/s at an angle of 45° to the floor. The center of the basketball is 8 ft above the floor at a horizontal distance of 18 feet from the center of the basketball hoop when it is released. The height h (in feet) of the center of the basketball after it has traveled a horizontal distance of x feet is modeled by the function
- $$h(x) = -\frac{32x^2}{v^2} + x + 8 \text{ (see figure).}$$

- a. Find the initial velocity v if the center of the basketball passes the center of the hoop that is located 10 ft above the floor. Assume the ball does not hit the front of the hoop (otherwise it might not pass through the center of the hoop). The validity of this assumption is explored in the remainder of this exercise.
- b. During the flight of the basketball, show that the distance s from the center of the basketball to the front of the hoop is

$$s = \sqrt{(x - 17.25)^2 + \left(-\frac{4x^2}{81} + x - 2\right)^2}.$$

(Hint: The diameter of the basketball hoop is 18 inches.)

- c. Determine whether the assumption that the basketball does not hit the front of the hoop in part (a) is valid. Use the fact that the diameter of a women's basketball is about 9.23 inches. (Hint: The ball will hit the front of the hoop if, during its flight, the distance from the center of the ball to the front of the hoop is less than the radius of the basketball.)
- d. A men's basketball has a diameter of about 9.5 inches. Would this larger ball lead to a different conclusion than in part (c)?

- 53. Light sources** The intensity of a light source at a distance is directly proportional to the strength of the source and inversely proportional to the square of the distance from the source. Two light sources, one twice as strong as the other, are 12 m apart. At what point on the line segment joining the sources is the intensity the weakest?

- 54. Snell's Law** Suppose a light source at A is in a medium in which light travels at a speed v_1 and that point B is in a medium in which light travels at a speed v_2 (see figure). Using Fermat's Principle, which states that light travels along the path that requires the minimum travel time (Exercise 55), show that the path taken between points A and B satisfies $(\sin \theta_1)/v_1 = (\sin \theta_2)/v_2$.

- 55. Fermat's Principle**

- a. Two poles of heights m and n are separated by a horizontal distance d . A rope is stretched from the top of one pole to the ground and then to the top of the other pole. Show that the

configuration that requires the least amount of rope occurs when $\theta_1 = \theta_2$ (see figure).

(a)

- b. Fermat's Principle states that when light travels between two points in the same medium (at a constant speed), it travels on the path that minimizes the travel time. Show that when light from a source A reflects off a surface and is received at point B , the angle of incidence equals the angle of reflection, or $\theta_1 = \theta_2$ (see figure).

(b)

56. **Crankshaft** A crank of radius r rotates with an angular frequency ω . It is connected to a piston by a connecting rod of length L (see figure). The acceleration of the piston varies with the position of the crank according to the function

$$a(\theta) = \omega^2 r \left(\cos \theta + \frac{r \cos 2\theta}{L} \right).$$

For $\omega = 1$, $L = 2$, and $r = 1$, find the values of θ , with $0 \leq \theta \leq 2\pi$, for which the acceleration of the piston is a maximum and minimum.

57. **Making silos** A grain silo consists of a cylindrical concrete tower surmounted by a metal hemispherical dome. The metal in the dome costs 1.5 times as much as the concrete (per unit of surface area). If the volume of the silo is 750 m^3 , what are the dimensions of the silo (radius and height of the cylindrical tower) that minimize the cost of the materials? Assume the silo has no floor and no flat ceiling under the dome.
58. **Searchlight problem—narrow beam** A searchlight is 100 m from the nearest point on a straight highway (see figure). As it rotates, the searchlight casts a horizontal beam that intersects the highway in a point. If the light revolves at a rate of $\pi/6 \text{ rad/s}$, find the rate at which the beam sweeps along the highway as a function of θ . For what value of θ is this rate maximized?

59. **Minimizing related functions** Complete each of the following parts.

- What value of x minimizes $f(x) = (x - a_1)^2 + (x - a_2)^2$, for constants a_1 and a_2 ?
- What value of x minimizes $f(x) = (x - a_1)^2 + (x - a_2)^2 + (x - a_3)^2$, for constants a_1 , a_2 , and a_3 ?
- Based on the answers to parts (a) and (b), make a conjecture about the values of x that minimize $f(x) = (x - a_1)^2 + (x - a_2)^2 + \cdots + (x - a_n)^2$, for a positive integer n and constants $a_1, a_2, \dots, a_n$. Use calculus to verify your conjecture.

(Source: T. Apostol, *Calculus*, Vol. 1, John Wiley and Sons, 1967)

Explorations and Challenges

60. **Gliding mammals** Many species of small mammals (such as flying squirrels and marsupial gliders) have the ability to walk and glide. Recent research suggests that these animals choose the most energy-efficient means of travel. According to one empirical model, the energy required for a glider with body mass m to walk a horizontal distance D is $8.46Dm^{2/3}$ (where m is measured in grams, D is measured in meters, and energy is measured in microliters of oxygen consumed in respiration). The energy cost of climbing to a height $D \tan \theta$ and gliding a horizontal distance D at an angle of θ is modeled by $1.36mD \tan \theta$ (where $\theta = 0$ represents horizontal flight and $\theta > 45^\circ$ represents controlled falling). Therefore, the function

$$S(m, \theta) = 8.46m^{2/3} - 1.36m \tan \theta$$

gives the energy difference per horizontal meter traveled between walking and gliding: If $S > 0$ for given values of m and θ , then it is more costly to walk than to glide.

- For what glide angles is it more efficient for a 200-gram animal to glide rather than walk?
- Find an equation that relates θ to m in the case that walking and gliding are equally efficient. Does the angle θ increase or decrease as the mass m increases?
- To make gliding more efficient than walking, do larger gliders have a larger or smaller selection of glide angles than smaller gliders?
- Let $\theta = 25^\circ$ (a typical glide angle). Graph S as a function of m , for $0 \leq m \leq 3000$. For what values of m is gliding more efficient?
- For $\theta = 25^\circ$, what value of m (call it m^*) maximizes S ?
- Does m^* , as defined in part (e), increase or decrease with increasing θ ? That is, as a glider reduces its glide angle, does its optimal size become larger or smaller?
- Assuming Dumbo is a gliding elephant whose weight is 1 metric ton (10^6 g), what glide angle would Dumbo use to be more efficient at gliding than walking?

(Source: R. Dial, *Energetic savings and the body size distribution of gliding mammals*, *Evolutionary Ecology Research*, 5, 2003)

- 61. Metal rain gutters** A rain gutter is made from sheets of metal 9 in wide. The gutters have a 3-in base and two 3-in sides, folded up at an angle θ (see figure). What angle θ maximizes the cross-sectional area of the gutter?

- 62. Crease-length problem** A rectangular sheet of paper of width a and length b , where $0 < a < b$, is folded by taking one corner of the sheet and placing it at a point P on the opposite long side of the sheet (see figure). The fold is then flattened to form a crease across the sheet. Assuming that the fold is made so that there is no flap extending beyond the original sheet, find the point P that produces the crease of minimum length. What is the length of that crease?

- 63. Watching a Ferris wheel** An observer stands 20 m from the bottom of a Ferris wheel on a line that is perpendicular to the face of the wheel, with her eyes at the level of the bottom of the wheel. The wheel revolves at a rate of π rad/min, and the observer's line of sight to a specific seat on the Ferris wheel makes an angle θ with the horizontal (see figure). At what time during a full revolution is θ changing most rapidly?

- 64. Blood flow** The resistance to blood flow in the circulatory system is one measure of how hard the heart works to pump blood through blood vessels. Lower resistance may correspond to a healthier, higher-efficiency circulatory system. Consider a smaller straight blood vessel of radius r_2 that branches off a larger straight blood vessel of radius r_1 at an angle θ (see figure with given lengths ℓ_1 , ℓ_2 , ℓ_3 , and ℓ_4). Using Poiseuille's Law, it can be shown that the total resistance T to blood flowing along the path from points A to B to D is $T = k\left(\frac{\ell_1}{r_1^4} + \frac{\ell_2}{r_2^4}\right)$, where $k > 0$ is a constant.

- a. Show that $T = k\left(\frac{\ell_4 - \ell_3 \cot \theta}{r_1^4} + \frac{\ell_3 \csc \theta}{r_2^4}\right)$, assuming that the line segment from A to C is perpendicular to the line segment from C to D and $0 < \theta < \frac{\pi}{2}$.
- b. Show that the total resistance T is minimized when $\cos \theta = \left(\frac{r_2}{r_1}\right)^4$.
- c. If the radius of the smaller vessel is 85% of the radius of the larger vessel, then find the value of θ that minimizes T . State your answer in degrees. (Source: *Blood Vessel Branching: Beyond the Standard Calculus Problem*, *Mathematics Magazine*, 84, 2011)

65. Sum of isosceles distances

- a. An isosceles triangle has a base of length 4 and two sides of length $2\sqrt{2}$. Let P be a point on the perpendicular bisector of the base. Find the location P that minimizes the sum of the distances between P and the three vertices.
- b. Assume in part (a) that the height of the isosceles triangle is $h > 0$ and its base has length 4. Show that the location of P that gives a minimum solution is independent of h for $h \geq \frac{2}{\sqrt{3}}$.

- 66. Cylinder and cones (Putnam Exam 1938)** Right circular cones of height h and radius r are attached to each end of a right circular cylinder of height h and radius r , forming a double-pointed object. For a given surface area A , what are the dimensions r and h that maximize the volume of the object?

- 67. Slowest shortcut** Suppose you are standing in a field near a straight section of railroad tracks just as the locomotive of a train passes the point nearest to you, which is $1/4$ mi away. The train, with length $1/3$ mi, is traveling at 20 mi/hr. If you start running in a straight line across the field, how slowly can you run and still catch the train? In which direction should you run?

- 68. Rectangles in triangles** Find the dimensions and area of the rectangle of maximum area that can be inscribed in the following figures.

- a. A right triangle with a given hypotenuse length L
- b. An equilateral triangle with a given side length L
- c. A right triangle with a given area A
- d. An arbitrary triangle with a given area A (The result applies to any triangle, but first consider triangles for which all the angles are less than or equal to 90° .)

- 69. Cylinder in a cone** A right circular cylinder is placed inside a cone of radius R and height H so that the base of the cylinder lies on the base of the cone.

- a. Find the dimensions of the cylinder with maximum volume. Specifically, show that the volume of the maximum-volume cylinder is $4/9$ the volume of the cone.
- b. Find the dimensions of the cylinder with maximum lateral surface area (area of the curved surface).

- 70. Another pen problem** A rancher is building a horse pen on the corner of her property using 1000 ft of fencing. Because of the unusual shape of her property, the pen must be built in the shape of a trapezoid (see figure).
- Determine the lengths of the sides that maximize the area of the pen.
 - Suppose there is already a fence along the side of the property opposite the side of length y . Find the lengths of the sides that maximize the area of the pen, using 1000 ft of fencing.

- 71. Minimum-length roads** A house is located at each corner of a square with side lengths of 1 mi. What is the length of the shortest road system with straight roads that connects all of the houses by roads (that is, a road system that allows one to drive from any house to any other house)? (*Hint*: Place two points inside the square at which roads meet.) (*Source*: Paul Halmos, *Problems for Mathematicians Young and Old*, MAA, 1991)
- 72. The arbelos** An arbelos is the region enclosed by three mutually tangent semicircles; it is the region inside the larger semicircle and outside the two smaller semicircles (see figure).
- Given an arbelos in which the diameter of the largest circle is 1, what positions of point B maximize the area of the arbelos?
 - Show that the area of the arbelos is the area of a circle whose diameter is the distance BD in the figure.

- 73. Proximity questions** Find the point on the graph of $y = \sqrt{x}$ that is nearest the point $(p, 0)$ if (i) $p > \frac{1}{2}$; and (ii) $0 < p < \frac{1}{2}$. Express the answer in terms of p .
- 74. Turning a corner with a pole**
- What is the length of the longest pole that can be carried horizontally around a corner at which a 3-ft corridor and a 4-ft corridor meet at right angles?
 - What is the length of the longest pole that can be carried horizontally around a corner at which a corridor that is a ft wide and a corridor that is b ft wide meet at right angles?

- What is the length of the longest pole that can be carried horizontally around a corner at which a corridor that is $a = 5$ ft wide and a corridor that is $b = 5$ ft wide meet at an angle of 120° ?
- What is the length of the longest pole that can be carried around a corner at which a corridor that is a ft wide and a corridor that is b feet wide meet at right angles, assuming there is an 8-foot ceiling and that you may tilt the pole at any angle?

- 75. Tree notch (Putnam Exam 1938, rephrased)** A notch is cut in a cylindrical vertical tree trunk (see figure). The notch penetrates to the axis of the cylinder and is bounded by two half-planes that intersect on a diameter D of the tree. The angle between the two half-planes is θ . Prove that for a given tree and fixed angle θ , the volume of the notch is minimized by taking the bounding planes at equal angles to the horizontal plane that also passes through D .

- 76. Circle in a triangle** What are the radius and area of the circle of maximum area that can be inscribed in an isosceles triangle whose two equal sides have length 1?
- 77. A challenging pen problem** A farmer uses 200 meters of fencing to build two triangular pens against a barn (see figure); the pens are constructed with three sides and a diagonal dividing fence. What dimensions maximize the area of the pen?

- 78. Folded boxes** Squares with sides of length x are cut out of each corner of a rectangular piece of cardboard with sides of length ℓ and L . The resulting piece of cardboard is then folded into a box without a lid. Holding ℓ fixed, find the size of the corner squares x that maximizes the volume of the box as $L \rightarrow \infty$. (*Source*: *Mathematics Teacher*, Nov 2002)

QUICK CHECK ANSWERS

- $V = 108w^2 - 2w^3$ ◀

4.6 Linear Approximation and Differentials

Imagine plotting a smooth curve with a graphing utility. Now pick a point P on the curve, draw the line tangent to the curve at P , and zoom in on it several times. As you successively enlarge the curve near P , it looks more and more like the tangent line (Figure 4.63a). This fundamental observation—that smooth curves appear straighter on smaller scales—is called *local linearity*; it is the basis of many important mathematical ideas, one of which is *linear approximation*.

Now consider a curve with a corner or cusp at a point Q (Figure 4.63b). No amount of magnification “straightens out” the curve or removes the corner at Q . The different behavior at P and Q is related to the idea of differentiability: The function in Figure 4.63a is differentiable at P , whereas the function in Figure 4.63b is not differentiable at Q . One of the requirements for the techniques presented in this section is that the function be differentiable at the point in question.

Figure 4.63

Figure 4.64

Linear Approximation

Figure 4.63a suggests that when we zoom in on the graph of a smooth function at a point P , the curve approaches its tangent line at P . This fact is the key to understanding linear approximation. The idea is to use the line tangent to the curve at P to approximate the value of the function at points near P . Here's how it works.

Assume f is differentiable on an interval containing the point a . The slope of the line tangent to the curve at the point $(a, f(a))$ is $f'(a)$. Therefore, an equation of the tangent line is

$$y - f(a) = f'(a)(x - a) \quad \text{or} \quad y = \underbrace{f(a) + f'(a)(x - a)}_{L(x)}.$$

This tangent line represents a new function L that we call the *linear approximation* to f at the point a (Figure 4.64). If f and f' are easy to evaluate at a , then the value of f at points near a is easily approximated using the linear approximation L . That is,

$$f(x) \approx L(x) = f(a) + f'(a)(x - a).$$

This approximation improves as x approaches a .

DEFINITION Linear Approximation to f at a

Suppose f is differentiable on an interval I containing the point a . The **linear approximation** to f at a is the linear function

$$L(x) = f(a) + f'(a)(x - a), \quad \text{for } x \text{ in } I.$$

QUICK CHECK 1 Sketch the graph of a function f that is concave up on an interval containing the point a . Sketch the linear approximation to f at a . Is the graph of the linear approximation above or below the graph of f ? ◀

► In Example 1, notice that when x is positive, you are driving slower than 60 mi/hr; when x is negative, you are driving faster than 60 mi/hr.

EXAMPLE 1 Useful driving math Suppose you are driving along a highway at a constant speed and you record the number of seconds it takes to travel between two consecutive mile markers. If it takes 60 seconds to travel one mile, then your average speed is 1 mi/60 s or 60 mi/hr. Now suppose you travel one mile in $60 + x$ seconds; for example, if it takes 62 seconds, then $x = 2$, and if it takes 57 seconds, then $x = -3$. In this case, your average speed over one mile is 1 mi/(60 + x) s. Because there are 3600 s in 1 hr, the function

$$s(x) = \frac{3600}{60 + x} = 3600(60 + x)^{-1}$$

gives your average speed in mi/hr if you travel one mile in x seconds more or less than 60 seconds. For example, if you travel one mile in 62 seconds, then $x = 2$ and your average speed is $s(2) \approx 58.06$ mi/hr. If you travel one mile in 57 seconds, then $x = -3$ and your average speed is $s(-3) \approx 63.16$ mi/hr. Because you don't want to use a calculator while driving, you need an easy approximation to this function. Use linear approximation to derive such a formula.

SOLUTION The idea is to find the linear approximation to s at the point 0. We first use the Chain Rule to compute

$$s'(x) = -3600(60 + x)^{-2},$$

and then note that $s(0) = 60$ and $s'(0) = -3600 \cdot 60^{-2} = -1$. Using the linear approximation formula, we find that

$$s(x) \approx L(x) = s(0) + s'(0)(x - 0) = 60 - x.$$

For example, if you travel one mile in 62 seconds, then $x = 2$ and your average speed is approximately $L(2) = 58$ mi/hr, which is very close to the exact value given previously. If you travel one mile in 57 seconds, then $x = -3$ and your average speed is approximately $L(-3) = 63$ mi/hr, which again is close to the exact value.

Related Exercises 13–14 ◀

QUICK CHECK 2 In Example 1, suppose you travel one mile in 75 seconds. What is the average speed given by the linear approximation formula? What is the exact average speed? Explain the discrepancy between the two values. ◀

Figure 4.65

EXAMPLE 2 Linear approximations and errors

- Find the linear approximation to $f(x) = \sqrt{x}$ at $x = 1$ and use it to approximate $\sqrt{1.1}$.
- Use linear approximation to estimate the value of $\sqrt{0.1}$.

SOLUTION

- We construct the linear approximation

$$L(x) = f(a) + f'(a)(x - a),$$

where $f(x) = \sqrt{x}$, $f'(x) = 1/(2\sqrt{x})$, and $a = 1$. Noting that $f(a) = f(1) = 1$ and $f'(a) = f'(1) = \frac{1}{2}$, we have

$$L(x) = 1 + \frac{1}{2}(x - 1) = \frac{1}{2}(x + 1),$$

which describes the line tangent to the curve at the point $(1, 1)$ (Figure 4.65). Because $x = 1.1$ is near $x = 1$, we approximate $\sqrt{1.1}$ by $L(1.1)$:

$$\sqrt{1.1} \approx L(1.1) = \frac{1}{2}(1.1 + 1) = 1.05.$$

The exact value is $f(1.1) = \sqrt{1.1} = 1.0488 \dots$; therefore, the linear approximation has an error of about 0.0012. Furthermore, our approximation is an *overestimate* because the tangent line lies above the graph of f . In Table 4.4, we see several approximations to $\sqrt{x}$ for x near 1 and the associated errors $|L(x) - \sqrt{x}|$. Clearly, the errors decrease as x approaches 1.

Table 4.4

x	$L(x)$	Exact $\sqrt{x}$	Error
1.2	1.1	1.0954 ...	4.6×10^{-3}
1.1	1.05	1.0488 ...	1.2×10^{-3}
1.01	1.005	1.0049 ...	1.2×10^{-5}
1.001	1.0005	1.0005 ...	1.2×10^{-7}

- b. If the linear approximation $L(x) = \frac{1}{2}(x + 1)$ obtained in part (a) is used to approximate $\sqrt{0.1}$, we have

$$\sqrt{0.1} \approx L(0.1) = \frac{1}{2}(0.1 + 1) = 0.55.$$

A calculator gives $\sqrt{0.1} = 0.3162 \dots$, which shows that the approximation is well off the mark. The error arises because the tangent line through $(1, 1)$ is not close to the curve at $x = 0.1$ (Figure 4.65). For this reason, we seek a different value of a , with the requirement that it is near $x = 0.1$, and both $f(a)$ and $f'(a)$ are easily computed. It is tempting to try $a = 0$, but $f'(0)$ is undefined. One choice that works well is $a = \frac{9}{100} = 0.09$. Using the linear approximation $L(x) = f(a) + f'(a)(x - a)$, we have

$$\begin{aligned}\sqrt{0.1} \approx L(0.1) &= \overbrace{\sqrt{\frac{9}{100}}}^{f(a)} + \overbrace{\frac{1}{2\sqrt{9/100}}}^{f'(a)} \overbrace{\left(\frac{1}{10} - \frac{9}{100}\right)}^{(x-a)} \\ &= \frac{3}{10} + \frac{10}{6} \left(\frac{1}{100}\right) \\ &= \frac{19}{60} \approx 0.3167.\end{aligned}$$

► We choose $a = \frac{9}{100}$ because it is close to 0.1 and its square root is easy to evaluate.

QUICK CHECK 3 Suppose you want to use linear approximation to estimate $\sqrt{0.18}$. What is a good choice for a ? ◀

This approximation agrees with the exact value to three decimal places.

Related Exercises 31–32 ◀

Figure 4.66

EXAMPLE 3 Linear approximation for the sine function Find the linear approximation to $f(x) = \sin x$ at $x = 0$ and use it to approximate $\sin 2.5^\circ$.

SOLUTION We first construct a linear approximation $L(x) = f(a) + f'(a)(x - a)$, where $f(x) = \sin x$ and $a = 0$. Noting that $f(0) = 0$ and $f'(0) = \cos(0) = 1$, we have

$$L(x) = 0 + 1(x - 0) = x.$$

Again, the linear approximation is the line tangent to the curve at the point $(0, 0)$ (Figure 4.66). Before using $L(x)$ to approximate $\sin 2.5^\circ$, we convert to radian measure (the derivative formulas for trigonometric functions require angles in radians):

$$2.5^\circ = 2.5^\circ \left(\frac{\pi}{180^\circ} \right) = \frac{\pi}{72} \approx 0.04363 \text{ rad.}$$

Therefore, $\sin 2.5^\circ \approx L(0.04363) = 0.04363$. A calculator gives $\sin 2.5^\circ \approx 0.04362$, so the approximation is accurate to four decimal places.

Related Exercises 38, 46 ◀

In Examples 2 and 3, we used a calculator to check the accuracy of our approximations. This raises a question: Why bother with linear approximation when a calculator does a better job? There are some good answers to that question.

Linear approximation is actually just the first step in the process of *polynomial approximation*. While linear approximation does a decent job of estimating function values when x is near a , we can generally do better with higher-degree polynomials. These ideas are explored further in Chapter 11.

Linear approximation also allows us to discover simple approximations to complicated functions. In Example 3, we found the *small-angle approximation to the sine function*: $\sin x \approx x$ for x near 0.

Linear Approximation and Concavity

Additional insight into linear approximation is gained by bringing concavity into the picture. Figure 4.67a shows the graph of a function f and its linear approximation (tangent line) at the point $(a, f(a))$. In this particular case, f is concave up on an interval containing a , and the

QUICK CHECK 4 Explain why the linear approximation to $f(x) = \cos x$ at $x = 0$ is $L(x) = 1$. ◀

graph of L lies below the graph of f near a . As a result, the linear approximation evaluated at a point near a is less than the exact value of f at that point. In other words, the linear approximation *underestimates* values of f near a .

The contrasting case is shown in Figure 4.67b, where we see graphs of f and L when f is concave down on an interval containing a . Now the graph of L lies above the graph of f , which means the linear approximation *overestimates* values of f near a .

Figure 4.67

We can make another observation related to the degree of concavity (also called *curvature*). A large value of $|f''(a)|$ (large curvature) means that near $(a, f(a))$, the slope of the curve changes rapidly and the graph of f separates quickly from the tangent line. A small value of $|f''(a)|$ (small curvature) means the slope of the curve changes slowly and the curve is relatively flat near $(a, f(a))$; therefore, the curve remains close to the tangent line. As a result, absolute errors in linear approximation are larger when $|f''(a)|$ is large.

EXAMPLE 4 Linear approximation and concavity

- Find the linear approximation to $f(x) = x^{1/3}$ at $x = 1$ and $x = 27$.
- Use the linear approximations of part (a) to approximate $\sqrt[3]{2}$ and $\sqrt[3]{26}$.
- Are the approximations in part (b) overestimates or underestimates?
- Compute the error in each approximation of part (b). Which error is greater? Explain.

SOLUTION

- a. Note that

$$f(1) = 1, \quad f(27) = 3, \quad f'(x) = \frac{1}{3x^{2/3}}, \quad f'(1) = \frac{1}{3}, \quad \text{and} \quad f'(27) = \frac{1}{27}.$$

Therefore, the linear approximation at $x = 1$ is

$$L_1(x) = 1 + \frac{1}{3}(x - 1) = \frac{1}{3}x + \frac{2}{3},$$

and the linear approximation at $x = 27$ is

$$L_2(x) = 3 + \frac{1}{27}(x - 27) = \frac{1}{27}x + 2.$$

- b. Using the results of part (a), we find that

$$\sqrt[3]{2} \approx L_1(2) = \frac{1}{3} \cdot 2 + \frac{2}{3} = \frac{4}{3} \approx 1.333$$

and

$$\sqrt[3]{26} \approx L_2(26) = \frac{1}{27} \cdot 26 + 2 \approx 2.963.$$

Figure 4.68

- c. Figure 4.68 shows the graphs of f and the linear approximations L_1 and L_2 at $x = 1$ and $x = 27$, respectively (note the different scales on the x -axes). We see that f is concave down at both points, which is confirmed by the fact that

$$f''(x) = -\frac{2}{9}x^{-5/3} < 0, \quad \text{for } x > 0.$$

As a result, the linear approximations lie above the graph of f and both approximations are overestimates.

- d. The errors in the two linear approximations are

$$|L_1(2) - 2^{1/3}| \approx 0.073 \quad \text{and} \quad |L_2(26) - 26^{1/3}| \approx 0.00047.$$

Because $|f''(1)| \approx 0.22$ and $|f''(27)| \approx 0.00091$, the curvature of f is greater at $x = 1$ than at $x = 27$, explaining why the approximation of $\sqrt[3]{2}$ is more accurate than the approximation of $\sqrt[3]{26}$.

Related Exercises 47–50 ◀

A Variation on Linear Approximation Linear approximation says that a function f can be approximated as

$$f(x) \approx f(a) + f'(a)(x - a),$$

where a is fixed and x is a nearby point. We first rewrite this expression as

$$\underbrace{f(x) - f(a)}_{\Delta y} \approx f'(a) \underbrace{(x - a)}_{\Delta x}.$$

It is customary to use the notation Δ (capital Greek delta) to denote a change. The factor $x - a$ is the change in the x -coordinate between a and a nearby point x . Similarly, $f(x) - f(a)$ is the corresponding change in the y -coordinate (Figure 4.69). So we write this approximation as

$$\Delta y \approx f'(a) \Delta x.$$

In other words, a change in y (the function value) can be approximated by the corresponding change in x magnified or diminished by a factor of $f'(a)$. This interpretation states the familiar fact that $f'(a)$ is the rate of change of y with respect to x .

Figure 4.69

Relationship Between Δx and Δy

Suppose f is differentiable on an interval I containing the point a . The change in the value of f between two points a and $a + \Delta x$ is approximately

$$\Delta y \approx f'(a) \Delta x,$$

where $a + \Delta x$ is in I .

EXAMPLE 5 Estimating changes with linear approximations

- a. Approximate the change in $y = f(x) = x^9 - 2x + 1$ when x changes from 1.00 to 1.05.
- b. Approximate the change in the surface area of a spherical hot-air balloon when the radius decreases from 4 m to 3.9 m.

SOLUTION

- a. The change in y is $\Delta y \approx f'(a) \Delta x$, where $a = 1$, $\Delta x = 0.05$, and $f'(x) = 9x^8 - 2$. Substituting these values, we find that

$$\Delta y \approx f'(a) \Delta x = f'(1) \cdot 0.05 = 7 \cdot 0.05 = 0.35.$$

If x increases from 1.00 to 1.05, then y increases by approximately 0.35.

- b. The surface area of a sphere is $S = 4\pi r^2$, so the change in the surface area when the radius changes by Δr is $\Delta S \approx S'(a) \Delta r$. Substituting $S'(r) = 8\pi r$, $a = 4$, and $\Delta r = -0.1$, the approximate change in the surface area is

$$\Delta S \approx S'(a) \Delta r = S'(4) \cdot (-0.1) = 32\pi \cdot (-0.1) \approx -10.05.$$

The change in surface area is approximately -10.05 m^2 ; it is negative, reflecting a decrease.

Related Exercises 55, 57 ◀

► Notice that the units in these calculations are consistent. If r has units of meters (m), S' has units of $\text{m}^2/\text{m} = \text{m}$, so ΔS has units of m^2 , as it should.

QUICK CHECK 5 Given that the volume of a sphere is $V = 4\pi r^3/3$, find an expression for the approximate change in the volume when the radius changes from a to $a + \Delta r$. ◀

SUMMARY Uses of Linear Approximation

- To approximate f near $x = a$, use

$$f(x) \approx L(x) = f(a) + f'(a)(x - a).$$

- To approximate the change Δy in the dependent variable when the independent variable x changes from a to $a + \Delta x$, use

$$\Delta y \approx f'(a) \Delta x.$$

Differentials

We now introduce an important concept that allows us to distinguish two related quantities:

- the change in the function $y = f(x)$ as x changes from a to $a + \Delta x$ (which we call Δy , as before), and
- the change in the linear approximation $y = L(x)$ as x changes from a to $a + \Delta x$ (which we call the *differential* dy).

Consider a function $y = f(x)$ differentiable on an interval containing a . If the x -coordinate changes from a to $a + \Delta x$, then the corresponding change in the function is *exactly*

$$\Delta y = f(a + \Delta x) - f(a).$$

Using the linear approximation $L(x) = f(a) + f'(a)(x - a)$, the change in L as x changes from a to $a + \Delta x$ is

$$\begin{aligned} \Delta L &= L(a + \Delta x) - L(a) \\ &= \underbrace{(f(a) + f'(a)(a + \Delta x - a))}_{L(a + \Delta x)} - \underbrace{(f(a) + f'(a)(a - a))}_{L(a)} \\ &= f'(a) \Delta x. \end{aligned}$$

To distinguish Δy and ΔL , we define two new variables called *differentials*. The differential dx is simply Δx ; the differential dy is the change in the linear approximation, which is $\Delta L = f'(a) \Delta x$. Using this notation,

$$\Delta L = \underbrace{dy}_{\text{same as } \Delta L} = f'(a) \Delta x = f'(a) \underbrace{dx}_{\text{same as } \Delta x}.$$

Therefore, at the point a , we have $dy = f'(a) dx$. More generally, we replace the fixed point a with a variable point x and write

$$dy = f'(x) dx.$$

DEFINITION Differentials

Let f be differentiable on an interval containing x . A small change in x is denoted by the **differential** dx . The corresponding change in f is approximated by the **differential** $dy = f'(x) dx$; that is,

$$\Delta y = f(x + dx) - f(x) \approx dy = f'(x) dx.$$

► As one of the two co-inventors of calculus, Gottfried Leibniz relied on the idea of differentials in his development of calculus. Leibniz's notation for differentials is essentially the same as the notation we use today. An Irish philosopher of the day, Bishop Berkeley, called differentials "the ghost of departed quantities."

Figure 4.70 shows that if $\Delta x = dx$ is small, then the change in f , which is Δy , is well approximated by the change in the linear approximation, which is dy . Furthermore, the approximation $\Delta y \approx dy$ improves as dx approaches 0. The notation for differentials is consistent with the notation for the derivative: If we divide both sides of $dy = f'(x) dx$ by dx , we have (symbolically)

$$\frac{dy}{dx} = \frac{f'(x) dx}{dx} = f'(x).$$

Figure 4.70

EXAMPLE 6 Differentials as change Use the notation of differentials to write the approximate change in $f(x) = 3 \cos^2 x$ given a small change dx .

SOLUTION With $f(x) = 3 \cos^2 x$, we have $f'(x) = -6 \cos x \sin x = -3 \sin 2x$. Therefore,

$$dy = f'(x) dx = -3 \sin 2x dx.$$

The interpretation is that a small change dx in the independent variable x produces an approximate change in the dependent variable of $dy = -3 \sin 2x dx$. For example, if x increases from $x = \pi/4$ to $x = \pi/4 + 0.1$, then $dx = 0.1$ and

$$dy = -3 \sin(\pi/2)(0.1) = -0.3.$$

The approximate change in the function is -0.3 , which means a decrease of approximately 0.3.

SECTION 4.6 EXERCISES

Getting Started

- Sketch the graph of a smooth function f and label a point $P(a, f(a))$ on the curve. Draw the line that represents the linear approximation to f at P .
- Suppose you find the linear approximation to a differentiable function at a local maximum of that function. Describe the graph of the linear approximation.
- How is linear approximation used to approximate the value of a function f near a point at which f and f' are easily evaluated?
- How can linear approximation be used to approximate the change in $y = f(x)$ given a change in x ?
- Suppose f is differentiable on $(-\infty, \infty)$, $f(1) = 2$, and $f'(1) = 3$. Find the linear approximation to f at $x = 1$ and use it to approximate $f(1.1)$.

6. Suppose f is differentiable on $(-\infty, \infty)$ and the equation of the line tangent to the graph of f at $x = 2$ is $y = 5x - 3$. Use the linear approximation to f at $x = 2$ to approximate $f(2.01)$.
7. Use linear approximation to estimate $f(3.85)$ given that $f(4) = 3$ and $f'(4) = 2$.
8. Use linear approximation to estimate $f(5.1)$ given that $f(5) = 10$ and $f'(5) = -2$.
9. Given a function f that is differentiable on its domain, write and explain the relationship between the differentials dx and dy .
10. Does the differential dy represent the change in f or the change in the linear approximation to f ? Explain.
11. Suppose f is differentiable on $(-\infty, \infty)$ and $f(5.01) - f(5) = 0.25$. Use linear approximation to estimate the value of $f'(5)$.
12. Suppose f is differentiable on $(-\infty, \infty)$, $f(5.99) = 7$, and $f(6) = 7.002$. Use linear approximation to estimate the value of $f'(6)$.
25. $f(x) = 12 - x^2$; $a = 2$; $f(2.1)$
26. $f(x) = \sin x$; $a = \pi/4$; $f(0.75)$
27. $f(x) = 1/(1+x)$; $a = 0$; $f(-0.1)$
28. $f(x) = x/(x+1)$; $a = 1$; $f(1.1)$
29. $f(x) = \cos x$; $a = 0$; $f(-0.01)$
30. $f(x) = x^{-3}$; $a = 1$; $f(1.05)$
31. $f(x) = (8+x)^{-1/3}$; $a = 0$; $f(-0.1)$
32. $f(x) = \sqrt[4]{x}$; $a = 81$; $f(85)$
33. $f(x) = 1/(x+1)$; $a = 0$; $1/1.1$
34. $f(x) = \cos x$; $a = \pi/4$; $\cos 0.8$
35. $f(x) = \sqrt[3]{64+x}$; $a = 0$; $\sqrt[3]{62.5}$
36. $f(x) = \tan x$; $a = 0$; $\tan 3^\circ$

Practice Exercises

13–14. Estimating speed Use the linear approximation given in Example 1 to answer the following questions.

13. If you travel one mile in 59 seconds, what is your approximate average speed? What is your exact speed?
14. If you travel one mile in 63 seconds, what is your approximate average speed? What is your exact speed?

15–18. Estimating time Suppose you want to travel D miles at a constant speed of $(60 + x)$ mi/hr, where x could be positive or negative. The time in minutes required to travel D miles is $T(x) = 60D(60 + x)^{-1}$.

15. Show that the linear approximation to T at the point $x = 0$ is
$$T(x) \approx L(x) = D\left(1 - \frac{x}{60}\right).$$
16. Use the result of Exercise 15 to approximate the amount of time it takes to drive 45 miles at 62 mi/hr. What is the exact time required?
17. Use the result of Exercise 15 to approximate the amount of time it takes to drive 80 miles at 57 mi/hr. What is the exact time required?
18. Use the result of Exercise 15 to approximate the amount of time it takes to drive 93 miles at 63 mi/hr. What is the exact time required?

19–24. Linear approximation Find the linear approximation to the following functions at the given point a .

19. $f(x) = 4x^2 + x$; $a = 1$
20. $f(x) = x^3 - 5x + 3$; $a = 2$
21. $g(t) = \sqrt{2t+9}$; $a = -4$
22. $h(w) = \sqrt{5w-1}$; $a = 1$
23. $f(x) = \sqrt[3]{x}$; $a = 8$
24. $f(x) = 9(4x+11)^{2/3}$; $a = 4$

T 25–36. Linear approximation

- a. Write the equation of the line that represents the linear approximation to the following functions at the given point a .
- b. Use the linear approximation to estimate the given quantity.
- c. Compute the percent error in your approximation, $100|\text{approximation} - \text{exact}|/|\text{exact}|$, where the exact value is given by a calculator.

37–46. Estimations with linear approximation Use linear approximations to estimate the following quantities. Choose a value of a to produce a small error.

37. $1/203$
38. $\tan(-2^\circ)$
39. $\sqrt{146}$
40. $\sqrt[3]{65}$
41. $1/1.05$
42. $\sqrt{5/29}$
43. $\sin(\pi/4 + 0.1)$
44. $1/\sqrt{119}$
45. $1/\sqrt[3]{510}$
46. $\cos 31^\circ$

47–50. Linear approximation and concavity Carry out the following steps for the given functions f and points a .

- a. Find the linear approximation L to the function f at the point a .
- b. Graph f and L on the same set of axes.
- c. Based on the graphs in part (b), state whether linear approximations to f near $x = a$ are underestimates or overestimates.
- d. Compute $f''(a)$ to confirm your conclusions in part (c).

47. $f(x) = \frac{2}{x}$; $a = 1$
48. $f(x) = 5 - x^2$; $a = 2$
49. $f(x) = 1/\sqrt{x}$; $a = 1$
50. $f(x) = \sqrt{2} \cos x$; $a = \frac{\pi}{4}$

T 51. Error in driving speed Consider again the average speed $s(x)$ and its linear approximation $L(x)$ discussed in Example 1. The error in using $L(x)$ to approximate $s(x)$ is given by $E(x) = |L(x) - s(x)|$. Use a graphing utility to determine the (approximate) values of x for which $E(x) \leq 1$. What does your answer say about the accuracy of the average speeds estimated by $L(x)$ over this interval?

52. Ideal Gas Law The pressure P , temperature T , and volume V of an ideal gas are related by $PV = nRT$, where n is the number of moles of the gas and R is the universal gas constant. For the purposes of this exercise, let $nR = 1$; therefore, $P = T/V$.

- a. Suppose the volume is held constant and the temperature increases by $\Delta T = 0.05$. What is the approximate change in the pressure? Does the pressure increase or decrease?
- b. Suppose the temperature is held constant and the volume increases by $\Delta V = 0.1$. What is the approximate change in the pressure? Does the pressure increase or decrease?
- c. Suppose the pressure is held constant and the volume increases by $\Delta V = 0.1$. What is the approximate change in the temperature? Does the temperature increase or decrease?

- 53. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- The linear approximation to $f(x) = x^2$ at $x = 0$ is $L(x) = 0$.
 - Linear approximation at $x = 0$ provides a good approximation to $f(x) = |x|$.
 - If $f(x) = mx + b$, then the linear approximation to f at any point is $L(x) = f(x)$.

- 54. Time function** Show that the function $T(x) = 60D(60 + x)^{-1}$ gives the time in minutes required to drive D miles at $60 + x$ miles per hour.

55–58. Approximating changes

- 55.** Approximate the change in the volume of a sphere when its radius changes from $r = 5$ ft to $r = 5.1$ ft ($V(r) = \frac{4}{3}\pi r^3$).
- 56.** Approximate the change in the volume of a right circular cone of fixed height $h = 4$ m when its radius increases from $r = 3$ m to $r = 3.05$ m ($V(r) = \frac{1}{3}\pi r^2 h$).
- 57.** Approximate the change in the lateral surface area (excluding the area of the base) of a right circular cone of fixed height $h = 6$ m when its radius decreases from $r = 10$ m to $r = 9.9$ m ($S = \pi r \sqrt{r^2 + h^2}$).
- 58.** Approximate the change in the magnitude of the electrostatic force between two charges when the distance between them increases from $r = 20$ m to $r = 21$ m ($F(r) = 0.01/r^2$).

59–66. Differentials Consider the following functions and express the relationship between a small change in x and the corresponding change in y in the form $dy = f'(x)dx$.

59. $f(x) = 2x + 1$
60. $f(x) = \sin^2 x$
61. $f(x) = \frac{1}{x^3}$
62. $f(x) = \sqrt{x^2 + 1}$
63. $f(x) = 2 - a \cos x$, a a constant
64. $f(x) = \frac{x + 4}{4 - x}$
65. $f(x) = 3x^3 - 4x$
66. $f(x) = \tan x$

Explorations and Challenges

- 67. Errors in approximations** Suppose $f(x) = \sqrt[3]{x}$ is to be approximated near $x = 8$. Find the linear approximation to f at 8. Then complete the following table, showing the errors in various approximations. Use a calculator to obtain the exact values. The percent error is $100|\text{approximation} - \text{exact}|/|\text{exact}|$. Comment on the behavior of the errors as x approaches 8.

- 69. Linear approximation and the second derivative** Draw the graph of a function f such that $f(1) = f'(1) = f''(1) = 1$. Draw the linear approximation to the function at the point $(1, 1)$. Now draw the graph of another function g such that $g(1) = g'(1) = 1$ and $g''(1) = 10$. (It is not possible to represent the second derivative exactly, but your graphs should reflect the fact that $f''(1)$ is relatively small compared to $g''(1)$.) Now suppose linear approximations are used to approximate $f(1.1)$ and $g(1.1)$.

- Which function has the more accurate linear approximation near $x = 1$ and why?
- Explain why the error in the linear approximation to f near a point a is proportional to the magnitude of $f''(a)$.

QUICK CHECK ANSWERS

- The linear approximation lies below the graph of f for x near a .
- $L(15) = 45$, $s(15) = 48$; $x = 15$ is not close to 0.
- $a = 0.16$
- Note that $f(0) = 1$ and $f'(0) = 0$, so $L(x) = 1$ (this is the line tangent to $y = \cos x$ at $(0, 1)$).
- $\Delta V \approx 4\pi a^2 \Delta r$

4.7 L'Hôpital's Rule

The study of limits in Chapter 2 was thorough but not exhaustive. Some limits, called *indeterminate forms*, cannot generally be evaluated using the techniques presented in Chapter 2. These limits tend to be the more interesting limits that arise in practice. A powerful result called *l'Hôpital's Rule* enables us to evaluate such limits with relative ease.

Here is how indeterminate forms arise. If f is a *continuous* function at a point a , then we know that $\lim_{x \rightarrow a} f(x) = f(a)$, allowing the limit to be evaluated by computing $f(a)$. But there are many limits that cannot be evaluated by substitution. In fact, we encountered such a limit in Section 3.5:

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1.$$

If we attempt to substitute $x = 0$ into $(\sin x)/x$, we get $0/0$, which has no meaning. Yet we proved that $(\sin x)/x$ has the limit 1 at $x = 0$ (Theorem 3.9). This limit is an example of an *indeterminate form*; specifically, $\lim_{x \rightarrow 0} \frac{\sin x}{x}$ has the form $0/0$ because the numerator and denominator both approach 0 as $x \rightarrow 0$.

The meaning of an *indeterminate form* is further illustrated by $\lim_{x \rightarrow \infty} \frac{ax}{x+1}$, where $a \neq 0$. This limit has the indeterminate form ∞/∞ (meaning that the numerator and denominator become arbitrarily large in magnitude as $x \rightarrow \infty$), but the actual value of the limit is $\lim_{x \rightarrow \infty} \frac{ax}{x+1} = a \lim_{x \rightarrow \infty} \frac{x}{x+1} = a$. In general, a limit with the form ∞/∞ or $0/0$ can have *any* value—which is why these limits must be handled carefully.

- The notations $0/0$ and ∞/∞ are merely symbols used to describe various types of indeterminate forms. The notation $0/0$ does not imply division by 0.

L'Hôpital's Rule for the Form $0/0$

Consider a function of the form $f(x)/g(x)$ and assume $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0$. Then the limit $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$ has the indeterminate form $0/0$. We first state l'Hôpital's Rule and then prove a special case.

- Guillaume François l'Hôpital (lo-pee-tal) (1661–1704) is credited with writing the first calculus textbook. Much of the material in his book, including l'Hôpital's Rule, was provided by the Swiss mathematician Johann Bernoulli (1667–1748).

THEOREM 4.12 L'Hôpital's Rule

Suppose f and g are differentiable on an open interval I containing a with $g'(x) \neq 0$ on I when $x \neq a$. If $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0$, then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)},$$

provided the limit on the right exists (or is $\pm\infty$). The rule also applies if $x \rightarrow a$ is replaced with $x \rightarrow \pm\infty$, $x \rightarrow a^+$, or $x \rightarrow a^-$.

Proof (special case): The proof of this theorem relies on the Generalized Mean Value Theorem (Exercise 55 of Section 4.2). We prove a special case of the theorem in which we assume f' and g' are continuous at a , $f(a) = g(a) = 0$, and $g'(a) \neq 0$. We have

$$\begin{aligned} \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)} &= \frac{f'(a)}{g'(a)} && \text{Continuity of } f' \text{ and } g' \\ &= \frac{\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}}{\lim_{x \rightarrow a} \frac{g(x) - g(a)}{x - a}} && \text{Definition of } f'(a) \text{ and } g'(a) \end{aligned}$$

- The definition of the derivative provides an example of an indeterminate form.

Assuming f is differentiable at x ,

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

has the form $0/0$.

Figure 4.71

Figure 4.72

QUICK CHECK 1 Which of the following functions lead to an indeterminate form as $x \rightarrow 0$: $f(x) = x^2/(x+2)$, $g(x) = (\tan 3x)/x$, or $h(x) = (1 - \cos x)/x^2$? ◀

- The limit in Example 1a can also be evaluated by factoring the numerator and canceling $(x-1)$:

$$\begin{aligned} \lim_{x \rightarrow 1} \frac{x^3 + x^2 - 2x}{x-1} &= \lim_{x \rightarrow 1} \frac{x(x-1)(x+2)}{x-1} \\ &= \lim_{x \rightarrow 1} x(x+2) = 3. \end{aligned}$$

$$\begin{aligned} &\frac{f(x) - f(a)}{g(x) - g(a)} \\ &= \lim_{x \rightarrow a} \frac{\frac{f(x) - f(a)}{x - a}}{\frac{g(x) - g(a)}{x - a}} \quad \text{Limit of a quotient, } g'(a) \neq 0 \\ &= \lim_{x \rightarrow a} \frac{f(x) - f(a)}{g(x) - g(a)} \quad \text{Cancel } x - a. \\ &= \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}. \quad f(a) = g(a) = 0 \end{aligned}$$

The geometry of l'Hôpital's Rule offers some insight. First consider two *linear* functions, f and g , whose graphs both pass through the point $(a, 0)$ with slopes 4 and 2, respectively; this means that

$$f(x) = 4(x - a) \quad \text{and} \quad g(x) = 2(x - a).$$

Furthermore, $f(a) = g(a) = 0$, $f'(x) = 4$, and $g'(x) = 2$ (Figure 4.71).

Looking at the quotient f/g , we see that

$$\frac{f(x)}{g(x)} = \frac{4(x - a)}{2(x - a)} = \frac{4}{2} = \frac{f'(x)}{g'(x)}.$$

This argument may be generalized, and we find that for any linear functions f and g with $f(a) = g(a) = 0$,

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)},$$

provided $g'(a) \neq 0$.

If f and g are not linear functions, we replace them with their linear approximations at a (Figure 4.72). Zooming in on the point a , the curves are close to their respective tangent lines $y = f'(a)(x - a)$ and $y = g'(a)(x - a)$, which have slopes $f'(a)$ and $g'(a) \neq 0$, respectively. Near $x = a$, we have

$$\frac{f(x)}{g(x)} \approx \frac{f'(a)(x - a)}{g'(a)(x - a)} = \frac{f'(a)}{g'(a)}.$$

Therefore, the ratio of the functions is well approximated by the ratio of the derivatives. In the limit as $x \rightarrow a$, we again have

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}.$$

EXAMPLE 1 Using l'Hôpital's Rule Evaluate the following limits.

a. $\lim_{x \rightarrow 1} \frac{x^3 + x^2 - 2x}{x - 1}$ b. $\lim_{x \rightarrow 0} \frac{\sqrt{9 + 3x} - 3}{x}$

SOLUTION

a. Direct substitution of $x = 1$ into $\frac{x^3 + x^2 - 2x}{x - 1}$ produces the indeterminate form $0/0$.

Applying l'Hôpital's Rule with $f(x) = x^3 + x^2 - 2x$ and $g(x) = x - 1$ gives

$$\lim_{x \rightarrow 1} \frac{x^3 + x^2 - 2x}{x - 1} = \lim_{x \rightarrow 1} \frac{f'(x)}{g'(x)} = \lim_{x \rightarrow 1} \frac{3x^2 + 2x - 2}{1} = 3.$$

b. Substituting $x = 0$ into this function produces the indeterminate form $0/0$. Let

$$f(x) = \sqrt{9 + 3x} - 3 \text{ and } g(x) = x, \text{ and note that } f'(x) = \frac{3}{2\sqrt{9 + 3x}} \text{ and } g'(x) = 1. \text{ Applying l'Hôpital's Rule, we have}$$

$$\lim_{x \rightarrow 0} \underbrace{\frac{\sqrt{9 + 3x} - 3}{x}}_{f/g} = \lim_{x \rightarrow 0} \underbrace{\frac{\frac{3}{2\sqrt{9 + 3x}}}{1}}_{f'/g'} = \frac{1}{2}.$$

Related Exercises 11–12 ◀

L'Hôpital's Rule requires evaluating $\lim_{x \rightarrow a} f'(x)/g'(x)$. It may happen that this second limit is another indeterminate form to which l'Hôpital's Rule may again be applied.

EXAMPLE 2 L'Hôpital's Rule repeated Evaluate the following limits.

$$\text{a. } \lim_{x \rightarrow 0} \frac{\sec x - 1}{x^2} \qquad \text{b. } \lim_{x \rightarrow 2} \frac{x^3 - 3x^2 + 4}{x^4 - 4x^3 + 7x^2 - 12x + 12}$$

SOLUTION

a. This limit has the indeterminate form $0/0$. Applying l'Hôpital's Rule, we have

$$\lim_{x \rightarrow 0} \frac{\sec x - 1}{x^2} = \lim_{x \rightarrow 0} \frac{\sec x \tan x}{2x},$$

which is another limit of the form $0/0$. Therefore, we apply l'Hôpital's Rule again:

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sec x \tan x}{2x} &= \lim_{x \rightarrow 0} \frac{\sec x \tan x}{2x} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow 0} \frac{(\sec x \tan x) \tan x + \sec x (\sec^2 x)}{2} && \text{L'Hôpital's Rule again; Product Rule} \\ &= \lim_{x \rightarrow 0} \frac{\sec x \tan^2 x + \sec^3 x}{2} = \frac{1}{2}. && \text{Evaluate limit.} \end{aligned}$$

approaches 0 approaches 1

► The second application of l'Hôpital's Rule in Example 2a is convenient, though not necessary. One could also write

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sec x \tan x}{2x} &= \lim_{x \rightarrow 0} \frac{1}{\cos x} \cdot \frac{\sin x}{\cos x} \cdot \frac{1}{2x} \\ &= \frac{1}{2} \lim_{x \rightarrow 0} \frac{\sin x}{x} \cdot \lim_{x \rightarrow 0} \frac{1}{\cos^2 x} = \frac{1}{2}. \end{aligned}$$

b. Evaluating the numerator and denominator at $x = 2$, we see that this limit has the form $0/0$. Applying l'Hôpital's Rule twice, we have

$$\begin{aligned} \lim_{x \rightarrow 2} \frac{x^3 - 3x^2 + 4}{x^4 - 4x^3 + 7x^2 - 12x + 12} &= \lim_{x \rightarrow 2} \frac{3x^2 - 6x}{4x^3 - 12x^2 + 14x - 12} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow 2} \frac{6x - 6}{12x^2 - 24x + 14} && \text{L'Hôpital's Rule again} \\ &= \frac{3}{7}. && \text{Evaluate limit.} \end{aligned}$$

limit of the form $0/0$

It is easy to overlook a crucial step in this computation: After applying l'Hôpital's Rule the first time, you *must* establish that the new limit is an indeterminate form before applying l'Hôpital's Rule a second time.

Related Exercises 30, 31 ◀

Indeterminate Form ∞/∞

L'Hôpital's Rule also applies directly to limits of the form $\lim_{x \rightarrow a} f(x)/g(x)$, where $\lim_{x \rightarrow a} f(x) = \pm \infty$ and $\lim_{x \rightarrow a} g(x) = \pm \infty$; this indeterminate form is denoted ∞/∞ . The proof of this result is found in advanced books.

QUICK CHECK 2 Which of the following functions lead to an indeterminate form as $x \rightarrow \infty$: $f(x) = (\sin x)/x$, $g(x) = (3x^2 + 4)/x^2$, or $h(x) = (x - 1)/x^3$? ◀

THEOREM 4.13 L'Hôpital's Rule (∞/∞)

Suppose f and g are differentiable on an open interval I containing a , with $g'(x) \neq 0$ on I when $x \neq a$. If $\lim_{x \rightarrow a} f(x) = \pm \infty$ and $\lim_{x \rightarrow a} g(x) = \pm \infty$, then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)},$$

provided the limit on the right exists (or is $\pm \infty$). The rule also applies for $x \rightarrow \pm \infty$, $x \rightarrow a^+$, or $x \rightarrow a^-$.

EXAMPLE 3 L'Hôpital's Rule for ∞/∞

Evaluate the following limits.

a. $\lim_{x \rightarrow \infty} \frac{4x^3 - 6x^2 + 1}{2x^3 - 10x + 3}$ b. $\lim_{x \rightarrow 0^+} \frac{1 - \cot(\sin x)}{\cot x}$

SOLUTION

a. This limit has the indeterminate form ∞/∞ because both the numerator and the denominator approach ∞ as $x \rightarrow \infty$. Applying L'Hôpital's Rule three times, we have

$$\lim_{x \rightarrow \infty} \frac{4x^3 - 6x^2 + 1}{2x^3 - 10x + 3} = \lim_{x \rightarrow \infty} \frac{12x^2 - 12x}{6x^2 - 10} = \lim_{x \rightarrow \infty} \frac{24x - 12}{12x} = \lim_{x \rightarrow \infty} \frac{24}{12} = 2.$$

b. In this limit, the numerator approaches $-\infty$ and the denominator approaches ∞ as $x \rightarrow 0^+$. L'Hôpital's Rule gives us

$$\begin{aligned} \lim_{x \rightarrow 0^+} \frac{1 - \cot(\sin x)}{\cot x} &= \lim_{x \rightarrow 0^+} \frac{\csc^2(\sin x) \cos x}{-\csc^2 x} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow 0^+} \frac{-\sin^2 x \cos x}{\sin^2(\sin x)}. && \text{Simplify.} \end{aligned}$$

The new limit has the form $0/0$, so we apply L'Hôpital's Rule again. However, before doing so, we use limit laws to ease the computations involved:

$$\begin{aligned} \lim_{x \rightarrow 0^+} \frac{-\sin^2 x \cos x}{\sin^2(\sin x)} &= - \left(\lim_{x \rightarrow 0^+} \frac{\sin x}{\sin(\sin x)} \right)^2 \cdot \lim_{x \rightarrow 0^+} \cos x && \text{Limit laws} \\ &= - \left(\lim_{x \rightarrow 0^+} \frac{\cos x}{\cos(\sin x) \cos x} \right)^2 \cdot 1 && \text{L'Hôpital's Rule} \\ &= -1 \cdot 1 = -1. && \text{Evaluate limits.} \end{aligned}$$

Note that we are justified in using the limit laws because both limits in the product exist.

Related Exercises 18, 39 ◀

Related Indeterminate Forms: $0 \cdot \infty$ and $\infty - \infty$

We now consider limits of the form $\lim_{x \rightarrow a} f(x)g(x)$, where $\lim_{x \rightarrow a} f(x) = 0$ and $\lim_{x \rightarrow a} g(x) = \pm \infty$; such limits are denoted $0 \cdot \infty$. L'Hôpital's Rule cannot be directly applied to limits of this form. Furthermore, it's risky to jump to conclusions about such

limits. Suppose $f(x) = x$ and $g(x) = \frac{1}{x^2}$, in which case $\lim_{x \rightarrow 0} f(x) = 0$, $\lim_{x \rightarrow 0} g(x) = \infty$, and

$\lim_{x \rightarrow 0} f(x)g(x) = \lim_{x \rightarrow 0} \frac{1}{x}$ does not exist. On the other hand, if $f(x) = x$ and $g(x) = \frac{1}{\sqrt{x}}$, we have $\lim_{x \rightarrow 0^+} f(x) = 0$, $\lim_{x \rightarrow 0^+} g(x) = \infty$, and $\lim_{x \rightarrow 0^+} f(x)g(x) = \lim_{x \rightarrow 0^+} \sqrt{x} = 0$. So a limit of

the form $0 \cdot \infty$, in which the two functions compete with each other, may have any value or may not exist. The following example illustrates how this indeterminate form can be recast in the form $0/0$ or ∞/∞ .

EXAMPLE 4 L'Hôpital's Rule for $0 \cdot \infty$ Evaluate $\lim_{x \rightarrow \infty} x^2 \sin\left(\frac{1}{4x^2}\right)$.

SOLUTION This limit has the form $0 \cdot \infty$. A common technique that converts this form to either $0/0$ or ∞/∞ is to *divide by the reciprocal*. We rewrite the limit and apply L'Hôpital's Rule:

$$\begin{aligned} \lim_{x \rightarrow \infty} x^2 \sin\left(\frac{1}{4x^2}\right) &= \lim_{x \rightarrow \infty} \frac{\sin\left(\frac{1}{4x^2}\right)}{\frac{1}{x^2}} && x^2 = \frac{1}{1/x^2} \\ &\quad \underbrace{\hspace{1.5cm}}_{0 \cdot \infty \text{ form}} && \underbrace{\hspace{1.5cm}}_{\text{recast in } 0/0 \text{ form}} \\ &= \lim_{x \rightarrow \infty} \frac{\cos\left(\frac{1}{4x^2}\right) \frac{1}{4} (-2x^{-3})}{-2x^{-3}} && \text{L'Hôpital's Rule} \\ &= \frac{1}{4} \lim_{x \rightarrow \infty} \cos\left(\frac{1}{4x^2}\right) && \text{Simplify.} \\ &= \frac{1}{4}. && \frac{1}{4x^2} \rightarrow 0, \cos 0 = 1 \end{aligned}$$

Related Exercise 41 ◀

QUICK CHECK 3 What is the form of the limit $\lim_{x \rightarrow \pi/2^-} (x - \pi/2)(\tan x)$? Write it in the form $0/0$. ◀

Limits of the form $\lim_{x \rightarrow a} (f(x) - g(x))$, where $\lim_{x \rightarrow a} f(x) = \infty$ and $\lim_{x \rightarrow a} g(x) = \infty$, are indeterminate forms that we denote $\infty - \infty$. L'Hôpital's Rule cannot be applied directly to an $\infty - \infty$ form. It must first be expressed in the form $0/0$ or ∞/∞ . With the $\infty - \infty$ form, it is easy to reach erroneous conclusions. For example, if $f(x) = 3x + 5$ and $g(x) = 3x$, then

$$\lim_{x \rightarrow \infty} ((3x + 5) - (3x)) = 5.$$

However, if $f(x) = 3x$ and $g(x) = 2x$, then

$$\lim_{x \rightarrow \infty} (3x - 2x) = \lim_{x \rightarrow \infty} x = \infty.$$

These examples show again why indeterminate forms are deceptive. Before proceeding, we introduce another useful technique.

Occasionally, it helps to convert a limit as $x \rightarrow \infty$ to a limit as $t \rightarrow 0^+$ (or vice versa) by a *change of variables*. To evaluate $\lim_{x \rightarrow \infty} f(x)$, we define $t = 1/x$ and note that as $x \rightarrow \infty$, $t \rightarrow 0^+$. Then

$$\lim_{x \rightarrow \infty} f(x) = \lim_{t \rightarrow 0^+} f\left(\frac{1}{t}\right).$$

This idea is illustrated in the next example.

EXAMPLE 5 L'Hôpital's Rule for $\infty - \infty$ Evaluate $\lim_{x \rightarrow \infty} (x - \sqrt{x^2 - 3x})$.

SOLUTION As $x \rightarrow \infty$, both terms in the difference $x - \sqrt{x^2 - 3x}$ approach ∞ and this limit has the form $\infty - \infty$. We first factor x from the expression and form a quotient:

$$\begin{aligned} \lim_{x \rightarrow \infty} (x - \sqrt{x^2 - 3x}) &= \lim_{x \rightarrow \infty} (x - \sqrt{x^2(1 - 3/x)}) && \text{Factor } x^2 \text{ under square root.} \\ &= \lim_{x \rightarrow \infty} x(1 - \sqrt{1 - 3/x}) && x > 0, \text{ so } \sqrt{x^2} = x \\ &= \lim_{x \rightarrow \infty} \frac{1 - \sqrt{1 - 3/x}}{1/x}. && \text{Write } 0 \cdot \infty \text{ form as } 0/0 \text{ form;} \\ &&& x = \frac{1}{1/x}. \end{aligned}$$

This new limit has the form $0/0$, and l'Hôpital's Rule may be applied. One way to proceed is to use the change of variables $t = 1/x$:

$$\begin{aligned}\lim_{x \rightarrow \infty} \frac{1 - \sqrt{1 - 3/x}}{1/x} &= \lim_{t \rightarrow 0^+} \frac{1 - \sqrt{1 - 3t}}{t} && \text{Let } t = 1/x; \text{ replace } \lim_{x \rightarrow \infty} \text{ with } \lim_{t \rightarrow 0^+}. \\ &= \lim_{t \rightarrow 0^+} \frac{\frac{3}{2\sqrt{1-3t}}}{1} && \text{l'Hôpital's Rule} \\ &= \frac{3}{2}. && \text{Evaluate limit.}\end{aligned}$$

Related Exercises 49–50 ◀

Pitfalls in Using l'Hôpital's Rule

We close with a list of common pitfalls to watch out for when using l'Hôpital's Rule.

1. L'Hôpital's Rule says $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$, not

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \left(\frac{f(x)}{g(x)} \right)' \quad \text{or} \quad \lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \left(\frac{1}{g(x)} \right)' f'(x).$$

In other words, you should evaluate $f'(x)$ and $g'(x)$, form their quotient, and then take the limit. Don't confuse l'Hôpital's Rule with the Quotient Rule.

2. Be sure that the given limit involves the indeterminate form $0/0$ or ∞/∞ before applying l'Hôpital's Rule. For example, consider the following erroneous use of l'Hôpital's Rule:

$$\lim_{x \rightarrow 0} \frac{1 - \sin x}{\cos x} = \lim_{x \rightarrow 0} \frac{\cos x}{\sin x},$$

which does not exist. The original limit is not an indeterminate form in the first place. This limit should be evaluated by direct substitution:

$$\lim_{x \rightarrow 0} \frac{1 - \sin x}{\cos x} = \frac{1 - \sin 0}{1} = 1.$$

3. When using l'Hôpital's Rule repeatedly, be sure to simplify expressions as much as possible at each step and evaluate the limit as soon as the new limit is no longer an indeterminate form.
4. Repeated use of l'Hôpital's Rule occasionally leads to unending cycles, in which case other methods must be used. For example, limits of the form $\lim_{x \rightarrow \infty} \frac{\sqrt{ax+1}}{\sqrt{bx+1}}$, where a and b are positive real numbers, lead to such behavior (Exercise 67).
5. Be sure that the limit produced by l'Hôpital's Rule exists. Consider $\lim_{x \rightarrow \infty} \frac{3x + \cos x}{x}$, which has the form ∞/∞ . Applying l'Hôpital's Rule, we have

$$\lim_{x \rightarrow \infty} \frac{3x + \cos x}{x} = \lim_{x \rightarrow \infty} \frac{3 - \sin x}{1}.$$

It is tempting to conclude that because the limit on the right side does not exist, the original limit also does not exist. In fact, the original limit has a value of 3 (divide numerator and denominator by x). To reach a conclusion from l'Hôpital's Rule, the limit produced by l'Hôpital's Rule must exist (or be $\pm \infty$).

SECTION 4.7 EXERCISES

Getting Started

- Explain with examples what is meant by the indeterminate form $0/0$.
- Why are special methods such as l'Hôpital's Rule, rather than substitution, needed to evaluate indeterminate forms?
- Explain the steps used to apply l'Hôpital's Rule to a limit of the form $0/0$.
- Give examples of each of the following.
 - A limit with the indeterminate form $0/0$ that equals 3.
 - A limit with the indeterminate form $0/0$ that equals 4.
- Give examples of each of the following.
 - A limit with the indeterminate form $0 \cdot \infty$ that equals 1.
 - A limit with the indeterminate form $0 \cdot \infty$ that equals 2.
- Which of the following limits can be evaluated without l'Hôpital's Rule? Evaluate each limit.
 - $\lim_{x \rightarrow 0} \frac{\sin x}{x^3 + 2x + 1}$
 - $\lim_{x \rightarrow 0} \frac{\sin x}{x^3 + 2x}$
- Explain how to convert a limit of the form $0 \cdot \infty$ to a limit of the form $0/0$ or ∞/∞ .
- Give an example of a limit of the form ∞/∞ as $x \rightarrow 0$.
- The limit $\lim_{x \rightarrow 1^-} (x - 1) \tan \frac{\pi x}{2}$ has the indeterminate form $0 \cdot \infty$. Convert the limit to the indeterminate form $0/0$ and then evaluate the limit.
- Evaluate $\lim_{x \rightarrow 2} \frac{x^3 - 3x^2 + 2x}{x - 2}$ using l'Hôpital's Rule and then check your work by evaluating the limit using an appropriate Chapter 2 method.

Practice Exercises

11–59. Limits Evaluate the following limits. Use l'Hôpital's Rule when it is convenient and applicable.

- $\lim_{x \rightarrow 2} \frac{x^2 - 2x}{x^2 - 6x + 8}$
- $\lim_{x \rightarrow -1} \frac{x^4 + x^3 + 2x + 2}{x + 1}$
- $\lim_{x \rightarrow 1} \frac{x^2 + 2x}{x + 3}$
- $\lim_{x \rightarrow 1} \frac{\cos \pi x + 1}{\sqrt{x} - 1}$
- $\lim_{x \rightarrow 1} \frac{4 \sin \pi x}{\cos \pi x + x}$
- $\lim_{x \rightarrow \pi} \frac{4 \sin x}{x + \cos x - \pi + 1}$
- $\lim_{x \rightarrow \infty} \frac{3x^4 - x^2}{6x^4 + 12}$
- $\lim_{x \rightarrow \infty} \frac{4x^3 - 2x^2 + 6}{\pi x^3 + 4}$
- $\lim_{x \rightarrow 1} \frac{x - 1}{\sqrt{x} - 1}$
- $\lim_{x \rightarrow 0^+} \frac{x - 3\sqrt{x}}{x - \sqrt{x}}$
- $\lim_{x \rightarrow 0} \frac{3 \sin 4x}{5x}$
- $\lim_{x \rightarrow 2\pi} \frac{x \sin x + x^2 - 4\pi^2}{x - 2\pi}$
- $\lim_{u \rightarrow \pi/4} \frac{\tan u - \cot u}{u - \pi/4}$
- $\lim_{z \rightarrow 0} \frac{\tan 4z}{\tan 7z}$
- $\lim_{x \rightarrow 0} \frac{1 - \cos 3x}{8x^2}$
- $\lim_{x \rightarrow 0} \frac{\sin^2 3x}{x^2}$

- $\lim_{x \rightarrow \pi} \frac{\cos x + 1}{(x - \pi)^2}$
- $\lim_{x \rightarrow 0} \frac{\cos x - x^2 - 1}{3x^2 + x^4}$
- $\lim_{x \rightarrow \pi/2^-} \frac{\tan x}{3/(2x - \pi)}$
- $\lim_{x \rightarrow \pi^-} \frac{\csc x + x}{\tan \frac{x}{2}}$
- $\lim_{x \rightarrow 0} \frac{\tan x - x}{x^3}$
- $\lim_{x \rightarrow 0} \frac{\sin x - x}{7x^3}$
- $\lim_{x \rightarrow -1} \frac{x^3 - x^2 - 5x - 3}{x^4 + 2x^3 - x^2 - 4x - 2}$
- $\lim_{x \rightarrow 1} \frac{x^n - 1}{x - 1}$, n is a positive integer
- $\lim_{v \rightarrow 3} \frac{v - 1 - \sqrt{v^2 - 5}}{v - 3}$
- $\lim_{y \rightarrow 2} \frac{y^2 + y - 6}{\sqrt{8 - y^2} - y}$
- $\lim_{x \rightarrow 2} \frac{x^2 - 4x + 4}{\sin^2 \pi x}$
- $\lim_{x \rightarrow 2} \frac{\sqrt[3]{3x + 2} - 2}{x - 2}$
- $\lim_{x \rightarrow \pi/2^-} \frac{1 + 2 \sec x}{1 + \tan x}$
- $\lim_{x \rightarrow 1^+} \left(\frac{1}{x - 1} - \frac{1}{\sqrt{x - 1}} \right)$
- $\lim_{x \rightarrow 0} x \csc x$
- $\lim_{x \rightarrow 1^-} (1 - x) \tan \frac{\pi x}{2}$
- $\lim_{x \rightarrow 0} \csc 6x \sin 7x$
- $\lim_{x \rightarrow \infty} \frac{3}{x} \csc \frac{5}{x}$
- $\lim_{x \rightarrow \pi/2^-} \left(\frac{\pi}{2} - x \right) \sec x$
- $\lim_{x \rightarrow 0^+} (\sin x) \sqrt{\frac{1 - x}{x}}$
- $\lim_{x \rightarrow 0^+} \left(\cot x - \frac{1}{x} \right)$
- $\lim_{\theta \rightarrow \pi/2^-} (\tan \theta - \sec \theta)$
- $\lim_{x \rightarrow \infty} (x^2 - \sqrt{x^4 + 16x^2})$
- $\lim_{x \rightarrow \infty} (x - \sqrt{x^2 + 4x})$
- $\lim_{x \rightarrow \infty} (\sqrt{x - 2} - \sqrt{x - 4})$
- $\lim_{x \rightarrow \infty} (\sqrt{x^2 - 1} - \sqrt[3]{x^3 - 1})$
- $\lim_{n \rightarrow \infty} \frac{1 + 2 + \cdots + n}{n^2} \left(\text{Hint: Use } 1 + 2 + \cdots + n = \frac{n(n+1)}{2} \right)$
- $\lim_{\theta \rightarrow \infty} \frac{\sin 2\theta - \theta^3}{3\theta^3}$
- $\lim_{x \rightarrow 6} \frac{\sqrt[5]{5x + 2} - 2}{1/x - 1/6}$
- $\lim_{x \rightarrow \pi/2} (\pi - 2x) \tan x$
- $\lim_{x \rightarrow \infty} x^3 \left(\frac{1}{x} - \sin \frac{1}{x} \right)$
- $\lim_{x \rightarrow 0} \left(\frac{1}{x} - \frac{\sin x}{x^2} \right)$
- $\lim_{x \rightarrow \pi/2^-} \frac{\sec x - 1}{\tan x}$
- An optics limit** The theory of interference of coherent oscillators requires the limit $\lim_{\delta \rightarrow 2m\pi} \frac{\sin^2(N\delta/2)}{\sin^2(\delta/2)}$, where N is a positive integer and m is any integer. Show that the value of this limit is N^2 .
- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - By l'Hôpital's Rule, $\lim_{x \rightarrow 2} \frac{x - 2}{x^2 - 1} = \lim_{x \rightarrow 2} \frac{1}{2x} = \frac{1}{4}$.
 - $\lim_{x \rightarrow 0} x \sin x = \lim_{x \rightarrow 0} f(x)g(x) = \lim_{x \rightarrow 0} f'(x) \lim_{x \rightarrow 0} g'(x) = (\lim_{x \rightarrow 0} 1)(\lim_{x \rightarrow 0} \cos x) = 1$.

$$\begin{aligned}\text{c. } \lim_{x \rightarrow 2} \frac{x^3 - 2x^2 + x - 2}{x^2 - 1} &= \lim_{x \rightarrow 2} \frac{3x^2 - 4x + 1}{2x} \\ \text{d. } \lim_{x \rightarrow 2} \frac{x^3 - 2x^2 + x - 2}{x^2 - 4} &= \lim_{x \rightarrow 2} \frac{3x^2 - 4x + 1}{2x}\end{aligned}$$

62–63. Two methods Evaluate the following limits in two different ways: Use the methods of Chapter 2 and use l'Hôpital's Rule.

$$\begin{aligned}62. \lim_{x \rightarrow \infty} \frac{2x^3 - x^2 + 1}{5x^3 + 2x} \quad 63. \lim_{x \rightarrow 0} \frac{1 - \cos^2 x}{1 - \cos x}\end{aligned}$$

Explorations and Challenges

64–65. More limits Evaluate the following limits.

$$\begin{aligned}64. \lim_{n \rightarrow \infty} \left(\cot \frac{1}{n} - n \right) \quad 65. \lim_{n \rightarrow \infty} \left(n \cot \frac{1}{n} - n^2 \right)\end{aligned}$$

66. Let a and b be positive real numbers. Evaluate $\lim_{x \rightarrow \infty} (ax - \sqrt{a^2x^2 - bx})$ in terms of a and b .

67. L'Hôpital loops Consider the limit $\lim_{x \rightarrow \infty} \frac{\sqrt{ax+b}}{\sqrt{cx+d}}$, where $a, b, c,$ and d are positive real numbers. Show that l'Hôpital's Rule fails for this limit. Find the limit using another method.

68. Evaluate one of the limits l'Hôpital used in his own textbook in about 1700:

$$\lim_{x \rightarrow a} \frac{\sqrt{2a^3x - x^4} - a\sqrt[3]{a^2x}}{a - \sqrt[4]{ax^3}}, \text{ where } a \text{ is a real number.}$$

69. A geometric limit Let $f(\theta)$ be the area of the triangle ABP (see figure), and let $g(\theta)$ be the area of the region between the chord PB and the arc PB . Evaluate $\lim_{\theta \rightarrow 0} \frac{g(\theta)}{f(\theta)}$.

QUICK CHECK ANSWERS

1. g and h 2. g and h 3. $0 \cdot \infty; (x - \pi/2)/\cot x \blacktriangleleft$

► Newton's method is attributed to Sir Isaac Newton, who devised the method in 1669. However, similar methods were known prior to Newton's time. A special case of Newton's method for approximating square roots is called the Babylonian method and was probably invented by Greek mathematicians.

4.8 Newton's Method

A common problem that arises in mathematics is finding the *roots*, or *zeros*, of a function. The roots of a function are the values of x that satisfy the equation $f(x) = 0$. Equivalently, they correspond to the x -intercepts of the graph of f . You have already seen an important example of a root-finding problem. To find the critical points of a function f , we must solve the equation $f'(x) = 0$; that is, we find the roots of f' . Newton's method, which we discuss in this section, is one of the most effective methods for *approximating* the roots of a function.

Why Approximate?

A little background about roots of functions explains why a method is needed to approximate roots. If you are given a linear function, such as $f(x) = 2x - 9$, you know how to use algebraic methods to solve $f(x) = 0$ and find the single root $x = \frac{9}{2}$. Similarly, given the quadratic function $f(x) = x^2 - 6x - 72$, you know how to factor or use the quadratic formula to discover that the roots are $x = 12$ and $x = -6$. It turns out that formulas also exist for finding the roots of cubic (third-degree) and quartic (fourth-degree) polynomials. Methods such as factoring and algebra are called *analytical methods*; when they work, they give the roots of a function *exactly* in terms of arithmetic operations and radicals.

Here is an important fact: Apart from the functions we have listed—polynomials of degree four or less—analytical methods do not give the roots of most functions. To be sure, there are special cases in which analytical methods work. For example, you should verify that the single real root of $f(x) = \sin x - x$ is $x = 0$ and that the two real roots of $f(x) = x^{10} - 1$ are $x = 1$ and $x = -1$. But in general, the roots of even relatively simple functions such as $f(x) = \cos x - x$ cannot be found exactly using analytical methods.

When analytical methods do not work, which is the majority of cases, we need another approach. That approach is to approximate roots using *numerical methods*, such as Newton's method.

Deriving Newton's Method

Newton's method is most easily derived geometrically. Assume r is a root of f that we wish to approximate; this means that $f(r) = 0$. We also assume f is differentiable on some interval containing r . Suppose x_0 is an initial approximation to r that is generally obtained by some preliminary analysis. A better approximation to r is often obtained by carrying out the following two steps:

- Draw a line tangent to the curve $y = f(x)$ at the point $(x_0, f(x_0))$.
- Find the point $(x_1, 0)$ at which the tangent line intersects the x -axis, and let x_1 be the new approximation to r .

For the curve shown in **Figure 4.73a**, x_1 is a better approximation to the root r than x_0 .

Figure 4.73

To improve the approximation x_1 , we repeat the two-step process, using x_1 to determine the next estimate x_2 (**Figure 4.73b**). Then we use x_2 to obtain x_3 (**Figure 4.73c**), and so forth. Continuing in this fashion, we obtain a *sequence* of approximations $\{x_1, x_2, x_3, \dots\}$ that ideally get closer and closer, or *converge*, to the root r . Several steps of Newton's method and the convergence of the approximations to the root are shown in **Figure 4.74**.

All that remains is to find a formula that captures the process just described. Assume we have computed the n th approximation x_n to the root r and we want to obtain the next approximation x_{n+1} . We first draw the line tangent to the curve at the point $(x_n, f(x_n))$; its slope is $m = f'(x_n)$. Using the point-slope form of the equation of a line, an equation of the tangent line at the point $(x_n, f(x_n))$ is

$$y - f(x_n) = \underbrace{f'(x_n)}_m (x - x_n).$$

We find the point at which this line intersects the x -axis by setting $y = 0$ in the equation of the line and solving for x . This value of x becomes the new approximation x_{n+1} :

$$\underbrace{0}_{\text{set } y \text{ to } 0} - f(x_n) = f'(x_n) \underbrace{(x - x_n)}_{\text{becomes } x_{n+1}}.$$

Solving for x and calling it x_{n+1} , we find that

$$\underbrace{x_{n+1}}_{\text{new approximation}} = \underbrace{x_n}_{\text{current approximation}} - \frac{f(x_n)}{f'(x_n)}, \quad \text{provided } f'(x_n) \neq 0.$$

QUICK CHECK 1 Verify that setting $y = 0$ in the equation $y - f(x_n) = f'(x_n)(x - x_n)$ and solving for x gives the formula for Newton's method. ◀

We have derived the general step of Newton's method for approximating roots of a function f . This step is repeated for $n = 0, 1, 2, \dots$, until a termination condition is met (to be discussed).

► Sequences are the subject of Chapter 10. An infinite, ordered list of numbers $\{x_1, x_2, x_3, \dots\}$ is a sequence, and if its values approach a number r , we say that the sequence *converges* to r . If a sequence fails to approach a single number, the sequence *diverges*.

Figure 4.74

► Newton's method is an example of a repetitive loop calculation called an *iteration*. The most efficient way to implement the method is with a calculator or computer. The method is also included in many software packages.

Figure 4.75

PROCEDURE Newton's Method for Approximating Roots of $f(x) = 0$

1. Choose an initial approximation x_0 as close to a root as possible.
2. For $n = 0, 1, 2, \dots$,

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)},$$

provided $f'(x_n) \neq 0$.

3. End the calculations when a termination condition is met.

EXAMPLE 1 Applying Newton's method Approximate the roots of $f(x) = x^3 - 5x + 1$ (Figure 4.75) using seven steps of Newton's method. Use $x_0 = -3$, $x_0 = 1$, and $x_0 = 4$ as initial approximations.

SOLUTION Noting that $f'(x) = 3x^2 - 5$, Newton's method takes the form

$$x_{n+1} = x_n - \frac{\overbrace{x_n^3 - 5x_n + 1}^{f(x_n)}}{\underbrace{3x_n^2 - 5}_{f'(x_n)}} = \frac{2x_n^3 - 1}{3x_n^2 - 5},$$

where $n = 0, 1, 2, \dots$, and x_0 is specified. With an initial approximation of $x_0 = -3$, the first approximation is

$$x_1 = \frac{2x_0^3 - 1}{3x_0^2 - 5} = \frac{2(-3)^3 - 1}{3(-3)^2 - 5} = -2.5.$$

The second approximation is

$$x_2 = \frac{2x_1^3 - 1}{3x_1^2 - 5} = \frac{2(-2.5)^3 - 1}{3(-2.5)^2 - 5} \approx -2.345455.$$

Continuing in this fashion, we generate the first seven approximations shown in Table 4.5. The approximations generated from the initial approximations $x_0 = 1$ and $x_0 = 4$ are also shown in the table.

Notice that with the initial approximation $x_0 = -3$ (second column), the resulting sequence of approximations settles on the value -2.330059 after four iterations, and then there are no further changes in these digits. A similar behavior is seen with the initial approximations $x_0 = 1$ and $x_0 = 4$. Based on this evidence, we conclude that -2.330059 , 0.201640 , and 2.128419 are approximations to the roots of f with at least six digits (to the right of the decimal point) of accuracy.

A graph of f (Figure 4.76) confirms that f has three real roots and that the Newton approximations to the three roots are reasonable. The figure also shows the first three Newton approximations at each root.

► The numbers in Table 4.5 were computed with 16 decimal digits of precision. The results are displayed with 6 digits to the right of the decimal point.

QUICK CHECK 2 What happens if you apply Newton's method to the function $f(x) = x$? ◀

Figure 4.76

When Do You Stop?

Example 1 raises an important question and gives a practical answer: How many Newton approximations should you compute? Ideally, we would like to compute the **error** in x_n as an approximation to the root r , which is the quantity $|x_n - r|$. Unfortunately, we don't know r in practice; it is the quantity that we are trying to approximate. So we need a practical way to estimate the error.

In the second column of Table 4.5, we see that x_4 and x_5 agree in their seven digits, -2.330059 . A general rule of thumb is that if two successive approximations agree to, say, seven digits, then those common digits are accurate (as an approximation to the root). So if you want p digits of accuracy in your approximation, you should compute either until two successive approximations agree to p digits or until some maximum number of iterations is exceeded (in which case Newton's method has failed to find an approximation of the root with the desired accuracy).

- If you write a program for Newton's method, it is a good idea to specify a maximum number of iterations as an escape clause in case the method does not converge.

► Small residuals do not always imply small errors: The function shown below has a zero at $x = 0$. An approximation such as 0.5 has a small residual but a large error.

There is another practical way to gauge the accuracy of approximations. Because Newton’s method generates approximations to a root of f , it follows that as the approximations x_n approach the root, $f(x_n)$ should approach zero. The quantity $f(x_n)$ is called a **residual**, and small residuals usually (but not always) suggest that the approximations have small errors. In Example 1, we find that for the approximations in the second column, $f(x_7) = -1.8 \times 10^{-15}$; for the approximations in the third column, $f(x_7) = 1.1 \times 10^{-16}$; and for the approximations in the fourth column, $f(x_7) = -1.8 \times 10^{-15}$. All these residuals (computed in full precision) are small in magnitude, giving us added confidence that the approximations have small errors.

EXAMPLE 2 Finding intersection points Find the points at which the curves $y = \cos x$ and $y = x$ intersect.

SOLUTION The graphs of two functions g and h intersect at points whose x -coordinates satisfy $g(x) = h(x)$, or, equivalently, where

$$f(x) = g(x) - h(x) = 0.$$

We see that finding intersection points is a root-finding problem. In this case, the intersection points of the curves $y = \cos x$ and $y = x$ satisfy

$$f(x) = \cos x - x = 0.$$

A preliminary graph is advisable to determine the number of intersection points and good initial approximations. From **Figure 4.77a**, we see that the two curves have one intersection point, and its x -coordinate is between 0 and 1. Equivalently, the function f has a zero between 0 and 1 (**Figure 4.77b**). A reasonable initial approximation is $x_0 = 0.5$.

Figure 4.77

Table 4.6

n	x_n	Residual
0	0.5	0.377583
1	0.755222	-0.0271033
2	0.739142	-0.0000946154
3	0.739085	-1.18098×10^{-9}
4	0.739085	0
5	0.739085	0

Newton’s method takes the form

$$x_{n+1} = x_n - \frac{\overbrace{\cos x_n - x_n}^{f(x_n)}}{\underbrace{-\sin x_n - 1}_{f'(x_n)}} = \frac{x_n \sin x_n + \cos x_n}{\sin x_n + 1}.$$

The results of Newton’s method, using an initial approximation of $x_0 = 0.5$, are shown in Table 4.6.

We see that after four iterations, the approximations agree to six digits, so we take 0.739085 as the approximation to the root. Furthermore, the residuals, shown in the last column and computed with full precision, are essentially zero, which confirms the accuracy of the approximation. Therefore, the intersection point is approximately (0.739085, 0.739085) (because the point lies on the line $y = x$).

► A more thorough analysis of the rate at which Newton's method converges and the ways in which it fails to converge is presented in a course in numerical analysis.

Newton's method is widely used because in general, it has a remarkable rate of convergence; the number of digits of accuracy roughly doubles with each iteration.

EXAMPLE 3 Finding Local Extrema Find the x -coordinate of the local maxima and local minima of the function $f(x) = x^5 - x^4 + x^2 - x$ on the interval $(-\infty, \infty)$.

SOLUTION A graph of the function provides some guidance. Figure 4.78 shows that f has a single local maximum on the interval $[-1, 0]$ and a single local minimum on the interval $[0, 1]$.

To locate the local extrema, we must find the critical points by solving

$$f'(x) = 5x^4 - 4x^3 + 2x - 1 = 0.$$

To this equation, we apply Newton's method. The results of the calculations, using initial approximations of $x_0 = -1$ and $x_0 = 1$, are shown in Table 4.7.

Newton's method finds the two critical points quickly, and they are consistent with the graph of f . We conclude that the local maximum occurs at $x \approx -0.683350$ and the local minimum occurs at $x \approx 0.607886$.

Related Exercises 41–42 ◀

Pitfalls of Newton's Method

Given a good initial approximation, Newton's method usually converges to a root. In addition, when the method converges, it usually does so quickly. However, when Newton's method fails, it does so in curious and spectacular ways. The formula for Newton's method suggests one way in which the method could encounter difficulties: The term $f'(x_n)$ appears in a denominator, so if at any step $f'(x_n) = 0$, then the method breaks down. Furthermore, if $f'(x_n)$ is close to zero at any step, then the method may converge slowly or may fail to converge. The following example shows three ways in which Newton's method may go awry.

EXAMPLE 4 Difficulties with Newton's method Find the root of $f(x) = \frac{8x^2}{3x^2 + 1}$ using Newton's method with initial approximations of $x_0 = 1$, $x_0 = 0.15$, and $x_0 = 1.1$.

SOLUTION Notice that f has the single root $x = 0$. So the point of the example is not to find the root, but to investigate the performance of Newton's method. Computing f' and doing a few steps of algebra show that the formula for Newton's method is

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = \frac{x_n}{2} (1 - 3x_n^2).$$

The results of five iterations of Newton's method are displayed in Table 4.8, and they tell three different stories.

Table 4.8

n	x_n	x_n	x_n
0	1	0.15	1.1
1	-1	0.0699375	-1.4465
2	1	0.0344556	3.81665
3	-1	0.0171665	-81.4865
4	1	0.00857564	8.11572×10^5
5	-1	0.00428687	-8.01692×10^{17}

Figure 4.79

The approximations generated using $x_0 = 1$ (second column) get stuck in a cycle that alternates between $+1$ and -1 . The geometry underlying this rare occurrence is illustrated in Figure 4.79.

The approximations generated using $x_0 = 0.15$ (third column) actually converge to the root 0, but they converge slowly (Figure 4.80). Notice that the error is reduced by a factor of approximately 2 with each step. Newton's method usually has a faster rate of error reduction. The slow convergence is due to the fact that both f and f' have zeros at 0. As mentioned earlier, if the approximations x_n approach a zero of f' , the rate of convergence is often compromised.

The approximations generated using $x_0 = 1.1$ (fourth column) increase in magnitude quickly and do not converge to a finite value, even though this initial approximation seems reasonable. The geometry of this case is shown in Figure 4.81.

Figure 4.80

Figure 4.81

The three cases in this example illustrate several ways in which Newton's method may fail to converge at its usual rate: The approximations may cycle or wander, they may converge slowly, or they may diverge (often at a rapid rate).

Related Exercises 50–51 ◀

SECTION 4.8 EXERCISES

Getting Started

1. Give a geometric explanation of Newton's method.
2. Explain how the iteration formula for Newton's method works.
3. A graph of f and the lines tangent to f at $x = 1, 2$, and 3 are given. If $x_0 = 3$, find the values of x_1, x_2 , and x_3 that are obtained by applying Newton's method.

4. A graph of f and the lines tangent to f at $x = -3, 2$, and 3 are given. If $x_0 = 3$, find the values of x_1, x_2 , and x_3 that are obtained by applying Newton's method.

5. Let $f(x) = 2x^3 - 6x^2 + 4x$. Use Newton's method to find x_1 given that $x_0 = 1.4$. Use the graph of f (see figure) and an appropriate tangent line to illustrate how x_1 is obtained from x_0 .

6. The function $f(x) = \frac{4x}{x^2 + 4}$ is differentiable and has a local maximum at $x = 2$, where $f'(2) = 0$ (see figure).
- Use a graphical explanation to show that Newton's method applied to $f(x) = 0$ fails to produce a value x_1 for the initial approximation $x_0 = 2$.
 - Use the formula for Newton's method to show that Newton's method fails to produce a value x_1 with the initial approximation $x_0 = 2$.

7. How do you decide when to terminate Newton's method?
8. Give the formula for Newton's method for the function $f(x) = x^2 - 5$.

T 9–12. Write the formula for Newton's method and use the given initial approximation to compute the approximations x_1 and x_2 .

9. $f(x) = x^2 - 6$; $x_0 = 3$ 10. $f(x) = x^2 - 2x - 3$; $x_0 = 2$
 11. $f(x) = 2 - \tan x$; $x_0 = 1$ 12. $f(x) = x^3 - 2$; $x_0 = 2$

Practice Exercises

T 13–19. Finding roots with Newton's method For the given function f and initial approximation x_0 , use Newton's method to approximate a root of f . Stop calculating approximations when two successive approximations agree to five digits to the right of the decimal point after rounding. Show your work by making a table similar to that in Example 1.

13. $f(x) = x^2 - 10$; $x_0 = 3$
 14. $f(x) = x^3 + x^2 + 1$; $x_0 = -1.5$
 15. $f(x) = \sin x + x - 1$; $x_0 = 0.5$
 16. $f(x) = x^2 - \cos x$; $x_0 = 1.5$
 17. $f(x) = \tan x - 2x$; $x_0 = 1.2$

18. $f(x) = 3 \sin x - 2$; $x_0 = 1$
 19. $f(x) = x^2 - \sqrt{x} - 1$; $x_0 = 2$

T 20–26. Finding all roots Use Newton's method to find all the roots of the following functions. Use preliminary analysis and graphing to determine good initial approximations.

20. $f(x) = \cos x - \frac{x}{7}$ 21. $f(x) = \cos 2x - x^2 + 2x$
 22. $f(x) = \frac{x}{6} - \sec x$ on $[0, 8]$
 23. $f(x) = 2 - \sin x - \sqrt{x}$ 24. $f(x) = \frac{x^5}{5} - \frac{x^3}{4} - \frac{1}{20}$
 25. $f(x) = \cos 3x + \sin 5x + x$
 26. $f(x) = x^2(x - 100) + 1$

T 27–32. Finding intersection points Use Newton's method to approximate all the intersection points of the following pairs of curves. Some preliminary graphing or analysis may help in choosing good initial approximations.

27. $y = \sin x$ and $y = \frac{x}{2}$
 28. $y = -x^3$ and $y = x + 1$
 29. $y = \frac{1}{x}$ and $y = 4 - x^2$
 30. $y = x^3$ and $y = x^2 + 1$
 31. $y = 4\sqrt{x}$ and $y = x^2 + 1$
 32. $y = \sin x$ and $y = \sqrt{x} - 1$

T 33. Retirement account Assume you invest \$10,000 at the end of each year for 30 years at an annual interest rate of r . The amount of money in your account after 30 years is

$$A = \frac{10,000((1+r)^{30} - 1)}{r}. \text{ Assume you want}$$

\$1,000,000 in your account after 30 years.

- Show that the minimum value of r required to meet your investment needs satisfies the equation $1,000,000r - 10,000(1+r)^{30} + 10,000 = 0$.
- Apply Newton's method to solve the equation in part (a) to find the interest rate required to meet your investment goal.

T 34. Investment problem A one-time investment of \$2500 is deposited in a 5-year savings account paying a fixed annual interest rate r , with monthly compounding. The amount of money in the

$$\text{account after 5 years is } A(r) = 2500 \left(1 + \frac{r}{12} \right)^{60}.$$

- Use Newton's method to find the value of r if the goal is to have \$3200 in the account after 5 years.
- Verify your answer to part (a) algebraically.

T 35. Mortgage payments. The monthly payment on a \$200,000, 30-year (360-month) home loan is given by

$$m(r) = \frac{200,000(r/12)}{1 - (1 + r/12)^{-360}},$$

where r is the annual interest rate. Use Newton's method to determine the interest rate r that enables you to make monthly payments of \$1200 per month.

- T 36. The sinc function** The sinc function, $\text{sinc}(x) = \frac{\sin x}{x}$ for $x \neq 0$, $\text{sinc}(0) = 1$, appears frequently in signal-processing applications.
- Graph the sinc function on $[-2\pi, 2\pi]$.
 - Locate the first local minimum and the first local maximum of $\text{sinc}(x)$, for $x > 0$.

T 37–40. Estimating roots The values of various roots can be approximated using Newton's method. For example, to approximate the value of $\sqrt[3]{10}$, we let $x = \sqrt[3]{10}$ and cube both sides of the equation to obtain $x^3 = 10$, or $x^3 - 10 = 0$. Therefore, $\sqrt[3]{10}$ is a root of $p(x) = x^3 - 10$, which we can approximate by applying Newton's method. Approximate each value of r by first finding a polynomial with integer coefficients that has a root r . Use an appropriate value of x_0 and stop calculating approximations when two successive approximations agree to five digits to the right of the decimal point after rounding.

37. $r = 7^{1/4}$

38. $r = 2^{1/3}$

39. $r = (-9)^{1/3}$

40. $r = (-67)^{1/5}$

T 41–44. Newton's method and curve sketching Use Newton's method to find approximate answers to the following questions.

- Where is the first local minimum of $f(x) = \frac{\cos x}{x}$ on the interval $(0, \infty)$ located?
- Where are all the local extrema of $f(x) = 3x^4 + 8x^3 + 12x^2 + 48x$ located?
- Where are the inflection points of $f(x) = \frac{9}{5}x^5 - \frac{15}{2}x^4 + \frac{7}{3}x^3 + 30x^2 + 1$ located?
- Where is the first local maximum of $f(x) = 2x + 5 \cos x$ on the interval $(0, \infty)$ located?
- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - Newton's method is an example of a numerical method for approximating the roots of a function.
 - Newton's method gives better approximations to the roots of a quadratic equation than the quadratic formula.
 - Newton's method always finds an approximate root of a function.

T 46–49. Fixed points An important question about many functions concerns the existence and location of fixed points. A **fixed point** of f is a value of x that satisfies the equation $f(x) = x$; it corresponds to a point at which the graph of f intersects the line $y = x$. Find all the fixed points of the following functions. Use preliminary analysis and graphing to determine good initial approximations.

46. $f(x) = x^3 - 3x^2 + x + 1$

47. $f(x) = \cos x$

48. $f(x) = \tan \frac{x}{2}$ on $(-\pi, \pi)$

49. $f(x) = 2x \cos x$ on $[0, 2]$

Explorations and Challenges

T 50–51. Pitfalls of Newton's method Let $f(x) = \frac{x}{1+x^2}$, which has just one root, $r = 0$.

- Use the initial approximation $x_0 = 1/\sqrt{3}$ to complete the following steps.
 - Use Newton's method to find the exact values of x_1 and x_2 .

- State the values of $x_3, x_4, x_5, \dots$ without performing any additional calculations.
- Use a graph of f to illustrate why Newton's method produces the values found in part (b).
- Why does Newton's method fail to approximate the root $r = 0$ if $x_0 = 1/\sqrt{3}$?

51. Use the initial approximation $x_0 = 2$ to complete the following steps.

- Use Newton's method to find the values of x_1, x_2 , and x_3 .
- Use a graph of f to illustrate why Newton's method produces the values x_1 and x_2 found in part (a).
- Why does Newton's method fail to approximate the root $r = 0$ if $x_0 = 2$?

T 52. Approximating square roots Let $a > 0$ be given and suppose we want to approximate $\sqrt{a}$ using Newton's method.

- Explain why the square root problem is equivalent to finding the positive root of $f(x) = x^2 - a$.
- Show that Newton's method applied to this function takes the form (sometimes called the Babylonian method)

$$x_{n+1} = \frac{1}{2} \left(x_n + \frac{a}{x_n} \right), \text{ for } n = 0, 1, 2, \dots$$

- How would you choose initial approximations to approximate $\sqrt{13}$ and $\sqrt{73}$?
- Approximate $\sqrt{13}$ and $\sqrt{73}$ with at least ten significant digits.

T 53. Approximating reciprocals To approximate the reciprocal of a number a without using division, we can apply Newton's method to the function $f(x) = \frac{1}{x} - a$.

- Verify that Newton's method gives the formula $x_{n+1} = (2 - ax_n)x_n$.
- Apply Newton's method with $a = 7$ using a starting value of your choice. Compute an approximation with eight digits of accuracy. What number does Newton's method approximate in this case?

T 54. Modified Newton's method The function f has a root of multiplicity 2 at r if $f(r) = f'(r) = 0$ and $f''(r) \neq 0$. In this case, a slight modification of Newton's method, known as the *modified* (or *accelerated*) Newton's method, is given by the formula

$$x_{n+1} = x_n - \frac{2f(x_n)}{f'(x_n)}, \text{ for } n = 0, 1, 2, \dots$$

This modified form generally increases the rate of convergence.

- Verify that 1.5 is a root of multiplicity 2 of the function $f(x) = \sin \pi x + 1$.
- Apply Newton's method and the modified Newton's method using $x_0 = 1.25$ to find the value of x_3 in each case. Compare the accuracy of these values of x_3 .
- Consider the function $f(x) = \frac{8x^2}{3x^2 + 1}$ given in Example 4. Use the modified Newton's method to find the value of x_3 using $x_0 = 0.15$. Compare this value to the value of x_3 found in Example 4 with $x_0 = 0.15$.

T 55. An eigenvalue problem A certain kind of differential equation (see Chapter 9) leads to the root-finding problem $\tan \pi \lambda = \lambda$, where the roots λ are called **eigenvalues**. Find the first three positive eigenvalues of this problem.

T 56. Fixed points of quadratics and quartics Let $f(x) = ax(1 - x)$, where a is a real number and $0 \leq x \leq 1$. Recall that the fixed point of a function is a value of x such that $f(x) = x$ (Exercises 46–49).

- Without using a calculator, find the values of a , with $0 < a \leq 4$, such that f has a fixed point. Give the fixed point in terms of a .
- Consider the polynomial $g(x) = f(f(x))$. Write g in terms of a and powers of x . What is its degree?
- Graph g for $a = 2, 3$, and 4 .
- Find the number and location of the fixed points of g for $a = 2, 3$, and 4 on the interval $0 \leq x \leq 1$.

T 57. Basins of attraction Suppose f has a real root r and Newton's method is used to approximate r with an initial approximation x_0 . The **basin of attraction** of r is the set of initial approximations that produce a sequence that converges to r . Points near r are often in the basin of attraction of r —but not always. Sometimes an initial approximation x_0 may produce a sequence that doesn't converge, and sometimes an initial approximation x_0

may produce a sequence that converges to a distant root. Let $f(x) = (x + 2)(x + 1)(x - 3)$, which has roots $x = -2, -1$, and 3 . Use Newton's method with initial approximations on the interval $[-4, 4]$ and determine (approximately) the basin of each root.

T 58. The functions $f(x) = (x - 1)^2$ and $g(x) = x^2 - 1$ both have a root at $x = 1$. Apply Newton's method to both functions with an initial approximation $x_0 = 2$. Compare the rates at which the method converges in these cases, and give an explanation.

QUICK CHECK ANSWERS

- $0 - f(x_n) = f'(x_n)(x - x_n) \Rightarrow -\frac{f(x_n)}{f'(x_n)} = x - x_n \Rightarrow x = x_n - \frac{f(x_n)}{f'(x_n)}$
- Newton's method will find the root $x = 0$ exactly in one step. ◀

4.9 Antiderivatives

The goal of differentiation is to find the derivative f' of a given function f . The reverse process, called *antidifferentiation*, is equally important: Given a function f , we look for an *antiderivative* function F whose derivative is f ; that is, a function F such that $F' = f$.

DEFINITION Antiderivative

A function F is an **antiderivative** of f on an interval I provided $F'(x) = f(x)$, for all x in I .

In this section, we revisit derivative formulas developed in previous chapters to discover corresponding antiderivative formulas.

Thinking Backward

Consider the derivative formula $\frac{d}{dx}(x) = 1$. It implies that an antiderivative of $f(x) = 1$ is $F(x) = x$ because $F'(x) = f(x)$. Using the same logic, we can write

$$\frac{d}{dx}(x^2) = 2x \Rightarrow \text{an antiderivative of } f(x) = 2x \text{ is } F(x) = x^2 \text{ and}$$

$$\frac{d}{dx}(\sin x) = \cos x \Rightarrow \text{an antiderivative of } f(x) = \cos x \text{ is } F(x) = \sin x.$$

QUICK CHECK 1 Verify by differentiation that x^4 is an antiderivative of $4x^3$. ◀

Each of these proposed antiderivative formulas is easily checked by showing that $F' = f$.

An immediate question arises: Does a function have more than one antiderivative? To answer this question, let's focus on $f(x) = 1$ and the antiderivative $F(x) = x$. Because the derivative of a constant C is zero, we see that $F(x) = x + C$ is also an antiderivative of $f(x) = 1$, which is easy to check:

$$F'(x) = \frac{d}{dx}(x + C) = 1 = f(x).$$

Therefore, $f(x) = 1$ actually has an infinite number of antiderivatives. For the same reason, any function of the form $F(x) = x^2 + C$ is an antiderivative of $f(x) = 2x$, and any function of the form $F(x) = \sin x + C$ is an antiderivative of $f(x) = \cos x$, where C is an arbitrary constant.

We might ask whether there are still *more* antiderivatives of a given function. The following theorem provides the answer.

THEOREM 4.14 The Family of Antiderivatives

Let F be any antiderivative of f on an interval I . Then *all* the antiderivatives of f on I have the form $F + C$, where C is an arbitrary constant.

Proof: Suppose F and G are antiderivatives of f on an interval I . Then $F' = f$ and $G' = f$, which implies that $F' = G'$ on I . Theorem 4.6 states that functions with equal derivatives differ by a constant. Therefore, $G = F + C$, and all antiderivatives of f have the form $F + C$, where C is an arbitrary constant. ◀

Theorem 4.14 says that while there are infinitely many antiderivatives of a function, they are all of one family, namely, those functions of the form $F + C$. Because the antiderivatives of a particular function differ by a constant, the antiderivatives are vertical translations of one another (Figure 4.82).

Figure 4.82

EXAMPLE 1 Finding antiderivatives Use what you know about derivatives to find all antiderivatives of the following functions.

- a. $f(x) = 3x^2$ b. $f(x) = -\frac{9}{x^{10}}$ c. $f(t) = \sin t$

SOLUTION

- a. Note that $\frac{d}{dx}(x^3) = 3x^2$. Therefore, an antiderivative of $f(x) = 3x^2$ is x^3 . By

Theorem 4.14, the complete family of antiderivatives is $F(x) = x^3 + C$, where C is an arbitrary constant.

- b. Because $\frac{d}{dx}(x^{-9}) = -9x^{-10} = -\frac{9}{x^{10}}$, all antiderivatives of f are of the form $F(x) = x^{-9} + C$, where C is an arbitrary constant.

- c. Recall that $\frac{d}{dt}(\cos t) = -\sin t$. We seek a function whose derivative is $\sin t$, not

$-\sin t$. Observing that $\frac{d}{dt}(-\cos t) = \sin t$, it follows that the antiderivatives of $\sin t$ are $F(t) = -\cos t + C$, where C is an arbitrary constant.

QUICK CHECK 2 Find the family of antiderivatives for each of $f(x) = \frac{1}{2\sqrt{x}}$, $g(x) = 4x^3$, and $h(x) = \sec^2 x$. ◀

Related Exercises 12–13, 17 ◀

Indefinite Integrals

The notation $\frac{d}{dx}(f(x))$ means *take the derivative of $f(x)$ with respect to x* . We need analogous notation for antiderivatives. For historical reasons that become apparent in the next chapter, the notation that means *find the antiderivatives of f* is the **indefinite integral** $\int f(x) dx$. Every time an indefinite integral sign $\int$ appears, it is followed by a function called the **integrand**, which in turn is followed by the differential dx . For now, dx simply means that x is the independent variable, or the **variable of integration**. The notation $\int f(x) dx$ represents *all* the antiderivatives of f . When the integrand is a function of a variable different from x —say, $g(t)$ —we write $\int g(t) dt$ to represent the antiderivatives of g .

Using this new notation, the three results of Example 1 are written

$$\int 3x^2 dx = x^3 + C, \quad \int \left(-\frac{9}{x^{10}}\right) dx = x^{-9} + C, \quad \text{and} \quad \int \sin t dt = -\cos t + C,$$

where C is an arbitrary constant called a **constant of integration**. The derivative formulas presented earlier in the text may be written in terms of indefinite integrals. We begin with the Power Rule.

- Notice that if $p = -1$ in Theorem 4.15, then $F(x)$ is undefined. The antiderivative of $f(x) = x^{-1}$ is discussed in Chapter 7. The case $p = 0$ says that $\int 1 dx = x + C$.

THEOREM 4.15 Power Rule for Indefinite Integrals

$$\int x^p dx = \frac{x^{p+1}}{p+1} + C,$$

where $p \neq -1$ is a real number and C is an arbitrary constant.

Proof: The theorem says that the antiderivatives of $f(x) = x^p$ have the form $F(x) = \frac{x^{p+1}}{p+1} + C$. Differentiating F , we verify that $F'(x) = f(x)$, provided $p \neq -1$:

$$\begin{aligned} F'(x) &= \frac{d}{dx} \left(\frac{x^{p+1}}{p+1} + C \right) \\ &= \frac{d}{dx} \left(\frac{x^{p+1}}{p+1} \right) + \underbrace{\frac{d}{dx}(C)}_0 \\ &= \frac{(p+1)x^{(p+1)-1}}{p+1} + 0 = x^p. \end{aligned}$$

- Any indefinite integral calculation can be checked by differentiation: The derivative of the alleged indefinite integral must equal the integrand.

Theorems 3.4 and 3.5 (Section 3.3) state the Constant Multiple and Sum Rules for derivatives. Here are the corresponding antiderivative rules, which are proved by differentiation.

THEOREM 4.16 Constant Multiple and Sum Rules

Constant Multiple Rule: $\int cf(x) dx = c \int f(x) dx$, for real numbers c

Sum Rule: $\int (f(x) + g(x)) dx = \int f(x) dx + \int g(x) dx$

The following example shows how Theorems 4.15 and 4.16 are used.

EXAMPLE 2 Indefinite integrals Determine the following indefinite integrals.

a. $\int (3x^5 + 2 - 5\sqrt{x}) dx$ b. $\int \left(\frac{4x^{19} - 5x^{-8}}{x^2} \right) dx$ c. $\int (z^2 + 1)(2z - 5) dz$

► $\int dx$ means $\int 1 dx$, which is the indefinite integral of the constant function $f(x) = 1$, so $\int dx = x + C$.

► Each indefinite integral in Example 2a produces an arbitrary constant, all of which may be combined in one arbitrary constant called C .

► Examples 2b and 2c show that in general, the indefinite integral of a product or quotient is not the product or quotient of indefinite integrals.

SOLUTION

$$\begin{aligned} \text{a. } \int (3x^5 + 2 - 5\sqrt{x}) dx &= \int 3x^5 dx + \int 2 dx - \int 5x^{1/2} dx && \text{Sum Rule} \\ &= 3 \int x^5 dx + 2 \int dx - 5 \int x^{1/2} dx && \text{Constant Multiple Rule} \\ &= 3 \cdot \frac{x^6}{6} + 2 \cdot x - 5 \cdot \frac{x^{3/2}}{3/2} + C && \text{Power Rule} \\ &= \frac{x^6}{2} + 2x - \frac{10}{3} x^{3/2} + C && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{b. } \int \left(\frac{4x^{19} - 5x^{-8}}{x^2} \right) dx &= \int (4x^{17} - 5x^{-10}) dx && \text{Simplify the integrand.} \\ &= 4 \int x^{17} dx - 5 \int x^{-10} dx && \text{Sum and Constant Multiple Rules} \\ &= 4 \cdot \frac{x^{18}}{18} - 5 \cdot \frac{x^{-9}}{-9} + C && \text{Power Rule} \\ &= \frac{2x^{18}}{9} + \frac{5x^{-9}}{9} + C && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{c. } \int (z^2 + 1)(2z - 5) dz &= \int (2z^3 - 5z^2 + 2z - 5) dz && \text{Expand integrand.} \\ &= \frac{1}{2} z^4 - \frac{5}{3} z^3 + z^2 - 5z + C && \text{Integrate each term.} \end{aligned}$$

All these results should be checked by differentiation.

Related Exercises 24, 25, 31, 35 ◀

Indefinite Integrals of Trigonometric Functions

We used a familiar derivative formula in Example 1c to find the antiderivative of $\sin x$. Our goal in this section is to write the other derivative results for trigonometric functions as indefinite integrals.

EXAMPLE 3 Indefinite integrals of trigonometric functions Evaluate the following indefinite integrals.

$$\text{a. } \int \sec^2 x dx \qquad \text{b. } \int (2x + 3 \cos x) dx \qquad \text{c. } \int \frac{\sin x}{\cos^2 x} dx$$

SOLUTION

a. The derivative result $\frac{d}{dx}(\tan x) = \sec^2 x$ is reversed to produce the indefinite integral

$$\int \sec^2 x dx = \tan x + C.$$

b. We first split the integral into two integrals using Theorem 4.16:

$$\int (2x + 3 \cos x) dx = 2 \int x dx + 3 \int \cos x dx. \quad \text{Sum and Constant Multiple Rules}$$

The first of these new integrals is handled by the Power Rule, and the second integral is evaluated by reversing the derivative result $\frac{d}{dx}(\sin x) = \cos x$:

$$\begin{aligned} 2 \int x dx + 3 \int \cos x dx &= 2 \cdot \frac{x^2}{2} + 3 \sin x + C && \text{Power Rule; } \frac{d}{dx}(\sin x) = \cos x \Rightarrow \\ & && \int \cos x dx = \sin x + C \\ &= x^2 + 3 \sin x + C. && \text{Simplify.} \end{aligned}$$

c. When we rewrite the integrand, a familiar derivative formula emerges:

$$\begin{aligned}\int \frac{\sin x}{\cos^2 x} dx &= \int \underbrace{\frac{1}{\cos x}}_{\sec x} \cdot \underbrace{\frac{\sin x}{\cos x}}_{\tan x} dx \\ &= \int \sec x \tan x dx && \text{Rewrite the integrand.} \\ &= \sec x + C. && \begin{aligned} \frac{d}{dx}(\sec x) &= \sec x \tan x \Rightarrow \\ \int \sec x \tan x dx &= \sec x + C \end{aligned}\end{aligned}$$

Related Exercises 40, 41, 47 ◀

The ideas illustrated in Example 3 are used to obtain the integrals in Table 4.9, where we assume C is an arbitrary constant. Example 4 provides additional integrals involving trigonometric functions.

Table 4.9 Indefinite Integrals of Trigonometric Functions

1.	$\frac{d}{dx}(\sin x) = \cos x \Rightarrow \int \cos x dx = \sin x + C$
2.	$\frac{d}{dx}(\cos x) = -\sin x \Rightarrow \int \sin x dx = -\cos x + C$
3.	$\frac{d}{dx}(\tan x) = \sec^2 x \Rightarrow \int \sec^2 x dx = \tan x + C$
4.	$\frac{d}{dx}(\cot x) = -\csc^2 x \Rightarrow \int \csc^2 x dx = -\cot x + C$
5.	$\frac{d}{dx}(\sec x) = \sec x \tan x \Rightarrow \int \sec x \tan x dx = \sec x + C$
6.	$\frac{d}{dx}(\csc x) = -\csc x \cot x \Rightarrow \int \csc x \cot x dx = -\csc x + C$

QUICK CHECK 3 Use differentiation to verify result 6 in Table 4.9:

$$\int \csc x \cot x dx = -\csc x + C. \blacktriangleleft$$

EXAMPLE 4 Indefinite integrals involving trigonometric functions Determine the following indefinite integrals.

$$\text{a. } \int \left(\frac{2}{\pi} \sin x - 2 \csc^2 x \right) dx \qquad \text{b. } \int \frac{4 \cos x + \sin^2 x}{\sin^2 x} dx$$

SOLUTION

a. Splitting up the integral (Theorem 4.16) and then using Table 4.9, we have

$$\begin{aligned}\int \left(\frac{2}{\pi} \sin x - 2 \csc^2 x \right) dx &= \frac{2}{\pi} \int \sin x dx - 2 \int \csc^2 x dx && \text{Sum and Constant Multiple Rules} \\ &= \frac{2}{\pi} (-\cos x) - 2(-\cot x) + C && \text{Results (2) and (4), Table 4.16} \\ &= 2 \cot x - \frac{2}{\pi} \cos x + C. && \text{Simplify.}\end{aligned}$$

b. Again, we split up the integral and then rewrite the first term in the integrand so that it matches result (6) in Table 4.9:

$$\begin{aligned}\int \frac{4 \cos x + \sin^2 x}{\sin^2 x} dx &= \int \left(\underbrace{\frac{4}{\sin x}}_{4 \csc x} \cdot \underbrace{\frac{\cos x}{\sin x}}_{\cot x} + \underbrace{\frac{\sin^2 x}{\sin^2 x}}_1 \right) dx \\ &= 4 \int \csc x \cot x dx + \int dx && \text{Rewrite the integrand; Theorem 4.16.} \\ &= -4 \csc x + x + C. && \text{Result (6), Table 4.9; } \int dx = x + C\end{aligned}$$

Related Exercises 45, 50 ◀

Introduction to Differential Equations

An equation involving an unknown function and its derivatives is called a **differential equation**. Here is an example to get us started.

Suppose you know that the derivative of a function f satisfies the equation

$$f'(x) = 2x + 10.$$

To find a function f that satisfies this equation, we note that the solutions are antiderivatives of $2x + 10$, which are $x^2 + 10x + C$, where C is an arbitrary constant. So we have found an infinite number of solutions, all of the form $f(x) = x^2 + 10x + C$.

Now consider a more general differential equation of the form $f'(x) = g(x)$, where g is given and f is unknown. The solution f consists of the antiderivatives of g , which involve an arbitrary constant. In most practical cases, the differential equation is accompanied by an **initial condition** that allows us to determine the arbitrary constant. Therefore, we consider problems of the form

$$\begin{aligned} f'(x) &= g(x), & \text{where } g \text{ is given, and} & & \text{Differential equation} \\ f(a) &= b, & \text{where } a \text{ and } b \text{ are given.} & & \text{Initial condition} \end{aligned}$$

A differential equation coupled with an initial condition is called an **initial value problem**.

EXAMPLE 5 Initial value problems Solve the following initial value problems.

- a. $f'(x) = x^2 - 2x$; $f(1) = \frac{1}{3}$ b. $f'(t) = 1 - \frac{1}{t^2}$; $f(1) = 0$
 c. Solve the differential equation in part (b) using the initial condition $f(-1) = -2$.

SOLUTION

- a. The solution f is an antiderivative of $x^2 - 2x$. Therefore,

$$f(x) = \frac{x^3}{3} - x^2 + C,$$

where C is an arbitrary constant. We have determined that the solution is a member of a family of functions, all of which differ by a constant. This family of functions, called the **general solution**, is shown in Figure 4.83, where we see curves for various choices of C .

Using the initial condition $f(1) = \frac{1}{3}$, we must find the particular function in the general solution whose graph passes through the point $(1, \frac{1}{3})$. Imposing the condition $f(1) = \frac{1}{3}$, we reason as follows:

$$f(x) = \frac{x^3}{3} - x^2 + C \quad \text{General solution}$$

$$f(1) = \frac{1}{3} - 1 + C \quad \text{Substitute } x = 1.$$

$$\frac{1}{3} = \frac{1}{3} - 1 + C \quad f(1) = \frac{1}{3}$$

$$C = 1. \quad \text{Solve for } C.$$

Therefore, the solution to the initial value problem is

$$f(x) = \frac{x^3}{3} - x^2 + 1,$$

which is just one of the curves in the family shown in Figure 4.83.

- b. By the Power Rule (Theorem 4.15), an antiderivative of $1 - 1/t^2$ is $t + 1/t$. Therefore, the family of functions

$$f(t) = t + \frac{1}{t} + C$$

represents the general solution of the differential equation. Figure 4.84 shows several members of this family for various values of C ; notice that for each value of C ,

QUICK CHECK 4 Explain why an antiderivative of f' is f . ◀

Figure 4.83

► It is advisable to check that the solution satisfies the original problem: $f'(x) = x^2 - 2x$ and $f(1) = \frac{1}{3} - 1 + 1 = \frac{1}{3}$.

the graph of f has two branches. The initial condition $f(1) = 0$ determines the value of C :

$$f(t) = t + \frac{1}{t} + C \quad \text{General solution}$$

$$f(1) = 1 + 1 + C \quad \text{Substitute } t = 1.$$

$$0 = 2 + C \quad f(1) = 0$$

$$C = -2 \quad \text{Solve for } C.$$

► Because $f(t) = t + \frac{1}{t} - 2$ is undefined at $t = 0$, it cannot be considered a solution to Example 5b over its entire domain. As discussed in Chapter 9, a solution to an initial value problem is a differentiable function defined on a single interval.

Substituting $C = -2$ into the general solution gives $f(t) = t + \frac{1}{t} - 2$. However, only the right branch of the curve $y = t + \frac{1}{t} - 2$ passes through the point $(1, 0)$ specified by the initial condition (Figure 4.84, quadrant I). Restricting the domain of f to reflect this fact, we find that the solution to the initial value problem is

$$f(t) = t + \frac{1}{t} - 2, \quad t > 0.$$

Figure 4.84

- c. Using the general solution from part (b) and the initial condition $f(-1) = -2$ leads to $f(-1) = -1 - 1 + C = -2$, which implies that $C = 0$. Substituting this value into the general solution yields $f(t) = t + \frac{1}{t}$, but just as we saw in part (b), an additional restriction is needed because only the left branch of the curve $y = t + \frac{1}{t}$ passes through the point $(-1, -2)$ (Figure 4.84, quadrant III). The solution to this initial value problem is

$$f(t) = t + \frac{1}{t}, \quad t < 0.$$

Related Exercises 62, 68 ◀

QUICK CHECK 5 Position is an antiderivative of velocity. But there are infinitely many antiderivatives that differ by a constant. Explain how two objects can have the same velocity function but two different position functions. ◀

► The convention with motion problems is to assume that motion begins at $t = 0$. This means that initial conditions are specified at $t = 0$.

Motion Problems Revisited

Antiderivatives allow us to revisit the topic of one-dimensional motion introduced in Section 3.6. Suppose the position of an object that moves along a line relative to an origin is $s(t)$, where $t \geq 0$ measures elapsed time. The velocity of the object is $v(t) = s'(t)$, which may now be read in terms of antiderivatives: *The position function is an antiderivative of the velocity.* If we are given the velocity function of an object and its position at a particular time, we can determine its position at all future times by solving an initial value problem.

We also know that the acceleration $a(t)$ of an object moving in one dimension is the rate of change of the velocity, which means $a(t) = v'(t)$. In antiderivative terms, this says that the velocity is an antiderivative of the acceleration. Therefore, if we are given the

acceleration of an object and its velocity at a particular time, we can determine its velocity at all times. These ideas lie at the heart of modeling the motion of objects.

Initial Value Problems for Velocity and Position

Suppose an object moves along a line with a (known) velocity $v(t)$, for $t \geq 0$. Then its position is found by solving the initial value problem

$$s'(t) = v(t), \quad s(0) = s_0, \quad \text{where } s_0 \text{ is the (known) initial position.}$$

If the (known) acceleration of the object $a(t)$ is given, then its velocity is found by solving the initial value problem

$$v'(t) = a(t), \quad v(0) = v_0, \quad \text{where } v_0 \text{ is the (known) initial velocity.}$$

EXAMPLE 6 A race Runner A begins at the point $s(0) = 0$ and runs on a straight and level road with velocity $v(t) = 2t$. Runner B begins with a head start at the point $S(0) = 8$ and runs with velocity $V(t) = 2$. Find the positions of the runners for $t \geq 0$ and determine who is ahead at $t = 6$ time units.

SOLUTION Let the position of Runner A be $s(t)$, with an initial position $s(0) = 0$. Then the position function satisfies the initial value problem

$$s'(t) = 2t, \quad s(0) = 0.$$

The solution is an antiderivative of $s'(t) = 2t$, which has the form $s(t) = t^2 + C$. Substituting $s(0) = 0$, we find that $C = 0$. Therefore, the position of Runner A is given by $s(t) = t^2$, for $t \geq 0$.

Let the position of Runner B be $S(t)$, with an initial position $S(0) = 8$. This position function satisfies the initial value problem

$$S'(t) = 2, \quad S(0) = 8.$$

The antiderivatives of $S'(t) = 2$ are $S(t) = 2t + C$. Substituting $S(0) = 8$ implies that $C = 8$. Therefore, the position of Runner B is given by $S(t) = 2t + 8$, for $t \geq 0$.

The graphs of the position functions are shown in **Figure 4.85**. Runner B begins with a head start but is overtaken when $s(t) = S(t)$, or when $t^2 = 2t + 8$. The solutions of this equation are $t = 4$ and $t = -2$. Only the positive solution is relevant because the race takes place for $t \geq 0$, so Runner A overtakes Runner B at $t = 4$, when $s = S = 16$. When $t = 6$, Runner A has the lead.

Related Exercises 87–88 ◀

Figure 4.85

Figure 4.86

EXAMPLE 7 Motion with gravity Neglecting air resistance, the motion of an object moving vertically near Earth's surface is determined by the acceleration due to gravity, which is approximately 9.8 m/s^2 . Suppose a stone is thrown vertically upward at $t = 0$ with a velocity of 40 m/s from the edge of a cliff that is 100 m above a river.

- Find the velocity $v(t)$ of the object, for $t \geq 0$.
- Find the position $s(t)$ of the object, for $t \geq 0$.
- Find the maximum height of the object above the river.
- With what speed does the object strike the river?

SOLUTION We establish a coordinate system in which the positive s -axis points vertically upward with $s = 0$ corresponding to the river (**Figure 4.86**). Let $s(t)$ be the position of the stone measured relative to the river, for $t \geq 0$. The initial velocity of the stone is $v(0) = 40 \text{ m/s}$ and the initial position of the stone is $s(0) = 100 \text{ m}$.

- The acceleration due to gravity points in the *negative* s -direction. Therefore, the initial value problem governing the motion of the object is

$$\text{acceleration} = v'(t) = -9.8, \quad v(0) = 40.$$

- The acceleration due to gravity at Earth's surface is approximately $g = 9.8 \text{ m/s}^2$, or $g = 32 \text{ ft/s}^2$. It varies (even at sea level) from about 9.8640 at the poles to 9.7982 at the equator. The equation $v'(t) = -g$ is an instance of Newton's Second Law of Motion and assumes no other forces (such as air resistance) are present.

Figure 4.87

The antiderivatives of -9.8 are $v(t) = -9.8t + C$. The initial condition $v(0) = 40$ gives $C = 40$. Therefore, the velocity of the stone is

$$v(t) = -9.8t + 40.$$

As shown in Figure 4.87, the velocity decreases from its initial value $v(0) = 40$ until it reaches zero at the high point of the trajectory. This point is reached when

$$v(t) = -9.8t + 40 = 0$$

or when $t \approx 4.1$ s. For $t > 4.1$, the velocity is negative and increases in magnitude as the stone falls to Earth.

- b. Knowing the velocity function of the stone, we can determine its position. The position function satisfies the initial value problem

$$v(t) = s'(t) = -9.8t + 40, \quad s(0) = 100.$$

The antiderivatives of $-9.8t + 40$ are

$$s(t) = -4.9t^2 + 40t + C.$$

The initial condition $s(0) = 100$ implies $C = 100$, so the position function of the stone is

$$s(t) = -4.9t^2 + 40t + 100,$$

as shown in Figure 4.88. The parabolic graph of the position function is not the actual trajectory of the stone; the stone moves vertically along the s -axis.

- c. The position function of the stone increases for $0 < t < 4.1$. At $t \approx 4.1$, the stone reaches a high point of $s(4.1) \approx 182$ m.
- d. For $t > 4.1$, the position function decreases, and the stone strikes the river when $s(t) = 0$. The roots of this equation are $t \approx 10.2$ and $t \approx -2.0$. Only the first root is relevant because the motion starts at $t = 0$. Therefore, the stone strikes the ground at $t \approx 10.2$ s. Its speed (in m/s) at this instant is $|v(10.2)| \approx |-60| = 60$.

Figure 4.88

Related Exercises 89–90 ◀

SECTION 4.9 EXERCISES

Getting Started

- Fill in the blanks with either of the words *the derivative* or *an antiderivative*: If $F'(x) = f(x)$, then f is _____ of F , and F is _____ of f .
- Describe the set of antiderivatives of $f(x) = 0$.
- Describe the set of antiderivatives of $f(x) = 1$.
- Why do two different antiderivatives of a function differ by a constant?
- Give the antiderivatives of x^p . For what values of p does your answer apply?

6. Give the antiderivatives of $a \csc^2 x$, where a is a constant.
7. Give the antiderivatives of $1/x^2$.
8. Evaluate $\int a \cos x \, dx$ and $\int a \sin x \, dx$, where a is a constant.
9. If $F(x) = x^2 - 3x + C$ and $F(-1) = 4$, what is the value of C ?
10. For a given function f , explain the steps used to solve the initial value problem $F'(t) = f(t)$, $F(0) = 10$.

Practice Exercises

11–22. Finding antiderivatives Find all the antiderivatives of the following functions. Check your work by taking derivatives.

11. $f(x) = 5x^4$ 12. $g(x) = 11x^{10}$
13. $f(x) = 2 \sin x + 1$ 14. $g(x) = -4 \cos x - x$
15. $p(x) = 3 \sec^2 x$ 16. $q(s) = \csc^2 s$
17. $f(y) = -\frac{2}{y^3}$ 18. $h(z) = -6z^{-7}$
19. $f(x) = \frac{1}{\sqrt{x}}$ 20. $h(y) = \sqrt[3]{y}$
21. $f(x) = \frac{7}{2}x^{5/2}$ 22. $f(t) = \pi$

23–54. Indefinite integrals Determine the following indefinite integrals. Check your work by differentiation.

23. $\int (3x^5 - 5x^9) \, dx$ 24. $\int (3u^{-2} - 4u^2 + 1) \, du$
25. $\int \left(4\sqrt{x} - \frac{4}{\sqrt{x}} \right) dx$ 26. $\int \left(\frac{5}{t^2} + 4t^2 \right) dt$
27. $\int (5s + 3)^2 \, ds$ 28. $\int 5m(12m^3 - 10m) \, dm$
29. $\int (3x^{1/3} + 4x^{-1/3} + 6) \, dx$ 30. $\int 5\sqrt[4]{x} \, dx$
31. $\int (3x + 1)(4 - x) \, dx$ 32. $\int (4z^{1/3} - z^{-1/3}) \, dz$
33. $\int \left(\frac{3}{x^4} + 2 - \frac{3}{x^2} \right) dx$ 34. $\int \sqrt[5]{r^2} \, dr$
35. $\int \frac{4x^4 - 6x^2}{x} \, dx$ 36. $\int \frac{12t^8 - t}{t^{3/2}} \, dt$
37. $\int \frac{x^2 - 36}{x - 6} \, dx$ 38. $\int \frac{y^3 - 9y^2 + 20y}{y - 4} \, dy$
39. $\int (\csc^2 \theta + 2\theta^2 - 3\theta) \, d\theta$ 40. $\int (\csc^2 \theta + 1) \, d\theta$
41. $\int \frac{2 + 3 \cos y}{\sin^2 y} \, dy$ 42. $\int \sin t(4 \csc t - \cot t) \, dt$
43. $\int (\sec^2 x - 1) \, dx$ 44. $\int \frac{\sec^3 v - \sec^2 v}{\sec v - 1} \, dv$
45. $\int (\sec^2 \theta + \sec \theta \tan \theta) \, d\theta$ 46. $\int \frac{\sin \theta - 1}{\cos^2 \theta} \, d\theta$
47. $\int (3t^2 + 2 \csc^2 t) \, dt$ 48. $\int \csc x(\cot x - \csc x) \, dx$
49. $\int \sec \theta(\tan \theta + \sec \theta + \cos \theta) \, d\theta$
50. $\int \frac{\csc^3 x + 1}{\csc x} \, dx$ 51. $\int \frac{\tan x + \sec x}{\sec x} \, dx$

52. $\int (\sqrt[3]{x^2} + \sqrt{x^3}) \, dx$ 53. $\int \sqrt{x} (2x^6 - 4\sqrt[3]{x}) \, dx$

54. $\int \frac{16 \cos^2 w - 81 \sin^2 w}{4 \cos w - 9 \sin w} \, dw$

55–60. Particular antiderivatives For the following functions f , find the antiderivative F that satisfies the given condition.

55. $f(x) = x^5 - 2x^2 + 1$; $F(0) = 1$
56. $f(x) = 4\sqrt{x} + 6$; $F(1) = 8$
57. $f(x) = 8x^3 + \sin x$; $F(0) = 2$
58. $f(t) = \sec^2 t$; $F(\pi/4) = 1$, $-\pi/2 < t < \pi/2$
59. $f(v) = \sec v \tan v$; $F(0) = 2$, $-\pi/2 < v < \pi/2$
60. $f(\theta) = 2 \sin \theta - 4 \cos \theta$; $F\left(\frac{\pi}{4}\right) = 2$

61–68. Solving initial value problems Find the solution of the following initial value problems.

61. $f'(x) = 2x - 3$; $f(0) = 4$
62. $g'(x) = 7x^6 - 4x^3 + 12$; $g(1) = 24$
63. $g'(x) = 7x\left(x^6 - \frac{1}{7}\right)$; $g(1) = 2$
64. $h'(t) = 1 + 6 \sin t$; $h\left(\frac{\pi}{3}\right) = -3$
65. $f'(u) = 4(\cos u - \sin u)$; $f\left(\frac{\pi}{2}\right) = 0$
66. $f'(x) = \sin x + \cos x + 1$; $f(\pi) = 3$
67. $y'(\theta) = \frac{\sqrt{2} \cos^3 \theta + 1}{\cos^2 \theta}$; $y\left(\frac{\pi}{4}\right) = 3$, $-\pi/2 < \theta < \pi/2$
68. $v'(x) = 4x^{1/3} + 2x^{-1/3}$; $v(8) = 40$, $x > 0$

69–72. Graphing general solutions Graph several functions that satisfy each of the following differential equations. Then find and graph the particular function that satisfies the given initial condition.

69. $f'(x) = 2x - 5$; $f(0) = 4$
70. $f'(x) = 3x^2 - 1$; $f(1) = 2$
71. $f'(x) = 3x + \sin x$; $f(0) = 3$
72. $f'(x) = \cos x - \sin x + 2$; $f(0) = 1$

73–78. Velocity to position Given the following velocity functions of an object moving along a line, find the position function with the given initial position.

73. $v(t) = 2t + 4$; $s(0) = 0$ 74. $v(t) = 5$; $s(0) = 4$
75. $v(t) = 2\sqrt{t}$; $s(0) = 1$ 76. $v(t) = 2 \cos t$; $s(0) = 0$
77. $v(t) = 6t^2 + 4t - 10$; $s(0) = 0$
78. $v(t) = 4t + \sin t$; $s(0) = 0$

79–84. Acceleration to position Given the following acceleration functions of an object moving along a line, find the position function with the given initial velocity and position.

79. $a(t) = -32$; $v(0) = 20$, $s(0) = 0$
80. $a(t) = 4$; $v(0) = -3$, $s(0) = 2$
81. $a(t) = 0.2t$; $v(0) = 0$, $s(0) = 1$

82. $a(t) = 2 \cos t$; $v(0) = 1$, $s(0) = 0$
83. $a(t) = 2 + 3 \sin t$; $v(0) = 1$, $s(0) = 10$
84. $a(t) = -9.8$; $v(0) = 5$, $s(0) = 0$
85. A car starting at rest accelerates at 16 ft/s^2 for 5 seconds on a straight road. How far does it travel during this time?
86. A car is moving at 60 mi/hr (88 ft/s) on a straight road when the driver steps on the brake pedal and begins decelerating at a constant rate of 10 ft/s^2 for 3 seconds. How far did the car go during this 3-second interval?

87–88. Races The velocity function and initial position of Runners A and B are given. Analyze the race that results by graphing the position functions of the runners and finding the time and positions (if any) at which they first pass each other.

87. A: $v(t) = \sin t$; $s(0) = 0$ B: $V(t) = \cos t$; $S(0) = 0$

88. A: $v(t) = 2t$; $s(0) = 0$ B: $V(t) = 3\sqrt{t}$; $S(0) = 0$

T 89–92. Motion with gravity Consider the following descriptions of the vertical motion of an object subject only to the acceleration due to gravity. Begin with the acceleration equation $a(t) = v'(t) = -g$, where $g = 9.8 \text{ m/s}^2$.

- Find the velocity of the object for all relevant times.
- Find the position of the object for all relevant times.
- Find the time when the object reaches its highest point. What is the height?
- Find the time when the object strikes the ground.

89. A softball is popped up vertically (from the ground) with a velocity of 30 m/s .

90. A stone is thrown vertically upward with a velocity of 30 m/s from the edge of a cliff 200 m above a river.

91. A payload is released at an elevation of 400 m from a hot-air balloon that is rising at a rate of 10 m/s .

92. A payload is dropped at an elevation of 400 m from a hot-air balloon that is descending at a rate of 10 m/s .

93. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- $F(x) = x^3 - 4x + 100$ and $G(x) = x^3 - 4x - 100$ are antiderivatives of the same function.
- If $f'(x) = f(x)$, then f is an antiderivative of F .
- If $f'(x) = f(x)$, then $\int f(x) dx = F(x) + C$.
- $f(x) = x^3 + 3$ and $g(x) = x^3 - 4$ are derivatives of the same function.
- If $F'(x) = G'(x)$, then $F(x) = G(x)$.

Explorations and Challenges

94–97. Functions from higher derivatives Find the function F that satisfies the following differential equations and initial conditions.

94. $F''(x) = 1$; $F'(0) = 3$, $F(0) = 4$

95. $F''(x) = \cos x$; $F'(0) = 3$, $F(\pi) = 4$

96. $F'''(x) = 4x$; $F''(0) = 0$, $F'(0) = 1$, $F(0) = 3$

97. $F'''(x) = 672x^5 + 24x$; $F''(0) = 0$, $F'(0) = 2$, $F(0) = 1$

98. Mass on a spring A mass oscillates up and down on the end of a spring. Find its position s relative to the equilibrium position if its acceleration is $a(t) = 2 \sin t$ and its initial velocity and position are $v(0) = 3$ and $s(0) = 0$, respectively.

99. Flow rate A large tank is filled with water when an outflow valve is opened at $t = 0$. Water flows out at a rate, in gal/min, given by $Q'(t) = 0.1(100 - t^2)$, for $0 \leq t \leq 10$.

- Find the amount of water $Q(t)$ that has flowed out of the tank after t minutes, given the initial condition $Q(0) = 0$.
- Graph the flow function Q , for $0 \leq t \leq 10$.
- How much water flows out of the tank in 10 min?

100. General head start problem Suppose object A is located at $s = 0$ at time $t = 0$ and starts moving along the s -axis with a velocity given by $v(t) = 2at$, where $a > 0$. Object B is located at $s = c > 0$ at $t = 0$ and starts moving along the s -axis with a constant velocity given by $V(t) = b > 0$. Show that A always overtakes B at time

$$t = \frac{b + \sqrt{b^2 + 4ac}}{2a}.$$

101–104. Verifying indefinite integrals Verify the following indefinite integrals by differentiation. These integrals are derived in later chapters.

101. $\int \frac{\cos \sqrt{x}}{\sqrt{x}} dx = 2 \sin \sqrt{x} + C$

102. $\int \frac{x}{\sqrt{x^2 + 1}} dx = \sqrt{x^2 + 1} + C$

103. $\int x^2 \cos x^3 dx = \frac{1}{3} \sin x^3 + C$

104. $\int \frac{x}{(x^2 - 1)^2} dx = -\frac{1}{2(x^2 - 1)} + C$

QUICK CHECK ANSWERS

- $d/dx(x^4) = 4x^3$
- $\sqrt{x} + C$, $x^4 + C$, $\tan x + C$
- $d/dx(-\csc x + C) = \csc x \cot x$
- One function that can be differentiated to get f' is f . Therefore, f is an antiderivative of f' .
- The two position functions involve two different initial positions; they differ by a constant. ◀

CHAPTER 4 REVIEW EXERCISES

1. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- If $f'(c) = 0$, then f has a local minimum or maximum at c .
- If $f''(c) = 0$, then f has an inflection point at c .
- $F(x) = x^2 + 10$ and $G(x) = x^2 - 100$ are antiderivatives of the same function.

d. Between two local minima of a function continuous on $(-\infty, \infty)$, there must be a local maximum.

e. The linear approximation to $f(x) = \sin x$ at $x = 0$ is $L(x) = x$.

f. If $\lim_{x \rightarrow \infty} f(x) = \infty$ and $\lim_{x \rightarrow \infty} g(x) = \infty$, then

$$\lim_{x \rightarrow \infty} (f(x) - g(x)) = 0.$$

- 2. Locating extrema** Consider the graph of a function f on the interval $[-3, 3]$.
- Give the approximate coordinates of the local maxima and minima of f .
 - Give the approximate coordinates of the absolute maximum and minimum values of f (if they exist).
 - Give the approximate coordinates of the inflection point(s) of f .
 - Give the approximate coordinates of the zero(s) of f .
 - On what intervals (approximately) is f concave up?
 - On what intervals (approximately) is f concave down?

3–4. Designer functions Sketch the graph of a function continuous on the given interval that satisfies the following conditions.

- f is continuous on the interval $[-4, 4]$; $f'(x) = 0$ for $x = -2, 0$, and 3 ; f has an absolute minimum at $x = 3$; f has a local minimum at $x = -2$; f has a local maximum at $x = 0$; f has an absolute maximum at $x = -4$.
- f is continuous on $(-\infty, \infty)$; $f'(x) < 0$ and $f''(x) < 0$ on $(-\infty, 0)$; $f'(x) > 0$ and $f''(x) > 0$ on $(0, \infty)$.
- Use the graphs of f' and f'' to complete the following steps.
 - Find the critical points of f and determine where f is increasing and where it is decreasing.
 - Determine the locations of the inflection points of f and the intervals on which f is concave up or concave down.
 - Determine where f has local maxima and minima.
 - Plot a possible graph of f .

6–12. Critical points Find the critical points of the following functions on the given intervals. Identify the absolute maximum and absolute minimum values (if they exist).

- $f(x) = x^3 - 6x^2$ on $[-1, 5]$
- $f(x) = 3x^4 - 6x^2 + 9$ on $[-2, 2]$
- $g(x) = x^4 - 50x^2$ on $[-1, 5]$
- $f(x) = 2x^3 - 3x^2 - 36x + 12$ on $(-\infty, \infty)$
- $f(x) = \sin 2x + 3$ on $[-\pi, \pi]$
- $g(x) = -\frac{1}{2} \sin x + \frac{1}{2} \sin x \cos x$ on $[0, 2\pi]$
- $f(x) = 4x^{1/2} - x^{5/2}$ on $[0, 4]$

T 13. Absolute values Consider the function $f(x) = |x - 2| + |x + 3|$ on $[-4, 4]$. Graph f , identify the critical points, and give the coordinates of the local and absolute extreme values.

T 14–16. Use f' and f'' to complete parts (a) and (b).

- Find the intervals on which f is increasing and the intervals on which it is decreasing.
- Find the intervals on which f is concave up and the intervals on which it is concave down.

14. $f(x) = 9(x - 1)^{5/3}(x + 3)$ 15. $f(x) = \frac{x^9}{9} + 3x^5 - 16x$

16. $f(x) = x\sqrt{x + 9}$

17. **Inflection points** Does $f(x) = 2x^5 - 10x^4 + 20x^3 + x + 1$ have any inflection points? If so, identify them.

T 18. Does $f(x) = \frac{x^6}{2} + \frac{5x^4}{4} - 15x^2$ have any inflection points? If so, identify them.

19. Identify the critical points and the inflection points of $f(x) = (x - a)(x + a)^3$, for $a > 0$.

20–28. Curve sketching Use the guidelines given in Section 4.4 to make a complete graph of the following functions on their domains or on the given interval. Use a graphing utility to check your work.

20. $f(x) = x(x + 4)^3$ 21. $f(x) = \frac{x^4}{2} - 3x^2 + 4x + 1$

22. $f(x) = \frac{3x}{x^2 + 2}$

23. $f(x) = 4 \cos(\pi(x - 1))$ on $[0, 2]$

24. $f(x) = \frac{x^2 + 3}{x - 1}$ 25. $f(x) = \frac{10x^2}{x^2 + 3}$

26. $f(x) = x\sqrt[3]{x + 4}$ (Hint: In addition to using the graphing guidelines outlined in Section 4.4, describe the line tangent to the graph of f at $x = -4$ by examining $\lim_{x \rightarrow -4} f'(x)$.)

27. $f(x) = \sqrt[3]{x} - \sqrt{x} + 2$ 28. $f(x) = \frac{x^2 + 12}{x - 2}$

29. Optimal popcorn box A small popcorn box is created from a $12'' \times 12''$ sheet of paperboard by first cutting out four shaded rectangles, each of length x and width $x/2$ (see figure). The remaining paperboard is folded along the solid lines to form a box. What dimensions of the box maximize the volume of the box?

30. Minimizing time Hannah is standing on the edge of an island, 1 mile from a straight shoreline (see figure). She wants to return to her beach house that is 2 miles from the point P on shore that is closest to where she is standing. Given that she can swim at 2 mi/hr and jog at 6 mi/hr, find the point at which she should

come ashore to minimize the total time of her trip. If she starts swimming at noon, can she make it home before 1 P.M.?

- 31. Minimizing sound intensity** Two sound speakers are 100 m apart and one speaker is three times as loud as the other speaker. At what point on a line segment between the speakers is the sound intensity the weakest? (*Hint:* Sound intensity is directly proportional to the sound level and inversely proportional to the square of the distance from the sound source.)

- 32. Hockey problem** A hockey player skates on a line that is perpendicular to the goal line. If the line on which he is skating is 10 ft to the left of the center of the hockey goal and if the hockey goal is 6 ft wide, then where (what value of x) should he shoot the puck to maximize the angle θ on goal (see figure)? (*Hint:* Use the identity $\tan(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$.)

- 33. Optimization** A right triangle has legs of length h and r and a hypotenuse of length 4 (see figure). It is revolved about the leg of length h to sweep out a right circular cone. What values of h and r maximize the volume of the cone? (Volume of a cone $= \frac{1}{3} \pi r^2 h$.)

- 34. Rectangles beneath a curve** A rectangle is constructed with one side on the positive x -axis, one side on the positive y -axis, and the vertex opposite the origin on the curve $y = \cos x$, for $0 < x < \pi/2$. Approximate the dimensions of the rectangle that maximize the area of the rectangle. What is the area?

- 35. Maximum printable area** A rectangular page in a text (with width x and length y) has an area of 98 in^2 , top and bottom margins

set at 1 in, and left and right margins set at $1/2$ in. The printable area of the page is the rectangle that lies within the margins. What are the dimensions of the page that maximize the printable area?

- 36. Nearest point** What point on the graph of $f(x) = 5/2 - x^2$ is closest to the origin? (*Hint:* You can minimize the square of the distance.)
- 37. Maximum area** A line segment of length 10 joins the points $(0, p)$ and $(q, 0)$ to form a triangle in the first quadrant. Find the values of p and q that maximize the area of the triangle.
- 38. Minimum painting surface** A metal cistern in the shape of a right circular cylinder with volume $V = 50 \text{ m}^3$ needs to be painted each year to reduce corrosion. The paint is applied only to surfaces exposed to the elements (the outside cylinder wall and the circular top). Find the dimensions r and h of the cylinder that minimize the area of the painted surfaces.

39–40. Linear approximation

- a. Find the linear approximation to f at the given point a .
b. Use your answer from part (a) to estimate the given function value. Does your approximation underestimate or overestimate the exact function value?

39. $f(x) = x^{2/3}$; $a = 27$; $f(29)$ 40. $f(x) = \sqrt{x}$; $a = 4$; $f(4.1)$

41–42. Estimations with linear approximation Use linear approximation to estimate the following quantities. Choose a value of a to produce a small error:

41. $\frac{1}{4.2^2}$

42. $\sqrt{9.05}$

- 43. Change in elevation** The elevation h (in feet above the ground) of a stone dropped from a height of 1000 ft is modeled by the equation $h(t) = 1000 - 16t^2$, where t is measured in seconds and air resistance is neglected. Approximate the change in elevation over the interval $5 \leq t \leq 5.7$ (recall that $\Delta h \approx h'(a) \Delta t$).

- 44. Growth rate of bamboo** Bamboo belongs to the grass family and is one of the fastest growing plants in the world.

- a. A bamboo shoot was 500 cm tall at 10:00 A.M. and 515 cm tall at 3:00 P.M. Compute the average growth rate of the bamboo shoot in cm/hr over the period of time from 10:00 A.M. to 3:00 P.M.
b. Based on the Mean Value Theorem, what can you conclude about the instantaneous growth rate of bamboo measured in millimeters per second between 10:00 A.M. and 3:00 P.M.?

- 45. Mean Value Theorem** For the function $f(x) = \sqrt{10x}$ and the interval $[a, b] = [0, 10]$, use the graph to make a conjecture about the value of c for which $\frac{f(b) - f(a)}{b - a} = f'(c)$. Then verify your conjectured value by solving the equation $\frac{f(b) - f(a)}{b - a} = f'(c)$ for c .

46. Mean Value Theorem Explain why the Mean Value Theorem does not apply to the function $f(x) = |x|$ on $[a, b] = [-1, 2]$.

47. Mean Value Theorem The population of a culture of cells grows according to the function $P(t) = \frac{100t}{t+1}$, where $t \geq 0$ is measured in weeks.

- What is the average rate of change in the population over the interval $[0, 8]$?
- At what point of the interval $[0, 8]$ is the instantaneous rate of change equal to the average rate of change?

48. Newton's method Use Newton's method to approximate the roots of $f(x) = \sin x - x^2 + 1$ to six digits. Make a table showing the first five approximations for each root using an initial estimate of your choice.

49. Newton's method Use Newton's method to approximate the roots of $f(x) = 3x^3 - 4x^2 + 1$ to six digits.

50. Newton's method Use Newton's method to approximate the x -coordinates of the inflection points of $f(x) = 2x^5 - 6x^3 - 4x + 2$ to six digits.

51–53. Two methods Evaluate the following limits in two different ways: with and without l'Hôpital's Rule.

$$51. \lim_{x \rightarrow \infty} \frac{2x^5 - x + 1}{5x^6 + x} \quad 52. \lim_{x \rightarrow \infty} \frac{4x^4 - \sqrt{x}}{2x^4 + x^{-1}}$$

$$53. \lim_{x \rightarrow 1} \frac{\sqrt{3x+1} - 2}{x-1}$$

54–61. Limits Evaluate the following limits. Use l'Hôpital's Rule when needed.

$$54. \lim_{t \rightarrow 2} \frac{t^3 - t^2 - 2t}{t^2 - 4} \quad 55. \lim_{t \rightarrow 0} \frac{1 - \cos 6t}{2t}$$

$$56. \lim_{x \rightarrow \infty} \frac{5x^2 + 2x - 5}{\sqrt{x^4 - 1}} \quad 57. \lim_{\theta \rightarrow 0} \frac{3 \sin^2 2\theta}{\theta^2}$$

$$58. \lim_{x \rightarrow \infty} (\sqrt{x^2 + x + 1} - \sqrt{x^2 - x})$$

$$59. \lim_{\theta \rightarrow 0} 2\theta \cot 3\theta \quad 60. \lim_{\theta \rightarrow 0} \frac{3 \sin 8\theta}{8 \sin 3\theta}$$

$$61. \lim_{x \rightarrow 1} \frac{x^4 - x^3 - 3x^2 + 5x - 2}{x^3 + x^2 - 5x + 3}$$

62–71. Indefinite integrals Determine the following indefinite integrals.

$$62. \int (x^8 - 3x^3 + 1) dx \quad 63. \int (2x + 1)^2 dx$$

$$64. \int \frac{x^3 - x^2}{x} dx \quad 65. \int \left(\frac{1}{x^2} - \frac{2}{x^{5/2}} \right) dx$$

$$66. \int \frac{x^4 - 2\sqrt{x} + 2}{x^2} dx$$

$$67. \int (1 + 3 \cos \theta) d\theta$$

$$68. \int 2 \sec^2 \theta d\theta$$

$$69. \int \frac{dx}{1 - \sin^2 x}$$

$$70. \int \frac{1 + \tan \theta}{\sec \theta} d\theta$$

$$71. \int (\sqrt[4]{x^3} + \sqrt{x^5}) dx$$

72–75. Functions from derivatives Find the function f with the following properties.

$$72. f'(x) = 3x^2 - 1; f(0) = 10$$

$$73. f'(t) = \sin t + 2t; f(0) = 5$$

$$74. f'(t) = t^2 + t^{-2}; f(1) = 1, \text{ for } t > 0$$

$$75. f'(x) = \cos^2 \frac{x}{2}; f(0) = 1$$

76. Motion along a line Two objects move along the x -axis with position functions $x_1(t) = 2 \sin t$ and $x_2(t) = \sin\left(t - \frac{\pi}{2}\right)$. At what times on the interval $[0, 2\pi]$ are the objects closest to each other and farthest from each other?

77. Vertical motion with gravity A rocket is launched vertically upward with an initial velocity of 120 m/s from a platform that is 125 m above the ground. Assume the only force at work is gravity. Determine the velocity and position functions of the rocket, for $t \geq 0$. Then describe the motion in words.

78. Distance traveled A car starting at rest accelerates at 20 ft/s² for 5 seconds on a straight road. How far does it travel during this time?

79. Projectile motion A ball is thrown vertically upward with a velocity of 64 ft/s from the edge of a cliff 128 ft above a river.

- Find the velocity of the ball for all relevant times.
- Find the position of the ball above the river for all relevant times.
- Find the time when the ball reaches its highest point above the river. What is the height?
- Find the velocity at which the ball strikes the ground.

80. Cosine limits Let n be a positive integer. Evaluate the following limits.

$$\text{a. } \lim_{x \rightarrow 0} \frac{1 - \cos x^n}{x^{2n}} \quad \text{b. } \lim_{x \rightarrow 0} \frac{1 - \cos^n x}{x^2}$$

Chapter Preview We are now at a critical point in the calculus story. Many would argue that this chapter is the cornerstone of calculus because it explains the relationship between the two processes of calculus: differentiation and integration. We begin by explaining why finding the area of regions bounded by the graphs of functions is such an important problem in calculus. Then you will see how antiderivatives lead to definite integrals, which are used to solve the area problem. But there is more to the story. You will also see the remarkable connection between derivatives and integrals, which is expressed in the Fundamental Theorem of Calculus. In this chapter, we develop key properties of definite integrals, investigate a few of their many applications, and present the first of several powerful techniques for evaluating definite integrals.

5.1 Approximating Areas under Curves

The derivative of a function is associated with rates of change and slopes of tangent lines. We also know that antiderivatives (or indefinite integrals) reverse the derivative operation. **Figure 5.1** summarizes our current understanding and raises the question: What is the geometric meaning of the integral? The following example reveals a clue.

Figure 5.1

Area under a Velocity Curve

Consider an object moving along a line with a known position function. You learned in previous chapters that the slope of the line tangent to the graph of the position function at a certain time gives the velocity v at that time. We now turn the situation around. If we know the velocity function of a moving object, what can we learn about its position function?

- Recall from Section 3.6 that the *displacement* of an object moving along a line is given by

$$\text{final position} - \text{initial position}.$$

If the velocity of an object is positive, its displacement equals the distance traveled.

- The side lengths of the rectangle in Figure 5.3 have units mi/hr and hr. Therefore, the units of the area are mi/hr $\cdot$ hr = mi, which is a unit of displacement.

QUICK CHECK 1 What is the displacement of an object that travels at a constant velocity of 10 mi/hr for a half hour, 20 mi/hr for the next half hour, and 30 mi/hr for the next hour? ◀

Imagine a car traveling at a constant velocity of 60 mi/hr along a straight highway over a two-hour period. The graph of the velocity function $v = 60$ on the interval $0 \leq t \leq 2$ is a horizontal line (Figure 5.2). The displacement of the car between $t = 0$ and $t = 2$ is found by a familiar formula:

$$\begin{aligned}\text{displacement} &= \text{rate} \cdot \text{time} \\ &= 60 \text{ mi/hr} \cdot 2 \text{ hr} = 120 \text{ mi}.\end{aligned}$$

This product is the area of the rectangle formed by the velocity curve and the t -axis between $t = 0$ and $t = 2$ (Figure 5.3). In this case (constant positive velocity), we see that the area between the velocity curve and the t -axis is the displacement of the moving object.

Figure 5.2

Figure 5.3

Because objects do not necessarily move at a constant velocity, we first extend these ideas to positive velocities that *change* over an interval of time. One strategy is to divide the time interval into many subintervals and approximate the velocity on each subinterval with a constant velocity. Then the displacements on each subinterval are calculated and summed. This strategy produces only an approximation to the displacement; however, this approximation generally improves as the number of subintervals increases.

EXAMPLE 1 Approximating the displacement Suppose the velocity in m/s of an object moving along a line is given by the function $v = t^2$, where $0 \leq t \leq 8$. Approximate the displacement of the object by dividing the time interval $[0, 8]$ into n subintervals of equal length. On each subinterval, approximate the velocity with a constant equal to the value of v evaluated at the midpoint of the subinterval.

- Begin by dividing $[0, 8]$ into $n = 2$ subintervals: $[0, 4]$ and $[4, 8]$.
- Divide $[0, 8]$ into $n = 4$ subintervals: $[0, 2]$, $[2, 4]$, $[4, 6]$, and $[6, 8]$.
- Divide $[0, 8]$ into $n = 8$ subintervals of equal length.

SOLUTION

- We divide the interval $[0, 8]$ into $n = 2$ subintervals, $[0, 4]$ and $[4, 8]$, each with length 4. The velocity on each subinterval is approximated by evaluating v at the midpoint of that subinterval (Figure 5.4a).
 - We approximate the velocity on $[0, 4]$ by $v(2) = 2^2 = 4$ m/s. Traveling at 4 m/s for 4 s results in a displacement of $4 \text{ m/s} \cdot 4 \text{ s} = 16 \text{ m}$.
 - We approximate the velocity on $[4, 8]$ by $v(6) = 6^2 = 36$ m/s. Traveling at 36 m/s for 4 s results in a displacement of $36 \text{ m/s} \cdot 4 \text{ s} = 144 \text{ m}$.

Therefore, an approximation to the displacement over the entire interval $[0, 8]$ is

$$(v(2) \cdot 4 \text{ s}) + (v(6) \cdot 4 \text{ s}) = (4 \text{ m/s} \cdot 4 \text{ s}) + (36 \text{ m/s} \cdot 4 \text{ s}) = 160 \text{ m}.$$

- With $n = 4$ (Figure 5.4b), each subinterval has length 2. The approximate displacement over the entire interval is

$$\underbrace{(1 \text{ m/s} \cdot 2 \text{ s})}_{v(1)} + \underbrace{(9 \text{ m/s} \cdot 2 \text{ s})}_{v(3)} + \underbrace{(25 \text{ m/s} \cdot 2 \text{ s})}_{v(5)} + \underbrace{(49 \text{ m/s} \cdot 2 \text{ s})}_{v(7)} = 168 \text{ m}.$$

- c. With $n = 8$ subintervals (Figure 5.4c), the approximation to the displacement is 170 m. In each case, the approximate displacement is the sum of the areas of the rectangles under the velocity curve.

The midpoint of each subinterval is used to approximate the velocity over that subinterval.

Figure 5.4

Related Exercises 3, 15–16 ◀

QUICK CHECK 2 In Example 1, if we used $n = 32$ subintervals of equal length, what would be the length of each subinterval? Find the midpoint of the first and last subinterval. ◀

The progression in Example 1 may be continued. Larger values of n mean more rectangles; in general, more rectangles give a better fit to the region under the curve (Figure 5.5). With the help of a calculator, we can generate the approximations in Table 5.1 using $n = 1, 2, 4, 8, 16, 32$, and 64 subintervals. Observe that as n increases, the approximations appear to approach a limit of approximately 170.7 m. The limit is the exact displacement, which is represented by the area of the region under the velocity curve. This strategy of taking limits of sums is developed fully in Section 5.2.

Figure 5.5

- The language “the area of the region bounded by the graph of a function” is often abbreviated as “the area under the curve.”

Figure 5.6

Table 5.1 Approximations to the area under the velocity curve $v = t^2$ on $[0, 8]$

Number of subintervals	Length of each subinterval	Approximate displacement (area under curve)
1	8 s	128.0 m
2	4 s	160.0 m
4	2 s	168.0 m
8	1 s	170.0 m
16	0.5 s	170.5 m
32	0.25 s	170.625 m
64	0.125 s	170.65625 m

Approximating Areas by Riemann Sums

We wouldn’t spend much time investigating areas under curves if the idea applied only to computing displacements from velocity curves. However, the problem of finding areas under curves arises frequently and turns out to be immensely important—as you will see in the next two chapters. For this reason, we now develop a systematic method for approximating areas under curves. Consider a function f that is continuous and nonnegative on an interval $[a, b]$. The goal is to approximate the area of the region R bounded by the graph of f and the x -axis from $x = a$ to $x = b$ (Figure 5.6). We begin by dividing the interval $[a, b]$ into n subintervals of equal length,

$$[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n],$$

where $a = x_0$ and $b = x_n$ (Figure 5.7). The length of each subinterval, denoted Δx , is found by dividing the length of the entire interval by n :

$$\Delta x = \frac{b - a}{n}.$$

Figure 5.7

DEFINITION Regular Partition

Suppose $[a, b]$ is a closed interval containing n subintervals

$$[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n]$$

of equal length $\Delta x = \frac{b-a}{n}$, with $a = x_0$ and $b = x_n$. The endpoints $x_0, x_1, x_2, \dots, x_{n-1}, x_n$ of the subintervals are called **grid points**, and they create a **regular partition** of the interval $[a, b]$. In general, the k th grid point is

$$x_k = a + k\Delta x, \text{ for } k = 0, 1, 2, \dots, n.$$

QUICK CHECK 3 If the interval $[1, 9]$ is partitioned into 4 subintervals of equal length, what is Δx ? List the grid points x_0, x_1, x_2, x_3 , and x_4 . ◀

In the k th subinterval $[x_{k-1}, x_k]$, we choose any point x_k^* and build a rectangle whose height is $f(x_k^*)$, the value of f at x_k^* (Figure 5.8). The area of the rectangle on the k th subinterval is

$$\text{height} \cdot \text{base} = f(x_k^*)\Delta x, \quad \text{where } k = 1, 2, \dots, n.$$

Summing the areas of the rectangles in Figure 5.8, we obtain an approximation to the area of R , which is called a **Riemann sum**:

$$f(x_1^*)\Delta x + f(x_2^*)\Delta x + \dots + f(x_n^*)\Delta x.$$

Three notable Riemann sums are the *left*, *right*, and *midpoint Riemann sums*.

Figure 5.8

DEFINITION Riemann Sum

Suppose f is defined on a closed interval $[a, b]$, which is divided into n subintervals of equal length Δx . If x_k^* is any point in the k th subinterval $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$, then

$$f(x_1^*)\Delta x + f(x_2^*)\Delta x + \dots + f(x_n^*)\Delta x$$

is called a **Riemann sum** for f on $[a, b]$. This sum is called

- a **left Riemann sum** if x_k^* is the left endpoint of $[x_{k-1}, x_k]$ (Figure 5.9);
- a **right Riemann sum** if x_k^* is the right endpoint of $[x_{k-1}, x_k]$ (Figure 5.10); and
- a **midpoint Riemann sum** if x_k^* is the midpoint of $[x_{k-1}, x_k]$ (Figure 5.11), for $k = 1, 2, \dots, n$.

► Although the idea of integration was developed in the 17th century, it was almost 200 years later that the German mathematician Bernhard Riemann (1826–1866) worked on the mathematical theory underlying integration.

Figure 5.9

Figure 5.10

Figure 5.11

EXAMPLE 2 Left and right Riemann sums Let R be the region bounded by the graph of $f(x) = 3\sqrt{x}$ and the x -axis between $x = 4$ and $x = 16$.

- Approximate the area of R using a left Riemann sum with $n = 6$ subintervals. Illustrate the sum with the appropriate rectangles.
- Approximate the area of R using a right Riemann sum with $n = 6$ subintervals. Illustrate the sum with the appropriate rectangles.
- Do the area approximations in parts (a) and (b) underestimate or overestimate the actual area under the curve?

SOLUTION Dividing the interval $[a, b] = [4, 16]$ into $n = 6$ subintervals means that the length of each subinterval is

$$\Delta x = \frac{b - a}{n} = \frac{16 - 4}{6} = 2;$$

therefore the grid points are 4, 6, 8, 10, 12, 14, and 16.

- To find the left Riemann sum, we set $x_1^*, x_2^*, \dots, x_6^*$ equal to the left endpoints of the six subintervals. The heights of the rectangles are $f(x_k^*)$, for $k = 1, 2, \dots, 6$.

Figure 5.12

The resulting left Riemann sum (Figure 5.12) is

$$\begin{aligned} & f(x_1^*)\Delta x + f(x_2^*)\Delta x + \cdots + f(x_6^*)\Delta x \\ &= f(4) \cdot 2 + f(6) \cdot 2 + f(8) \cdot 2 + f(10) \cdot 2 + f(12) \cdot 2 + f(14) \cdot 2 \\ &= 3\sqrt{4} \cdot 2 + 3\sqrt{6} \cdot 2 + 3\sqrt{8} \cdot 2 + 3\sqrt{10} \cdot 2 + 3\sqrt{12} \cdot 2 + 3\sqrt{14} \cdot 2 \\ &\approx 105.876. \end{aligned}$$

- In a right Riemann sum, the right endpoints are used for $x_1^*, x_2^*, \dots, x_6^*$, and the heights of the rectangles are $f(x_k^*)$, for $k = 1, 2, \dots, 6$.

Figure 5.13

The resulting right Riemann sum (Figure 5.13) is

$$\begin{aligned}
 & f(x_1^*)\Delta x + f(x_2^*)\Delta x + \cdots + f(x_6^*)\Delta x \\
 &= f(6) \cdot 2 + f(8) \cdot 2 + f(10) \cdot 2 + f(12) \cdot 2 + f(14) \cdot 2 + f(16) \cdot 2 \\
 &= 3\sqrt{6} \cdot 2 + 3\sqrt{8} \cdot 2 + 3\sqrt{10} \cdot 2 + 3\sqrt{12} \cdot 2 + 3\sqrt{14} \cdot 2 + 3\sqrt{16} \cdot 2 \\
 &\approx 117.876.
 \end{aligned}$$

QUICK CHECK 4 If the function in Example 2 is replaced with $f(x) = 1/x$, does the left Riemann sum or the right Riemann sum overestimate the area under the curve? ◀

- c. Looking at the graphs, we see that the left Riemann sum in part (a) underestimates the actual area of R , whereas the right Riemann sum in part (b) overestimates the area of R . Therefore, the area of R is between 105.876 and 117.876. These approximations improve as the number of rectangles increases.

Related Exercises 23–24, 29 ◀

EXAMPLE 3 A midpoint Riemann sum Let R be the region bounded by the graph of $f(x) = 3\sqrt{x}$ and the x -axis between $x = 4$ and $x = 16$. Approximate the area of R using a midpoint Riemann sum with $n = 6$ subintervals. Illustrate the sum with the appropriate rectangles.

SOLUTION The grid points and the length of the subintervals are the same as in Example 2. To find the midpoint Riemann sum, we set $x_1^*, x_2^*, \dots, x_6^*$ equal to the midpoints of the subintervals. The midpoint of the first subinterval is the average of x_0 and x_1 , which is

$$x_1^* = \frac{x_0 + x_1}{2} = \frac{4 + 6}{2} = 5.$$

The remaining midpoints are also computed by averaging the two nearest grid points.

Figure 5.14

The resulting midpoint Riemann sum (Figure 5.14) is

$$\begin{aligned}
 & f(x_1^*)\Delta x + f(x_2^*)\Delta x + \cdots + f(x_6^*)\Delta x \\
 &= f(5) \cdot 2 + f(7) \cdot 2 + f(9) \cdot 2 + f(11) \cdot 2 + f(13) \cdot 2 + f(15) \cdot 2 \\
 &= 3\sqrt{5} \cdot 2 + 3\sqrt{7} \cdot 2 + 3\sqrt{9} \cdot 2 + 3\sqrt{11} \cdot 2 + 3\sqrt{13} \cdot 2 + 3\sqrt{15} \cdot 2 \\
 &\approx 112.062.
 \end{aligned}$$

Comparing the midpoint Riemann sum (Figure 5.14) with the left and right Riemann sums (Figures 5.12 and 5.13) suggests that the midpoint sum is a more accurate estimate of the area under the curve. Indeed, in Section 5.3, we will learn that the exact area under the curve is 112.

Related Exercises 33–34, 39 ◀

EXAMPLE 4 Riemann sums from tables Estimate the area A under the graph of f on the interval $[0, 2]$ using left and right Riemann sums with $n = 4$, where f is continuous but known only at the points in Table 5.2.

Table 5.2

x	$f(x)$
0	1
0.5	3
1.0	4.5
1.5	5.5
2.0	6.0

SOLUTION With $n = 4$ subintervals on the interval $[0, 2]$, $\Delta x = 2/4 = 0.5$. Using the left endpoint of each subinterval, the left Riemann sum is

$$\begin{aligned} A &\approx f(0)\Delta x + f(0.5)\Delta x + f(1.0)\Delta x + f(1.5)\Delta x \\ &= 1 \cdot 0.5 + 3 \cdot 0.5 + 4.5 \cdot 0.5 + 5.5 \cdot 0.5 = 7.0. \end{aligned}$$

Using the right endpoint of each subinterval, the right Riemann sum is

$$\begin{aligned} A &\approx f(0.5)\Delta x + f(1.0)\Delta x + f(1.5)\Delta x + f(2.0)\Delta x \\ &= 3 \cdot 0.5 + 4.5 \cdot 0.5 + 5.5 \cdot 0.5 + 6.0 \cdot 0.5 = 9.5. \end{aligned}$$

With only five function values, these estimates of the area are necessarily crude. Better estimates are obtained by using more subintervals and more function values.

Related Exercises 43–44 ◀

Sigma (Summation) Notation

Working with Riemann sums is cumbersome with large numbers of subintervals. Therefore, we pause for a moment to introduce some notation that simplifies our work.

Sigma (or summation) notation is used to express sums in a compact way. For example, the sum $1 + 2 + 3 + \cdots + 10$ is represented in sigma notation as $\sum_{k=1}^{10} k$. Here is how the notation works. The symbol Σ (*sigma*, the Greek capital S) stands for *sum*. The **index** k takes on all integer values from the lower limit ($k = 1$) to the upper limit ($k = 10$). The expression that immediately follows Σ (the **summand**) is evaluated for each value of k , and the resulting values are summed. Here are some examples.

$$\begin{aligned} \sum_{k=1}^{99} k &= 1 + 2 + 3 + \cdots + 99 = 4950 & \sum_{k=1}^n k &= 1 + 2 + \cdots + n \\ \sum_{k=0}^3 k^2 &= 0^2 + 1^2 + 2^2 + 3^2 = 14 & \sum_{k=1}^4 (2k+1) &= 3 + 5 + 7 + 9 = 24 \\ \sum_{k=-1}^2 (k^2 + k) &= ((-1)^2 + (-1)) + (0^2 + 0) + (1^2 + 1) + (2^2 + 2) = 8 \end{aligned}$$

The index in a sum is a *dummy variable*. It is internal to the sum, so it does not matter what symbol you choose as an index. For example,

$$\sum_{k=1}^{99} k = \sum_{n=1}^{99} n = \sum_{p=1}^{99} p.$$

Two properties of sums and sigma notation are useful in upcoming work. Suppose $\{a_1, a_2, \dots, a_n\}$ and $\{b_1, b_2, \dots, b_n\}$ are two sets of real numbers, and suppose c is a real number. Then we can factor multiplicative constants out of a sum:

$$\text{Constant Multiple Rule} \quad \sum_{k=1}^n ca_k = c \sum_{k=1}^n a_k.$$

We can also split a sum into two sums:

$$\text{Addition Rule} \quad \sum_{k=1}^n (a_k + b_k) = \sum_{k=1}^n a_k + \sum_{k=1}^n b_k.$$

- Formulas for $\sum_{k=1}^n k^p$, where p is a positive integer, have been known for centuries. The formulas for $p = 0, 1, 2$, and 3 are relatively simple. The formulas become complicated as p increases.

In the coming examples and exercises, the following formulas for sums of powers of integers are essential.

THEOREM 5.1 Sums of Powers of Integers

Let n be a positive integer and c a real number.

$$\begin{aligned}\sum_{k=1}^n c &= cn & \sum_{k=1}^n k &= \frac{n(n+1)}{2} \\ \sum_{k=1}^n k^2 &= \frac{n(n+1)(2n+1)}{6} & \sum_{k=1}^n k^3 &= \frac{n^2(n+1)^2}{4}\end{aligned}$$

Riemann Sums Using Sigma Notation

With sigma notation, a Riemann sum has the convenient compact form

$$f(x_1^*)\Delta x + f(x_2^*)\Delta x + \cdots + f(x_n^*)\Delta x = \sum_{k=1}^n f(x_k^*)\Delta x.$$

To express left, right, and midpoint Riemann sums in sigma notation, we must identify the points x_k^* .

- For the left Riemann sum,
 $x_1^* = a + 0 \cdot \Delta x$, $x_2^* = a + 1 \cdot \Delta x$,
 $x_3^* = a + 2 \cdot \Delta x$,
 and in general, $x_k^* = a + (k-1)\Delta x$, for
 $k = 1, \dots, n$.

For the right Riemann sum,
 $x_1^* = a + 1 \cdot \Delta x$, $x_2^* = a + 2 \cdot \Delta x$,
 $x_3^* = a + 3 \cdot \Delta x$,
 and in general, $x_k^* = a + k\Delta x$,
 for $k = 1, \dots, n$.

For the midpoint Riemann sum,
 $x_1^* = a + \frac{1}{2}\Delta x$, $x_2^* = a + \frac{3}{2}\Delta x$,
 and in general,
 $x_k^* = a + (k - \frac{1}{2})\Delta x = \frac{x_k + x_{k-1}}{2}$,
 for $k = 1, \dots, n$.

- For left Riemann sums, the left endpoints of the subintervals are $x_k^* = a + (k-1)\Delta x$, for $k = 1, \dots, n$.
- For right Riemann sums, the right endpoints of the subintervals are $x_k^* = a + k\Delta x$, for $k = 1, \dots, n$.
- For midpoint Riemann sums, the midpoints of the subintervals are $x_k^* = a + (k - \frac{1}{2})\Delta x$, for $k = 1, \dots, n$.

The three Riemann sums are written compactly as follows.

DEFINITION Left, Right, and Midpoint Riemann Sums in Sigma Notation

Suppose f is defined on a closed interval $[a, b]$, which is divided into n subintervals of equal length Δx . If x_k^* is a point in the k th subinterval $[x_{k-1}, x_k]$, for

$k = 1, 2, \dots, n$, then the **Riemann sum** for f on $[a, b]$ is $\sum_{k=1}^n f(x_k^*)\Delta x$. Three cases arise in practice.

- $\sum_{k=1}^n f(x_k^*)\Delta x$ is a **left Riemann sum** if $x_k^* = a + (k-1)\Delta x$.
- $\sum_{k=1}^n f(x_k^*)\Delta x$ is a **right Riemann sum** if $x_k^* = a + k\Delta x$.
- $\sum_{k=1}^n f(x_k^*)\Delta x$ is a **midpoint Riemann sum** if $x_k^* = a + (k - \frac{1}{2})\Delta x$.

Figure 5.15

EXAMPLE 5 Calculating Riemann sums Evaluate the left, right, and midpoint Riemann sums for $f(x) = x^3 + 1$ between $a = 0$ and $b = 2$ using $n = 50$ subintervals. Make a conjecture about the exact area of the region under the curve (Figure 5.15).

SOLUTION With $n = 50$, the length of each subinterval is

$$\Delta x = \frac{b-a}{n} = \frac{2-0}{50} = \frac{1}{25} = 0.04.$$

The value of x_k^* for the left Riemann sum is

$$x_k^* = a + (k-1)\Delta x = 0 + 0.04(k-1) = 0.04k - 0.04,$$

for $k = 1, 2, \dots, 50$. Therefore, the left Riemann sum, evaluated with a calculator, is

$$\sum_{k=1}^n f(x_k^*) \Delta x = \sum_{k=1}^{50} f(0.04k - 0.04) 0.04 = 5.8416.$$

To evaluate the right Riemann sum, we let $x_k^* = a + k\Delta x = 0.04k$ and find that

$$\sum_{k=1}^n f(x_k^*) \Delta x = \sum_{k=1}^{50} f(0.04k) 0.04 = 6.1616.$$

For the midpoint Riemann sum, we let

$$x_k^* = a + \left(k - \frac{1}{2}\right) \Delta x = 0 + 0.04 \left(k - \frac{1}{2}\right) = 0.04k - 0.02.$$

The value of the sum is

$$\sum_{k=1}^n f(x_k^*) \Delta x = \sum_{k=1}^{50} f(0.04k - 0.02) 0.04 = 5.9992.$$

Because f is increasing on $[0, 2]$, the left Riemann sum underestimates the area of the shaded region in Figure 5.15, and the right Riemann sum overestimates the area. Therefore, the exact area lies between 5.8416 and 6.1616. The midpoint Riemann sum usually gives the best estimate for increasing or decreasing functions.

Table 5.3 shows the left, right, and midpoint Riemann sum approximations for values of n up to 200. All three sets of approximations approach a value near 6, which is a reasonable estimate of the area under the curve. In Section 5.2, we show rigorously that the limit of all three Riemann sums as $n \rightarrow \infty$ is 6.

Table 5.3 Left, right, and midpoint Riemann sum approximations

n	L_n	R_n	M_n
20	5.61	6.41	5.995
40	5.8025	6.2025	5.99875
60	5.86778	6.13444	5.99944
80	5.90063	6.10063	5.99969
100	5.9204	6.0804	5.9998
120	5.93361	6.06694	5.99986
140	5.94306	6.05735	5.9999
160	5.95016	6.05016	5.99992
180	5.95568	6.04457	5.99994
200	5.9601	6.0401	5.99995

ALTERNATIVE SOLUTION It is worth examining another approach to Example 5. Consider the right Riemann sum given previously:

$$\sum_{k=1}^n f(x_k^*) \Delta x = \sum_{k=1}^{50} f(0.04k) 0.04.$$

Rather than evaluating this sum with a calculator, we note that $f(0.04k) = (0.04k)^3 + 1$ and use the properties of sums:

$$\begin{aligned} \sum_{k=1}^n f(x_k^*) \Delta x &= \sum_{k=1}^{50} \underbrace{((0.04k)^3 + 1)}_{f(x_k^*)} \underbrace{0.04}_{\Delta x} \\ &= \sum_{k=1}^{50} (0.04k)^3 0.04 + \sum_{k=1}^{50} 1 \cdot 0.04 \quad \sum (a_k + b_k) = \sum a_k + \sum b_k \\ &= (0.04)^4 \sum_{k=1}^{50} k^3 + 0.04 \sum_{k=1}^{50} 1. \quad \sum c a_k = c \sum a_k \end{aligned}$$

Using the summation formulas for powers of integers in Theorem 5.1, we find that

$$\sum_{k=1}^{50} 1 = 50 \quad \text{and} \quad \sum_{k=1}^{50} k^3 = \frac{50^2 \cdot 51^2}{4}.$$

Substituting the values of these sums into the right Riemann sum yields

$$\sum_{k=1}^{50} f(x_k^*) \Delta x = \frac{3851}{625} = 6.1616,$$

confirming the result given by a calculator. The idea of evaluating Riemann sums for arbitrary values of n is used in Section 5.2, where we evaluate the limit of the Riemann sum as $n \rightarrow \infty$.

SECTION 5.1 EXERCISES

Getting Started

- Suppose an object moves along a line at 15 m/s, for $0 \leq t < 2$, and at 25 m/s, for $2 \leq t \leq 5$, where t is measured in seconds. Sketch the graph of the velocity function and find the displacement of the object, for $0 \leq t \leq 5$.
- Given the graph of the positive velocity of an object moving along a line, what is the geometrical representation of its displacement over a time interval $[a, b]$?
- The velocity in ft/s of an object moving along a line is given by $v = f(t)$ on the interval $0 \leq t \leq 8$ (see figure), where t is measured in seconds.
 - Divide the interval $[0, 8]$ into $n = 2$ subintervals, $[0, 4]$ and $[4, 8]$. On each subinterval, assume the object moves at a constant velocity equal to the value of v evaluated at the midpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[0, 8]$ (see part (a) of the figure).
 - Repeat part (a) for $n = 4$ subintervals (see part (b) of the figure).

- The velocity in ft/s of an object moving along a line is given by $v = f(t)$ on the interval $0 \leq t \leq 6$ (see figure), where t is measured in seconds.
 - Divide the interval $[0, 6]$ into $n = 3$ subintervals, $[0, 2]$, $[2, 4]$, and $[4, 6]$. On each subinterval, assume the object moves at a constant velocity equal to the value of v evaluated at the left endpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[0, 6]$ (see part (a) of the figure).
 - Repeat part (a) for $n = 6$ subintervals (see part (b) of the figure).

- The velocity in ft/s of an object moving along a line is given by $v = f(t)$ on the interval $0 \leq t \leq 6$ (see figure), where t is measured in seconds.
 - Divide the interval $[0, 6]$ into $n = 3$ subintervals, $[0, 2]$, $[2, 4]$, and $[4, 6]$. On each subinterval, assume the object moves at a constant velocity equal to the value of v evaluated at the right endpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[0, 6]$ (see part (a) of the figure).
 - Repeat part (a) for $n = 6$ subintervals (see part (b) of the figure).

- The velocity in ft/s of an object moving along a line is given by $v = f(t)$ on the interval $0 \leq t \leq 10$ (see figure), where t is measured in seconds.
 - Divide the interval $[0, 10]$ into $n = 5$ subintervals. On each subinterval, assume the object moves at a constant velocity equal to the value of v evaluated at the left endpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[0, 10]$.
 - Repeat part (a) using the right endpoints to estimate the displacement on $[0, 10]$.
 - Repeat part (a) using the midpoints of each subinterval to estimate the displacement on $[0, 10]$.

- Suppose you want to approximate the area of the region bounded by the graph of $f(x) = \cos x$ and the x -axis between $x = 0$ and $x = \frac{\pi}{2}$. Explain a possible strategy.
- Explain how Riemann sum approximations to the area of a region under a curve change as the number of subintervals increases.
- Approximating area from a graph** Approximate the area of the region bounded by the graph (see figure) and the x -axis by dividing the interval $[1, 7]$ into $n = 6$ subintervals. Use

a left and right Riemann sum to obtain two different approximations.

- 10. Approximating area from a graph** Approximate the area of the region bounded by the graph (see figure) and the x -axis by dividing the interval $[0, 6]$ into $n = 3$ subintervals. Use a left, right, and midpoint Riemann sum to obtain three different approximations.

- 11.** Suppose the interval $[1, 3]$ is partitioned into $n = 4$ subintervals. What is the subinterval length Δx ? List the grid points x_0, x_1, x_2, x_3 , and x_4 . Which points are used for the left, right, and midpoint Riemann sums?
- 12.** Suppose the interval $[2, 6]$ is partitioned into $n = 4$ subintervals with grid points $x_0 = 2, x_1 = 3, x_2 = 4, x_3 = 5$, and $x_4 = 6$. Write, but do not evaluate, the left, right, and midpoint Riemann sums for $f(x) = x^2$.
- 13.** Does a right Riemann sum underestimate or overestimate the area of the region under the graph of a function that is positive and decreasing on an interval $[a, b]$? Explain.
- 14.** Does a left Riemann sum underestimate or overestimate the area of the region under the graph of a function that is positive and increasing on an interval $[a, b]$? Explain.

Practice Exercises

- 15. Approximating displacement** The velocity in ft/s of an object moving along a line is given by $v = 3t^2 + 1$ on the interval $0 \leq t \leq 4$, where t is measured in seconds.

- a.** Divide the interval $[0, 4]$ into $n = 4$ subintervals, $[0, 1]$, $[1, 2]$, $[2, 3]$, and $[3, 4]$. On each subinterval, assume the object moves at a constant velocity equal to v evaluated at the midpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[0, 4]$ (see part (a) of the figure).
- b.** Repeat part (a) for $n = 8$ subintervals (see part (b) of the figure).

- T 16. Approximating displacement** The velocity in ft/s of an object moving along a line is given by $v = \sqrt{10t}$ on the interval $1 \leq t \leq 7$, where t is measured in seconds.

- a.** Divide the interval $[1, 7]$ into $n = 3$ subintervals, $[1, 3]$, $[3, 5]$, and $[5, 7]$. On each subinterval, assume the object moves at a constant velocity equal to v evaluated at the midpoint of the subinterval, and use these approximations to estimate the displacement of the object on $[1, 7]$ (see part (a) of the figure).
- b.** Repeat part (a) for $n = 6$ subintervals (see part (b) of the figure).

17–22. Approximating displacement The velocity of an object is given by the following functions on a specified interval. Approximate the displacement of the object on this interval by subdividing the interval into n subintervals. Use the left endpoint of each subinterval to compute the height of the rectangles.

17. $v = 2t + 1$ (m/s), for $0 \leq t \leq 8$; $n = 2$

18. $v = t^3 + 1$ (m/s), for $0 \leq t \leq 3$; $n = 3$

19. $v = \frac{1}{2t + 1}$ (m/s), for $0 \leq t \leq 8$; $n = 4$

20. $v = \frac{t^2}{2} + 4$ (ft/s), for $0 \leq t \leq 12$; $n = 6$

T 21. $v = 4\sqrt{t + 1}$ (mi/hr), for $0 \leq t \leq 15$; $n = 5$

22. $v = \frac{t + 3}{6}$ (m/s), for $0 \leq t \leq 4$; $n = 4$

23–24. Left and right Riemann sums Use the figures to calculate the left and right Riemann sums for f on the given interval and for the given value of n .

- 23.** $f(x) = x + 1$ on $[1, 6]$; $n = 5$

- 24.** $f(x) = \frac{1}{x}$ on $[1, 5]$; $n = 4$

25–32. Left and right Riemann sums Complete the following steps for the given function, interval, and value of n .

- Sketch the graph of the function on the given interval.
- Calculate Δx and the grid points $x_0, x_1, \dots, x_n$.
- Illustrate the left and right Riemann sums. Then determine which Riemann sum underestimates and which sum overestimates the area under the curve.
- Calculate the left and right Riemann sums.

- 25.** $f(x) = x + 1$ on $[0, 4]$; $n = 4$

- 26.** $f(x) = 9 - x$ on $[3, 8]$; $n = 5$

- T 27.** $f(x) = \cos x$ on $\left[0, \frac{\pi}{2}\right]$; $n = 4$

- 28.** $f(x) = \sin(\pi x/6)$ on $[0, 3]$; $n = 3$

- 29.** $f(x) = x^2 - 1$ on $[2, 4]$; $n = 4$

- 30.** $f(x) = 2x^2$ on $[1, 6]$; $n = 5$

- T 31.** $f(x) = \sqrt{x}$ on $[0, 3]$; $n = 6$

- T 32.** $f(x) = 2^x$ on $[0, 1]$; $n = 4$

- 33. A midpoint Riemann sum** Approximate the area of the region bounded by the graph of $f(x) = 100 - x^2$ and the x -axis on $[0, 10]$ with $n = 5$ subintervals. Use the midpoint of each subinterval to determine the height of each rectangle (see figure).

- T 34. A midpoint Riemann sum** Approximate the area of the region bounded by the graph of $f(t) = \cos \frac{t}{2}$ and the t -axis on $[0, \pi]$ with $n = 4$ subintervals. Use the midpoint of each subinterval to determine the height of each rectangle (see figure).

- 35. Free fall** On October 14, 2012, Felix Baumgartner stepped off a balloon capsule at an altitude of almost 39 km above Earth's surface and began his free fall. His velocity in m/s during the fall is given in the figure. It is claimed that Felix reached the speed of sound 34 seconds into his fall and that he continued to fall at supersonic speed for 30 seconds. (Source: <http://www.redbullstratos.com>)

- Divide the interval $[34, 64]$ into $n = 5$ subintervals with the grid points $x_0 = 34, x_1 = 40, x_2 = 46, x_3 = 52, x_4 = 58$, and $x_5 = 64$. Use left and right Riemann sums to estimate how far Felix fell while traveling at supersonic speed.
- It is claimed that the actual distance that Felix fell at supersonic speed was approximately 10,485 m. Which estimate in part (a) produced the more accurate estimate?
- How could you obtain more accurate estimates of the total distance fallen than those found in part (a)?

- 36. Free fall** Use geometry and the figure given in Exercise 35 to estimate how far Felix fell in the first 20 seconds of his free fall.

37–42. Midpoint Riemann sums Complete the following steps for the given function, interval, and value of n .

- Sketch the graph of the function on the given interval.
- Calculate Δx and the grid points $x_0, x_1, \dots, x_n$.
- Illustrate the midpoint Riemann sum by sketching the appropriate rectangles.
- Calculate the midpoint Riemann sum.

37. $f(x) = 2x + 1$ on $[0, 4]$; $n = 4$

T 38. $f(x) = 2 \cos(\pi x/2)$ on $[0, 1]$; $n = 6$

T 39. $f(x) = \sqrt{x}$ on $[1, 3]$; $n = 4$

40. $f(x) = x^2$ on $[0, 4]$; $n = 4$

41. $f(x) = \frac{1}{x}$ on $[1, 6]$; $n = 5$

42. $f(x) = 4 - x$ on $[-1, 4]$; $n = 5$

43–44. Riemann sums from tables Evaluate the left and right Riemann sums for f over the given interval for the given value of n .

43. $[0, 2]$; $n = 4$

x	0	0.5	1	1.5	2
$f(x)$	5	3	2	1	1

44. $[1, 5]$; $n = 8$

x	1	1.5	2	2.5	3	3.5	4	4.5	5
$f(x)$	0	2	3	2	2	1	0	2	3

45. Displacement from a table of velocities The velocities (in mi/hr) of an automobile moving along a straight highway over a two-hour period are given in the following table.

t (hr)	0	0.25	0.5	0.75	1	1.25	1.5	1.75	2
v (mi/hr)	50	50	60	60	55	65	50	60	70

- Sketch a smooth curve passing through the data points.
- Find the midpoint Riemann sum approximation to the displacement on $[0, 2]$ with $n = 2$ and $n = 4$ subintervals.

46. Displacement from a table of velocities The velocities (in m/s) of an automobile moving along a straight freeway over a four-second period are given in the following table.

t (s)	0	0.5	1	1.5	2	2.5	3	3.5	4
v (m/s)	20	25	30	35	30	30	35	40	40

- Sketch a smooth curve passing through the data points.
- Find the midpoint Riemann sum approximation to the displacement on $[0, 4]$ with $n = 2$ and $n = 4$ subintervals.

47. Sigma notation Express the following sums using sigma notation. (Answers are not unique.)

- $1 + 2 + 3 + 4 + 5$
- $4 + 5 + 6 + 7 + 8 + 9$
- $1^2 + 2^2 + 3^2 + 4^2$
- $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}$

48. Sigma notation Express the following sums using sigma notation. (Answers are not unique.)

- $1 + 3 + 5 + 7 + \dots + 99$
- $4 + 9 + 14 + \dots + 44$
- $3 + 8 + 13 + \dots + 63$
- $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{49 \cdot 50}$

49. Sigma notation Evaluate the following expressions.

- $\sum_{k=1}^{10} k$
- $\sum_{k=1}^6 (2k + 1)$
- $\sum_{k=1}^4 k^2$
- $\sum_{n=1}^5 (1 + n^2)$
- $\sum_{m=1}^3 \frac{2m + 2}{3}$
- $\sum_{j=1}^3 (3j - 4)$
- $\sum_{p=1}^5 (2p + p^2)$
- $\sum_{n=0}^4 \sin \frac{n\pi}{2}$

T 50. **Evaluating sums** Evaluate the following expressions by two methods. (i) Use Theorem 5.1. (ii) Use a calculator.

- $\sum_{k=1}^{45} k$
- $\sum_{k=1}^{45} (5k - 1)$
- $\sum_{k=1}^{75} 2k^2$
- $\sum_{n=1}^{50} (1 + n^2)$
- $\sum_{m=1}^{75} \frac{2m + 2}{3}$
- $\sum_{j=1}^{20} (3j - 4)$
- $\sum_{p=1}^{35} (2p + p^2)$
- $\sum_{n=0}^{40} (n^2 + 3n - 1)$

T 51–54. **Riemann sums for larger values of n** Complete the following steps for the given function f and interval.

- For the given value of n , use sigma notation to write the left, right, and midpoint Riemann sums. Then evaluate each sum using a calculator.
- Based on the approximations found in part (a), estimate the area of the region bounded by the graph of f and the x -axis on the interval.

51. $f(x) = 3\sqrt{x}$ on $[0, 4]$; $n = 40$

52. $f(x) = x^2 + 1$ on $[-1, 1]$; $n = 50$

53. $f(x) = x^2 - 1$ on $[2, 5]$; $n = 75$

54. $f(x) = \cos 2x$ on $\left[0, \frac{\pi}{4}\right]$; $n = 60$

T 55–58. **Approximating areas with a calculator** Use a calculator and right Riemann sums to approximate the area of the given region. Present your calculations in a table showing the approximations for $n = 10, 30, 60$, and 80 subintervals. Make a conjecture about the limit of Riemann sums as $n \rightarrow \infty$.

55. The region bounded by the graph of $f(x) = 12 - 3x^2$ and the x -axis on the interval $[-1, 1]$.

56. The region bounded by the graph of $f(x) = 3x^2 + 1$ and the x -axis on the interval $[-1, 1]$.

57. The region bounded by the graph of $f(x) = \frac{1 - \cos x}{2}$ and the x -axis on the interval $[-\pi, \pi]$.

58. The region bounded by the graph of $f(x) = \sin x + \cos x$ and the x -axis on the interval $[0, \pi/2]$.

59. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- Consider the linear function $f(x) = 2x + 5$ and the region bounded by its graph and the x -axis on the interval $[3, 6]$. Suppose the area of this region is approximated using midpoint

Riemann sums. Then the approximations give the exact area of the region for any number of subintervals.

- A left Riemann sum always overestimates the area of a region bounded by a positive increasing function and the x -axis on an interval $[a, b]$.
- For an increasing or decreasing nonconstant function on an interval $[a, b]$ and a given value of n , the value of the midpoint Riemann sum always lies between the values of the left and right Riemann sums.

60. Riemann sums for a semicircle Let $f(x) = \sqrt{1 - x^2}$.

- Show that the graph of f is the upper half of a circle of radius 1 centered at the origin.
- Estimate the area between the graph of f and the x -axis on the interval $[-1, 1]$ using a midpoint Riemann sum with $n = 25$.
- Repeat part (b) using $n = 75$ rectangles.
- What happens to the midpoint Riemann sums on $[-1, 1]$ as $n \rightarrow \infty$?

61–64. Sigma notation for Riemann sums Use sigma notation to write the following Riemann sums. Then evaluate each Riemann sum using Theorem 5.1 or a calculator.

- The right Riemann sum for $f(x) = x + 1$ on $[0, 4]$ with $n = 50$
- The left Riemann sum for $f(x) = \frac{3}{x}$ on $[1, 3]$ with $n = 30$
- The midpoint Riemann sum for $f(x) = x^3$ on $[3, 11]$ with $n = 32$
- The midpoint Riemann sum for $f(x) = 1 + \cos \pi x$ on $[0, 2]$ with $n = 50$

65–68. Identifying Riemann sums Fill in the blanks with an interval and a value of n .

- $\sum_{k=1}^4 f(1 + k) \cdot 1$ is a right Riemann sum for f on the interval $[\text{---}, \text{---}]$ with $n = \text{---}$.
 - $\sum_{k=1}^4 f(2 + k) \cdot 1$ is a right Riemann sum for f on the interval $[\text{---}, \text{---}]$ with $n = \text{---}$.
 - $\sum_{k=1}^4 f(1.5 + k) \cdot 1$ is a midpoint Riemann sum for f on the interval $[\text{---}, \text{---}]$ with $n = \text{---}$.
 - $\sum_{k=1}^8 f\left(1.5 + \frac{k}{2}\right) \cdot \frac{1}{2}$ is a left Riemann sum for f on the interval $[\text{---}, \text{---}]$ with $n = \text{---}$.
- 69. Approximating areas** Estimate the area of the region bounded by the graph of $f(x) = x^2 + 2$ and the x -axis on $[0, 2]$ in the following ways.
- Divide $[0, 2]$ into $n = 4$ subintervals and approximate the area of the region using a left Riemann sum. Illustrate the solution geometrically.
 - Divide $[0, 2]$ into $n = 4$ subintervals and approximate the area of the region using a midpoint Riemann sum. Illustrate the solution geometrically.
 - Divide $[0, 2]$ into $n = 4$ subintervals and approximate the area of the region using a right Riemann sum. Illustrate the solution geometrically.

70. Displacement from a velocity graph Consider the velocity function for an object moving along a line (see figure).

- Describe the motion of the object over the interval $[0, 6]$.
- Use geometry to find the displacement of the object between $t = 0$ and $t = 3$.
- Use geometry to find the displacement of the object between $t = 3$ and $t = 5$.
- Assuming the velocity remains 30 m/s, for $t \geq 4$, find the function that gives the displacement between $t = 0$ and any time $t \geq 4$.

71. Displacement from a velocity graph Consider the velocity function for an object moving along a line (see figure).

- Describe the motion of the object over the interval $[0, 6]$.
- Use geometry to find the displacement of the object between $t = 0$ and $t = 2$.
- Use geometry to find the displacement of the object between $t = 2$ and $t = 5$.
- Assuming the velocity remains 10 m/s, for $t \geq 5$, find the function that gives the displacement between $t = 0$ and any time $t \geq 5$.

72. Flow rates Suppose a gauge at the outflow of a reservoir measures the flow rate of water in units of ft^3/hr . In Chapter 6, we show that the total amount of water that flows out of the reservoir is the area under the flow rate curve. Consider the flow rate function shown in the figure.

- Find the amount of water (in units of ft^3) that flows out of the reservoir over the interval $[0, 4]$.
- Find the amount of water that flows out of the reservoir over the interval $[8, 10]$.
- Does more water flow out of the reservoir over the interval $[0, 4]$ or $[4, 6]$?
- Show that the units of your answer are consistent with the units of the variables on the axes.

73. Mass from density A thin 10-cm rod is made of an alloy whose density varies along its length according to the function shown in the figure. Assume density is measured in units of g/cm. In Chapter 6, we show that the mass of the rod is the area under the density curve.

- Find the mass of the left half of the rod ($0 \leq x \leq 5$).
- Find the mass of the right half of the rod ($5 \leq x \leq 10$).
- Find the mass of the entire rod ($0 \leq x \leq 10$).
- Find the point along the rod at which it will balance (called the center of mass).

74–75. Displacement from velocity The following functions describe the velocity of a car (in mi/hr) moving along a straight highway for a 3-hr interval. In each case, find the function that gives the displacement of the car over the interval $[0, t]$, where $0 \leq t \leq 3$.

74.
$$v(t) = \begin{cases} 40 & \text{if } 0 \leq t \leq 1.5 \\ 50 & \text{if } 1.5 < t \leq 3 \end{cases}$$

75.
$$v(t) = \begin{cases} 30 & \text{if } 0 \leq t \leq 2 \\ 50 & \text{if } 2 < t \leq 2.5 \\ 44 & \text{if } 2.5 < t \leq 3 \end{cases}$$

76–77. Functions with absolute value Use a calculator and the method of your choice to approximate the area of the following regions. Present your calculations in a table, showing approximations using $n = 16, 32$, and 64 subintervals. Make a conjecture about the limits of the approximations.

- The region bounded by the graph of $f(x) = |25 - x^2|$ and the x -axis on the interval $[0, 10]$.
- The region bounded by the graph of $f(x) = |1 - x^3|$ and the x -axis on the interval $[-1, 2]$.

Explorations and Challenges

- Riemann sums for constant functions** Let $f(x) = c$, where $c > 0$, be a constant function on $[a, b]$. Prove that any Riemann sum for any value of n gives the exact area of the region between the graph of f and the x -axis on $[a, b]$.
- Riemann sums for linear functions** Assume the linear function $f(x) = mx + c$ is positive on the interval $[a, b]$. Prove that the midpoint Riemann sum with any value of n gives the exact area of the region between the graph of f and the x -axis on $[a, b]$.
- Shape of the graph for left Riemann sums** Suppose a left Riemann sum is used to approximate the area of the region bounded by the graph of a positive function and the x -axis on the interval $[a, b]$. Fill in the following table to indicate whether the resulting approximation underestimates or overestimates the exact area in the four cases shown. Use a sketch to explain your reasoning in each case.

	Increasing on $[a, b]$	Decreasing on $[a, b]$
Concave up on $[a, b]$		
Concave down on $[a, b]$		

- Shape of the graph for right Riemann sums** Suppose a right Riemann sum is used to approximate the area of the region bounded by the graph of a positive function and the x -axis on the interval $[a, b]$. Fill in the following table to indicate whether the resulting approximation underestimates or overestimates the exact area in the four cases shown. Use a sketch to explain your reasoning in each case.

	Increasing on $[a, b]$	Decreasing on $[a, b]$
Concave up on $[a, b]$		
Concave down on $[a, b]$

5.2 Definite Integrals

We introduced Riemann sums in Section 5.1 as a way to approximate the area of a region bounded by a curve $y = f(x)$ and the x -axis on an interval $[a, b]$. In that discussion, we assumed f to be nonnegative on the interval. Our next task is to discover the geometric meaning of Riemann sums when f is negative on some or all of $[a, b]$. Once this matter is settled, we proceed to the main event of this section, which is to define the *definite integral*. With definite integrals, the approximations given by Riemann sums become exact.

Net Area

How do we interpret Riemann sums when f is negative at some or all points of $[a, b]$? The answer follows directly from the Riemann sum definition.

EXAMPLE 1 Interpreting Riemann sums Evaluate and interpret the following Riemann sums for $f(x) = 1 - x^2$ on the interval $[a, b]$ with n equally spaced subintervals.

- A midpoint Riemann sum with $[a, b] = [1, 3]$ and $n = 4$
- A left Riemann sum with $[a, b] = [0, 3]$ and $n = 6$

SOLUTION

- a.** The length of each subinterval is $\Delta x = \frac{b-a}{n} = \frac{3-1}{4} = 0.5$. So the grid points are

$$x_0 = 1, \quad x_1 = 1.5, \quad x_2 = 2, \quad \text{and} \quad x_3 = 2.5, \quad \text{and} \quad x_4 = 3.$$

To compute the midpoint Riemann sum, we evaluate f at the midpoints of the subintervals, which are

$$x_1^* = 1.25, \quad x_2^* = 1.75, \quad x_3^* = 2.25, \quad \text{and} \quad x_4^* = 2.75.$$

The resulting midpoint Riemann sum is

$$\begin{aligned} \sum_{k=1}^n f(x_k^*) \Delta x &= \sum_{k=1}^4 f(x_k^*)(0.5) \\ &= f(1.25)(0.5) + f(1.75)(0.5) + f(2.25)(0.5) + f(2.75)(0.5) \\ &= (-0.5625 - 2.0625 - 4.0625 - 6.5625)0.5 \\ &= -6.625. \end{aligned}$$

All values of $f(x_k^*)$ are negative, so the Riemann sum is also negative. Because area is always a nonnegative quantity, this Riemann sum does not approximate the area of the region between the curve and the x -axis on $[1, 3]$. Notice, however, that the values of $f(x_k^*)$ are the *negative* of the heights of the corresponding rectangles (Figure 5.16). Therefore, the Riemann sum approximates the *negative* of the area of the region bounded by the curve.

- b.** The length of each subinterval is $\Delta x = \frac{b-a}{n} = \frac{3-0}{6} = 0.5$, and the grid points are

$$x_0 = 0, \quad x_1 = 0.5, \quad x_2 = 1, \quad x_3 = 1.5, \quad x_4 = 2, \quad x_5 = 2.5, \quad \text{and} \quad x_6 = 3.$$

To calculate the left Riemann sum, we set $x_1^*, x_2^*, \dots, x_6^*$ equal to the left endpoints of the subintervals:

$$x_1^* = 0, \quad x_2^* = 0.5, \quad x_3^* = 1, \quad x_4^* = 1.5, \quad x_5^* = 2, \quad \text{and} \quad x_6^* = 2.5.$$

The resulting left Riemann sum is

$$\begin{aligned} \sum_{k=1}^n f(x_k^*) \Delta x &= \sum_{k=1}^6 f(x_k^*)(0.5) \\ &= \underbrace{(f(0) + f(0.5) + f(1))}_{\text{nonnegative contribution}} + \underbrace{(f(1.5) + f(2) + f(2.5))}_{\text{negative contribution}} \\ &= (1 + 0.75 + 0 - 1.25 - 3 - 5.25)0.5 \\ &= -3.875. \end{aligned}$$

Figure 5.16

Figure 5.17

In this case, the values of $f(x_k^*)$ are nonnegative for $k = 1, 2$, and 3 , and negative for $k = 4, 5$, and 6 (Figure 5.17). Where f is positive, we get positive contributions to the Riemann sum, and where f is negative, we get negative contributions to the sum.

Related Exercises 17, 22 ◀

Let's recap what we learned in Example 1. On intervals where $f(x) < 0$, Riemann sums approximate the *negative* of the area of the region bounded by the curve (Figure 5.18).

Figure 5.18

Figure 5.19

► Net area suggests the difference between positive and negative contributions much like net change or net profit. Some texts use the term **signed area** for net area.

QUICK CHECK 1 Suppose $f(x) = -5$. What is the net area of the region bounded by the graph of f and the x -axis on the interval $[1, 5]$? Make a sketch of the function and the region. ◀

QUICK CHECK 2 Sketch a continuous function f that is positive over the interval $[0, 1)$ and negative over the interval $(1, 2]$, such that the net area of the region bounded by the graph of f and the x -axis on $[0, 2]$ is zero. ◀

DEFINITION Net Area

Consider the region R bounded by the graph of a continuous function f and the x -axis between $x = a$ and $x = b$. The **net area** of R is the sum of the areas of the parts of R that lie above the x -axis *minus* the sum of the areas of the parts of R that lie below the x -axis on $[a, b]$.

The Definite Integral

Riemann sums for f on $[a, b]$ give *approximations* to the net area of the region bounded by the graph of f and the x -axis between $x = a$ and $x = b$, where $a < b$. How can we make these approximations exact? If f is continuous on $[a, b]$, it is reasonable to expect the Riemann sum approximations to approach the exact value of the net area as the number of subintervals $n \rightarrow \infty$ and as the length of the subintervals $\Delta x \rightarrow 0$ (Figure 5.20). In terms of limits, we write

$$\text{net area} = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x.$$

The Riemann sums we have used so far involve regular partitions in which the subintervals have the same length Δx . We now introduce partitions of $[a, b]$ in which the

Figure 5.20

lengths of the subintervals are not necessarily equal. A **general partition** of $[a, b]$ consists of the n subintervals

$$[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n],$$

where $x_0 = a$ and $x_n = b$. The length of the k th subinterval is $\Delta x_k = x_k - x_{k-1}$, for $k = 1, \dots, n$. We let x_k^* be any point in the subinterval $[x_{k-1}, x_k]$. This general partition is used to define the *general Riemann sum*.

DEFINITION General Riemann Sum

Suppose $[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n]$ are subintervals of $[a, b]$ with

$$a = x_0 < x_1 < x_2 < \dots < x_{n-1} < x_n = b.$$

Let Δx_k be the length of the subinterval $[x_{k-1}, x_k]$ and let x_k^* be any point in $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$.

If f is defined on $[a, b]$, the sum

$$\sum_{k=1}^n f(x_k^*) \Delta x_k = f(x_1^*) \Delta x_1 + f(x_2^*) \Delta x_2 + \dots + f(x_n^*) \Delta x_n$$

is called a **general Riemann sum** for f on $[a, b]$.

As was the case for regular Riemann sums, if we choose x_k^* to be the left endpoint of $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$, then the general Riemann sum is a left Riemann sum. Similarly, if we choose x_k^* to be the right endpoint $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$, then the general Riemann sum is a right Riemann sum, and if we choose x_k^* to be the midpoint of the interval $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$, then the general Riemann sum is a midpoint Riemann sum.

Now consider the limit of $\sum_{k=1}^n f(x_k^*) \Delta x_k$ as $n \rightarrow \infty$ and as *all* the $\Delta x_k \rightarrow 0$. We let Δ denote the largest value of Δx_k ; that is, $\Delta = \max\{\Delta x_1, \Delta x_2, \dots, \Delta x_n\}$. Observe that if $\Delta \rightarrow 0$, then $\Delta x_k \rightarrow 0$, for $k = 1, 2, \dots, n$. For the limit $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k$ to exist, it must have the same value over all general partitions of $[a, b]$ and for all choices of x_k^* on a partition.

► Note that $\Delta \rightarrow 0$ forces all $\Delta x_k \rightarrow 0$, which forces $n \rightarrow \infty$. Therefore, it suffices to write $\Delta \rightarrow 0$ in the limit.

DEFINITION Definite Integral

A function f defined on $[a, b]$ is **integrable** on $[a, b]$ if $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k$ exists and is unique over all partitions of $[a, b]$ and all choices of x_k^* on a partition. This limit is the **definite integral of f from a to b** , which we write

$$\int_a^b f(x) dx = \lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k.$$

When the limit defining the definite integral of f exists, it equals the net area of the region bounded by the graph of f and the x -axis on $[a, b]$. It is imperative to remember that the indefinite integral $\int f(x) dx$ is a family of functions of x (the antiderivatives of f) and that the definite integral $\int_a^b f(x) dx$ is a real number (the net area of a region).

Figure 5.21

Notation The notation for the definite integral requires some explanation. There is a direct match between the notation on either side of the equation in the definition (Figure 5.21). In the limit as $\Delta \rightarrow 0$, the finite sum, denoted $\sum$, becomes a sum with an infinite number of terms, denoted $\int$. The integral sign $\int$ is an elongated S for sum. The **limits of integration**, a and b , and the limits of summation also match: The lower limit in the sum, $k = 1$, corresponds to the left endpoint of the interval, $x = a$, and the upper limit in the sum, $k = n$, corresponds to the right endpoint of the interval, $x = b$. The function under the integral sign is called the **integrand**. Finally, the differential dx in the integral (which corresponds to Δx_k in the sum) is an essential part of the notation; it tells us that the **variable of integration** is x .

The variable of integration is a dummy variable that is completely internal to the integral. It does not matter what the variable of integration is called, as long as it does not conflict with other variables that are in use. Therefore, the integrals in Figure 5.22 all have the same meaning.

Figure 5.22

► For Leibniz, who introduced this notation in 1675, dx represented the width of an infinitesimally thin rectangle and $f(x) dx$ represented the area of such a rectangle. He used $\int_a^b f(x) dx$ to denote the sum of these areas from a to b .

- A function f is bounded on an interval I if there is a number M such that $|f(x)| < M$ for all x in I .

QUICK CHECK 3 Graph $f(x) = x$ and use geometry to evaluate $\int_{-1}^1 x \, dx$. ◀

$$\text{Net area} = \int_a^b f(x) \, dx$$

= area above x -axis (Regions 1 and 3)
– area below x -axis (Region 2)

A bounded piecewise continuous function is integrable.

Figure 5.23

The strategy of slicing a region into smaller parts, summing the results from the parts, and taking a limit is used repeatedly in calculus and its applications. We call this strategy the **slice-and-sum method**. It often results in a Riemann sum whose limit is a definite integral.

Evaluating Definite Integrals

Most of the functions encountered in this text are integrable (see Exercise 91 for an exception). In fact, if f is continuous on $[a, b]$ or if f is bounded on $[a, b]$ with a finite number of discontinuities, then f is integrable on $[a, b]$. The proof of this result lies beyond the scope of this text.

THEOREM 5.2 Integrable Functions

If f is continuous on $[a, b]$ or bounded on $[a, b]$ with a finite number of discontinuities, then f is integrable on $[a, b]$.

When f is continuous on $[a, b]$, we have seen that the definite integral $\int_a^b f(x) \, dx$ is the net area bounded by the graph of f and the x -axis on $[a, b]$. Figure 5.23 illustrates how the idea of net area carries over to piecewise continuous functions (Exercises 84–88).

EXAMPLE 2 Identifying the limit of a sum Assume

$$\lim_{\Delta \rightarrow 0} \sum_{k=1}^n (3x_k^{*2} + 2x_k^* + 1) \Delta x_k$$

is the limit of a Riemann sum for a function f on $[1, 3]$. Identify the function f and express the limit as a definite integral. What does the definite integral represent geometrically?

SOLUTION By comparing the sum $\sum_{k=1}^n (3x_k^{*2} + 2x_k^* + 1) \Delta x_k$ to the general Riemann sum $\sum_{k=1}^n f(x_k^*) \Delta x_k$, we see that $f(x) = 3x^2 + 2x + 1$. Because f is a polynomial, it is continuous on $[1, 3]$ and is, therefore, integrable on $[1, 3]$. It follows that

$$\lim_{\Delta \rightarrow 0} \sum_{k=1}^n (3x_k^{*2} + 2x_k^* + 1) \Delta x_k = \int_1^3 (3x^2 + 2x + 1) \, dx.$$

Because f is positive on $[1, 3]$, the definite integral $\int_1^3 (3x^2 + 2x + 1) \, dx$ is the area of the region bounded by the curve $y = 3x^2 + 2x + 1$ and the x -axis on $[1, 3]$ (Figure 5.24).

Figure 5.24

Related Exercises 33–34 ◀

EXAMPLE 3 Evaluating definite integrals using geometry Use familiar area formulas to evaluate the following definite integrals.

- a. $\int_2^4 (2x + 3) \, dx$ b. $\int_1^6 (2x - 6) \, dx$ c. $\int_3^4 \sqrt{1 - (x - 3)^2} \, dx$

Figure 5.25

- **A trapezoid and its area** When $a = 0$, we get the area of a triangle. When $a = b$, we get the area of a rectangle.

Figure 5.27

QUICK CHECK 4 Let $f(x) = 5$ and use geometry to evaluate $\int_1^3 f(x) dx$. What is the value of $\int_a^b c dx$, where c is a real number? ◀

Figure 5.28

SOLUTION To evaluate these definite integrals geometrically, a sketch of the corresponding region is essential.

- a. The definite integral $\int_2^4 (2x + 3) dx$ is the area of the trapezoid bounded by the x -axis and the line $y = 2x + 3$ from $x = 2$ to $x = 4$ (Figure 5.25). The width of its base is 2 and the lengths of its two parallel sides are $f(2) = 7$ and $f(4) = 11$. Using the area formula for a trapezoid, we have

$$\int_2^4 (2x + 3) dx = \frac{1}{2} \cdot 2(11 + 7) = 18.$$

- b. A sketch shows that the regions bounded by the line $y = 2x - 6$ and the x -axis are triangles (Figure 5.26). The area of the triangle on the interval $[1, 3]$ is $\frac{1}{2} \cdot 2 \cdot 4 = 4$. Similarly, the area of the triangle on $[3, 6]$ is $\frac{1}{2} \cdot 3 \cdot 6 = 9$. The definite integral is the net area of the entire region, which is the area of the triangle above the x -axis minus the area of the triangle below the x -axis:

$$\int_1^6 (2x - 6) dx = \text{net area} = 9 - 4 = 5.$$

Figure 5.26

- c. We first let $y = \sqrt{1 - (x - 3)^2}$ and observe that $y \geq 0$ when $2 \leq x \leq 4$. Squaring both sides leads to the equation $(x - 3)^2 + y^2 = 1$, whose graph is a circle of radius 1 centered at $(3, 0)$. Because $y \geq 0$, the graph of $y = \sqrt{1 - (x - 3)^2}$ is the upper half of the circle. It follows that the integral $\int_2^4 \sqrt{1 - (x - 3)^2} dx$ is the area of a quarter circle of radius 1 (Figure 5.27). Therefore,

$$\int_2^4 \sqrt{1 - (x - 3)^2} dx = \frac{1}{4} \pi (1)^2 = \frac{\pi}{4}.$$

Related Exercises 37–38, 41 ◀

EXAMPLE 4 **Definite integrals from graphs** Figure 5.28 shows the graph of a function f with the areas of the regions bounded by its graph and the x -axis given. Find the values of the following definite integrals.

- a. $\int_a^b f(x) dx$ b. $\int_b^c f(x) dx$ c. $\int_a^c f(x) dx$ d. $\int_b^d f(x) dx$

SOLUTION

- a. Because $f(x) \geq 0$ on $[a, b]$, the value of the definite integral is the area of the region between the graph and the x -axis on $[a, b]$; that is, $\int_a^b f(x) dx = 12$.
b. Because $f(x) \leq 0$ on $[b, c]$, the value of the definite integral is the negative of the area of the corresponding region; that is, $\int_b^c f(x) dx = -10$.
c. The value of the definite integral is the area of the region on $[a, b]$ (where $f(x) \geq 0$) minus the area of the region on $[b, c]$ (where $f(x) \leq 0$). Therefore, $\int_a^c f(x) dx = 12 - 10 = 2$.
d. Reasoning as in part (c), we have $\int_b^d f(x) dx = -10 + 8 = -2$.

Related Exercises 57–60 ◀

Properties of Definite Integrals

Recall that the definite integral $\int_a^b f(x) dx$ was defined assuming $a < b$. There are, however, occasions when it is necessary to reverse the limits of integration. If f is integrable on $[a, b]$, we define

$$\int_b^a f(x) dx = -\int_a^b f(x) dx.$$

In other words, reversing the limits of integration changes the sign of the integral.

Another fundamental property of integrals is that if we integrate from a point to itself, then the length of the interval of integration is zero, which means the definite integral is also zero.

DEFINITION Reversing Limits and Identical Limits of Integration

Suppose f is integrable on $[a, b]$.

$$1. \int_b^a f(x) dx = -\int_a^b f(x) dx \quad 2. \int_a^a f(x) dx = 0$$

QUICK CHECK 5 Evaluate $\int_a^b f(x) dx + \int_b^a f(x) dx$ assuming f is integrable on $[a, b]$. ◀

Integral of a Sum Definite integrals possess other properties that often simplify their evaluation. Assume f and g are integrable on $[a, b]$. The first property states that their sum $f + g$ is integrable on $[a, b]$ and the integral of their sum is the sum of their integrals:

$$\int_a^b (f(x) + g(x)) dx = \int_a^b f(x) dx + \int_a^b g(x) dx.$$

We prove this property assuming f and g are continuous. In this case, $f + g$ is continuous and, therefore, integrable. We then have

$$\begin{aligned} \int_a^b (f(x) + g(x)) dx &= \lim_{\Delta \rightarrow 0} \sum_{k=1}^n (f(x_k^*) + g(x_k^*)) \Delta x_k && \text{Definition of definite integral} \\ &= \lim_{\Delta \rightarrow 0} \left(\sum_{k=1}^n f(x_k^*) \Delta x_k + \sum_{k=1}^n g(x_k^*) \Delta x_k \right) && \text{Addition rule for finite sums} \\ &= \lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k + \lim_{\Delta \rightarrow 0} \sum_{k=1}^n g(x_k^*) \Delta x_k && \text{Limit of a sum} \\ &= \int_a^b f(x) dx + \int_a^b g(x) dx. && \text{Definition of definite integral} \end{aligned}$$

Constants in Integrals Another property of definite integrals is that constants can be factored out of the integral. If f is integrable on $[a, b]$ and c is a constant, then cf is integrable on $[a, b]$ and

$$\int_a^b cf(x) dx = c \int_a^b f(x) dx.$$

The justification for this property (Exercise 89) is based on the fact that for finite sums,

$$\sum_{k=1}^n cf(x_k^*) \Delta x_k = c \sum_{k=1}^n f(x_k^*) \Delta x_k.$$

Combining the previous two properties, we can also show that

$$\int_a^b (f(x) - g(x)) dx = \int_a^b f(x) dx - \int_a^b g(x) dx;$$

that is, the integral of the difference of two functions is the difference of the integrals.

Integrals over Subintervals If the point p lies between a and b , then the integral on $[a, b]$ may be split into two integrals. As shown in Figure 5.29, we have the property

Figure 5.29

It is surprising that this property also holds when p lies outside the interval $[a, b]$. For example, if $a < b < p$ and f is integrable on $[a, p]$, then it follows (Figure 5.30) that

Figure 5.30

Because $\int_p^b f(x) dx = -\int_b^p f(x) dx$, we have the original property:

$$\int_a^b f(x) dx = \int_a^p f(x) dx + \int_p^b f(x) dx.$$

$$\begin{aligned} \int_a^b |f(x)| dx &= \text{area of } R_1^* + \text{area of } R_2 \\ &= \text{area of } R_1 + \text{area of } R_2 \end{aligned}$$

Figure 5.31

Integrals of Absolute Values Finally, how do we interpret $\int_a^b |f(x)| dx$, the integral of the absolute value of an integrable function? The graphs f and $|f|$ are shown in Figure 5.31. The integral $\int_a^b |f(x)| dx$ gives the area of regions R_1^* and R_2 . But R_1 and R_1^* have the same area; therefore, $\int_a^b |f(x)| dx$ also gives the area of R_1 and R_2 . The conclusion is that $\int_a^b |f(x)| dx$ is the area of the entire region (above and below the x -axis) that lies between the graph of f and the x -axis on $[a, b]$.

All these properties will be used frequently in upcoming work. It's worth collecting them in one table (Table 5.4).

Table 5.4 Properties of definite integrals

Let f and g be integrable functions on an interval that contains a , b , and p .

1. $\int_a^a f(x) dx = 0$ **Definition**
2. $\int_b^a f(x) dx = -\int_a^b f(x) dx$ **Definition**
3. $\int_a^b (f(x) \pm g(x)) dx = \int_a^b f(x) dx \pm \int_a^b g(x) dx$
4. $\int_a^b c f(x) dx = c \int_a^b f(x) dx$, for any constant c
5. $\int_a^b f(x) dx = \int_a^p f(x) dx + \int_p^b f(x) dx$
6. The function $|f|$ is integrable on $[a, b]$, and $\int_a^b |f(x)| dx$ is the sum of the areas of the regions bounded by the graph of f and the x -axis on $[a, b]$.

EXAMPLE 5 Properties of integrals Assume $\int_0^5 f(x) dx = 3$ and $\int_0^7 f(x) dx = -10$. Evaluate the following integrals, if possible.

- a. $\int_0^7 2f(x) dx$ b. $\int_5^7 f(x) dx$ c. $\int_5^0 f(x) dx$ d. $\int_7^0 6f(x) dx$ e. $\int_0^7 |f(x)| dx$

SOLUTION

a. By Property 4 of Table 5.4,

$$\int_0^7 2f(x) dx = 2 \int_0^7 f(x) dx = 2 \cdot (-10) = -20.$$

b. By Property 5 of Table 5.4, $\int_0^7 f(x) dx = \int_0^5 f(x) dx + \int_5^7 f(x) dx$. Therefore,

$$\int_5^7 f(x) dx = \int_0^7 f(x) dx - \int_0^5 f(x) dx = -10 - 3 = -13.$$

c. By Property 2 of Table 5.4,

$$\int_5^0 f(x) dx = -\int_0^5 f(x) dx = -3.$$

d. Using Properties 2 and 4 of Table 5.4, we have

$$\int_7^0 6f(x) dx = -\int_0^7 6f(x) dx = -6 \int_0^7 f(x) dx = (-6)(-10) = 60.$$

e. This integral cannot be evaluated without knowing the intervals on which f is positive and negative. It could have any value greater than or equal to 10.

Related Exercises 49–50 ◀

QUICK CHECK 6 Evaluate $\int_{-1}^2 x dx$ and $\int_{-1}^2 |x| dx$ using geometry. ◀

Bounds on Definite Integrals

We conclude our discussion of properties of definite integrals with three results that are helpful for upcoming theoretical work. We assume f and g are continuous on $[a, b]$, where $b > a$.

Nonnegative Integrand If $f(x) \geq 0$ on $[a, b]$, it is geometrically apparent that $\int_a^b f(x) dx \geq 0$ (Figure 5.32). To prove this result, suppose m is the absolute minimum value of f on $[a, b]$, guaranteed to exist by Theorem 4.1 (note that $m \geq 0$). Working with a general partition of $[a, b]$, observe that

$$\begin{aligned} 0 &\leq m(b-a) = m \sum_{k=1}^n \Delta x_k & \sum_{k=1}^n \Delta x_k &= (b-a) \\ &= \sum_{k=1}^n m \Delta x_k & \text{Property of finite sums, Section 5.1} \\ &\leq \sum_{k=1}^n f(x_k^*) \Delta x_k & m &\leq f(x_k^*) \text{ for all } x_k^* \text{ in } [a, b] \\ &\quad \text{General Riemann sum for } f \text{ on } [a, b]. \end{aligned}$$

We have shown that for any general partition of $[a, b]$ and for every choice of x_k^* , the general Riemann sum for f is nonnegative. Taking the limit as $\Delta \rightarrow 0$, where $\Delta = \max\{\Delta x_1, \Delta x_2, \dots, \Delta x_n\}$, we have

$$\int_a^b f(x) dx \geq 0.$$

Comparing Definite Integrals A related property of definite integrals says that if $f(x) \geq g(x)$ on $[a, b]$ (Figure 5.33), then

$$\int_a^b f(x) dx \geq \int_a^b g(x) dx.$$

This property follows from the previous result and Property 3 of Table 5.4 (Exercise 94).

$\int_a^b f(x) dx = \text{net area under the curve } y = f(x);$
when $f(x) \geq 0$, net area ≥ 0 .

Figure 5.32

If $f(x) \geq g(x)$ on $[a, b]$, then
 $\int_a^b f(x) dx \geq \int_a^b g(x) dx$.

Figure 5.33

Figure 5.34

Lower and Upper Bounds Because f is continuous on $[a, b]$, it attains an absolute minimum value m and an absolute maximum value M on $[a, b]$ (Theorem 4.1). Our final property (Figure 5.34) claims that

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a).$$

To prove this result, once again working with a general partition of $[a, b]$, notice that

$$\begin{aligned} m(b-a) &= m \sum_{k=1}^n \Delta x_k && \sum_{k=1}^n \Delta x_k = b-a \\ &= \sum_{k=1}^n m \Delta x_k && \text{Property of finite sums} \\ &\leq \sum_{k=1}^n f(x_k^*) \Delta x_k && m \leq f(x_k^*) \text{ for all } x_k^* \text{ in } [a, b] \\ &\leq \sum_{k=1}^n M \Delta x_k && f(x_k^*) \leq M \text{ for all } x_k^* \text{ in } [a, b] \\ &= M \sum_{k=1}^n \Delta x_k && \text{Property of finite sums} \\ &= M(b-a). && \sum_{k=1}^n \Delta x_k = b-a \end{aligned}$$

We have shown that $m(b-a) \leq \sum_{k=1}^n f(x_k^*) \Delta x_k \leq M(b-a)$ for any partition of $[a, b]$ and for every choice of x_k^* . Letting $\Delta \rightarrow 0$, we obtain

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a).$$

Table 5.5 summarizes our findings.

Table 5.5 Additional properties of definite integrals

Let f and g be integrable functions on $[a, b]$, where $b > a$.

7. If $f(x) \geq 0$ on $[a, b]$, then $\int_a^b f(x) dx \geq 0$.
8. If $f(x) \geq g(x)$ on $[a, b]$, then $\int_a^b f(x) dx \geq \int_a^b g(x) dx$.
9. If $m \leq f(x) \leq M$, then $m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$.

In the next section, Property 9 is used to prove the central result of this chapter, the Fundamental Theorem of Calculus.

Evaluating Definite Integrals Using Limits

In Example 3, we used area formulas for trapezoids, triangles, and circles to evaluate definite integrals. Regions bounded by more general functions have curved boundaries for which conventional geometrical methods do not work. At this point in our discussion, the only way to handle such integrals is to appeal to the definition of the definite integral and the summation formulas given in Theorem 5.1.

We know that if f is integrable on $[a, b]$, then $\int_a^b f(x) dx = \lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k$, for any partition of $[a, b]$ and any points x_k^* . To simplify these calculations, we use equally spaced

► Although we proved Properties 3, 4, 7, 8, and 9 of Tables 5.4 and 5.5 for continuous functions f and g , these properties hold when f and g are integrable.

grid points and right Riemann sums. That is, for each value of n , we let $\Delta x_k = \Delta x = \frac{b-a}{n}$ and $x_k^* = a + k\Delta x$, for $k = 1, 2, \dots, n$. Then as $n \rightarrow \infty$ and $\Delta \rightarrow 0$,

$$\int_a^b f(x) dx = \lim_{\Delta \rightarrow 0} \sum_{k=1}^n f(x_k^*) \Delta x_k = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(a + k\Delta x) \Delta x.$$

EXAMPLE 6 Evaluating definite integrals Find the value of $\int_0^2 (x^3 + 1) dx$ by evaluating a right Riemann sum and letting $n \rightarrow \infty$.

SOLUTION Based on approximations found in Example 5, Section 5.1, we conjectured that the value of this integral is 6. To verify this conjecture, we now evaluate the integral exactly. The interval $[a, b] = [0, 2]$ is divided into n subintervals of length

$$\Delta x = \frac{b-a}{n} = \frac{2}{n}, \text{ which produces the grid points}$$

$$x_k^* = a + k\Delta x = 0 + k \cdot \frac{2}{n} = \frac{2k}{n}, \quad \text{for } k = 1, 2, \dots, n.$$

Letting $f(x) = x^3 + 1$, the right Riemann sum is

$$\begin{aligned} \sum_{k=1}^n f(x_k^*) \Delta x &= \sum_{k=1}^n \left(\left(\frac{2k}{n} \right)^3 + 1 \right) \frac{2}{n} \\ &= \frac{2}{n} \sum_{k=1}^n \left(\frac{8k^3}{n^3} + 1 \right) && \sum_{k=1}^n ca_k = c \sum_{k=1}^n a_k \\ &= \frac{2}{n} \left(\frac{8}{n^3} \sum_{k=1}^n k^3 + \sum_{k=1}^n 1 \right) && \sum_{k=1}^n (ca_k + b_k) = c \sum_{k=1}^n a_k + \sum_{k=1}^n b_k \\ &= \frac{2}{n} \left(\frac{8}{n^3} \left(\frac{n^2(n+1)^2}{4} \right) + n \right) && \sum_{k=1}^n k^3 = \frac{n^2(n+1)^2}{4} \text{ and } \sum_{k=1}^n 1 = n; \\ & && \text{Theorem 5.1} \\ &= \frac{4(n^2 + 2n + 1)}{n^2} + 2. && \text{Simplify.} \end{aligned}$$

Now we evaluate $\int_0^2 (x^3 + 1) dx$ by letting $n \rightarrow \infty$ in the Riemann sum:

$$\begin{aligned} \int_0^2 (x^3 + 1) dx &= \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x \\ &= \lim_{n \rightarrow \infty} \left(\frac{4(n^2 + 2n + 1)}{n^2} + 2 \right) \\ &= 4 \lim_{n \rightarrow \infty} \underbrace{\left(\frac{n^2 + 2n + 1}{n^2} \right)}_1 + \lim_{n \rightarrow \infty} 2 \\ &= 4(1) + 2 = 6. \end{aligned}$$

Therefore, $\int_0^2 (x^3 + 1) dx = 6$, confirming our conjecture in Example 5, Section 5.1.

Related Exercises 78, 80 ◀

► An analogous calculation could be done using left Riemann sums or midpoint Riemann sums.

The Riemann sum calculations in Example 6 are tedious even if f is a simple function. For polynomials of degree 4 and higher, the calculations are more challenging, and for rational and transcendental functions, advanced mathematical results are needed. The next section introduces more efficient methods for evaluating definite integrals.

SECTION 5.2 EXERCISES

Getting Started

1. What does net area measure?
2. Under what conditions does the net area of a region (bounded by a continuous function) equal the area of a region? When does the net area of a region differ from the area of a region?
3. Use the graph of $y = f(x)$ to estimate $\int_0^6 f(x) dx$ using a left and right Riemann sum with $n = 6$.

4. Use the graph of $y = g(x)$ to estimate $\int_2^{10} g(x) dx$ using a left, right, and midpoint Riemann sum with $n = 4$.

5. Suppose f is continuous on $[2, 8]$. Use the table of values of f to estimate $\int_2^8 f(x) dx$ using a left, right, and midpoint Riemann sum with $n = 3$.

x	2	3	4	5	6	7	8
$f(x)$	2	-2	-3	-4	-5	-2	-1

6. Suppose g is continuous on $[1, 9]$. Use the table of values of g to estimate $\int_1^9 g(x) dx$ using a left, right, and midpoint Riemann sum with $n = 4$.

x	1	2	3	4	5	6	7	8	9
$g(x)$	-5	-4	-3	0	2	4	5	0	-1

7. Sketch a graph of $y = 2$ on $[-1, 4]$ and use geometry to find the exact value of $\int_{-1}^4 2 dx$.
8. Sketch a graph of $y = -3$ on $[1, 5]$ and use geometry to find the exact value of $\int_1^5 (-3) dx$.
9. Sketch a graph of $y = 2x$ on $[-1, 2]$ and use geometry to find the exact value of $\int_{-1}^2 2x dx$.

10. Suppose $\int_1^3 f(x) dx = 10$ and $\int_1^3 g(x) dx = -20$. Evaluate $\int_1^3 (2f(x) - 4g(x)) dx$ and $\int_3^1 (2f(x) - 4g(x)) dx$.
11. Use graphs to evaluate $\int_0^{2\pi} \sin x dx$ and $\int_0^{2\pi} \cos x dx$.
12. Explain how the notation for Riemann sums, $\sum_{k=1}^n f(x_k^*) \Delta x_k$, corresponds to the notation for the definite integral, $\int_a^b f(x) dx$.
13. Give a geometrical explanation of why $\int_a^a f(x) dx = 0$.
14. Use Table 5.4 to rewrite $\int_1^6 (2x^3 - 4x) dx$ as the difference of two integrals.
15. Use geometry to find a formula for $\int_0^a x dx$, in terms of a constant $a > 0$.
16. If f is continuous on $[a, b]$ and $\int_a^b |f(x)| dx = 0$, what can you conclude about f ?

Practice Exercises

17–20. Approximating net area The following functions are negative on the given interval.

- a. Sketch the function on the interval.
- b. Approximate the net area bounded by the graph of f and the x -axis on the interval using a left, right, and midpoint Riemann sum with $n = 4$.

17. $f(x) = -2x - 1$ on $[0, 4]$ **T** 18. $f(x) = -4 - x^3$ on $[3, 7]$

T 19. $f(x) = \sin 2x$ on $\left[\frac{\pi}{2}, \pi\right]$ **T** 20. $f(x) = x^3 - 1$ on $[-2, 0]$

T **21–24. Approximating net area** The following functions are positive and negative on the given interval.

- a. Sketch the function on the interval.
- b. Approximate the net area bounded by the graph of f and the x -axis on the interval using a left, right, and midpoint Riemann sum with $n = 4$.
- c. Use the sketch in part (a) to show which intervals of $[a, b]$ make positive and negative contributions to the net area.

21. $f(x) = 4 - 2x$ on $[0, 4]$ 22. $f(x) = 8 - 2x^2$ on $[0, 4]$

23. $f(x) = \sin 2x$ on $\left[0, \frac{3\pi}{4}\right]$ 24. $f(x) = x^3$ on $[-1, 2]$

25–28. Area versus net area Graph the following functions. Then use geometry (not Riemann sums) to find the area and the net area of the region described.

25. The region between the graph of $y = -3x$ and the x -axis, for $-2 \leq x \leq 2$
26. The region between the graph of $y = 4x - 8$ and the x -axis, for $-4 \leq x \leq 8$
27. The region between the graph of $y = 1 - |x|$ and the x -axis, for $-2 \leq x \leq 2$
28. The region between the graph of $y = 3x - 6$ and the x -axis, for $0 \leq x \leq 6$

T 29–32. Approximating definite integrals Complete the following steps for the given integral and the given value of n .

- Sketch the graph of the integrand on the interval of integration.
- Calculate Δx and the grid points $x_0, x_1, \dots, x_n$, assuming a regular partition.
- Calculate the left and right Riemann sums for the given value of n .
- Determine which Riemann sum (left or right) underestimates the value of the definite integral and which overestimates the value of the definite integral.

29. $\int_3^6 (1 - 2x) dx; n = 6$ 30. $\int_0^2 (x^2 - 2) dx; n = 4$

31. $\int_1^7 \frac{1}{x} dx; n = 6$ 32. $\int_0^{\pi/2} \cos x dx; n = 4$

33–36. Identifying definite integrals as limits of sums Consider the following limits of Riemann sums for a function f on $[a, b]$. Identify f and express the limit as a definite integral.

33. $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n (x_k^{*2} + 1) \Delta x_k$ on $[0, 2]$

34. $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n (4 - x_k^{*2}) \Delta x_k$ on $[-2, 2]$

35. $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n x_k^* (\cos x_k^*) \Delta x_k$ on $[1, 2]$

36. $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n |x_k^{*2} - 1| \Delta x_k$ on $[-2, 2]$

37–44. Definite integrals Use geometry (not Riemann sums) to evaluate the following definite integrals. Sketch a graph of the integrand, show the region in question, and interpret your result.

37. $\int_0^4 (8 - 2x) dx$ 38. $\int_{-4}^2 (2x + 4) dx$

39. $\int_{-1}^2 (-|x|) dx$ 40. $\int_0^2 (1 - x) dx$

41. $\int_0^4 \sqrt{16 - x^2} dx$ 42. $\int_{-1}^3 \sqrt{4 - (x - 1)^2} dx$

43. $\int_0^4 f(x) dx$, where $f(x) = \begin{cases} 5 & \text{if } x \leq 2 \\ 3x - 1 & \text{if } x > 2 \end{cases}$

44. $\int_1^{10} g(x) dx$, where $g(x) = \begin{cases} 4x & \text{if } 0 \leq x \leq 2 \\ -8x + 16 & \text{if } 2 < x \leq 3 \\ -8 & \text{if } x > 3 \end{cases}$

45–48. The accompanying figure shows four regions bounded by the graph of $y = x \sin x$: R_1, R_2, R_3 , and R_4 , whose areas are 1, $\pi - 1$, $\pi + 1$, and $2\pi - 1$, respectively. (We verify these results later in the text.) Use this information to evaluate the following integrals.

45. $\int_0^{\pi} x \sin x dx$ 46. $\int_0^{3\pi/2} x \sin x dx$

47. $\int_0^{2\pi} x \sin x dx$ 48. $\int_{\pi/2}^{2\pi} x \sin x dx$

49. Properties of integrals Use only the fact that $\int_0^4 3x(4 - x) dx = 32$, and the definitions and properties of integrals, to evaluate the following integrals, if possible.

a. $\int_4^0 3x(4 - x) dx$ b. $\int_0^4 x(x - 4) dx$

c. $\int_4^0 6x(4 - x) dx$ d. $\int_0^8 3x(4 - x) dx$

50. Properties of integrals Suppose $\int_1^4 f(x) dx = 8$ and $\int_1^6 f(x) dx = 5$. Evaluate the following integrals.

a. $\int_1^4 (-3f(x)) dx$ b. $\int_1^4 3f(x) dx$

c. $\int_6^4 12f(x) dx$ d. $\int_4^6 3f(x) dx$

51. Properties of integrals Suppose $\int_0^3 f(x) dx = 2$, $\int_3^6 f(x) dx = -5$, and $\int_3^6 g(x) dx = 1$. Evaluate the following integrals.

a. $\int_0^3 5f(x) dx$ b. $\int_3^6 (-3g(x)) dx$

c. $\int_3^6 (3f(x) - g(x)) dx$ d. $\int_6^3 (f(x) + 2g(x)) dx$

52. Properties of integrals Suppose $f(x) \geq 0$ on $[0, 2]$, $f(x) \leq 0$ on $[2, 5]$, $\int_0^2 f(x) dx = 6$, and $\int_2^5 f(x) dx = -8$. Evaluate the following integrals.

a. $\int_0^5 f(x) dx$ b. $\int_0^5 |f(x)| dx$

c. $\int_2^5 4|f(x)| dx$ d. $\int_0^5 (f(x) + |f(x)|) dx$

53. Properties of integrals Consider two functions f and g on $[1, 6]$ such that $\int_1^6 f(x) dx = 10$, $\int_1^6 g(x) dx = 5$, $\int_4^6 f(x) dx = 5$, and $\int_1^4 g(x) dx = 2$. Evaluate the following integrals.

a. $\int_1^4 3f(x) dx$ b. $\int_1^6 (f(x) - g(x)) dx$

c. $\int_1^4 (f(x) - g(x)) dx$ d. $\int_4^6 (g(x) - f(x)) dx$

e. $\int_4^6 8g(x) dx$ f. $\int_4^1 2f(x) dx$

54. Suppose f is continuous on $[1, 5]$ and $2 \leq f(x) \leq 3$, for all x in $[1, 5]$. Find lower and upper bounds for $\int_1^5 f(x) dx$.

55–56. Using properties of integrals Use the value of the first integral I to evaluate the two given integrals.

55. $I = \int_0^1 (x^3 - 2x) dx = -\frac{3}{4}$

a. $\int_0^1 (4x - 2x^3) dx$ b. $\int_1^0 (2x - x^3) dx$

56. $I = \int_0^{\pi/2} (\cos \theta - 2 \sin \theta) d\theta = -1$

a. $\int_0^{\pi/2} (2 \sin \theta - \cos \theta) d\theta$ b. $\int_{\pi/2}^0 (4 \cos \theta - 8 \sin \theta) d\theta$

57–64. Definite integrals from graphs The figure shows the areas of regions bounded by the graph of f and the x -axis. Evaluate the following integrals.

57. $\int_0^a f(x) dx$ 58. $\int_0^b f(x) dx$
59. $\int_a^c f(x) dx$ 60. $\int_0^c f(x) dx$
61. $\int_0^c |f(x)| dx$ 62. $\int_0^c (2|f(x)| + 3f(x)) dx$
63. $\int_a^0 f(x) dx$ 64. $\int_c^0 |f(x)| dx$
65. Use geometry and properties of integrals to evaluate $\int_0^1 (2x + \sqrt{1-x^2} + 1) dx$.
66. Use geometry and properties of integrals to evaluate $\int_1^5 (|x-2| + \sqrt{-x^2+6x-5}) dx$.
67. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- If f is a constant function on the interval $[a, b]$, then the right and left Riemann sums give the exact value of $\int_a^b f(x) dx$, for any positive integer n .
 - If f is a linear function on the interval $[a, b]$, then a midpoint Riemann sum gives the exact value of $\int_a^b f(x) dx$, for any positive integer n .
 - $\int_0^{2\pi/a} \sin ax dx = \int_0^{2\pi/a} \cos ax dx = 0$ (Hint: Graph the functions and use properties of trigonometric functions.)
 - If $\int_a^b f(x) dx = \int_b^a f(x) dx$, then f is a constant function.
 - Property 4 of Table 5.4 implies that $\int_a^b xf(x) dx = x \int_a^b f(x) dx$.

68–70. Approximating definite integrals with a calculator Consider the following definite integrals.

- Write the left and right Riemann sums in sigma notation for an arbitrary value of n .
- Evaluate each sum using a calculator with $n = 20, 50$, and 100 . Use these values to estimate the value of the integral.

68. $\int_4^9 3\sqrt{x} dx$ 69. $\int_0^1 (x^2 + 1) dx$

70. $\int_{-1}^1 \pi \cos\left(\frac{\pi x}{2}\right) dx$

71–74. Midpoint Riemann sums with a calculator Consider the following definite integrals.

- Write the midpoint Riemann sum in sigma notation for an arbitrary value of n .
- Evaluate each sum using a calculator with $n = 20, 50$, and 100 . Use these values to estimate the value of the integral.

71. $\int_1^4 2\sqrt{x} dx$

72. $\int_{-1}^2 \sin\left(\frac{\pi x}{4}\right) dx$

73. $\int_0^4 (4x - x^2) dx$

74. $\int_0^3 \frac{2}{\sqrt{x+1}} dx$

75–81. Limits of sums Use the definition of the definite integral to evaluate the following definite integrals. Use right Riemann sums and Theorem 5.1.

75. $\int_0^2 (2x + 1) dx$

76. $\int_1^5 (1 - x) dx$

77. $\int_3^7 (4x + 6) dx$

78. $\int_0^2 (x^2 - 1) dx$

79. $\int_1^4 (x^2 - 1) dx$

80. $\int_0^2 (x^3 + x + 1) dx$

81. $\int_0^1 (4x^3 + 3x^2) dx$

Explorations and Challenges

82–83. Area by geometry Use geometry to evaluate the following integrals.

82. $\int_1^6 |2x - 4| dx$

83. $\int_{-6}^4 \sqrt{24 - 2x - x^2} dx$

84. Integrating piecewise continuous functions Suppose f is continuous on the intervals $[a, p]$ and $(p, b]$, where $a < p < b$, with a finite jump at p . Form a uniform partition on the interval $[a, p]$ with n grid points and another uniform partition on the interval $[p, b]$ with m grid points, where p is a grid point of both partitions. Write a Riemann sum for $\int_a^b f(x) dx$ and separate it into two pieces for $[a, p]$ and $[p, b]$. Explain why $\int_a^b f(x) dx = \int_a^p f(x) dx + \int_p^b f(x) dx$.

85–86. Integrating piecewise continuous functions Use geometry and the result of Exercise 84 to evaluate the following integrals.

85. $\int_0^{10} f(x) dx$, where $f(x) = \begin{cases} 2 & \text{if } 0 \leq x \leq 5 \\ 3 & \text{if } 5 < x \leq 10 \end{cases}$

86. $\int_1^6 f(x) dx$, where $f(x) = \begin{cases} 2x & \text{if } 1 \leq x < 4 \\ 10 - 2x & \text{if } 4 \leq x \leq 6 \end{cases}$

87–88. Integrating piecewise continuous functions Recall that the floor function $\lfloor x \rfloor$ is the greatest integer less than or equal to x and that the ceiling function $\lceil x \rceil$ is the least integer greater than or equal to x . Use the result of Exercise 84 and the graphs to evaluate the following integrals.

87. $\int_1^5 x \lfloor x \rfloor dx$

88. $\int_0^4 \frac{x}{\lceil x \rceil} dx$

89. **Constants in integrals** Use the definition of the definite integral to justify the property $\int_a^b c f(x) dx = c \int_a^b f(x) dx$, where f is continuous and c is a real number.

90. **Zero net area** Assuming $0 < c < d$, find the value of b (in terms of c and d) for which $\int_c^d (x + b) dx = 0$.

91. **A nonintegrable function** Consider the function defined on $[0, 1]$ such that $f(x) = 1$ if x is a rational number and $f(x) = 0$ if x is irrational. This function has an infinite number of discontinuities, and the integral $\int_0^1 f(x) dx$ does not exist. Show that the right, left, and midpoint Riemann sums on *regular* partitions with n subintervals equal 1 for all n . (Hint: Between any two real numbers lie a rational and an irrational number.)

92. **Powers of x by Riemann sums** Consider the integral $I(p) = \int_0^1 x^p dx$, where p is a positive integer.

a. Write the left Riemann sum for the integral with n subintervals.
b. It is a fact (proved by the 17th-century mathematicians Fermat and Pascal) that $\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=0}^{n-1} \left(\frac{k}{n}\right)^p = \frac{1}{p+1}$. Use this fact to evaluate $I(p)$.

93. **An exact integration formula** Evaluate $\int_a^b \frac{dx}{x^2}$, where

$0 < a < b$, using the definition of the definite integral and the following steps.

a. Assume $\{x_0, x_1, \dots, x_n\}$ is a partition of $[a, b]$ with $\Delta x_k = x_k - x_{k-1}$, for $k = 1, 2, \dots, n$. Show that $x_{k-1} \leq \sqrt{x_{k-1}x_k} \leq x_k$, for $k = 1, 2, \dots, n$.

b. Show that $\frac{1}{x_{k-1}} - \frac{1}{x_k} = \frac{\Delta x_k}{x_{k-1}x_k}$, for $k = 1, 2, \dots, n$.

c. Simplify the general Riemann sum for $\int_a^b \frac{dx}{x^2}$ using $x_k^* = \sqrt{x_{k-1}x_k}$.

d. Conclude that $\int_a^b \frac{dx}{x^2} = \frac{1}{a} - \frac{1}{b}$.

(Source: *The College Mathematics Journal*, 32, 4, Sep 2001)

94. Use Property 3 of Table 5.4 and Property 7 of Table 5.5 to prove Property 8 of Table 5.5.

5.3 Fundamental Theorem of Calculus

Evaluating definite integrals using limits of Riemann sums, as described in Section 5.2, is usually not possible or practical. Fortunately, there is a powerful and practical method for evaluating definite integrals, which is developed in this section. Along the way, we discover the inverse relationship between differentiation and integration, expressed in the most important result of calculus, the Fundamental Theorem of Calculus. The first step in this process is to introduce *area functions* (first seen in Section 1.2).

Area Functions

The concept of an area function is crucial to the discussion about the connection between derivatives and integrals. We start with a continuous function $y = f(t)$ defined for $t \geq a$, where a is a fixed number. The *area function* for f with left endpoint a is denoted $A(x)$; it gives the net area of the region bounded by the graph of f and the t -axis between $t = a$ and $t = x$ (Figure 5.35). The net area of this region is also given by the definite integral.

Figure 5.35

- Suppose you want to devise a function A whose value is the sum of the first n positive integers, $1 + 2 + \cdots + n$. The most compact way to write this function is $A(n) = \sum_{k=1}^n k$, for $n \geq 1$. In this function, n is the independent variable of the function A , and k , which is internal to the sum, is a dummy variable. This function involving a sum is analogous to an area function involving an integral.

Notice that x is the upper limit of the integral *and* the independent variable of the area function: As x changes, so does the net area under the curve. Because the symbol x is already in use as the independent variable for A , we must choose another symbol for the variable of integration. Any symbol—except x —can be used because it is a *dummy variable*; we have chosen t as the integration variable.

Figure 5.36 gives a general view of how an area function is generated. Suppose f is a continuous function and a is a fixed number. Now choose a point $b > a$. The net area of the region between the graph of f and the t -axis on the interval $[a, b]$ is $A(b)$. Moving the right endpoint to $(c, 0)$ or $(d, 0)$ produces different regions with net areas $A(c)$ and $A(d)$, respectively. In general, if $x > a$ is a variable point, then $A(x) = \int_a^x f(t) dt$ is the net area of the region between the graph of f and the t -axis on the interval $[a, x]$.

- Notice that t is the independent variable when we plot f , and x is the independent variable when we plot A .

Figure 5.36

Figure 5.36 shows how $A(x)$ varies with respect to x . Notice that $A(a) = \int_a^a f(t) dt = 0$. Then for $x > a$, the net area increases for $x < c$, at which point $f(c) = 0$. For $x > c$, the function f is negative, which produces a negative contribution to the area function. As a result, the area function decreases for $x > c$.

DEFINITION Area Function

Let f be a continuous function, for $t \geq a$. The **area function for f with left endpoint a** is

$$A(x) = \int_a^x f(t) dt,$$

where $x \geq a$. The area function gives the net area of the region bounded by the graph of f and the t -axis on the interval $[a, x]$.

The following two examples illustrate the idea of area functions.

EXAMPLE 1 Comparing area functions The graph of f is shown in Figure 5.37 with areas of various regions marked. Let $A(x) = \int_{-1}^x f(t) dt$ and $F(x) = \int_3^x f(t) dt$ be two area functions for f (note the different left endpoints). Evaluate the following area functions.

a. $A(3)$ and $F(3)$

b. $A(5)$ and $F(5)$

c. $A(9)$ and $F(9)$

Figure 5.37

SOLUTION

- a. The value of $A(3) = \int_{-1}^3 f(t) dt$ is the net area of the region bounded by the graph of f and the t -axis on the interval $[-1, 3]$. Using the graph of f , we see that $A(3) = -27$ (because this region has an area of 27 and lies below the t -axis). On the other hand, $F(3) = \int_3^3 f(t) dt = 0$ by Property 1 of Table 5.4. Notice that $A(3) - F(3) = -27$.
- b. The value of $A(5) = \int_{-1}^5 f(t) dt$ is found by subtracting the area of the region that lies below the t -axis on $[-1, 3]$ from the area of the region that lies above the t -axis on $[3, 5]$. Therefore, $A(5) = 3 - 27 = -24$. Similarly, $F(5)$ is the net area of the region bounded by the graph of f and the t -axis on the interval $[3, 5]$; therefore, $F(5) = 3$. Notice that $A(5) - F(5) = -27$.
- c. Reasoning as in parts (a) and (b), we see that $A(9) = -27 + 3 - 35 = -59$ and $F(9) = 3 - 35 = -32$. As before, observe that $A(9) - F(9) = -27$.

Related Exercises 13–14 ◀

Figure 5.38

Figure 5.39

Figure 5.40

Figure 5.41

Example 1 illustrates the important fact (to be explained shortly) that two area functions of the same function differ by a constant; in Example 1, the constant is -27 .

QUICK CHECK 1 In Example 1, let $B(x)$ be the area function for f with left endpoint 5. Evaluate $B(5)$ and $B(9)$. ◀

EXAMPLE 2 Area of a trapezoid Consider the trapezoid bounded by the line $f(t) = 2t + 3$ and the t -axis from $t = 2$ to $t = x$ (Figure 5.38). The area function $A(x) = \int_2^x f(t) dt$ gives the area of the trapezoid, for $x \geq 2$.

- a. Evaluate $A(2)$. b. Evaluate $A(5)$.
 c. Find and graph the area function $y = A(x)$, for $x \geq 2$.
 d. Compare the derivative of A to f .

SOLUTION

- a. By Property 1 of Table 5.4, $A(2) = \int_2^2 (2t + 3) dt = 0$.
- b. Notice that $A(5)$ is the area of the trapezoid (Figure 5.38) bounded by the line $y = 2t + 3$ and the t -axis on the interval $[2, 5]$. Using the area formula for a trapezoid (Figure 5.39), we find that

$$A(5) = \int_2^5 (2t + 3) dt = \frac{1}{2} \underbrace{(5 - 2)}_{\text{distance between parallel sides}} \cdot \underbrace{(f(2) + f(5))}_{\text{sum of parallel side lengths}} = \frac{1}{2} \cdot 3(7 + 13) = 30.$$

- c. Now the right endpoint of the base is a variable $x \geq 2$ (Figure 5.40). The distance between the parallel sides of the trapezoid is $x - 2$. By the area formula for a trapezoid, the area of this trapezoid, for any $x \geq 2$, is

$$\begin{aligned} A(x) &= \frac{1}{2} \underbrace{(x - 2)}_{\text{distance between parallel sides}} \cdot \underbrace{(f(2) + f(x))}_{\text{sum of parallel side lengths}} \\ &= \frac{1}{2} (x - 2)(7 + 2x + 3) \\ &= (x - 2)(x + 5) \\ &= x^2 + 3x - 10. \end{aligned}$$

Expressing the area function in terms of an integral with a variable upper limit, we have

$$A(x) = \int_2^x (2t + 3) dt = x^2 + 3x - 10, \text{ for } x \geq 2.$$

Because the line $f(t) = 2t + 3$ is above the t -axis, for $t \geq 2$, the area function $A(x) = x^2 + 3x - 10$ is an increasing function of x with $A(2) = 0$ (Figure 5.41).

- Recall that if $A'(x) = f(x)$, then f is the derivative of A ; equivalently, A is an antiderivative of f .

QUICK CHECK 2 Verify that the area function in Example 2c gives the correct area when $x = 6$ and $x = 10$. ◀

d. Differentiating the area function, we find that

$$A'(x) = \frac{d}{dx}(x^2 + 3x - 10) = 2x + 3 = f(x).$$

Therefore, $A'(x) = f(x)$, or equivalently, the area function A is an antiderivative of f . We soon show that this relationship is not an accident; it is the first part of the Fundamental Theorem of Calculus.

Related Exercises 18–19 ◀

Fundamental Theorem of Calculus

Example 2 suggests that the area function A for a linear function f is an antiderivative of f ; that is, $A'(x) = f(x)$. Our goal is to show that this conjecture holds for more general functions. Let's start with an intuitive argument; a formal proof is given at the end of the section.

Assume f is a continuous function defined on an interval $[a, b]$. As before, $A(x) = \int_a^x f(t) dt$ is the area function for f with a left endpoint a : It gives the net area of the region bounded by the graph of f and the t -axis on the interval $[a, x]$, for $x \geq a$.

Figure 5.42 is the key to the argument.

Figure 5.42

Note that with $h > 0$, $A(x + h)$ is the net area of the region whose base is the interval $[a, x + h]$ and $A(x)$ is the net area of the region whose base is the interval $[a, x]$. So the difference $A(x + h) - A(x)$ is the net area of the region whose base is the interval $[x, x + h]$. If h is small, the region in question is nearly rectangular with a base of length h and a height $f(x)$. Therefore, the net area of this region is

$$A(x + h) - A(x) \approx hf(x).$$

Dividing by h , we have

$$\frac{A(x + h) - A(x)}{h} \approx f(x).$$

An analogous argument can be made with $h < 0$. Now observe that as h tends to zero, this approximation improves. In the limit as $h \rightarrow 0$, we have

$$\lim_{h \rightarrow 0} \frac{A(x + h) - A(x)}{h} = \lim_{h \rightarrow 0} f(x).$$

$\underbrace{\hspace{1.5cm}}_{A'(x)} \qquad \qquad \underbrace{\hspace{1.5cm}}_{f(x)}$

We see that indeed $A'(x) = f(x)$. Because $A(x) = \int_a^x f(t) dt$, the result can also be written

$$A'(x) = \frac{d}{dx} \underbrace{\int_a^x f(t) dt}_{A(x)} = f(x),$$

which says that the derivative of the integral of f is f . This conclusion is the first part of the Fundamental Theorem of Calculus.

- Recall that

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h}.$$

If the function f is replaced with A , then

$$A'(x) = \lim_{h \rightarrow 0} \frac{A(x + h) - A(x)}{h}.$$

THEOREM 5.3 (PART 1) Fundamental Theorem of Calculus

If f is continuous on $[a, b]$, then the area function

$$A(x) = \int_a^x f(t) \, dt, \quad \text{for } a \leq x \leq b,$$

is continuous on $[a, b]$ and differentiable on (a, b) . The area function satisfies $A'(x) = f(x)$. Equivalently,

$$A'(x) = \frac{d}{dx} \int_a^x f(t) \, dt = f(x),$$

which means that the area function of f is an antiderivative of f on $[a, b]$.

Given that A is an antiderivative of f on $[a, b]$, it is one short step to a powerful method for evaluating definite integrals. Remember (Section 4.9) that any two antiderivatives of f differ by a constant. Assuming F is any other antiderivative of f on $[a, b]$, we have

$$F(x) = A(x) + C, \quad \text{for } a \leq x \leq b.$$

Noting that $A(a) = 0$, it follows that

$$F(b) - F(a) = (A(b) + C) - (A(a) + C) = A(b).$$

Writing $A(b)$ in terms of a definite integral leads to the remarkable result

$$A(b) = \int_a^b f(x) \, dx = F(b) - F(a).$$

We have shown that to evaluate a definite integral of f , we

- find any antiderivative of f , which we call F ; and
- compute $F(b) - F(a)$, the difference in the values of F between the upper and lower limits of integration.

This process comprises the second part of the Fundamental Theorem of Calculus.

THEOREM 5.3 (PART 2) Fundamental Theorem of Calculus

If f is continuous on $[a, b]$ and F is any antiderivative of f on $[a, b]$, then

$$\int_a^b f(x) \, dx = F(b) - F(a).$$

It is customary and convenient to denote the difference $F(b) - F(a)$ by $F(x)|_a^b$. Using this shorthand, Part 2 of the Fundamental Theorem is summarized in [Figure 5.43](#).

Figure 5.43

QUICK CHECK 3 Evaluate $\left(\frac{x}{x+1}\right)\bigg|_1^2$. ◀

The Inverse Relationship Between Differentiation and Integration It is worth pausing to observe that the two parts of the Fundamental Theorem express the inverse relationship between differentiation and integration. Part 1 of the Fundamental Theorem says

$$\frac{d}{dx} \int_a^x f(t) dt = f(x),$$

or the derivative of the integral of f is f itself.

Noting that f is an antiderivative of f' , Part 2 of the Fundamental Theorem says

$$\int_a^b f'(x) dx = f(b) - f(a),$$

or the definite integral of the derivative of f is given in terms of f evaluated at two points. In other words, the integral “undoes” the derivative.

This last relationship is important because it expresses the integral as an *accumulation* operation. Suppose we know the rate of change of f (which is f') on an interval $[a, b]$. The Fundamental Theorem says that we can integrate (that is, sum or accumulate) the rate of change over that interval, and the result is simply the difference in f evaluated at the endpoints. You will see this accumulation property used many times in the next chapter. Now let's use the Fundamental Theorem to evaluate definite integrals.

QUICK CHECK 4 Explain why f is an antiderivative of f' . ◀

Figure 5.44

Figure 5.45

Figure 5.46

EXAMPLE 3 Evaluating definite integrals Evaluate the following definite integrals using the Fundamental Theorem of Calculus, Part 2. Interpret each result geometrically.

a. $\int_0^{10} (60x - 6x^2) dx$ b. $\int_4^{16} 3\sqrt{x} dx$ c. $\int_0^{2\pi} 3\sin x dx$ d. $\int_{1/16}^{1/4} \frac{\sqrt{t} - 2t}{t} dt$

SOLUTION

a. Using the antiderivative rules of Section 4.9, an antiderivative of $f(x) = 60x - 6x^2$ is $F(x) = 30x^2 - 2x^3$. By the Fundamental Theorem, the value of the definite integral is

$$\begin{aligned} \int_0^{10} (60x - 6x^2) dx &= \underbrace{(30x^2 - 2x^3)}_{F(x)} \Big|_0^{10} && \text{Fundamental Theorem} \\ &= \underbrace{(30 \cdot 10^2 - 2 \cdot 10^3)}_{F(10)} - \underbrace{(30 \cdot 0^2 - 2 \cdot 0^3)}_{F(0)} && \text{Evaluate at } x = 10 \text{ and } x = 0. \\ &= (3000 - 2000) - 0 \\ &= 1000. && \text{Simplify.} \end{aligned}$$

Because $f(x) = 60x - 6x^2$ is positive on $[0, 10]$, the definite integral $\int_0^{10} (60x - 6x^2) dx$ is the area of the region between the graph of f and the x -axis on the interval $[0, 10]$ (Figure 5.44).

b. Because $f(x) = 3\sqrt{x}$ is positive on $[4, 16]$ (Figure 5.45), the definite integral $\int_4^{16} 3\sqrt{x} dx$ equals the area of the region under the graph of f on $[4, 16]$. In Example 3 of Section 5.1, we used a midpoint Riemann sum to show that the area is approximately 112.062. Using the Fundamental Theorem, we can compute the exact area. Noting that an antiderivative of $x^{1/2}$ is $\frac{2}{3}x^{3/2}$, we have

$$\begin{aligned} \int_4^{16} 3\sqrt{x} dx &= 3 \int_4^{16} x^{1/2} dx && \text{Property 4, Table 5.4} \\ &= 3 \cdot \frac{2}{3} x^{3/2} \Big|_4^{16} && \text{Fundamental Theorem} \\ &= 2(16^{3/2} - 4^{3/2}) && \text{Evaluate at } x = 16 \text{ and } x = 4. \\ &= 2(64 - 8) = 112. && \text{Simplify.} \end{aligned}$$

c. As shown in Figure 5.46, the region bounded by the graph of $f(x) = 3\sin x$ and the x -axis on $[0, 2\pi]$ consists of two parts, one above the x -axis and one below the x -axis. By the symmetry of f , these two regions have the same area, so the definite integral

- When evaluating definite integrals, factor out multiplicative constants when possible, as we did in parts (b) and (c) of Example 3. To illustrate: It is better to write

$$\begin{aligned}-3 \cos x \Big|_0^{2\pi} &= -3(\cos 2\pi - \cos 0) \text{ than} \\ -3 \cos x \Big|_0^{2\pi} &= (-3 \cos 2\pi) - (-3 \cos 0).\end{aligned}$$

- We know that

$$\frac{d}{dt}(t^{1/2}) = \frac{1}{2}t^{-1/2}.$$

$$\text{Therefore, } \int \frac{1}{2}t^{-1/2} dt = t^{1/2} + C$$

$$\text{and } \int \frac{dt}{\sqrt{t}} = \int t^{-1/2} dt = 2t^{1/2} + C.$$

Figure 5.47

over $[0, 2\pi]$, which gives the net area of the entire region, is zero. Let's confirm this fact. An antiderivative of $f(x) = 3 \sin x$ is $-3 \cos x$. Therefore, the value of the definite integral is

$$\begin{aligned}\int_0^{2\pi} 3 \sin x \, dx &= -3 \cos x \Big|_0^{2\pi} && \text{Fundamental Theorem} \\ &= -3(\cos 2\pi - \cos 0) && \text{Substitute.} \\ &= -3(1 - 1) = 0. && \text{Simplify.}\end{aligned}$$

- d. Although the variable of integration is t , rather than x , we proceed as before, after simplifying the integrand:

$$f(t) = \frac{\sqrt{t} - 2t}{t} = \frac{1}{\sqrt{t}} - 2.$$

Finding antiderivatives with respect to t and applying the Fundamental Theorem, we have

$$\begin{aligned}\int_{1/16}^{1/4} \frac{\sqrt{t} - 2t}{t} dt &= \int_{1/16}^{1/4} (t^{-1/2} - 2) dt && \text{Simplify the integrand.} \\ &= (2t^{1/2} - 2t) \Big|_{1/16}^{1/4} && \text{Fundamental Theorem} \\ &= \left(2\left(\frac{1}{4}\right)^{1/2} - \frac{1}{2}\right) - \left(2\left(\frac{1}{16}\right)^{1/2} - \frac{1}{8}\right) && \text{Evaluate.} \\ &= 1 - \frac{1}{2} - \frac{1}{2} + \frac{1}{8} && \text{Simplify.} \\ &= \frac{1}{8}.\end{aligned}$$

The definite integral is positive because the graph of f lies above the t -axis on the interval of integration $[\frac{1}{16}, \frac{1}{4}]$ (Figure 5.47).

Related Exercises 23–24, 26, 36 ◀

EXAMPLE 4 Net areas and definite integrals The graph of $f(x) = 6x(x+1)(x-2)$ is shown in Figure 5.48. The region R_1 is bounded by the curve and the x -axis on the interval $[-1, 0]$, and R_2 is bounded by the curve and the x -axis on the interval $[0, 2]$.

Figure 5.48

- Find the *net area* of the region between the curve and the x -axis on $[-1, 2]$.
- Find the *area* of the region between the curve and the x -axis on $[-1, 2]$.

SOLUTION

- a. The net area of the region is given by a definite integral. The integrand f is first expanded to find an antiderivative:

$$\begin{aligned}\int_{-1}^2 f(x) \, dx &= \int_{-1}^2 (6x^3 - 6x^2 - 12x) \, dx. && \text{Expand } f. \\ &= \left(\frac{3}{2}x^4 - 2x^3 - 6x^2\right) \Big|_{-1}^2 && \text{Fundamental Theorem} \\ &= -\frac{27}{2}. && \text{Simplify.}\end{aligned}$$

The net area of the region between the curve and the x -axis on $[-1, 2]$ is $-\frac{27}{2}$, which is the area of R_1 *minus* the area of R_2 (Figure 5.48). Because R_2 has a larger area than R_1 , the net area is negative.

- b. The region R_1 lies above the x -axis, so its area is

$$\int_{-1}^0 (6x^3 - 6x^2 - 12x) \, dx = \left(\frac{3}{2}x^4 - 2x^3 - 6x^2\right) \Big|_{-1}^0 = \frac{5}{2}.$$

The region R_2 lies below the x -axis, so its net area is negative:

$$\int_0^2 (6x^3 - 6x^2 - 12x) dx = \left(\frac{3}{2}x^4 - 2x^3 - 6x^2 \right) \Big|_0^2 = -16.$$

Therefore, the *area* of R_2 is $-(-16) = 16$. The combined area of R_1 and R_2 is $\frac{5}{2} + 16 = \frac{37}{2}$. We could also find the area of this region directly by evaluating $\int_{-1}^2 |f(x)| dx$.

Related Exercises 66, 68 ◀

Examples 3 and 4 make use of Part 2 of the Fundamental Theorem, which is the most potent tool for evaluating definite integrals. The remaining examples illustrate the use of the equally important Part 1 of the Fundamental Theorem.

EXAMPLE 5 Derivatives of integrals Use Part 1 of the Fundamental Theorem to simplify the following expressions.

a. $\frac{d}{dx} \int_1^x \sin^2 t \, dt$ b. $\frac{d}{dx} \int_x^5 \sqrt{t^2 + 1} \, dt$ c. $\frac{d}{dx} \int_0^{x^2} \cos t^2 \, dt$

SOLUTION

a. Using Part 1 of the Fundamental Theorem, we see that

$$\frac{d}{dx} \int_1^x \sin^2 t \, dt = \sin^2 x.$$

b. To apply Part 1 of the Fundamental Theorem, the variable must appear in the upper limit. Therefore, we use the fact that $\int_a^b f(t) \, dt = -\int_b^a f(t) \, dt$ and then apply the Fundamental Theorem:

$$\frac{d}{dx} \int_x^5 \sqrt{t^2 + 1} \, dt = -\frac{d}{dx} \int_5^x \sqrt{t^2 + 1} \, dt = -\sqrt{x^2 + 1}.$$

c. The upper limit of the integral is not x , but a function of x . Therefore, the function to be differentiated is a composite function, which requires the Chain Rule. We let $u = x^2$ to produce

$$y = g(u) = \int_0^u \cos t^2 \, dt.$$

By the Chain Rule,

$$\begin{aligned} \frac{d}{dx} \int_0^{x^2} \cos t^2 \, dt &= \frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx} && \text{Chain Rule} \\ &= \left(\frac{d}{du} \int_0^u \cos t^2 \, dt \right) (2x) && \text{Substitute for } g; \text{ note that } u'(x) = 2x. \\ &= (\cos u^2)(2x) && \text{Fundamental Theorem} \\ &= 2x \cos x^4. && \text{Substitute } u = x^2. \end{aligned}$$

Related Exercises 71, 73, 76 ◀

► Example 5c illustrates one case of Leibniz's Rule:

$$\frac{d}{dx} \int_a^{g(x)} f(t) \, dt = f(g(x))g'(x).$$

Figure 5.49

EXAMPLE 6 Working with area functions Consider the function f shown in Figure 5.49 and its area function $A(x) = \int_0^x f(t) \, dt$, for $0 \leq x \leq 17$. Assume the four regions R_1 , R_2 , R_3 , and R_4 have the same area. Based on the graph of f , do the following.

- Find the zeros of A on $[0, 17]$.
- Find the points on $[0, 17]$ at which A has a local maximum or a local minimum.
- Sketch a graph of A , for $0 \leq x \leq 17$.

SOLUTION

- a. The area function $A(x) = \int_0^x f(t) dt$ gives the net area bounded by the graph of f and the t -axis on the interval $[0, x]$ (Figure 5.50a). Therefore, $A(0) = \int_0^0 f(t) dt = 0$. Because R_1 and R_2 have the same area but lie on opposite sides of the t -axis, it follows that $A(8) = \int_0^8 f(t) dt = 0$. Similarly, $A(16) = \int_0^{16} f(t) dt = 0$. Therefore, the zeros of A are $x = 0, 8$, and 16 .
- b. Observe that the function f is positive, for $0 < t < 4$, which implies that $A(x)$ increases as x increases from 0 to 4 (Figure 5.50b). Then as x increases from 4 to 8, $A(x)$ decreases because f is negative, for $4 < t < 8$ (Figure 5.50c). Similarly, $A(x)$ increases as x increases from $x = 8$ to $x = 12$ (Figure 5.50d) and decreases from $x = 12$ to $x = 16$. By the First Derivative Test, A has local minima at $x = 8$ and $x = 16$ and local maxima at $x = 4$ and $x = 12$ (Figure 5.50e).
- c. Combining the observations in parts (a) and (b) leads to a qualitative sketch of A (Figure 5.50e). Note that $A(x) \geq 0$, for all $x \geq 0$. It is not possible to determine function values (y -coordinates) on the graph of A .

► Recall that local extrema occur only at interior points of the domain.

Figure 5.50

Related Exercises 69–70 ◀

EXAMPLE 7 The sine integral function Let

$$g(t) = \begin{cases} \frac{\sin t}{t} & \text{if } t > 0 \\ 1 & \text{if } t = 0. \end{cases}$$

Graph the *sine integral function* $S(x) = \int_0^x g(t) dt$, for $x \geq 0$.

SOLUTION Notice that S is an area function for g . The independent variable of S is x , and t has been chosen as the (dummy) variable of integration. A good way to start is by graphing the integrand g (Figure 5.51a). The function oscillates with a decreasing amplitude with $g(0) = 1$. Beginning with $S(0) = 0$, the area function S increases until $x = \pi$ because g is positive on $(0, \pi)$. However, on $(\pi, 2\pi)$, g is negative and the net area decreases. On $(2\pi, 3\pi)$, g is positive again, so S again increases. Therefore, the graph of S has alternating local maxima and minima. Because the amplitude of g decreases, each

maximum of S is less than the previous maximum, and each minimum of S is greater than the previous minimum (Figure 5.51b). Determining the exact value of S at these maxima and minima is difficult.

Figure 5.51

Appealing to Part 1 of the Fundamental Theorem, we find that

$$S'(x) = \frac{d}{dx} \int_0^x g(t) dt = \frac{\sin x}{x}, \text{ for } x > 0.$$

► Note that

$$\lim_{x \rightarrow \infty} S'(x) = \lim_{x \rightarrow \infty} g(x) = 0.$$

As anticipated, the derivative of S changes sign at integer multiples of π . Specifically, S' is positive and S increases on the intervals $(0, \pi)$, $(2\pi, 3\pi)$, $\dots$, $(2n\pi, (2n+1)\pi)$, $\dots$, while S' is negative and S decreases on the remaining intervals. Clearly, S has local maxima at $x = \pi, 3\pi, 5\pi, \dots$, and it has local minima at $x = 2\pi, 4\pi, 6\pi, \dots$.

One more observation is helpful. It can be shown that although S oscillates for increasing x , its graph gradually flattens out and approaches a horizontal asymptote. (Finding the exact value of this horizontal asymptote is challenging; see Exercise 113.) Assembling all these observations, the graph of the sine integral function emerges (Figure 5.51b).

Related Exercises 99–100 ◀

We conclude this section with a formal proof of the Fundamental Theorem of Calculus.

Proof of the Fundamental Theorem: Let f be continuous on $[a, b]$ and let A be the area function for f with left endpoint a . The first step is to prove that A is differentiable on (a, b) and $A'(x) = f(x)$, which is Part 1 of the Fundamental Theorem. The proof of Part 2 then follows.

Step 1. We assume $a < x < b$ and use the definition of the derivative,

$$A'(x) = \lim_{h \rightarrow 0} \frac{A(x+h) - A(x)}{h}.$$

First assume $h > 0$. Using Figure 5.52 and Property 5 of Table 5.4, we have

$$A(x+h) - A(x) = \int_a^{x+h} f(t) dt - \int_a^x f(t) dt = \int_x^{x+h} f(t) dt.$$

That is, $A(x+h) - A(x)$ is the net area of the region bounded by the curve on the interval $[x, x+h]$.

Figure 5.52

- The quantities m and M exist for any $h > 0$; however, their values depend on h .

Let m and M be the minimum and maximum values of f on $[x, x + h]$, respectively, which exist by the continuity of f . Note that $m \leq f(t) \leq M$ on $[x, x + h]$ (which is an interval of length h). It follows, by Property 9 of Table 5.5, that

$$mh \leq \underbrace{\int_x^{x+h} f(t) \, dt}_{A(x+h) - A(x)} \leq Mh.$$

Substituting for the integral, we find that

$$mh \leq A(x+h) - A(x) \leq Mh.$$

Dividing these inequalities by $h > 0$, we have

$$m \leq \frac{A(x+h) - A(x)}{h} \leq M.$$

The case $h < 0$ is handled similarly and leads to the same conclusion.

We now take the limit as $h \rightarrow 0$ across these inequalities. As $h \rightarrow 0$, m and M approach $f(x)$, because f is continuous at x . At the same time, as $h \rightarrow 0$, the quotient that is sandwiched between m and M approaches $A'(x)$:

$$\underbrace{\lim_{h \rightarrow 0} m}_{f(x)} \leq \underbrace{\lim_{h \rightarrow 0} \frac{A(x+h) - A(x)}{h}}_{A'(x)} \leq \underbrace{\lim_{h \rightarrow 0} M}_{f(x)}.$$

By the Squeeze Theorem (Theorem 2.5), we conclude that $A'(x)$ exists and A is differentiable for $a < x < b$. Furthermore, $A'(x) = f(x)$. Finally, because A is differentiable on (a, b) , A is continuous on (a, b) by Theorem 3.1. Exercise 116 shows that A is also right- and left-continuous at the endpoints a and b , respectively.

- Once again we use an important fact:
Two antiderivatives of the same function differ by a constant.

Step 2. Having established that the area function A is an antiderivative of f , we know that $F(x) = A(x) + C$, where F is any antiderivative of f and C is a constant. Noting that $A(a) = 0$, it follows that

$$F(b) - F(a) = (A(b) + C) - (A(a) + C) = A(b).$$

Writing $A(b)$ in terms of a definite integral, we have

$$A(b) = \int_a^b f(x) \, dx = F(b) - F(a),$$

which is Part 2 of the Fundamental Theorem. 

SECTION 5.3 EXERCISES

Getting Started

- Suppose A is an area function of f . What is the relationship between f and A ?
- Suppose F is an antiderivative of f and A is an area function of f . What is the relationship between F and A ?
- Explain mathematically how the Fundamental Theorem of Calculus is used to evaluate definite integrals.
- Let $f(x) = c$, where c is a positive constant. Explain why an area function of f is an increasing function.
- The linear function $f(x) = 3 - x$ is decreasing on the interval $[0, 3]$. Is its area function for f (with left endpoint 0) increasing or decreasing on the interval $[0, 3]$? Draw a picture and explain.
- Evaluate $\int_0^2 3x^2 \, dx$ and $\int_{-2}^2 3x^2 \, dx$.
- Explain in words and express mathematically the inverse relationship between differentiation and integration as given by Part 1 of the Fundamental Theorem of Calculus.
- Why can the constant of integration be omitted from the antiderivative when evaluating a definite integral?
- Evaluate $\frac{d}{dx} \int_a^x f(t) \, dt$ and $\frac{d}{dx} \int_a^b f(t) \, dt$, where a and b are constants.
- Explain why $\int_a^b f'(x) \, dx = f(b) - f(a)$.
- Evaluate $\int_3^8 f'(t) \, dt$, where f' is continuous on $[3, 8]$, $f(3) = 4$, and $f(8) = 20$.
- Evaluate $\int_2^7 3 \, dx$ using the Fundamental Theorem of Calculus. Check your work by evaluating the integral using geometry.

Practice Exercises

- 13. Area functions** The graph of f is shown in the figure. Let $A(x) = \int_{-2}^x f(t) dt$ and $F(x) = \int_4^x f(t) dt$ be two area functions for f . Evaluate the following area functions.

a. $A(-2)$ b. $F(8)$ c. $A(4)$ d. $F(4)$ e. $A(8)$

- 14. Area functions** The graph of f is shown in the figure. Let $A(x) = \int_0^x f(t) dt$ and $F(x) = \int_2^x f(t) dt$ be two area functions for f . Evaluate the following area functions.

a. $A(2)$ b. $F(5)$ c. $A(0)$ d. $F(8)$
e. $A(8)$ f. $A(5)$ g. $F(2)$

- 15–16. Area functions for constant functions** Consider the following functions f and real numbers a (see figure).

- a. Find and graph the area function $A(x) = \int_a^x f(t) dt$ for f .
b. Verify that $A'(x) = f(x)$.

15. $f(t) = 5, a = 0$ 16. $f(t) = 5, a = -5$

- 17. Area functions for the same linear function** Let $f(t) = t$ and consider the two area functions $A(x) = \int_0^x f(t) dt$ and $F(x) = \int_2^x f(t) dt$.

- a. Evaluate $A(2)$ and $A(4)$. Then use geometry to find an expression for $A(x)$, for $x \geq 0$.
b. Evaluate $F(4)$ and $F(6)$. Then use geometry to find an expression for $F(x)$, for $x \geq 2$.
c. Show that $A(x) - F(x)$ is a constant and that $A'(x) = F'(x) = f(x)$.

- 18. Area functions for the same linear function** Let $f(t) = 2t - 2$ and consider the two area functions $A(x) = \int_1^x f(t) dt$ and $F(x) = \int_4^x f(t) dt$.

- a. Evaluate $A(2)$ and $A(3)$. Then use geometry to find an expression for $A(x)$, for $x \geq 1$.
b. Evaluate $F(5)$ and $F(6)$. Then use geometry to find an expression for $F(x)$, for $x \geq 4$.
c. Show that $A(x) - F(x)$ is a constant and that $A'(x) = F'(x) = f(x)$.

- 19–22. Area functions for linear functions** Consider the following functions f and real numbers a (see figure).

- a. Find and graph the area function $A(x) = \int_a^x f(t) dt$.
b. Verify that $A'(x) = f(x)$.

19. $f(t) = t + 5, a = -5$ 20. $f(t) = 2t + 5, a = 0$
21. $f(t) = 3t + 1, a = 2$ 22. $f(t) = 4t + 2, a = 0$

- 23–24. Definite integrals** Evaluate the following integrals using the Fundamental Theorem of Calculus. Explain why your result is consistent with the figure.

23. $\int_0^1 (x^2 - 2x + 3) dx$ 24. $\int_{-\pi/4}^{7\pi/4} (\sin x + \cos x) dx$

- 25–28. Definite integrals** Evaluate the following integrals using the Fundamental Theorem of Calculus. Sketch the graph of the integrand and shade the region whose net area you have found.

25. $\int_{-2}^3 (x^2 - x - 6) dx$ 26. $\int_0^1 (x - \sqrt{x}) dx$
27. $\int_0^5 (x^2 - 9) dx$ 28. $\int_{1/2}^2 \left(1 - \frac{1}{x^2}\right) dx$

- 29–60. Definite integrals** Evaluate the following integrals using the Fundamental Theorem of Calculus.

29. $\int_0^2 4x^3 dx$ 30. $\int_0^2 (3x^2 + 2x) dx$ 31. $\int_1^8 8x^{1/3} dx$
32. $\int_1^{16} x^{-5/4} dx$ 33. $\int_0^1 (x + \sqrt{x}) dx$ 34. $\int_0^{\pi/4} 2 \cos x dx$
35. $\int_1^9 \frac{2}{\sqrt{x}} dx$ 36. $\int_4^9 \frac{2 + \sqrt{t}}{\sqrt{t}} dt$ 37. $\int_{-2}^2 (x^2 - 4) dx$
38. $\int_0^{\pi/4} (\sin x + \cos x) dx$ 39. $\int_{1/2}^1 (t^{-3} - 8) dt$
40. $\int_0^4 t(t - 2)(t - 4) dt$

41. $\int_1^4 (1-x)(x-4) dx$

42. $\int_2^0 t(t+1) dt$

43. $\int_{-2}^{-1} x^{-3} dx$

44. $\int_0^{\pi} (1 - \sin x) dx$

45. $\int_0^{\pi/4} \sec^2 \theta d\theta$

46. $\int_{-\pi/2}^{\pi/2} (\cos x - 1) dx$

47. $\int_1^2 \frac{3}{w^2} dw$

48. $\int_4^9 \frac{x - \sqrt{x}}{x^3} dx$

49. $\int_1^8 \sqrt[3]{y} dy$

50. $\frac{1}{2} \int_1^4 \frac{x^2 - 1}{x^2} dx$

51. $\int_1^4 \frac{x-2}{\sqrt{x}} dx$

52. $\int_1^2 \frac{2s-4}{s^3} ds$

53. $\int_0^{\pi/3} \sec x \tan x dx$

54. $\int_{\pi/4}^{\pi/2} \csc^2 \theta d\theta$

55. $\int_{\pi/4}^{3\pi/4} (\cot^2 x + 1) dx$

56. $\int_1^2 \frac{x^2 + 6x + 8}{x^4 + 2x^3} dx$

57. $\int_{\pi/4}^{\pi/2} \csc x \cot x dx$

58. $\int_0^{\pi/4} \sec x (\sec x + \cos x) dx$

59. $\int_0^{\pi} f(x) dx$, where $f(x) = \begin{cases} \sin x + 1 & \text{if } x \leq \pi/2 \\ 2 \cos x + 2 & \text{if } x > \pi/2 \end{cases}$

60. $\int_1^3 g(x) dx$, where $g(x) = \begin{cases} 3x^2 + 4x + 1 & \text{if } x \leq 2 \\ 2x + 5 & \text{if } x > 2 \end{cases}$

61–64. Area Find (i) the net area and (ii) the area of the following regions. Graph the function and indicate the region in question.

61. The region bounded by $y = x^{1/2}$ and the x -axis between $x = 1$ and $x = 4$

62. The region above the x -axis bounded by $y = 4 - x^2$

63. The region below the x -axis bounded by $y = x^4 - 16$

64. The region bounded by $y = 6 \cos x$ and the x -axis between $x = -\pi/2$ and $x = \pi$

65–70. Areas of regions Find the area of the region bounded by the graph of f and the x -axis on the given interval.

65. $f(x) = x^2 - 25$ on $[2, 4]$

66. $f(x) = x^3 - 1$ on $[-1, 2]$

67. $f(x) = \frac{1}{x^5}$ on $[-2, -1]$

68. $f(x) = x(x+1)(x-2)$ on $[-1, 2]$

69. $f(x) = \sin x$ on $\left[-\frac{\pi}{4}, \frac{3\pi}{4}\right]$

70. $f(x) = \cos x$ on $\left[\frac{\pi}{2}, \pi\right]$

71–84. Derivatives of integrals Simplify the following expressions.

71. $\frac{d}{dx} \int_3^x (t^2 + t + 1) dt$

72. $\frac{d}{dx} \int_0^x \sin^2 t dt$

73. $\frac{d}{dx} \int_x^1 \sqrt{t^4 + 1} dt$

74. $\frac{d}{dx} \int_x^0 \frac{dp}{p^2 + 1}$

75. $\frac{d}{dx} \int_2^{x^3} \frac{dp}{p^2}$

76. $\frac{d}{dx} \int_0^{x^2} \frac{dt}{t^2 + 4}$

77. $\frac{d}{dx} \int_0^{\cos x} (t^4 + 6) dt$

78. $\frac{d}{dx} \int_x^1 \cos^3 t dt$

79. $\frac{d}{dz} \int_{\sin z}^{10} \frac{dt}{t^4 + 1}$

80. $\frac{d}{dy} \int_{y^3}^{10} \sqrt{x^6 + 1} dx$

81. $\frac{d}{dt} \left(\int_1^t \frac{3}{x} dx - \int_t^1 \frac{3}{x} dx \right)$

82. $\frac{d}{dt} \left(\int_0^t \frac{dx}{1+x^2} + \int_1^{1/t} \frac{dx}{1+x^2} \right)$

83. $\frac{d}{dx} \int_{-x}^x \sqrt{1+t^2} dt$

(Hint: $\int_{-x}^x \sqrt{1+t^2} dt = \int_{-x}^0 \sqrt{1+t^2} dt + \int_0^x \sqrt{1+t^2} dt$.)

84. $\frac{d}{dx} \int_x^{x^2} \sin t^2 dt$

85. Matching functions with area functions Match the functions f , whose graphs are given in a–d, with the area functions

$A(x) = \int_0^x f(t) dt$, whose graphs are given in A–D.

86–89. Working with area functions Consider the function f and its graph.

- Estimate the zeros of the area function $A(x) = \int_0^x f(t) dt$, for $0 \leq x \leq 10$.
- Estimate the points (if any) at which A has a local maximum or minimum.
- Sketch a graph of A , for $0 \leq x \leq 10$, without a scale on the y -axis.

- 90. Area functions from graphs** The graph of f is given in the figure. Let $A(x) = \int_0^x f(t) dt$ and evaluate $A(1)$, $A(2)$, $A(4)$, and $A(6)$.

- 91. Area functions from graphs** The graph of f is given in the figure. Let $A(x) = \int_0^x f(t) dt$ and evaluate $A(2)$, $A(5)$, $A(8)$, and $A(12)$.

92–96. Working with area functions Consider the function f and the points a , b , and c .

- Find the area function $A(x) = \int_a^x f(t) dt$ using the Fundamental Theorem.
- Graph f and A .
- Evaluate $A(b)$ and $A(c)$. Interpret the results using the graphs of part (b).

92. $f(x) = \sin x$; $a = 0$, $b = \frac{\pi}{2}$, $c = \pi$

93. $f(x) = \cos \pi x$; $a = 0$, $b = \frac{1}{2}$, $c = 1$

94. $f(x) = -12x(x-1)(x-2)$; $a = 0$, $b = 1$, $c = 2$

95. $f(x) = \cos x$; $a = 0$, $b = \frac{\pi}{2}$, $c = \pi$

96. $f(x) = \frac{1}{x^2}$; $a = 1$, $b = 2$, $c = 4$

97. Find the critical points of the function

$$f(x) = \int_{-1}^x t^2(t-3)(t-4) dt,$$

and determine the intervals on which f is increasing or decreasing.

98. Determine the intervals on which the function

$$g(x) = \int_x^0 \frac{t}{t^2 + 1} dt$$

is concave up or concave down.

99–100. Functions defined by integrals Consider the function g , which is given in terms of a definite integral with a variable upper limit.

- Graph the integrand.
- Calculate $g'(x)$.
- Graph g , showing all your work and reasoning.

99. $g(x) = \int_0^x \sin^2 t dt$

100. $g(x) = \int_0^x \sin(\pi t^2) dt$ (a Fresnel integral)

101–104. Areas of regions Find the area of the region R bounded by the graph of f and the x -axis on the given interval. Graph f and show the region R .

101. $f(x) = 2 - |x|$ on $[-2, 4]$

102. $f(x) = 16 - x^4$ on $[-2, 2]$

103. $f(x) = x^4 - 4$ on $[1, 4]$

104. $f(x) = x^2(x-2)$ on $[-1, 3]$

105. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- Suppose f is a positive decreasing function, for $x > 0$. Then the area function $A(x) = \int_0^x f(t) dt$ is an increasing function of x .
- Suppose f is a negative increasing function, for $x > 0$. Then the area function $A(x) = \int_0^x f(t) dt$ is a decreasing function of x .
- The functions $p(x) = \sin 3x$ and $q(x) = 4 \sin 3x$ are antiderivatives of the same function.
- If $A(x) = 3x^2 - x - 3$ is an area function for f , then $B(x) = 3x^2 - x$ is also an area function for f .

Explorations and Challenges

106. Evaluate $\lim_{x \rightarrow 2} \frac{\int_2^x \sqrt{t^2 + t + 3} dt}{x^2 - 4}$.

107. Maximum net area What value of $b > -1$ maximizes the integral $\int_{-1}^b x^2(3-x) dx$?

108. Maximum net area Graph the function $f(x) = 8 + 2x - x^2$ and determine the values of a and b that maximize the value of the integral $\int_a^b f(x) dx$.

- 109. Zero net area** Consider the function $f(x) = x^2 - 4x$.
- Graph f on the interval $x \geq 0$.
 - For what value of $b > 0$ is $\int_0^b f(x) dx = 0$?
 - In general, for the function $f(x) = x^2 - ax$, where $a > 0$, for what value of $b > 0$ (as a function of a) is $\int_0^b f(x) dx = 0$?

- 110. Cubic zero net area** Consider the graph of the cubic $y = x(x - a)(x - b)$, where $0 < a < b$. Verify that the graph bounds a region above the x -axis, for $0 < x < a$, and bounds a region below the x -axis, for $a < x < b$. What is the relationship between a and b if the areas of these two regions are equal?

- 111. An integral equation** Use the Fundamental Theorem of Calculus, Part 1, to find the function f that satisfies the equation

$$\int_0^x f(t) dt = 2 \cos x + 3x - 2.$$

Verify the result by substitution into the equation.

- 112. Max/min of area functions** Suppose f is continuous on $[0, \infty)$ and $A(x)$ is the net area of the region bounded by the graph of f and the t -axis on $[0, x]$. Show that the local maxima and minima of A occur at the zeros of f . Verify this fact with the function $f(x) = x^2 - 10x$.

- 113. Asymptote of sine integral** Use a calculator to approximate

$$\lim_{x \rightarrow \infty} S(x) = \lim_{x \rightarrow \infty} \int_0^x \frac{\sin t}{t} dt,$$

where S is the sine integral function (see Example 7). Explain your reasoning.

- 114. Sine integral** Show that the sine integral $S(x) = \int_0^x \frac{\sin t}{t} dt$ satisfies the (differential) equation $xS'(x) + 2S''(x) + xS'''(x) = 0$.

- 115. Fresnel integral** Show that the Fresnel integral $S(x) = \int_0^x \sin t^2 dt$ satisfies the (differential) equation $(S'(x))^2 + \left(\frac{S''(x)}{2x}\right)^2 = 1$.

- 116. Continuity at the endpoints** Assume f is continuous on $[a, b]$ and let A be the area function for f with left endpoint a . Let m^* and M^* be the absolute minimum and maximum values of f on $[a, b]$, respectively.

- Prove that $m^*(x - a) \leq A(x) \leq M^*(x - a)$, for all x in $[a, b]$. Use this result and the Squeeze Theorem to show that A is continuous from the right at $x = a$.
- Prove that $m^*(b - x) \leq A(b) - A(x) \leq M^*(b - x)$, for all x in $[a, b]$. Use this result to show that A is continuous from the left at $x = b$.

- 117. Discrete version of the Fundamental Theorem** In this exercise, we work with a discrete problem and show why the relationship $\int_a^b f'(x) dx = f(b) - f(a)$ makes sense. Suppose we have a set of equally spaced grid points

$$\{a = x_0 < x_1 < x_2 < \cdots < x_{n-1} < x_n = b\},$$

where the distance between any two grid points is Δx . Suppose also that at each grid point x_k , a function value $f(x_k)$ is defined, for $k = 0, \dots, n$.

- We now replace the integral with a sum and replace the derivative with a difference quotient. Explain why $\int_a^b f'(x) dx$ is analogous to $\sum_{k=1}^n \frac{f(x_k) - f(x_{k-1})}{\Delta x} \Delta x$.

$$\approx \sum_{k=1}^n f'(x_k) \Delta x$$
- Simplify the sum in part (a) and show that it is equal to $f(b) - f(a)$.
- Explain the correspondence between the integral relationship and the summation relationship.

QUICK CHECK ANSWERS

- 0, -35
- $A(6) = 44$; $A(10) = 120$
- $\frac{2}{3} - \frac{1}{2} = \frac{1}{6}$
- If f is differentiated, we get f' . Therefore, f is an antiderivative of f' . ◀

5.4 Working with Integrals

With the Fundamental Theorem of Calculus in hand, we may begin an investigation of integration and its applications. In this section, we discuss the role of symmetry in integrals, we use the slice-and-sum strategy to define the average value of a function, and we explore a theoretical result called the Mean Value Theorem for Integrals.

Integrating Even and Odd Functions

Symmetry appears throughout mathematics in many different forms, and its use often leads to insights and efficiencies. Here we use the symmetry of a function to simplify integral calculations.

Section 1.1 introduced the symmetry of even and odd functions. An **even function** satisfies the property $f(-x) = f(x)$, which means that its graph is symmetric about the y -axis (Figure 5.53a). Examples of even functions are $f(x) = \cos x$ and $f(x) = x^n$, where n is an even integer. An **odd function** satisfies the property $f(-x) = -f(x)$, which means that its graph is symmetric about the origin (Figure 5.53b). Examples of odd functions are $f(x) = \sin x$ and $f(x) = x^n$, where n is an odd integer.

Figure 5.53

QUICK CHECK 1 If f and g are both even functions, is the product fg even or odd? Use the facts that $f(-x) = f(x)$ and $g(-x) = g(x)$. ◀

► There are a couple of ways to see that $\sin^3 x$ is an odd function. Its graph is symmetric about the origin, indicating that $\sin^3(-x) = -\sin^3 x$. Or by analogy, take an odd power of x and raise it to an odd power. For example, $(x^3)^3 = x^{15}$, which is odd. See Exercises 49–52 for direct proofs of symmetry in composite functions.

Special things happen when we integrate even and odd functions on intervals centered at the origin. First suppose f is an even function and consider $\int_{-a}^a f(x) dx$. From Figure 5.53a, we see that the integral of f on $[-a, 0]$ equals the integral of f on $[0, a]$. Therefore, the integral on $[-a, a]$ is twice the integral on $[0, a]$, or

$$\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx.$$

On the other hand, suppose f is an odd function and consider $\int_{-a}^a f(x) dx$. As shown in Figure 5.53b, the integral on the interval $[-a, 0]$ is the negative of the integral on $[0, a]$. Therefore, the integral on $[-a, a]$ is zero, or

$$\int_{-a}^a f(x) dx = 0.$$

We summarize these results in the following theorem.

THEOREM 5.4 Integrals of Even and Odd Functions

Let a be a positive real number and let f be an integrable function on the interval $[-a, a]$.

- If f is even, $\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx$.
- If f is odd, $\int_{-a}^a f(x) dx = 0$.

The following example shows how symmetry can simplify integration.

EXAMPLE 1 Integrating symmetric functions Evaluate the following integrals using symmetry arguments.

a. $\int_{-2}^2 (x^4 - 3x^3) dx$ b. $\int_{-\pi/2}^{\pi/2} (\cos x - 4 \sin^3 x) dx$

SOLUTION

- a. Note that $x^4 - 3x^3$ is neither odd nor even, so Theorem 5.4 cannot be applied directly. However, we can split the integral and then use symmetry:

$$\begin{aligned} \int_{-2}^2 (x^4 - 3x^3) dx &= \int_{-2}^2 x^4 dx - 3 \underbrace{\int_{-2}^2 x^3 dx}_0 && \text{Properties 3 and 4 of Table 5.4} \\ &= 2 \int_0^2 x^4 dx - 0 && x^4 \text{ is even; } x^3 \text{ is odd.} \\ &= 2 \left(\frac{x^5}{5} \right) \bigg|_0^2 && \text{Fundamental Theorem} \\ &= 2 \left(\frac{32}{5} \right) = \frac{64}{5}. && \text{Simplify.} \end{aligned}$$

Notice how the odd-powered term of the integrand is eliminated by symmetry. Integration of the even-powered term is simplified because the lower limit is zero.

- b. The $\cos x$ term is an even function, so it can be integrated on the interval $[0, \pi/2]$. What about $\sin^3 x$? It is an odd function raised to an odd power, which results in an odd function; its integral on $[-\pi/2, \pi/2]$ is zero. Therefore,

$$\begin{aligned} \int_{-\pi/2}^{\pi/2} (\cos x - 4 \sin^3 x) dx &= 2 \int_0^{\pi/2} \cos x dx - 0 && \text{Symmetry} \\ &= 2 \sin x \bigg|_0^{\pi/2} && \text{Fundamental Theorem} \\ &= 2(1 - 0) = 2. && \text{Simplify.} \end{aligned}$$

Average Value of a Function

If five people weigh 155, 143, 180, 105, and 123 lb, their average (mean) weight is

$$\frac{155 + 143 + 180 + 105 + 123}{5} = 141.2 \text{ lb.}$$

This idea generalizes quite naturally to functions. Consider a function f that is continuous on $[a, b]$. Using a regular partition $x_0 = a, x_1, x_2, \dots, x_n = b$ with $\Delta x = \frac{b-a}{n}$, we select a point x_k^* in each subinterval and compute $f(x_k^*)$, for $k = 1, \dots, n$. The values of $f(x_k^*)$ may be viewed as a sampling of f on $[a, b]$. The average of these function values is

$$\frac{f(x_1^*) + f(x_2^*) + \cdots + f(x_n^*)}{n}.$$

Noting that $n = \frac{b-a}{\Delta x}$, we write the average of the n sample values as the Riemann sum

$$\frac{f(x_1^*) + f(x_2^*) + \cdots + f(x_n^*)}{(b-a)/\Delta x} = \frac{1}{b-a} \sum_{k=1}^n f(x_k^*) \Delta x.$$

Now suppose we increase n , taking more and more samples of f , while Δx decreases to zero. The limit of this sum is a definite integral that gives the average value $\bar{f}$ on $[a, b]$:

$$\begin{aligned} \bar{f} &= \frac{1}{b-a} \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x \\ &= \frac{1}{b-a} \int_a^b f(x) dx. \end{aligned}$$

This definition of the average value of a function is analogous to the definition of the average of a finite set of numbers.

DEFINITION Average Value of a Function

The average value of an integrable function f on the interval $[a, b]$ is

$$\bar{f} = \frac{1}{b-a} \int_a^b f(x) dx.$$

The average value of a function f on an interval $[a, b]$ has a clear geometrical interpretation. Multiplying both sides of the definition of average value by $(b-a)$, we have

$$\underbrace{(b-a)}_{\text{net area of rectangle}} \bar{f} = \underbrace{\int_a^b f(x) dx}_{\text{net area of region bounded by curve}}.$$

We see that $|\bar{f}|$ is the height of a rectangle with base $[a, b]$, and that rectangle has the same net area as the region bounded by the graph of f on the interval $[a, b]$ (Figure 5.54). Note that $\bar{f}$ may be zero or negative.

Figure 5.54

QUICK CHECK 2 What is the average value of a constant function on an interval? What is the average value of an odd function on an interval $[-a, a]$? ◀

EXAMPLE 2 Average elevation A hiking trail has an elevation given by

$$f(x) = 60x^3 - 650x^2 + 1200x + 4500,$$

where f is measured in feet above sea level and x represents horizontal distance along the trail in miles, with $0 \leq x \leq 5$. What is the average elevation of the trail?

Figure 5.55

SOLUTION The trail ranges between elevations of about 2000 and 5000 ft (Figure 5.55). If we let the endpoints of the trail correspond to the horizontal distances $a = 0$ and $b = 5$, the average elevation of the trail in feet is

$$\begin{aligned}\bar{f} &= \frac{1}{5} \int_0^5 (60x^3 - 650x^2 + 1200x + 4500) dx \\ &= \frac{1}{5} \left(60 \frac{x^4}{4} - 650 \frac{x^3}{3} + 1200 \frac{x^2}{2} + 4500x \right) \bigg|_0^5 \quad \text{Fundamental Theorem} \\ &= 3958 \frac{1}{3}. \quad \text{Simplify.}\end{aligned}$$

The average elevation of the trail is slightly less than 3960 ft.

Related Exercises 26, 34

Mean Value Theorem for Integrals

- Compare this statement to that of the Mean Value Theorem for Derivatives: There is at least one point c in (a, b) such that $f'(c)$ equals the average slope of f .

The average value of a function brings us close to an important theoretical result. The Mean Value Theorem for Integrals says that if f is continuous on $[a, b]$, then there is at least one point c in the interval (a, b) such that $f(c)$ equals the average value of f on (a, b) . In other words, the horizontal line $y = \bar{f}$ intersects the graph of f for some point c in (a, b) (Figure 5.56). If f were not continuous, such a point might not exist.

Figure 5.56

- Theorem 5.5 guarantees a point c in the open interval (a, b) at which f equals its average value. However, f may also equal its average value at an endpoint of that interval.

THEOREM 5.5 Mean Value Theorem for Integrals

Let f be continuous on the interval $[a, b]$. There exists a point c in (a, b) such that

$$f(c) = \bar{f} = \frac{1}{b-a} \int_a^b f(t) dt.$$

Proof: We begin by letting $F(x) = \int_a^x f(t) dt$ and noting that F is continuous on $[a, b]$ and differentiable on (a, b) (by Theorem 5.3, Part 1). We now apply the Mean Value Theorem for derivatives (Theorem 4.4) to F and conclude that there exists at least one point c in (a, b) such that

$$\underbrace{F'(c)}_{f(c)} = \frac{F(b) - F(a)}{b - a}.$$

By Theorem 5.3, Part 1, we know that $F'(c) = f(c)$, and by Theorem 5.3, Part 2, we know that

$$F(b) - F(a) = \int_a^b f(t) dt.$$

- A more general form of the Mean Value Theorem states that if f and g are continuous on $[a, b]$ with $g(x) \geq 0$ on $[a, b]$, then there exists a number c in (a, b) such that

$$\int_a^b f(x)g(x) dx = f(c) \int_a^b g(x) dx.$$

QUICK CHECK 3 Explain why $f(x) = 0$ for at least one point of (a, b) if f is continuous and $\int_a^b f(x) dx = 0$. ◀

Figure 5.57

Combining these observations, we have

$$f(c) = \frac{1}{b-a} \int_a^b f(t) dt,$$

where c is a point in (a, b) . ▶

EXAMPLE 3 Average value equals function value Find the point(s) on the interval $(0, 1)$ at which $f(x) = 2x(1 - x)$ equals its average value on $[0, 1]$.

SOLUTION The average value of f on $[0, 1]$ is

$$\bar{f} = \frac{1}{1-0} \int_0^1 2x(1-x) dx = \left(x^2 - \frac{2}{3}x^3 \right) \Big|_0^1 = \frac{1}{3}.$$

We must find the points on $(0, 1)$ at which $f(x) = \frac{1}{3}$ (Figure 5.57). Using the quadratic formula, the two solutions of $f(x) = 2x(1 - x) = \frac{1}{3}$ are

$$\frac{1 - \sqrt{1/3}}{2} \approx 0.211 \quad \text{and} \quad \frac{1 + \sqrt{1/3}}{2} \approx 0.789.$$

These two points are located symmetrically on either side of $x = \frac{1}{2}$. The two solutions, 0.211 and 0.789, are the same for $f(x) = ax(1 - x)$ for any nonzero value of a (Exercise 53).

SECTION 5.4 EXERCISES

Getting Started

- If f is an odd function, why is $\int_{-a}^a f(x) dx = 0$?
- If f is an even function, why is $\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx$?
- Suppose f is an even function and $\int_{-8}^8 f(x) dx = 18$.
 - Evaluate $\int_0^8 f(x) dx$.
 - Evaluate $\int_{-8}^8 xf(x) dx$.
- Suppose f is an odd function, $\int_0^4 f(x) dx = 3$, and $\int_0^8 f(x) dx = 9$.
 - Evaluate $\int_{-4}^8 f(x) dx$.
 - Evaluate $\int_{-8}^4 f(x) dx$.
- Use symmetry to explain why

$$\int_{-4}^4 (5x^4 + 3x^3 + 2x^2 + x + 1) dx = 2 \int_0^4 (5x^4 + 2x^2 + 1) dx.$$
- Use symmetry to fill in the blanks:

$$\int_{-\pi}^{\pi} (\sin x + \cos x) dx = \underline{\hspace{2cm}} \int_0^{\pi} \underline{\hspace{2cm}} dx.$$
- Is x^{12} an even or odd function? Is $\sin x^2$ an even or odd function?
- Explain how to find the average value of a function on an interval $[a, b]$ and why this definition is analogous to the definition of the average of a set of numbers.
- Explain the statement that a continuous function on an interval $[a, b]$ equals its average value at some point on (a, b) .
- Sketch the function $y = x$ on the interval $[0, 2]$ and let R be the region bounded by $y = x$ and the x -axis on $[0, 2]$. Now sketch a rectangle in the first quadrant whose base is $[0, 2]$ and whose area equals the area of R .

Practice Exercises

11–24. Symmetry in integrals Use symmetry to evaluate the following integrals.

- | | |
|---|---|
| 11. $\int_{-2}^2 x^9 dx$ | 12. $\int_{-200}^{200} 2x^5 dx$ |
| 13. $\int_{-2}^2 (3x^8 - 2) dx$ | 14. $\int_{-\pi/4}^{\pi/4} \cos x dx$ |
| 15. $\int_{-2}^2 (x^2 + x^3) dx$ | 16. $\int_{-\pi}^{\pi} t^2 \sin t dt$ |
| 17. $\int_{-2}^2 (x^9 - 3x^5 + 2x^2 - 10) dx$ | |
| 18. $\int_{-\pi/2}^{\pi/2} 5 \sin \theta d\theta$ | 19. $\int_{-\pi/4}^{\pi/4} \sin^5 t dt$ |
| 20. $\int_{-1}^1 (1 - x) dx$ | 21. $\int_{-\pi/4}^{\pi/4} \sec^2 x dx$ |
| 22. $\int_{-\pi/4}^{\pi/4} \tan \theta d\theta$ | 23. $\int_{-2}^2 \frac{x^3 - 4x}{x^2 + 1} dx$ |
| 24. $\int_{-2}^2 (1 - x ^3) dx$ | |

25–32. Average values Find the average value of the following functions on the given interval. Draw a graph of the function and indicate the average value.

- | | |
|---|--|
| 25. $f(x) = x^3$ on $[-1, 1]$ | 26. $f(x) = x^2 + 1$ on $[-2, 2]$ |
| 27. $f(x) = \frac{1}{\sqrt{x}}$ on $[1, 4]$ | 28. $f(x) = \frac{1}{x^3}$ on $[1, 2]$ |
| 29. $f(x) = \cos x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ | 30. $f(x) = x(1 - x)$ on $[0, 1]$ |

31. $f(x) = x^n$ on $[0, 1]$, for any positive integer n
32. $f(x) = x^{1/n}$ on $[0, 1]$, for any positive integer n
33. **Average distance on a parabola** What is the average distance between the parabola $y = 30x(20 - x)$ and the x -axis on the interval $[0, 20]$?
- 34. Average elevation** The elevation of a path is given by $f(x) = x^3 - 5x^2 + 30$, where x measures horizontal distance. Draw a graph of the elevation function and find its average value, for $0 \leq x \leq 4$.
35. **Average velocity** The velocity in m/s of an object moving along a line over the time interval $[0, 6]$ is $v(t) = t^2 + 3t$. Find the average velocity of the object over this time interval.
36. **Average velocity** A rock is launched vertically upward from the ground with a speed of 64 ft/s. The height of the rock (in ft) above the ground after t seconds is given by the function $s(t) = -16t^2 + 64t$. Find its average velocity during its flight.
37. **Average height of an arch** The height of an arch above the ground is given by the function $y = 10 \sin x$, for $0 \leq x \leq \pi$. What is the average height of the arch above the ground?
38. **Average height of a wave** The surface of a water wave is described by $y = 5(1 + \cos x)$, for $-\pi \leq x \leq \pi$, where $y = 0$ corresponds to a trough of the wave (see figure). Find the average height of the wave above the trough on $[-\pi, \pi]$.

39–44. Mean Value Theorem for Integrals Find or approximate all points at which the given function equals its average value on the given interval.

39. $f(x) = 8 - 2x$ on $[0, 4]$ **40.** $f(x) = \cos x$ on $[-\frac{\pi}{2}, \frac{\pi}{2}]$

41. $f(x) = 1 - \frac{x^2}{a^2}$ on $[0, a]$, where a is a positive real number

42. $f(x) = \frac{\pi}{4} \sin x$ on $[0, \pi]$ **43.** $f(x) = 1 - |x|$ on $[-1, 1]$

44. $f(x) = \frac{1}{x^2}$ on $[1, 4]$

45. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- If f is symmetric about the line $x = 2$, then $\int_0^4 f(x) dx = 2 \int_0^2 f(x) dx$.
- If f has the property $f(a + x) = -f(a - x)$, for all x , where a is constant, then $\int_{a-2}^{a+2} f(x) dx = 0$.
- The average value of a linear function on an interval $[a, b]$ is the function value at the midpoint of $[a, b]$.
- Consider the function $f(x) = x(a - x)$ on the interval $[0, a]$, for $a > 0$. Its average value on $[0, a]$ is $\frac{1}{2}$ of its maximum value.

46. Planetary orbits The planets orbit the Sun in elliptical orbits with the Sun at one focus (see Section 12.4 for more on ellipses). The equation of an ellipse whose dimensions are $2a$ in the x -direction and $2b$ in the y -direction is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

- Let d^2 denote the square of the distance from a planet to the center of the ellipse at $(0, 0)$. Integrate over the interval $[-a, a]$ to show that the average value of d^2 is $\frac{a^2 + 2b^2}{3}$.
- Show that in the case of a circle ($a = b = R$), the average value in part (a) is R^2 .
- Assuming $0 < b < a$, the coordinates of the Sun are $(\sqrt{a^2 - b^2}, 0)$. Let D^2 denote the square of the distance from the planet to the Sun. Integrate over the interval $[-a, a]$ to show that the average value of D^2 is $\frac{4a^2 - b^2}{3}$.

47. Gateway Arch The Gateway Arch in St. Louis is 630 ft high and has a 630-ft base. Its shape can be modeled by the parabola

$$y = 630 \left(1 - \left(\frac{x}{315} \right)^2 \right).$$

Find the average height of the arch above the ground.

48. Comparing a sine and a quadratic function Consider the functions $f(x) = \sin x$ and $g(x) = \frac{4}{\pi^2} x(\pi - x)$.

- Carefully graph f and g on the same set of axes. Verify that both functions have a single local maximum on the interval $[0, \pi]$ and that they have the same maximum value on $[0, \pi]$.
- On the interval $[0, \pi]$, which is true: $f(x) \geq g(x)$, $g(x) \geq f(x)$, or neither?
- Compute and compare the average values of f and g on $[0, \pi]$.

49–52. Symmetry of composite functions Prove that the integrand is either even or odd. Then give the value of the integral or show how it can be simplified. Assume f and g are even functions and p and q are odd functions.

49. $\int_{-a}^a f(g(x)) \, dx$

50. $\int_{-a}^a f(p(x)) \, dx$

51. $\int_{-a}^a p(g(x)) \, dx$

52. $\int_{-a}^a p(q(x)) \, dx$

53. Average value with a parameter Consider the function $f(x) = ax(1 - x)$ on the interval $[0, 1]$, where a is a positive real number.

- Find the average value of f as a function of a .
- Find the points at which the value of f equals its average value, and prove that they are independent of a .

Explorations and Challenges

54. Alternative definitions of means Consider the function

$$f(t) = \frac{\int_a^b x^{t+1} dx}{\int_a^b x^t dx}.$$

Show that the following means can be defined in terms of f .

- Arithmetic mean: $f(0) = \frac{a+b}{2}$
- Geometric mean: $f\left(-\frac{3}{2}\right) = \sqrt{ab}$
- Harmonic mean: $f(-3) = \frac{2ab}{a+b}$

(Source: *Mathematics Magazine*, 78, 5, Dec 2005)

55. Problems of antiquity Several calculus problems were solved by Greek mathematicians long before the discovery of calculus. The following problems were solved by Archimedes using methods that predated calculus by 2000 years.

- Show that the area of a segment of a parabola is $4/3$ that of its inscribed triangle of greatest area. In other words, the area bounded by the parabola $y = a^2 - x^2$ and the x -axis is $4/3$ the area of the triangle with vertices $(\pm a, 0)$ and $(0, a^2)$. Assume $a > 0$ is unspecified.
- Show that the area bounded by the parabola $y = a^2 - x^2$ and the x -axis is $2/3$ the area of the rectangle with vertices $(\pm a, 0)$ and $(\pm a, a^2)$. Assume $a > 0$ is unspecified.

56. Average value of the derivative Suppose f' is a continuous function for all real numbers. Show that the average value of the derivative on an interval $[a, b]$ is $\bar{f}' = \frac{f(b) - f(a)}{b - a}$. Interpret this result in terms of secant lines.

57. Symmetry of powers Fill in the following table with either **even** or **odd**, and prove each result. Assume n is a nonnegative integer and f^n means the n th power of f .

	f is even	f is odd
n is even	f^n is _____	f^n is _____
n is odd	f^n is _____	f^n is _____

58. Bounds on an integral Suppose f is continuous on $[a, b]$ with $f''(x) > 0$ on the interval. It can be shown that

$$(b-a)f\left(\frac{a+b}{2}\right) \leq \int_a^b f(x) \, dx \leq (b-a) \frac{f(a) + f(b)}{2}.$$

- Assuming f is nonnegative on $[a, b]$, draw a figure to illustrate the geometric meaning of these inequalities. Discuss your conclusions.
- Divide these inequalities by $(b-a)$ and interpret the resulting inequalities in terms of the average value of f on $[a, b]$.

59. Generalizing the Mean Value Theorem for Integrals Suppose f and g are continuous on $[a, b]$ and let

$$h(x) = (x-b) \int_a^x f(t) \, dt + (x-a) \int_x^b g(t) \, dt.$$

- Use Rolle's Theorem to show that there is a number c in (a, b) such that

$$\int_a^c f(t) \, dt + \int_c^b g(t) \, dt = f(c)(b-c) + g(c)(c-a),$$

which is a generalization of the Mean Value Theorem for Integrals.

- Show that there is a number c in (a, b) such that $\int_a^c f(t) \, dt = f(c)(b-c)$.
- Use a sketch to interpret part (b) geometrically.
- Use the result of part (a) to give an alternative proof of the Mean Value Theorem for Integrals.

(Source: *The College Mathematics Journal*, 33, 5, Nov 2002)

60. Evaluating a sine integral by Riemann sums Consider the integral $I = \int_0^{\pi/2} \sin x \, dx$.

- Write the left Riemann sum for I with n subintervals.
- Show that $\lim_{\theta \rightarrow 0} \theta \left(\frac{\cos \theta + \sin \theta - 1}{2(1 - \cos \theta)} \right) = 1$.

$$\text{c. It is a fact that } \sum_{k=0}^{n-1} \sin\left(\frac{\pi k}{2n}\right) = \frac{\cos\left(\frac{\pi}{2n}\right) + \sin\left(\frac{\pi}{2n}\right) - 1}{2\left(1 - \cos\left(\frac{\pi}{2n}\right)\right)}.$$

Use this fact and part (b) to evaluate I by taking the limit of the Riemann sum as $n \rightarrow \infty$.

QUICK CHECK ANSWERS

- $f(-x)g(-x) = f(x)g(x)$; therefore, fg is even.
- The average value is the constant; the average value is 0.
- The average value is zero on the interval; by the Mean Value Theorem for Integrals, $f(x) = 0$ at some point on the interval. ◀

5.5 Substitution Rule

Given just about any differentiable function, with enough know-how and persistence, you can compute its derivative. But the same cannot be said of antiderivatives. Many functions, even relatively simple ones, do not have antiderivatives that can be expressed in terms of familiar functions. Examples are $\sin x^2$ and $(\sin x)/x$. The immediate goal of this section is to enlarge the family of functions for which we can find antiderivatives. This campaign resumes in Chapter 8, where additional integration methods are developed.

Indefinite Integrals

One way to find new antiderivative rules is to start with familiar derivative rules and work backward. When applied to the Chain Rule, this strategy leads to the Substitution Rule. For example, consider the indefinite integral $\int \cos 2x \, dx$. The closest familiar integral related to this problem is

- We assume C is an arbitrary constant without stating so each time it appears.

$$\int \cos x \, dx = \sin x + C,$$

which is true because

$$\frac{d}{dx}(\sin x + C) = \cos x.$$

Therefore, we might *incorrectly* conclude that the indefinite integral of $\cos 2x$ is $\sin 2x + C$. However, by the Chain Rule,

$$\frac{d}{dx}(\sin 2x + C) = 2 \cos 2x \neq \cos 2x.$$

Note that $\sin 2x$ fails to be an antiderivative of $\cos 2x$ by a multiplicative factor of 2. A small adjustment corrects this problem. Let's try $\frac{1}{2} \sin 2x$:

$$\frac{d}{dx}\left(\frac{1}{2} \sin 2x\right) = \frac{1}{2} \cdot 2 \cos 2x = \cos 2x.$$

It works! So we have

$$\int \cos 2x \, dx = \frac{1}{2} \sin 2x + C.$$

The trial-and-error approach of the previous example is impractical for complicated integrals. To develop a systematic method, consider a composite function $F(g(x))$, where F is an antiderivative of f ; that is, $F' = f$. Using the Chain Rule to differentiate the composite function $F(g(x))$, we find that

$$\frac{d}{dx}(F(g(x))) = \underbrace{F'(g(x))}_{f(g(x))} g'(x) = f(g(x)) g'(x).$$

This equation says that $F(g(x))$ is an antiderivative of $f(g(x))g'(x)$, which is written

$$\int f(g(x))g'(x) \, dx = F(g(x)) + C, \quad (1)$$

where F is any antiderivative of f .

- You can call the new variable anything you want because it is just another variable of integration. Typically, u is the standard choice for the new variable.

Why is this approach called the *Substitution Rule* (or *Change of Variables Rule*)? In the composite function $f(g(x))$ in equation (1), we identify the inner function as $u = g(x)$, which implies that $du = g'(x) \, dx$. Making this identification, the integral in equation (1) is written

$$\int \underbrace{f(g(x))}_{f(u)} \underbrace{g'(x) \, dx}_{du} = \int f(u) \, du = F(u) + C.$$

We see that the integral $\int f(g(x))g'(x) \, dx$ with respect to x is replaced with a new integral $\int f(u) \, du$ with respect to the new variable u . In other words, we have substituted the new

variable u for the old variable x . Of course, if the new integral with respect to u is no easier to find than the original integral, then the change of variables has not helped. The Substitution Rule requires plenty of practice until certain patterns become familiar.

THEOREM 5.6 Substitution Rule for Indefinite Integrals

Let $u = g(x)$, where g is differentiable on an interval, and let f be continuous on the corresponding range of g . On that interval,

$$\int f(g(x))g'(x) dx = \int f(u) du.$$

In practice, Theorem 5.6 is applied using the following procedure.

PROCEDURE Substitution Rule (Change of Variables)

1. Given an indefinite integral involving a composite function $f(g(x))$, identify an inner function $u = g(x)$ such that a constant multiple of $g'(x)$ appears in the integrand.
2. Substitute $u = g(x)$ and $du = g'(x) dx$ in the integral.
3. Evaluate the new indefinite integral with respect to u .
4. Write the result in terms of x using $u = g(x)$.

Disclaimer: Not all integrals yield to the Substitution Rule.

EXAMPLE 1 Perfect substitutions Use the Substitution Rule to find the following indefinite integrals. Check your work by differentiating.

a. $\int 2(2x + 1)^3 dx$ b. $\int 2x \cos x^2 dx$

SOLUTION

- a. We identify $u = 2x + 1$ as the inner function of the composite function $(2x + 1)^3$.

Therefore, we choose the new variable $u = 2x + 1$, which implies that $\frac{du}{dx} = 2$, or $du = 2 dx$. Notice that $du = 2 dx$ appears as a factor in the integrand. The change of variables looks like this:

$$\int \underbrace{(2x + 1)^3}_{u^3} \cdot \underbrace{2 dx}_{du} = \int u^3 du \quad \text{Substitute } u = 2x + 1, du = 2 dx.$$

$$= \frac{u^4}{4} + C \quad \text{Antiderivative}$$

$$= \frac{(2x + 1)^4}{4} + C. \quad \text{Replace } u \text{ with } 2x + 1.$$

► Use the Chain Rule to check that

$$\frac{d}{dx} \left(\frac{(2x + 1)^4}{4} + C \right) = 2(2x + 1)^3.$$

Notice that the final step uses $u = 2x + 1$ to return to the original variable.

- b. The composite function $\cos x^2$ has the inner function $u = x^2$, which implies that $du = 2x dx$. The change of variables appears as

$$\int \underbrace{(\cos x^2)}_{\cos u} \underbrace{2x dx}_{du} = \int \cos u du \quad \text{Substitute } u = x^2, du = 2x dx.$$

$$= \sin u + C \quad \text{Antiderivative}$$

$$= \sin x^2 + C. \quad \text{Replace } u \text{ with } x^2.$$

To check the result, we compute $\frac{d}{dx}(\sin x^2 + C) = (\cos x^2) 2x = 2x \cos x^2$.

QUICK CHECK 1 Find a new variable u so that $\int 4x^3(x^4 + 5)^{10} dx = \int u^{10} du$. ◀

Related Exercises 17, 20–21 ◀

Most substitutions are not perfect. The remaining examples show more typical situations that require introducing a constant factor.

EXAMPLE 2 Introducing a constant Find the following indefinite integrals.

a. $\int x^4(x^5 + 6)^9 dx$ b. $\int \cos^3 x \sin x dx$

SOLUTION

- a. The inner function of the composite function $(x^5 + 6)^9$ is $x^5 + 6$, and its derivative $5x^4$ also appears in the integrand (up to a multiplicative factor). Therefore, we use the substitution $u = x^5 + 6$, which implies that $du = 5x^4 dx$, or $x^4 dx = \frac{1}{5} du$. By the Substitution Rule,

$$\begin{aligned} \int \underbrace{(x^5 + 6)^9}_{u^9} \underbrace{x^4 dx}_{\frac{1}{5} du} &= \int u^9 \cdot \frac{1}{5} du && \text{Substitute } u = x^5 + 6, \\ &&& du = 5x^4 dx \Rightarrow x^4 dx = \frac{1}{5} du. \\ &= \frac{1}{5} \int u^9 du && \int cf(x) dx = c \int f(x) dx \\ &= \frac{1}{5} \cdot \frac{u^{10}}{10} + C && \text{Antiderivative} \\ &= \frac{1}{50} (x^5 + 6)^{10} + C. && \text{Replace } u \text{ with } x^5 + 6. \end{aligned}$$

QUICK CHECK 2 In Example 2a, explain why the same substitution would not work as well for the integral $\int x^3(x^5 + 6)^9 dx$. ◀

- b. The integrand can be written as $(\cos x)^3 \sin x$. The inner function in the composition $(\cos x)^3$ is $\cos x$, which suggests the substitution $u = \cos x$. Note that $du = -\sin x dx$ or $\sin x dx = -du$. The change of variables appears as

$$\begin{aligned} \int \underbrace{\cos^3 x}_{u^3} \underbrace{\sin x dx}_{-du} &= - \int u^3 du && \text{Substitute } u = \cos x, du = -\sin x dx. \\ &= -\frac{u^4}{4} + C && \text{Antiderivative} \\ &= -\frac{\cos^4 x}{4} + C. && \text{Replace } u \text{ with } \cos x. \end{aligned}$$

Related Exercises 23–24 ◀

Sometimes the choice for a u -substitution is not so obvious or more than one u -substitution works. The following example illustrates both of these points.

EXAMPLE 3 Variations on the substitution method Find $\int \frac{x}{\sqrt{x+1}} dx$.

SOLUTION

Substitution 1 The composite function $\sqrt{x+1}$ suggests the new variable $u = x + 1$. You might doubt whether this choice will work because $du = dx$, which leaves the x in the numerator of the integrand unaccounted for. But let's proceed. Letting $u = x + 1$, we have $x = u - 1$, $du = dx$, and

$$\begin{aligned} \int \frac{x}{\sqrt{x+1}} dx &= \int \frac{u-1}{\sqrt{u}} du && \text{Substitute } u = x+1, du = dx. \\ &= \int \left(\sqrt{u} - \frac{1}{\sqrt{u}} \right) du && \text{Rewrite integrand.} \\ &= \int (u^{1/2} - u^{-1/2}) du. && \text{Fractional powers} \end{aligned}$$

We integrate each term individually and then return to the original variable x :

$$\begin{aligned}\int (u^{1/2} - u^{-1/2}) du &= \frac{2}{3} u^{3/2} - 2u^{1/2} + C && \text{Antiderivatives} \\ &= \frac{2}{3} (x+1)^{3/2} - 2(x+1)^{1/2} + C && \text{Replace } u \text{ with } x+1. \\ &= \frac{2}{3} (x+1)^{1/2} (x-2) + C. && \text{Factor out } (x+1)^{1/2} \text{ and simplify.}\end{aligned}$$

► In Substitution 2, you could also use the fact that

$$u'(x) = \frac{1}{2\sqrt{x+1}},$$

which implies

$$du = \frac{1}{2\sqrt{x+1}} dx.$$

Substitution 2 Another possible substitution is $u = \sqrt{x+1}$. Now $u^2 = x+1$, $x = u^2 - 1$, and $dx = 2u du$. Making these substitutions leads to

$$\begin{aligned}\int \frac{x}{\sqrt{x+1}} dx &= \int \frac{u^2 - 1}{u} 2u du && \text{Substitute } u = \sqrt{x+1}, x = u^2 - 1. \\ &= 2 \int (u^2 - 1) du && \text{Simplify the integrand.} \\ &= 2 \left(\frac{u^3}{3} - u \right) + C && \text{Antiderivatives} \\ &= \frac{2}{3} (x+1)^{3/2} - 2(x+1)^{1/2} + C && \text{Replace } u \text{ with } \sqrt{x+1}. \\ &= \frac{2}{3} (x+1)^{1/2} (x-2) + C. && \text{Factor out } (x+1)^{1/2} \text{ and simplify.}\end{aligned}$$

Observe that the same indefinite integral is found using either substitution.

Related Exercises 74–75 ◀

General Formulas for Indefinite Integrals

Integrals of the form $\int f(ax) dx$ occur frequently in the remainder of this text, so our aim here is to generalize the integral formulas first introduced in Section 4.9. We encountered an integral of the form $\int f(ax) dx$ in the opening of this section, where we used trial and error to discover that $\int \cos 2x dx = \frac{1}{2} \sin 2x + C$. Notice that 2 could be replaced by any nonzero constant a to produce the more general result

$$\int \cos ax dx = \frac{1}{a} \sin ax + C.$$

Let's verify this result without resorting to trial and error by using substitution. Letting $u = ax$, we have $du = a dx$, or $dx = \frac{1}{a} du$. By the Substitution Rule,

$$\begin{aligned}\int \cos ax dx &= \int \cos u \cdot \frac{1}{a} du && \text{Substitute } u = ax, dx = \frac{1}{a} du. \\ &= \frac{1}{a} \int \cos u du && \int cf(x) dx = c \int f(x) dx \\ &= \frac{1}{a} \sin u + C && \text{Antiderivative} \\ &= \frac{1}{a} \sin ax + C. && \text{Replace } u \text{ with } ax.\end{aligned}$$

QUICK CHECK 3 Evaluate $\int \cos 6x dx$ without using the substitution method. ◀

Now that we have established a general result for $\int \cos ax dx$, we can use it to evaluate integrals such as $\int \cos 6x dx$ without resorting to the substitution method. Table 5.6 lists additional general formulas for standard trigonometric integrals, where we assume $a \neq 0$ is a real number. The derivations of results (2)–(6) are similar to the derivation of result (1) just given. Note that all these integration formulas can be verified by differentiation.

Table 5.6 General Integration Formulas

1. $\int \cos ax \, dx = \frac{1}{a} \sin ax + C$	2. $\int \sin ax \, dx = -\frac{1}{a} \cos ax + C$
3. $\int \sec^2 ax \, dx = \frac{1}{a} \tan ax + C$	4. $\int \csc^2 ax \, dx = -\frac{1}{a} \cot ax + C$
5. $\int \sec ax \tan ax \, dx = \frac{1}{a} \sec ax + C$	6. $\int \csc ax \cot ax \, dx = -\frac{1}{a} \csc ax + C$

Definite Integrals

The Substitution Rule is also used for definite integrals; in fact, there are two ways to proceed.

- You may use the Substitution Rule to find an antiderivative F and then use the Fundamental Theorem to evaluate $F(b) - F(a)$.
- Alternatively, once you have changed variables from x to u , you also may change the limits of integration and complete the integration with respect to u . Specifically, if $u = g(x)$, the lower limit $x = a$ is replaced with $u = g(a)$ and the upper limit $x = b$ is replaced with $u = g(b)$.

The second option tends to be more efficient, and we use it whenever possible. This approach is summarized in the following theorem, which is then applied to several definite integrals.

THEOREM 5.7 Substitution Rule for Definite Integrals

Let $u = g(x)$, where g' is continuous on $[a, b]$, and let f be continuous on the range of g . Then

$$\int_a^b f(g(x))g'(x) \, dx = \int_{g(a)}^{g(b)} f(u) \, du. \quad (2)$$

Proof: We apply Part 2 of the Fundamental Theorem of Calculus to both sides of equation (2). Let F be an antiderivative of f . Then, by equation (1) (p. 337), we know that $F(g(x))$ is an antiderivative of $f(g(x))g'(x)$, which implies that

$$\int_a^b f(g(x))g'(x) \, dx = F(g(x)) \Big|_a^b = F(g(b)) - F(g(a)). \quad \text{Fundamental Theorem, Part 2}$$

Applying the Fundamental Theorem to the right side of equation (2) leads to the same result:

$$\int_{g(a)}^{g(b)} f(u) \, du = F(u) \Big|_{g(a)}^{g(b)} = F(g(b)) - F(g(a)).$$

EXAMPLE 4 Definite integrals Evaluate the following integrals.

$$\text{a. } \int_0^2 \frac{dx}{(x+3)^3} \quad \text{b. } \int_{-1}^2 \frac{x^2}{(x^3+2)^3} dx \quad \text{c. } \int_0^{\pi/2} \sin^4 x \cos x \, dx$$

SOLUTION

► When the integrand has the form $f(ax+b)$, the substitution $u = ax+b$ is often effective.

- a. Let the new variable be $u = x + 3$ and then $du = dx$. Because we have changed the variable of integration from x to u , the limits of integration must also be expressed in terms of u . In this case,

$$x = 0 \text{ implies } u = 0 + 3 = 3, \quad \text{Lower limit}$$

$$x = 2 \text{ implies } u = 2 + 3 = 5. \quad \text{Upper limit}$$

The entire integration is carried out as follows:

$$\begin{aligned}\int_0^2 \frac{dx}{(x+3)^3} &= \int_3^5 u^{-3} du && \text{Substitute } u = x+3, du = dx. \\ &= -\frac{u^{-2}}{2} \Big|_3^5 && \text{Fundamental Theorem} \\ &= -\frac{1}{2}(5^{-2} - 3^{-2}) = \frac{8}{225}. && \text{Simplify.}\end{aligned}$$

- b. Notice that a multiple of the derivative of $x^3 + 2$ appears in the numerator; therefore, we let $u = x^3 + 2$, which implies that $du = 3x^2 dx$, or $x^2 dx = \frac{1}{3} du$. We also change the limits of integration:

$$\begin{aligned}x = -1 &\text{ implies } u = -1 + 2 = 1, && \text{Lower limit} \\ x = 2 &\text{ implies } u = 2^3 + 2 = 10. && \text{Upper limit}\end{aligned}$$

Changing variables, we have

$$\begin{aligned}\int_{-1}^2 \frac{x^2}{(x^3+2)^3} dx &= \frac{1}{3} \int_1^{10} u^{-3} du && \text{Substitute } u = x^3 + 2, du = 3x^2 dx. \\ &= \frac{1}{3} \left(-\frac{u^{-2}}{2} \right) \Big|_1^{10} && \text{Fundamental Theorem} \\ &= \frac{1}{3} \left(-\frac{1}{200} - \left(-\frac{1}{2} \right) \right) && \text{Simplify.} \\ &= \frac{33}{200}.\end{aligned}$$

- c. Let $u = \sin x$, which implies that $du = \cos x dx$. The lower limit of integration becomes $u = 0$ and the upper limit becomes $u = 1$. Changing variables, we have

$$\begin{aligned}\int_0^{\pi/2} \sin^4 x \cos x dx &= \int_0^1 u^4 du && u = \sin x, du = \cos x dx \\ &= \frac{u^5}{5} \Big|_0^1 = \frac{1}{5}. && \text{Fundamental Theorem}\end{aligned}$$

Related Exercises 44, 47, 60 ◀

The Substitution Rule enables us to find two standard integrals that appear frequently in practice, $\int \sin^2 x dx$ and $\int \cos^2 x dx$. These integrals are handled using the identities

$$\sin^2 x = \frac{1 - \cos 2x}{2} \quad \text{and} \quad \cos^2 x = \frac{1 + \cos 2x}{2}.$$

EXAMPLE 5 **Integral of $\cos^2 \theta$** Evaluate $\int_0^{\pi/2} \cos^2 \theta d\theta$.

SOLUTION Working with the indefinite integral first, we use the identity for $\cos^2 \theta$:

$$\int \cos^2 \theta d\theta = \int \frac{1 + \cos 2\theta}{2} d\theta = \frac{1}{2} \int d\theta + \frac{1}{2} \int \cos 2\theta d\theta.$$

Result (1) of Table 5.6 is used for the second integral, and we have

$$\begin{aligned}\int \cos^2 \theta d\theta &= \frac{1}{2} \int d\theta + \frac{1}{2} \underbrace{\int \cos 2\theta d\theta}_{\frac{1}{2} \sin 2\theta + C} \\ &= \frac{\theta}{2} + \frac{1}{4} \sin 2\theta + C. && \text{Evaluate integrals; Table 5.6.}\end{aligned}$$

► See Exercise 108 for a generalization of Example 5. Trigonometric integrals involving powers of $\sin x$ and $\cos x$ are explored in greater detail in Section 8.3.

Using the Fundamental Theorem of Calculus, the value of the definite integral is

$$\begin{aligned}\int_0^{\pi/2} \cos^2 \theta \, d\theta &= \left(\frac{\theta}{2} + \frac{1}{4} \sin 2\theta \right) \Big|_0^{\pi/2} \\ &= \left(\frac{\pi}{4} + \frac{1}{4} \sin \pi \right) - \left(0 + \frac{1}{4} \sin 0 \right) = \frac{\pi}{4}.\end{aligned}$$

Related Exercises 83, 87 ◀

Area of R = Area of R'

Figure 5.58

Geometry of Substitution

The Substitution Rule has a geometric interpretation. To keep matters simple, consider the integral $\int_0^2 2(2x + 1) \, dx$. The graph of the integrand $y = 2(2x + 1)$ on the interval $[0, 2]$ is shown in Figure 5.58a, along with the region R whose area is given by the integral. The change of variables $u = 2x + 1$, $du = 2 \, dx$, $u(0) = 1$, and $u(2) = 5$ leads to the new integral

$$\int_0^2 2(2x + 1) \, dx = \int_1^5 u \, du.$$

Figure 5.58b shows the graph of the new integrand $y = u$ on the interval $[1, 5]$ and the region R' whose area is given by the new integral. You can check that the areas of R and R' are equal. An analogous interpretation may be given to more complicated integrands and substitutions.

QUICK CHECK 4 Changes of variables occur frequently in mathematics. For example, suppose you want to solve the equation $x^4 - 13x^2 + 36 = 0$. If you use the substitution $u = x^2$, what is the new equation that must be solved for u ? What are the roots of the original equation? ◀

SECTION 5.5 EXERCISES

Getting Started

- On which derivative rule is the Substitution Rule based?
- Why is the Substitution Rule referred to as a change of variables?
- The composite function $f(g(x))$ consists of an inner function g and an outer function f . If an integrand includes $f(g(x))$, which function is often a likely choice for a new variable u ?
- Find a suitable substitution for evaluating $\int \tan x \sec^2 x \, dx$ and explain your choice.
- When using a change of variables $u = g(x)$ to evaluate the definite integral $\int_a^b f(g(x))g'(x) \, dx$, how are the limits of integration transformed?
- If the change of variables $u = x^2 - 4$ is used to evaluate the definite integral $\int_2^4 f(x) \, dx$, what are the new limits of integration?

7–10. Use the given substitution to evaluate the following indefinite integrals. Check your answer by differentiating.

- $\int 2x(x^2 + 1)^4 \, dx$, $u = x^2 + 1$
- $\int 8x \cos(4x^2 + 3) \, dx$, $u = 4x^2 + 3$
- $\int \sin^3 x \cos x \, dx$, $u = \sin x$
- $\int (6x + 1)\sqrt{3x^2 + x} \, dx$, $u = 3x^2 + x$

11–14. Use a substitution of the form $u = ax + b$ to evaluate the following indefinite integrals.

- $\int (x + 1)^{12} \, dx$
- $\int \sin 10x \, dx$
- $\int \sqrt{2x + 1} \, dx$
- $\int \cos(2x + 5) \, dx$
- Use Table 5.6 to evaluate the following indefinite integrals.
 - $\int \csc^2 10x \, dx$
 - $\int \sec 5x \tan 5x \, dx$
 - $\int \sin 7x \, dx$
 - $\int \cos \frac{x}{7} \, dx$

16. Use Table 5.6 to evaluate the following definite integrals.

- $\int_0^{2\pi} \sin \frac{x}{2} \, dx$
- $\int_0^{\pi/40} \cos 20x \, dx$
- $\int_{\pi/8}^{\pi/4} \csc 2x \cot 2x \, dx$
- $\int_0^{\pi/16} \sec^2 4x \, dx$

Practice Exercises

17–40. **Indefinite integrals** Use a change of variables or Table 5.6 to evaluate the following indefinite integrals. Check your work by differentiating.

- $\int 2x(x^2 - 1)^{99} \, dx$
- $\int x \sin x^2 \, dx$

19. $\int \frac{2x^2}{\sqrt{1-4x^3}} dx$ 20. $\int \frac{(\sqrt{x}+1)^4}{2\sqrt{x}} dx$
21. $\int (x^2+x)^{10}(2x+1) dx$ 22. $\int \frac{1}{(10x-3)^2} dx$
23. $\int x^3(x^4+16)^6 dx$ 24. $\int \sin^{10} \theta \cos \theta d\theta$
25. $\int \frac{x}{\sqrt{4-9x^2}} dx$ 26. $\int x^9 \sin x^{10} dx$
27. $\int (x^6-3x^2)^4(x^5-x) dx$ 28. $\int \frac{x}{(1+4x^2)^3} dx$
29. $\int x \csc x^2 \cot x^2 dx$ 30. $\int \sec 4w \tan 4w dw$
31. $\int \sec^2(10x+7) dx$ 32. $\int \csc^4 x \cot x dx$
33. $\int t^3 \sin t^4 \cos t^4 dt$
34. $\int (\sin^5 x + 3 \sin^3 x - \sin x) \cos x dx$
35. $\int \frac{\csc^2 x}{\cot^3 x} dx$ 36. $\int (x^{3/2}+8)^5 \sqrt{x} dx$
37. $\int \sin x \sec^8 x dx$ 38. $\int \frac{\cos \sqrt{t}}{\sqrt{t}} dt$
39. $\int (\sec w + 3)^9 \sec w \tan w dw$
40. $\int (\sec^5 x + \sec^3 x) \tan x dx$

41–70. Definite integrals Use a change of variables or Table 5.6 to evaluate the following definite integrals.

41. $\int_0^{\pi/8} \cos 2x dx$ 42. $\int_{\pi/16}^{\pi/8} 8 \csc^2 4x dx$
43. $\int_0^1 2x(4-x^2) dx$ 44. $\int_0^2 \frac{2x}{(x^2+1)^2} dx$
45. $\int_0^{\pi/4} \frac{\sec^2 x}{\sqrt{\tan x+3}} dx$ 46. $\int_{-2\pi}^{2\pi} \cos \frac{\theta}{8} d\theta$
47. $\int_0^{\pi/2} \sin^2 \theta \cos \theta d\theta$ 48. $\int_0^{\pi/4} \frac{\sin x}{\cos^2 x} dx$
49. $\int_0^{\pi/4} (\sec^3 x + \sec^2 x) \tan x dx$
50. $\int_{\pi/12}^{\pi/6} \csc^4 3x \cot 3x dx$
51. $\int_{-\pi/12}^{\pi/8} \sec^2 2y dy$ 52. $\int_0^4 \frac{p}{\sqrt{9+p^2}} dp$
53. $\int_{\pi/8}^{\pi/4} (\sin^3 2x + \sin 2x) \cos 2x dx$
54. $\int_0^{\pi/4} \frac{\sin \theta}{\cos^3 \theta} d\theta$
55. $\int_2^6 \frac{x}{\sqrt{2x-3}} dx$ 56. $\int_0^1 \frac{v^3+1}{\sqrt{v^4+4v+4}} dv$
57. $\int_0^{\sqrt{3}} \frac{w}{\sqrt{w^2+1}} dw$ 58. $\int_0^4 3\sqrt{2t+1} dt$

59. $\int_0^1 (2p+1)^3 dp$ 60. $\int_0^2 \frac{81q}{(2q^2+1)^3} dq$
61. $\int_0^1 x\sqrt{1-x^2} dx$ 62. $\int_1^3 \frac{(1+4/x)^2}{x^2} dx$
63. $\int_2^3 \frac{x}{\sqrt[3]{x^2-1}} dx$ 64. $\int_0^{6/5} \frac{x}{(25x^2+36)^2} dx$
65. $\int_0^2 x^3 \sqrt{16-x^4} dx$ 66. $\int_{-1}^1 (x-1)(x^2-2x)^7 dx$
67. $\int_0^1 x(x+1)^{10}(x-1)^{10} dx$ 68. $\int_{\pi/8}^{\pi/4} \csc^2 2x \sqrt{1+\cot 2x} dx$
69. $\int_1^2 \frac{4}{9x^2+6x+1} dx$ 70. $\int_0^{\pi/2} (2+\sin x) \sin x \cos x dx$
- 71. Average velocity** An object moves in one dimension with a velocity in m/s given by $v(t) = 8 \sin \pi t + 2t$. Find its average velocity over the time interval from $t = 0$ to $t = 10$, where t is measured in seconds.

72. Periodic motion An object moves along a line with a velocity in

m/s given by $v(t) = 8 \cos \frac{\pi t}{6}$. Its initial position is $s(0) = 0$.

- Graph the velocity function.
- As discussed in Chapter 6, the position of the object is given by $s(t) = \int_0^t v(y) dy$, for $t \geq 0$. Find the position function, for $t \geq 0$.
- What is the period of the motion—that is, starting at any point, how long does it take the object to return to that position?

73. Population models The population of a culture of bacteria has a

growth rate given by $p'(t) = \frac{200}{(t+1)^r}$ bacteria per hour, for $t \geq 0$, where $r > 1$ is a real number. In Chapter 6 it is shown that the increase in the population over the time interval $[0, t]$ is given by $\int_0^t p'(s) ds$. (Note that the growth rate decreases in time, reflecting competition for space and food.)

- Using the population model with $r = 2$, what is the increase in the population over the time interval $0 \leq t \leq 4$?
- Using the population model with $r = 3$, what is the increase in the population over the time interval $0 \leq t \leq 6$?
- Let ΔP be the increase in the population over a fixed time interval $[0, T]$. For fixed T , does ΔP increase or decrease with the parameter r ? Explain.
- A lab technician measures an increase in the population of 350 bacteria over the 10-hr period $[0, 10]$. Estimate the value of r that best fits this data point.
- Looking ahead: Use the population model in part (b) to find the increase in population over the time interval $[0, T]$, for any $T > 0$. If the culture is allowed to grow indefinitely ($T \rightarrow \infty$), does the bacteria population increase without bound? Or does it approach a finite limit?

74–82. Variations on the substitution method Evaluate the following integrals.

74. $\int \frac{x}{(x-2)^3} dx$ 75. $\int \frac{x}{\sqrt{x-4}} dx$
76. $\int \frac{y^2}{(y+1)^4} dy$ 77. $\int \frac{x}{\sqrt[3]{x+4}} dx$

$$78. \int \frac{2x}{\sqrt{3x+2}} dx \quad 79. \int x\sqrt[3]{2x+1} dx$$

$$80. \int (z+1)\sqrt{3z+2} dz \quad 81. \int x(x+10)^9 dx$$

$$82. \int x^3(x^2+1)^{10} dx$$

83–90. Integrals with $\sin^2 x$ and $\cos^2 x$ Evaluate the following integrals.

$$83. \int_{-\pi}^{\pi} \cos^2 x dx \quad 84. \int \sin^2 x dx$$

$$85. \int \sin^2 \left(\theta + \frac{\pi}{6} \right) d\theta \quad 86. \int_0^{\pi/4} \cos^2 8\theta d\theta$$

$$87. \int_{-\pi/4}^{\pi/4} \sin^2 2\theta d\theta \quad 88. \int x \cos^2 x^2 dx$$

$$89. \int_0^{\pi/6} \frac{\sin 2y}{(\sin^2 y + 2)^2} dy \text{ (Hint: } \sin 2y = 2 \sin y \cos y \text{.)}$$

$$90. \int_0^{\pi/2} \sin^4 \theta d\theta$$

91. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample. Assume f , f' , and f'' are continuous functions for all real numbers.

$$\text{a. } \int f(x)f'(x) dx = \frac{1}{2}(f(x))^2 + C.$$

$$\text{b. } \int (f(x))^n f'(x) dx = \frac{1}{n+1} (f(x))^{n+1} + C, n \neq -1.$$

$$\text{c. } \int \sin 2x dx = 2 \int \sin x dx.$$

$$\text{d. } \int (x^2 + 1)^9 dx = \frac{(x^2 + 1)^{10}}{10} + C.$$

$$\text{e. } \int_a^b f'(x)f''(x) dx = f'(b) - f'(a).$$

92–94. Areas of regions Find the area of the following regions.

- 92.** The region bounded by the graph of $f(x) = \frac{x}{\sqrt{x^2 - 9}}$ and the x -axis between $x = 4$ and $x = 5$
- 93.** The region bounded by the graph of $f(x) = x \sin x^2$ and the x -axis between $x = 0$ and $x = \sqrt{\pi}$
- 94.** The region bounded by the graph of $f(x) = (x - 4)^4$ and the x -axis between $x = 2$ and $x = 6$

Explorations and Challenges

- 95. Morphing parabolas** The family of parabolas $y = \frac{1}{a} - \frac{x^2}{a^3}$, where $a > 0$, has the property that for $x \geq 0$, the x -intercept is $(a, 0)$ and the y -intercept is $(0, 1/a)$. Let $A(a)$ be the area of the region in the first quadrant bounded by the parabola and the x -axis. Find $A(a)$ and determine whether it is an increasing, decreasing, or constant function of a .
- 96. Substitutions** Suppose f is an even function with $\int_0^8 f(x) dx = 9$. Evaluate each integral.
- $$\text{a. } \int_{-1}^1 xf(x^2) dx. \quad \text{b. } \int_{-2}^2 x^2 f(x^3) dx.$$

97. Substitutions Suppose p is a nonzero real number and f is an odd function with $\int_0^1 f(x) dx = \pi$. Evaluate each integral.

$$\text{a. } \int_0^{\pi/(2p)} (\cos px)f(\sin px) dx \quad \text{b. } \int_{-\pi/2}^{\pi/2} (\cos x)f(\sin x) dx$$

98. Average distance on a triangle Consider the right triangle with vertices $(0, 0)$, $(0, b)$, and $(a, 0)$, where $a > 0$ and $b > 0$. Show that the average vertical distance from points on the x -axis to the hypotenuse is $b/2$, for all $a > 0$.

99. Average value of sine functions Use a graphing utility to verify that the functions $f(x) = \sin kx$ have a period of $2\pi/k$, where $k = 1, 2, 3, \dots$. Equivalently, the first “hump” of $f(x) = \sin kx$ occurs on the interval $[0, \pi/k]$. Verify that the average value of the first hump of $f(x) = \sin kx$ is independent of k . What is the average value?

100. Equal areas The area of the shaded region under the curve $y = 2 \sin 2x$ in part (a) of the figure equals the area of the shaded region under the curve $y = \sin x$ in part (b) of the figure. Explain why this is true without computing areas.

101. Equal areas The area of the shaded region under the curve

$y = \frac{(\sqrt{x} - 1)^2}{2\sqrt{x}}$ on the interval $[4, 9]$ in part (a) of the following figure equals the area of the shaded region under the curve $y = x^2$ on the interval $[1, 2]$ in part (b) of the figure. Without computing areas, explain why.

102–104. General results Evaluate the following integrals in which the function f is unspecified. Note that $f^{(p)}$ is the p th derivative of f and f^p is the p th power of f . Assume f and its derivatives are continuous for all real numbers.

$$102. \int (5f^3(x) + 7f^2(x) + f(x))f'(x) dx$$

$$103. \int_1^2 (5f^3(x) + 7f^2(x) + f(x))f'(x) dx, \text{ where } f(1) = 4, f(2) = 5$$

$$104. \int (f^{(p)}(x))^n f^{(p+1)}(x) dx, \text{ where } p \text{ is a positive integer, } n \neq -1$$

105–107. More than one way Occasionally, two different substitutions do the job. Use each substitution to evaluate the following integrals.

105. $\int_0^1 x\sqrt{x+a} \, dx; a > 0$ ($u = \sqrt{x+a}$ and $u = x+a$)

106. $\int_0^1 x\sqrt[p]{x+a} \, dx; a > 0$ ($u = \sqrt[p]{x+a}$ and $u = x+a$)

107. $\int \sec^3 \theta \tan \theta \, d\theta$ ($u = \cos \theta$ and $u = \sec \theta$)

108. $\sin^2 ax$ and $\cos^2 ax$ integrals Use the Substitution Rule to prove that

$$\int \sin^2 ax \, dx = \frac{x}{2} - \frac{\sin(2ax)}{4a} + C \text{ and}$$

$$\int \cos^2 ax \, dx = \frac{x}{2} + \frac{\sin(2ax)}{4a} + C.$$

109. Integral of $\sin^2 x \cos^2 x$ Consider the integral $I = \int \sin^2 x \cos^2 x \, dx$.

- Find I using the identity $\sin 2x = 2 \sin x \cos x$.
- Find I using the identity $\cos^2 x = 1 - \sin^2 x$.
- Confirm that the results in parts (a) and (b) are consistent and compare the work involved in the two methods.

110. Substitution: shift Perhaps the simplest change of variables is the shift or translation given by $u = x + c$, where c is a real number.

- Prove that shifting a function does not change the net area under the curve, in the sense that

$$\int_a^b f(x+c) \, dx = \int_{a+c}^{b+c} f(u) \, du.$$

- Draw a picture to illustrate this change of variables in the case where $f(x) = \sin x$, $a = 0$, $b = \pi$, and $c = \pi/2$.

111. Substitution: scaling Another change of variables that can be interpreted geometrically is the scaling $u = cx$, where c is a real number. Prove and interpret the fact that

$$\int_a^b f(cx) \, dx = \frac{1}{c} \int_{ac}^{bc} f(u) \, du.$$

Draw a picture to illustrate this change of variables in the case where $f(x) = \sin x$, $a = 0$, $b = \pi$, and $c = 1/2$.

112–115. Multiple substitutions If necessary, use two or more substitutions to find the following integrals.

112. $\int x \sin^4 x^2 \cos x^2 \, dx$ (Hint: Begin with $u = x^2$, and then use $v = \sin u$.)

113. $\int \frac{dx}{\sqrt{1+x}\sqrt{1+x}}$ (Hint: Begin with $u = \sqrt{1+x}$.)

114. $\int \tan^{10} 4x \sec^2 4x \, dx$ (Hint: Begin with $u = 4x$.)

115. $\int_0^{\pi/2} \frac{\cos \theta \sin \theta}{\sqrt{\cos^2 \theta + 16}} \, d\theta$ (Hint: Begin with $u = \cos \theta$.)

QUICK CHECK ANSWERS

- $u = x^4 + 5$
- With $u = x^5 + 6$, we have $du = 5x^4$, and x^4 does not appear in the integrand.
- $\frac{1}{6} \sin 6x + C$
- New equation: $u^2 - 13u + 36 = 0$; roots: $x = \pm 2, \pm 3$ ◀

CHAPTER 5 REVIEW EXERCISES

- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample. Assume f and f' are continuous functions for all real numbers.
 - If $A(x) = \int_a^x f(t) \, dt$ and $f(t) = 2t - 3$, then A is a quadratic function.
 - Given an area function $A(x) = \int_a^x f(t) \, dt$ and an antiderivative F of f , it follows that $A'(x) = F(x)$.
 - $\int_a^b f'(x) \, dx = f(b) - f(a)$.
 - If f is continuous on $[a, b]$ and $\int_a^b |f(x)| \, dx = 0$, then $f(x) = 0$ on $[a, b]$.
 - If the average value of f on $[a, b]$ is zero, then $f(x) = 0$ on $[a, b]$.
 - $\int_a^b (2f(x) - 3g(x)) \, dx = 2 \int_a^b f(x) \, dx + 3 \int_b^a g(x) \, dx$.
 - $\int f'(g(x))g'(x) \, dx = f(g(x)) + C$.
- The velocity in ft/s of an object moving along a line is given by the function $v = f(t)$ on the interval $0 \leq t \leq 12$, where t is in seconds (see figure). Estimate the displacement of the object on $[0, 12]$ using left, right, and midpoint Riemann sums with $n = 3$ subintervals and a regular partition.

- Ascent rate of a scuba diver** Divers who ascend too quickly in the water risk *decompression illness*. A common recommendation for a maximum rate of ascent is 30 feet/minute with a 5-minute safety stop 15 feet below the surface of the water. Suppose a diver ascends to the surface in 8 minutes according to the velocity function

$$v(t) = \begin{cases} 30 & \text{if } 0 \leq t \leq 2 \\ 0 & \text{if } 2 < t \leq 7 \\ 15 & \text{if } 7 < t \leq 8. \end{cases}$$

- Graph the velocity function v .
- Compute the area under the velocity curve.
- Interpret the physical meaning of the area under the velocity curve.

4. Use the tabulated values of f to estimate the value of $\int_0^6 f(x) dx$ by evaluating the left, right, and midpoint Riemann sums using a regular partition with $n = 3$ subintervals.

x	0	1	2	3	4	5	6
$f(x)$	20	22	26	30	34	38	40

5. Estimate $\int_1^4 \sqrt{4x+1} dx$ by evaluating the left, right, and midpoint Riemann sums using a regular partition with $n = 6$ subintervals.
6. **Evaluating Riemann sums** Consider the function $f(x) = 3x + 4$ on the interval $[3, 7]$. Show that the midpoint Riemann sum with $n = 4$ gives the exact area of the region bounded by the graph. Assume a regular partition.

7. **Estimating a definite integral** Use a calculator and midpoint Riemann sums to approximate $\int_1^{25} \sqrt{2x-1} dx$. Present your calculations in a table showing the approximations for $n = 10, 30$, and 60 subintervals, assuming a regular partition. Make a conjecture about the exact value of the integral and verify your conjecture using the Fundamental Theorem of Calculus.

8. Suppose the expression $\lim_{\Delta \rightarrow 0} \sum_{k=1}^n (x_k^{*3} + x_k^*) \Delta x_k$ is the limit of a Riemann sum of a function f on $[3, 8]$. Identify a possible function f and express the limit as a definite integral.

9. **Integration by Riemann sums** Consider the integral $\int_1^4 (3x - 2) dx$.

- Evaluate the right Riemann sum for the integral with $n = 3$.
- Use summation notation to express the right Riemann sum in terms of a positive integer n .
- Evaluate the definite integral by taking the limit as $n \rightarrow \infty$ of the Riemann sum in part (b).
- Confirm the result from part (c) by graphing $y = 3x - 2$ and using geometry to evaluate the integral. Then evaluate $\int_1^4 (3x - 2) dx$ with the Fundamental Theorem of Calculus.

10–13. Limit definition of the definite integral Use the limit definition of the definite integral with right Riemann sums and a regular partition to evaluate the following definite integrals. Use the Fundamental Theorem of Calculus to check your answer.

10. $\int_0^1 (4x - 2) dx$ 11. $\int_0^2 (x^2 - 4) dx$

12. $\int_1^2 (3x^2 + x) dx$ 13. $\int_0^4 (x^3 - x) dx$

14. **Sum to integral** Evaluate the following limit by identifying the integral that it represents:

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \left(\left(\frac{4k}{n} \right)^5 + 1 \right) \frac{4}{n}$$

15. **Symmetry properties** Suppose $\int_0^4 f(x) dx = 10$ and $\int_0^4 g(x) dx = 20$. Furthermore, suppose f is an even function and g is an odd function. Evaluate the following integrals.

- $\int_{-4}^4 f(x) dx$
- $\int_{-4}^4 3g(x) dx$
- $\int_{-4}^4 (4f(x) - 3g(x)) dx$
- $\int_0^1 8xf(4x^2) dx$
- $\int_{-2}^2 3xf(x) dx$

16. **Properties of integrals** The figure shows the areas of regions bounded by the graph of f and the x -axis. Evaluate the following integrals.

- $\int_a^c f(x) dx$
- $\int_b^d f(x) dx$
- $\int_c^b 2f(x) dx$
- $\int_a^d 4f(x) dx$
- $\int_a^b 3f(x) dx$
- $\int_b^d 2f(x) dx$
- $\int_a^c |f(x)| dx$
- $\int_d^c |f(x)| dx$

- 17–22. Properties of integrals** Suppose $\int_1^4 f(x) dx = 6$, $\int_1^4 g(x) dx = 4$, and $\int_3^4 f(x) dx = 2$. Evaluate the following integrals or state that there is not enough information.

- $\int_1^4 3f(x) dx$
- $-\int_4^1 2f(x) dx$
- $\int_1^4 (3f(x) - 2g(x)) dx$
- $\int_1^4 f(x)g(x) dx$
- $\int_1^3 \frac{f(x)}{g(x)} dx$
- $\int_4^1 (f(x) - g(x)) dx$

23. **Area by geometry** Use geometry to evaluate the following definite integrals, where the graph of f is given in the figure.

- $\int_0^4 f(x) dx$
- $\int_6^4 f(x) dx$
- $\int_5^7 f(x) dx$
- $\int_0^7 f(x) dx$

24. Use geometry to find the displacement of an object moving along a line for the time intervals (i) $0 \leq t \leq 5$, (ii) $3 \leq t \leq 7$, and (iii) $0 \leq t \leq 8$, where the graph of its velocity $v = g(t)$ is given in the figure.

25–26. Use geometry and properties of integrals to evaluate the following definite integrals.

25. $\int_0^4 \sqrt{8x - x^2} dx$. (Hint: Complete the square.)

26. $\int_4^0 (2x + \sqrt{16 - x^2}) dx$ (Hint: Write the integral as a sum of two integrals.)

27. Identifying functions Match the graphs A, B, and C in the figure with the functions $f(x)$, $f'(x)$, and $\int_0^x f(t) dt$.

28. Area functions Consider the graph of the function f in the figure and let $F(x) = \int_0^x f(t) dt$ and $G(x) = \int_1^x f(t) dt$. Assume the graph consists of a line segment from $(0, -2)$ to $(2, 2)$ and two quarter circles of radius 2.

- Evaluate $F(2)$, $F(-2)$, and $F(4)$.
- Evaluate $G(-2)$, $G(0)$, and $G(4)$.
- Explain why there is a constant C such that $F(x) = G(x) + C$, for $-2 \leq x \leq 4$. Fill in the blank with a number: $F(x) = G(x) + \underline{\hspace{1cm}}$, for $-2 \leq x \leq 4$.

29–34. Evaluate the following derivatives.

29. $\frac{d}{dx} \int_7^x \sqrt{1 + t^4 + t^6} dt$

30. $\frac{d}{dx} \int_3^{x^2} \cos t dt$

31. $\frac{d}{dx} \int_x^5 \sin w^6 dw$

32. $\frac{d}{dx} \int_{x^2}^5 \sin w^6 dw$

33. $\frac{d}{dx} \int_{-x}^x \frac{dt}{t^{10} + 1}$

34. $\frac{d}{dx} \int_x^{7x} \sin^3 t dt$

35. Find the intervals on which $f(x) = \int_x^1 (t - 3)(t - 6)^{11} dt$ is increasing and the intervals on which it is decreasing.

36. Area function by geometry Use geometry to find the area $A(x)$ that is bounded by the graph of $f(t) = 2t - 4$ and the t -axis between the point $(2, 0)$ and the variable point $(x, 0)$, where $x \geq 2$. Verify that $A'(x) = f(x)$.

37. Given that $F' = f$, use the substitution method to show that $\int f(ax + b) dx = \frac{1}{a} F(ax + b) + C$, for nonzero constants a and b .

38–80. Evaluating integrals Evaluate the following integrals.

38. $\int_1^5 dx$

39. $\int_{-2}^2 (3x^4 - 2x + 1) dx$

40. $\int_0^1 (4x^{21} - 2x^{16} + 1) dx$

41. $\int_0^1 (9x^8 - 7x^6) dx$

42. $\int \frac{\sqrt{x} + 1}{\sqrt{x}} dx$

43. $\int_0^1 \sqrt{x} (\sqrt{x} + 1) dx$

44. $\int (3x + 1)(3x^2 + 2x + 1)^3 dx$

45. $\int_{\pi/6}^{\pi/3} (\sec^2 t + \csc^2 t) dt$

46. $\int_{\pi/12}^{\pi/9} (\csc 3x \cot 3x + \sec 3x \tan 3x) dx$

47. $\int_{\sqrt{2}}^{\sqrt{10}} \frac{x}{\sqrt{x^2 - 1}} dx$

48. $\int_1^4 \frac{\sqrt{v} + v}{v} dv$

49. $\int \frac{\cos x}{\sin^{7/4} x} dx$

50. $\int_1^4 \frac{dx}{\sqrt{x}(1 + \sqrt{x})^2}$

51. $\int x^2 \cos x^3 dx$

52. $\int \frac{\cos 3t}{(1 + \sin 3t)^2} dt$

53. $\int \frac{\sin 14w}{(16 + \sin^2 7w)^2} dw$

54. $\int \sqrt{1 + \tan 2t} \sec^2 2t dt$

55. $\int (\sin^3 3x + \sin^2 3x) \cos 3x dx$

56. $\int \cos 3x dx$

57. $\int_0^2 (2x + 1)^3 dx$

58. $\int \sin z \sin(\cos z) dz$

59. $\int_0^1 \frac{6x}{(4 - x^2)^{3/2}} dx$

60. $\int \frac{y^2}{(y^3 + 27)^2} dy$

61. $\int \frac{x^2 + 2x - 2}{(x^3 + 3x^2 - 6x)^2} dx$

62. $\int y^2(3y^3 + 1)^4 dy$

63. $\int_0^{2\pi} \cos^2 \frac{x}{6} dx$

64. $\int x \sin x^2 \cos^8 x^2 dx$

65. $\int_0^{\pi} \sin^2 5\theta d\theta$

66. $\int_0^{\pi} (1 - \cos^2 3\theta) d\theta$

67. $\int_{-5}^5 \frac{w^3}{\sqrt{w^{50} + w^{20} + 1}} dw$ (Hint: Use symmetry.)

68. $\int_{-3}^3 (511x^{17} + 302x^{13} + 117x^9 + 303x^3 + x^2) dx$

69. $\int \frac{1}{x^2} \sin \frac{1}{x} dx$

70. $\int_1^4 \frac{1 + x^{3/2}}{x^{1/2}} dx$

71. $\int_0^1 \frac{\sqrt{x}}{(\sqrt{x} + 1)^4} dx$
72. $\int \frac{(\cos \sqrt{x}) \sqrt{\sin \sqrt{x}}}{\sqrt{x}} dx$
73. $\int x(x + 3)^{10} dx$
74. $\int x^7 \sqrt{x^4 + 1} dx$
75. $\int_0^3 \frac{x}{\sqrt{25 - x^2}} dx$
76. $\int \frac{x}{(x + 1)^3} dx$
77. $\int_{-10}^{10} \frac{x}{\sqrt{200 - x^2}} dx$
78. $\int_{-\pi/2}^{\pi/2} (\cos 2x + \cos x \sin x - 3 \sin x^5) dx$
79. $\int_0^4 f(x) dx$ for $f(x) = \begin{cases} 2x + 1 & \text{if } x \leq 3 \\ 3x^2 + 2x - 8 & \text{if } x > 3 \end{cases}$
80. $\int_0^5 |2x - 8| dx$

81–84. Area of regions Compute the area of the region bounded by the graph of f and the x -axis on the given interval. You may find it useful to sketch the region.

81. $f(x) = 16 - x^2$ on $[-4, 4]$

82. $f(x) = x^3 - x$ on $[-1, 0]$

83. $f(x) = 2 \sin \frac{x}{4}$ on $[0, 2\pi]$

84. $f(x) = \cos \pi x$ on $[0, 2]$

85–86. Area versus net area Find (i) the net area and (ii) the area of the region bounded by the graph of f and the x -axis on the given interval. You may find it useful to sketch the region.

85. $f(x) = x^4 - x^2$ on $[-1, 1]$

86. $f(x) = x^2 - x$ on $[0, 3]$

87. Suppose $\int_1^2 f(x) dx = 10$. Evaluate the following integrals.

a. $\int_{-1}^{-\sqrt{2}} x f(x^2) dx$

b. $\int_1^4 \frac{f(\sqrt{x})}{\sqrt{x}} dx$

88. Root mean square The root mean square (or RMS) is another measure of average value, often used with oscillating functions (for example, sine and cosine functions that describe the current, voltage, or power in an alternating circuit). The RMS of a function f on the interval $[0, T]$ is

$$\bar{f}_{\text{RMS}} = \sqrt{\frac{1}{T} \int_0^T f(t)^2 dt}.$$

Compute the RMS of $f(t) = A \sin(\omega t)$, where A and ω are positive constants and T is any integer multiple of the period of f , which is $2\pi/\omega$.

89. **Displacement from velocity** A particle moves along a line with a velocity given by $v(t) = 5 \sin \pi t$, starting with an initial position $s(0) = 0$. Find the displacement of the particle between $t = 0$ and $t = 2$, which is given by $s(t) = \int_0^t v(t) dt$. Find the distance traveled by the particle during this interval, which is $\int_0^2 |v(t)| dt$.
90. **Velocity to displacement** An object travels on the x -axis with a velocity given by $v(t) = 2t + 5$, for $0 \leq t \leq 4$.
- a. How far does the object travel, for $0 \leq t \leq 4$?

- b. What is the average velocity of the object on the interval $[0, 4]$?
- c. True or false: The object would travel as far as in part (a) if it traveled at its average velocity (a constant), for $0 \leq t \leq 4$.

91. Find the average value of $f(x) = \cos 3x$ on $\left[0, \frac{\pi}{6}\right]$.

92. **Average height** A baseball is launched into the outfield on a parabolic trajectory given by $y = 0.01x(200 - x)$. Find the average height of the baseball over the horizontal extent of its flight.

93. **Average values** Integration is not needed.

- a. Find the average value of f shown in the figure on the interval $[1, 6]$ and then find the point(s) c in $(1, 6)$ guaranteed to exist by the Mean Value Theorem for Integrals.

- b. Find the average value of f shown in the figure on the interval $[2, 6]$ and then find the point(s) c in $(2, 6)$ guaranteed to exist by the Mean Value Theorem for Integrals.

94. **An unknown function** The function f satisfies the equation $3x^4 - 48 = \int_2^x f(t) dt$. Find f and check your answer by substitution.

95. **An unknown function** Assume f' is a continuous on $[2, 4]$, $\int_1^2 f'(2x) dx = 10$, and $f(2) = 4$. Evaluate $f(4)$.

96. **Function defined by an integral** Let $H(x) = \int_0^x \sqrt{4 - t^2} dt$, for $-2 \leq x \leq 2$.

- a. Evaluate $H(0)$.
- b. Evaluate $H'(1)$.
- c. Evaluate $H'(2)$.
- d. Use geometry to evaluate $H(2)$.
- e. Find the value of s such that $H(x) = sH(-x)$.

97. **Function defined by an integral** Make a graph of the function $f(x) = \int_1^x \frac{dt}{t}$, for $x \geq 1$. Be sure to include all of the evidence you used to arrive at the graph.

98. **Change of variables** Use the change of variables $u^3 = x^2 - 1$ to evaluate the integral $\int_1^3 x \sqrt[3]{x^2 - 1} dx$.

99–100. Area functions and the Fundamental Theorem Consider the function

$$f(t) = \begin{cases} t & \text{if } -2 \leq t < 0 \\ t^2/2 & \text{if } 0 \leq t \leq 2 \end{cases}$$

and its graph shown below. Let $F(x) = \int_{-1}^x f(t) dt$ and $G(x) = \int_{-2}^x f(t) dt$.

- 99.** a. Evaluate $F(-2)$ and $F(2)$.
 b. Use the Fundamental Theorem to find an expression for $F'(x)$, for $-2 \leq x < 0$.
 c. Use the Fundamental Theorem to find an expression for $F'(x)$, for $0 \leq x \leq 2$.
 d. Evaluate $F'(-1)$ and $F'(1)$. Interpret these values.
 e. Evaluate $F''(-1)$ and $F''(1)$.
 f. Find a constant C such that $F(x) = G(x) + C$.
- 100.** a. Evaluate $G(-1)$ and $G(1)$.
 b. Use the Fundamental Theorem to find an expression for $G'(x)$, for $-2 \leq x < 0$.
 c. Use the Fundamental Theorem to find an expression for $G'(x)$, for $0 \leq x \leq 2$.
 d. Evaluate $G'(0)$ and $G'(1)$. Interpret these values.
 e. Find a constant C such that $F(x) = G(x) + C$.

101–102. Limits with integrals Evaluate the following limits.

101. $\lim_{x \rightarrow 1} \frac{\int_1^x \cos \pi t^2 dt}{x - 1}$ **102.** $\lim_{x \rightarrow 1} \frac{\int_1^{x^2} \cos t^3 dt}{x - 1}$

103. Evaluate $\int_0^3 x \lceil x \rceil dx$.

104. Area with a parameter Let $a > 0$ be a real number and consider the family of functions $f(x) = \sin ax$ on the interval $[0, \pi/a]$.

- a. Graph f , for $a = 1, 2$, and 3 .
 b. Let $g(a)$ be the area of the region bounded by the graph of f and the x -axis on the interval $[0, \pi/a]$. Graph g for $0 < a < \infty$. Is g an increasing function, a decreasing function, or neither?

105. Evaluate $\int \sec^8(\tan x^2) \sin(\tan x^2) x \sec^2 x^2 dx$.

T 106. Area function properties Consider the function $f(t) = t^2 - 5t + 4$ and the area function $A(x) = \int_0^x f(t) dt$.

- a. Graph f on the interval $[0, 6]$.
 b. Compute and graph A on the interval $[0, 6]$.
 c. Show that the local extrema of A occur at the zeros of f .
 d. Give a geometric and analytical explanation for the observation in part (c).
 e. Find the approximate zeros of A , other than 0 , and call them x_1 and x_2 , where $x_1 < x_2$.
 f. Find b such that the area bounded by the graph of f and the t -axis on the interval $[0, x_1]$ equals the area bounded by the graph of f and the t -axis on the interval $[x_1, b]$.
 g. If f is an integrable function and $A(x) = \int_a^x f(t) dt$, is it always true that the local extrema of A occur at the zeros of f ? Explain.

107. Function defined by an integral

Let $f(x) = \int_0^x (t - 1)^{15}(t - 2)^9 dt$.

- a. Find the intervals on which f is increasing and the intervals on which f is decreasing.
 b. Find the intervals on which f is concave up and the intervals on which f is concave down.
 c. For what values of x does f have local minima? Local maxima?
 d. Where are the inflection points of f ?

108. Unit area sine curve Find the value of c such that the region bounded by $y = c \sin x$ and the x -axis on the interval $[0, \pi]$ has area 1.

109. Equivalent equations Explain why, if a function u satisfies the equation $u(x) + 2 \int_0^x u(t) dt = 10$, then it also satisfies the equation $u'(x) + 2u(x) = 0$. Is it true that if u satisfies the second equation, then it satisfies the first equation?

110. Unit area cubic Find the value of $c > 0$ such that the region bounded by the cubic $y = x(x - c)^2$ and the x -axis on the interval $[0, c]$ has area 1.

Applications of Integration

- 6.1 Velocity and Net Change
- 6.2 Regions Between Curves
- 6.3 Volume by Slicing
- 6.4 Volume by Shells
- 6.5 Length of Curves
- 6.6 Surface Area
- 6.7 Physical Applications

Chapter Preview Now that we have some basic techniques for evaluating integrals, we turn our attention to the uses of integration, which are virtually endless. We first illustrate the general rule that if the rate of change of a quantity is known, then integration can be used to determine the net change or the future value of that quantity over a certain time interval. Next, we explore some rich geometric applications of integration: computing the area of regions bounded by several curves, the volume and surface area of three-dimensional solids, and the length of curves. We end the chapter with an examination of a variety of physical applications of integration, such as finding the work done by a variable force and computing the total force exerted by water behind a dam. All these applications are unified by their use of the *slice-and-sum* strategy.

6.1 Velocity and Net Change

In previous chapters, we established the relationship between the position and velocity of an object moving along a line. With integration, we can now say much more about this relationship. Once we relate velocity and position through integration, we can make analogous observations about a variety of other practical problems, which include fluid flow, population growth, manufacturing costs, and production and consumption of natural resources. The ideas in this section come directly from the Fundamental Theorem of Calculus, and they are among the most powerful applications of calculus.

Velocity, Position, and Displacement

Suppose you are driving along a straight highway and your position relative to a reference point or origin is $s(t)$ for times $t \geq 0$. Your *displacement* over a time interval $[a, b]$ is the change in the position $s(b) - s(a)$ (Figure 6.1). If $s(b) > s(a)$, then your displacement is positive; when $s(b) < s(a)$, your displacement is negative.

Figure 6.1

Now assume $v(t)$ is the velocity of the object at a particular time t . Recall from Chapter 3 that $v(t) = s'(t)$, which means that s is an antiderivative of v . From the Fundamental Theorem of Calculus, it follows that

$$\int_a^b v(t) dt = \int_a^b s'(t) dt = s(b) - s(a) = \text{displacement}.$$

We see that the definite integral $\int_a^b v(t) dt$ is the displacement (change in position) between times $t = a$ and $t = b$. Equivalently, the displacement over the time interval $[a, b]$ is the net area under the velocity curve over $[a, b]$ (Figure 6.2a).

Not to be confused with the displacement is the *distance traveled* over a time interval, which is the total distance traveled by the object, independent of the direction of motion. If the velocity is positive, the object moves in the positive direction and the displacement equals the distance traveled. However, if the velocity changes sign, then the displacement and the distance traveled are not generally equal.

QUICK CHECK 1 A police officer leaves his station on a north-south freeway at 9 A.M., traveling north (the positive direction) for 40 mi between 9 A.M. and 10 A.M. From 10 A.M. to 11 A.M., he travels south to a point 20 mi south of the station. What are the distance traveled and the displacement between 9 A.M. and 11 A.M.? ◀

To compute the distance traveled, we need the magnitude, but not the sign, of the velocity. The magnitude of the velocity $|v(t)|$ is called the *speed*. The distance traveled over a small time interval dt is $|v(t)| dt$ (speed multiplied by elapsed time). Summing these distances, the distance traveled over the time interval $[a, b]$ is the integral of the speed; that is,

$$\text{distance traveled} = \int_a^b |v(t)| dt.$$

As shown in Figure 6.2b, integrating the speed produces the area (not net area) bounded by the velocity curve and the t -axis, which corresponds to the distance traveled. The distance traveled is always nonnegative.

Figure 6.2

QUICK CHECK 2 Describe a possible motion of an object along a line, for $0 \leq t \leq 5$, for which the displacement and the distance traveled are different. ◀

DEFINITION Position, Velocity, Displacement, and Distance

1. The **position** of an object moving along a line at time t , denoted $s(t)$, is the location of the object relative to the origin.
2. The **velocity** of an object at time t is $v(t) = s'(t)$.
3. The **displacement** of the object between $t = a$ and $t = b > a$ is

$$s(b) - s(a) = \int_a^b v(t) dt.$$

4. The **distance traveled** by the object between $t = a$ and $t = b > a$ is

$$\int_a^b |v(t)| dt,$$

where $|v(t)|$ is the **speed** of the object at time t .

EXAMPLE 1 Displacement from velocity A jogger runs along a straight road with velocity (in mi/hr) $v(t) = 2t^2 - 8t + 6$, for $0 \leq t \leq 3$, where t is measured in hours.

- a. Graph the velocity function over the interval $[0, 3]$. Determine when the jogger moves in the positive direction and when she moves in the negative direction.
- b. Find the displacement of the jogger (in miles) on the time intervals $[0, 1]$, $[1, 3]$, and $[0, 3]$. Interpret these results.
- c. Find the distance traveled over the interval $[0, 3]$.

Figure 6.3

SOLUTION

a. By solving $v(t) = 2t^2 - 8t + 6 = 2(t - 1)(t - 3) = 0$, we find that the velocity is zero at $t = 1$ and $t = 3$; these values are the t -intercepts of the graph of v , which is an upward-opening parabola with a v -intercept of 6 (Figure 6.3a). The velocity is positive on the interval $0 \leq t < 1$, which means the jogger moves in the positive s direction. For $1 < t < 3$, the velocity is negative and the jogger moves in the negative s direction.

b. The displacement (in miles) over the interval $[0, 1]$ is

$$\begin{aligned} s(1) - s(0) &= \int_0^1 v(t) \, dt \\ &= \int_0^1 (2t^2 - 8t + 6) \, dt && \text{Substitute for } v. \\ &= \left(\frac{2}{3}t^3 - 4t^2 + 6t \right) \Big|_0^1 = \frac{8}{3}. && \text{Evaluate integral.} \end{aligned}$$

A similar calculation shows that the displacement over the interval $[1, 3]$ is

$$s(3) - s(1) = \int_1^3 v(t) \, dt = -\frac{8}{3}.$$

Over the interval $[0, 3]$, the displacement is $\frac{8}{3} + (-\frac{8}{3}) = 0$, which means the jogger returns to the starting point after three hours.

c. From part (b), we can deduce the total distance traveled by the jogger. On the interval $[0, 1]$, the distance traveled is $\frac{8}{3}$ mi; on the interval $[1, 3]$, the distance traveled is also $\frac{8}{3}$ mi. Therefore, the distance traveled on $[0, 3]$ is $\frac{16}{3}$ mi. Alternatively (Figure 6.3b), we can integrate the speed and get the same result:

$$\begin{aligned} \int_0^3 |v(t)| \, dt &= \int_0^1 (2t^2 - 8t + 6) \, dt + \int_1^3 -(2t^2 - 8t + 6) \, dt && \text{Definition of } |v(t)| \\ &= \left(\frac{2}{3}t^3 - 4t^2 + 6t \right) \Big|_0^1 + \left(-\frac{2}{3}t^3 + 4t^2 - 6t \right) \Big|_1^3 && \text{Evaluate integrals.} \\ &= \frac{16}{3}. && \text{Simplify.} \end{aligned}$$

Related Exercises 7–8

Future Value of the Position Function

To find the displacement of an object, we do not need to know its initial position. For example, whether an object moves from $s = -20$ to $s = -10$ or from $s = 50$ to $s = 60$, its displacement is 10 units. What happens if we are interested in the actual *position* of the object at some future time?

Suppose we know the velocity of an object and its initial position $s(0)$. The goal is to find the position $s(t)$ at some future time $t \geq 0$. The Fundamental Theorem of Calculus gives us the answer directly. Because the position s is an antiderivative of the velocity v , we have

$$\int_0^t v(x) \, dx = \int_0^t s'(x) \, dx = s(x) \Big|_0^t = s(t) - s(0).$$

Rearranging this expression leads to the following result.

THEOREM 6.1 Position from Velocity

Given the velocity $v(t)$ of an object moving along a line and its initial position $s(0)$, the position function of the object for future times $t \geq 0$ is

$$\underbrace{s(t)}_{\text{position at } t} = \underbrace{s(0)}_{\text{initial position}} + \underbrace{\int_0^t v(x) \, dx}_{\text{displacement over } [0, t]}.$$

► Note that t is the independent variable of the position function. Therefore, another (dummy) variable, in this case x , must be used as the variable of integration.

► Theorem 6.1 is a consequence (actually a statement) of the Fundamental Theorem of Calculus.

QUICK CHECK 3 Is the position $s(t)$ a number or a function? For fixed times $t = a$ and $t = b$, is the displacement $s(b) - s(a)$ a number or a function? ◀

Theorem 6.1 says that to find the position $s(t)$, we add the displacement over the interval $[0, t]$ to the initial position $s(0)$.

There are two *equivalent* ways to determine the position function:

- Using antiderivatives (Section 4.9)
- Using Theorem 6.1

The latter method is usually more efficient, but either method produces the same result. The following example illustrates both approaches.

Figure 6.4

Figure 6.5

- It is worth repeating that to find the displacement, we need to know only the velocity. To find the position, we must know both the velocity and the initial position $s(0)$.

EXAMPLE 2 Position from velocity A block hangs at rest from a massless spring at the origin ($s = 0$). At $t = 0$, the block is pulled downward $\frac{1}{4}$ m to its initial position $s(0) = -\frac{1}{4}$ and released (Figure 6.4). Its velocity (in m/s) is given by $v(t) = \frac{1}{4} \sin t$, for $t \geq 0$. Assume the upward direction is positive.

- Find the position of the block, for $t \geq 0$.
- Graph the position function, for $0 \leq t \leq 3\pi$.
- When does the block move through the origin for the first time?
- When does the block reach its highest point for the first time and what is its position at that time? When does the block return to its lowest point?

SOLUTION

- The velocity function (Figure 6.5a) is positive for $0 < t < \pi$, which means the block moves in the positive (upward) direction. At $t = \pi$, the block comes to rest momentarily; for $\pi < t < 2\pi$, the block moves in the negative (downward) direction. We let $s(t)$ be the position at time $t \geq 0$ with the initial position $s(0) = -\frac{1}{4}$ m.

Method 1: Using antiderivatives Because the position is an antiderivative of the velocity, we have

$$s(t) = \int v(t) dt = \int \frac{1}{4} \sin t dt = -\frac{1}{4} \cos t + C.$$

To determine the arbitrary constant C , we substitute the initial condition $s(0) = -\frac{1}{4}$ into the expression for $s(t)$:

$$-\frac{1}{4} = -\frac{1}{4} \cos 0 + C.$$

Solving for C , we find that $C = 0$. Therefore, the position for any time $t \geq 0$ is

$$s(t) = -\frac{1}{4} \cos t.$$

Method 2: Using Theorem 6.1 Alternatively, we may use the relationship

$$s(t) = s(0) + \int_0^t v(x) dx.$$

Substituting $v(x) = \frac{1}{4} \sin x$ and $s(0) = -\frac{1}{4}$, the position function is

$$\begin{aligned} s(t) &= \underbrace{-\frac{1}{4}}_{s(0)} + \int_0^t \underbrace{\frac{1}{4} \sin x}_{v(x)} dx \\ &= -\frac{1}{4} - \left(\frac{1}{4} \cos x \right) \Big|_0^t && \text{Evaluate integral.} \\ &= -\frac{1}{4} - \frac{1}{4} (\cos t - 1) && \text{Simplify.} \\ &= -\frac{1}{4} \cos t. && \text{Simplify.} \end{aligned}$$

- b. The graph of the position function is shown in [Figure 6.5b](#). We see that $s(0) = -\frac{1}{4}$ m, as prescribed.
- c. The block initially moves in the positive s direction (upward), reaching the origin ($s = 0$) when $s(t) = -\frac{1}{4} \cos t = 0$. So the block arrives at the origin for the first time when $t = \pi/2$.
- d. The block moves in the positive direction and reaches its high point for the first time when $t = \pi$; the position at that moment is $s(\pi) = \frac{1}{4}$ m. The block then reverses direction and moves in the negative (downward) direction, reaching its low point at $t = 2\pi$. This motion repeats every 2π seconds.

QUICK CHECK 4 Without doing further calculations, what are the displacement and distance traveled by the block in Example 2 over the interval $[0, 2\pi]$? ◀

- The terminal velocity of an object depends on its density, shape, and size and on the medium through which it falls. Estimates for humans in free fall in the lower atmosphere vary from 120 mi/hr (54 m/s) to 180 mi/hr (80 m/s).

Related Exercises 17, 20 ◀

EXAMPLE 3 Skydiving Suppose a skydiver leaps from a hovering helicopter and falls in a straight line. Assume he reaches a terminal velocity of 80 m/s immediately at $t = 0$ and falls for 19 seconds, at which time he opens his parachute. The velocity decreases linearly to 6 m/s over a two-second period and then remains constant until he reaches the ground at $t = 40$ s. The motion is described by the velocity function

$$v(t) = \begin{cases} 80 & \text{if } 0 \leq t < 19 \\ 783 - 37t & \text{if } 19 \leq t < 21 \\ 6 & \text{if } 21 \leq t \leq 40. \end{cases}$$

Determine the height above the ground from which the skydiver jumped.

SOLUTION We let the position of the skydiver increase *downward* with the origin ($s = 0$) corresponding to the position of the helicopter. The velocity is positive, so the distance traveled by the skydiver equals the displacement, which is

$$\begin{aligned} \int_0^{40} |v(t)| \, dt &= \int_0^{19} 80 \, dt + \int_{19}^{21} (783 - 37t) \, dt + \int_{21}^{40} 6 \, dt \\ &= 80t \Big|_0^{19} + \left(783t - \frac{37t^2}{2} \right) \Big|_{19}^{21} + 6t \Big|_{21}^{40} && \text{Fundamental Theorem} \\ &= 1720. && \text{Evaluate and simplify.} \end{aligned}$$

The skydiver jumped from 1720 m above the ground. Notice that the displacement of the skydiver is the area under the velocity curve ([Figure 6.6](#)).

Figure 6.6

QUICK CHECK 5 Suppose (unrealistically) in Example 3 that the velocity of the skydiver is 80 m/s, for $0 \leq t < 20$, and then it changes instantaneously to 6 m/s, for $20 \leq t \leq 40$. Sketch the velocity function and, without integrating, find the distance the skydiver falls in 40 s. ◀

Related Exercises 27–28 ◀

Acceleration

Because the acceleration of an object moving along a line is given by $a(t) = v'(t)$, the relationship between velocity and acceleration is the same as the relationship between position and velocity. Given the acceleration of an object, the change in velocity over an interval $[a, b]$ is

$$\text{change in velocity} = v(b) - v(a) = \int_a^b v'(t) dt = \int_a^b a(t) dt.$$

Furthermore, if we know the acceleration and initial velocity $v(0)$, then we can also find the velocity at future times.

► Theorem 6.2 is a consequence of the Fundamental Theorem of Calculus.

THEOREM 6.2 Velocity from Acceleration

Given the acceleration $a(t)$ of an object moving along a line and its initial velocity $v(0)$, the velocity of the object for future times $t \geq 0$ is

$$v(t) = v(0) + \int_0^t a(x) dx.$$

Figure 6.7

Figure 6.8

EXAMPLE 4 Motion in a gravitational field An artillery shell is fired directly upward with an initial velocity of 300 m/s from a point 30 m above the ground (Figure 6.7). Assume only the force of gravity acts on the shell and it produces an acceleration of 9.8 m/s^2 . Find the velocity of the shell while it is in the air.

SOLUTION We let the positive direction be upward with the origin ($s = 0$) corresponding to the ground. The initial velocity of the shell is $v(0) = 300 \text{ m/s}$. The acceleration due to gravity is downward; therefore, $a(t) = -9.8 \text{ m/s}^2$. Integrating the acceleration, the velocity is

$$v(t) = \underbrace{v(0)}_{300 \text{ m/s}} + \int_0^t \underbrace{a(x)}_{-9.8 \text{ m/s}^2} dx = 300 + \int_0^t (-9.8) dx = 300 - 9.8t.$$

The velocity decreases from its initial value of 300 m/s, reaching zero at the high point of the trajectory when $v(t) = 300 - 9.8t = 0$, or at $t \approx 30.6 \text{ s}$ (Figure 6.8). At this point, the velocity becomes negative, and the shell begins its descent to Earth.

Knowing the velocity function, you could now find the position function using the methods of Example 2.

Related Exercises 30–31 ◀

Net Change and Future Value

Everything we have said about velocity, position, and displacement carries over to more general situations. Suppose you are interested in some quantity Q that changes over time; Q may represent the amount of water in a reservoir, the population of a cell culture, or the amount of a resource that is consumed or produced. If you are given the rate Q' at which Q changes, then integration allows you to calculate either the net change in the quantity Q or the future value of Q .

We argue just as we did for velocity and position: Because $Q(t)$ is an antiderivative of $Q'(t)$, the Fundamental Theorem of Calculus tells us that

$$\int_a^b Q'(t) dt = Q(b) - Q(a) = \text{net change in } Q \text{ over } [a, b].$$

Geometrically, the net change in Q over the time interval $[a, b]$ is the net area under the graph of Q' over $[a, b]$. We interpret the product $Q'(t) dt$ as a change in Q over a small increment of

- Note that the units in the integral are consistent. For example, if Q' has units of gallons/second, and t and x have units of seconds, then $Q'(x) dx$ has units of (gallons/second)(seconds) = gallons, which are the units of Q .

time. Integrating $Q'(t)$ accumulates, or adds up, these small changes over the interval $[a, b]$. The result is the net change in Q between $t = a$ and $t = b$. We see that accumulating the rate of change of a quantity over the interval gives the net change in that quantity over the interval.

Alternatively, suppose we are given both the rate of change Q' and the initial value $Q(0)$. Integrating over the interval $[0, t]$, where $t \geq 0$, we have

$$\int_0^t Q'(x) dx = Q(t) - Q(0).$$

Rearranging this equation, we write the value of Q at any future time $t \geq 0$ as

$$\underbrace{Q(t)}_{\text{future value}} = \underbrace{Q(0)}_{\text{initial value}} + \underbrace{\int_0^t Q'(x) dx}_{\text{net change over } [0, t]}.$$

- At the risk of being repetitious, Theorem 6.3 is also a consequence of the Fundamental Theorem of Calculus. We assume Q' is an integrable function.

THEOREM 6.3 Net Change and Future Value

Suppose a quantity Q changes over time at a known rate Q' . Then the **net change** in Q between $t = a$ and $t = b > a$ is

$$\underbrace{Q(b) - Q(a)}_{\text{net change in } Q} = \int_a^b Q'(t) dt.$$

Given the initial value $Q(0)$, the **future value** of Q at time $t \geq 0$ is

$$Q(t) = Q(0) + \int_0^t Q'(x) dx.$$

The correspondences between velocity–displacement problems and more general problems are shown in Table 6.1.

Table 6.1

Velocity–Displacement Problems	General Problems
Position $s(t)$	Quantity $Q(t)$ (such as volume or population)
Velocity: $s'(t) = v(t)$	Rate of change: $Q'(t)$
Displacement: $s(b) - s(a) = \int_a^b v(t) dt$	Net change: $Q(b) - Q(a) = \int_a^b Q'(t) dt$
Future position: $s(t) = s(0) + \int_0^t v(x) dx$	Future value of Q : $Q(t) = Q(0) + \int_0^t Q'(x) dx$

We now consider two general applications that involve integrating rates of change.

EXAMPLE 5 Emptying a tank Imagine an open cylindrical tank with radius R and height H filled to the top with water. At time $t = 0$, a circular drain of radius r in the bottom of the tank is opened and water flows out of the tank (Figure 6.9). Using a result known as **Torricelli's law** (proposed in 1643), it can be shown that under ideal conditions the rate of change of the volume of water in the tank at time $t \geq 0$ is

$$V'(t) = \frac{\pi r^4 g}{R^2} t - \pi r^2 \sqrt{2gH},$$

where $g = 980 \text{ cm/s}^2$ is the acceleration due to gravity. In the specific case that $r = 5 \text{ cm}$, $R = 50 \text{ cm}$, and $H = 100 \text{ cm}$, we have $V'(t) = \pi(245t - 3500\sqrt{10})$, where t is measured in seconds and $V(0) = 250,000\pi \text{ cm}^3$. Find the function that gives the volume of water remaining in the tank until the tank is empty.

Figure 6.9

Figure 6.10

SOLUTION As shown in Figure 6.10, the rate of change of the volume is negative, reflecting the decreasing volume of water in the tank. Knowing the initial volume $V(0)$ and the rate of change $V'(t)$, Theorem 6.3 gives the volume of water in the tank:

$$\begin{aligned}
 V(t) &= V(0) + \int_0^t V'(x) \, dx && \text{Theorem 6.3} \\
 &= \underbrace{250,000\pi}_{V(0)} + \int_0^t \underbrace{(\pi(245x - 3500\sqrt{10}))}_{V'(x)} \, dx && \text{Substitute.} \\
 &= 250,000\pi + \pi \left(\frac{245x^2}{2} - 3500\sqrt{10}x \right) \Big|_0^t && \text{Fundamental Theorem} \\
 &= \pi(122.5t^2 - 3500\sqrt{10}t + 250,000) && \text{Simplify.}
 \end{aligned}$$

The graph of the volume function (Figure 6.10) shows that the volume decreases until the volume reaches zero at $t \approx 45.2$ seconds—the same time at which the rate of change equals zero.

Related Exercise 44 ◀

EXAMPLE 6 Production costs A book publisher estimates that the marginal cost of producing a particular title (in dollars/book) is given by

$$C'(x) = 12 - 0.0002x,$$

where $0 \leq x \leq 50,000$ is the number of books printed. What is the cost of producing the 12,001st through the 15,000th book?

SOLUTION Recall from Section 3.6 that the cost function $C(x)$ is the cost required to produce x units of a product. The marginal cost $C'(x)$ is the approximate cost of producing one additional unit after x units have already been produced. The cost of producing books $x = 12,001$ through $x = 15,000$ is the cost of producing 15,000 books minus the cost of producing the first 12,000 books. Therefore, the cost in dollars of producing books 12,001 through 15,000 is

$$\begin{aligned}
 C(15,000) - C(12,000) &= \int_{12,000}^{15,000} C'(x) \, dx \\
 &= \int_{12,000}^{15,000} (12 - 0.0002x) \, dx && \text{Substitute for } C'(x). \\
 &= (12x - 0.0001x^2) \Big|_{12,000}^{15,000} && \text{Fundamental Theorem} \\
 &= 27,900. && \text{Simplify.}
 \end{aligned}$$

Related Exercises 51–52 ◀

▶ Although x is a positive integer (the number of books produced), we treat it as a continuous variable in this example.

QUICK CHECK 6 Is the cost of increasing production from 9000 books to 12,000 books in Example 6 more or less than the cost of increasing production from 12,000 books to 15,000 books? Explain. ◀

SECTION 6.1 EXERCISES

Getting Started

1. Explain the meaning of position, displacement, and distance traveled as they apply to an object moving along a line.
2. Suppose the velocity of an object moving along a line is positive. Are displacement and distance traveled equal? Explain.
3. Given the velocity function v of an object moving along a line, explain how definite integrals can be used to find the displacement of the object.
4. Explain how to use definite integrals to find the net change in a quantity, given the rate of change of that quantity.
5. Given the rate of change of a quantity Q and its initial value $Q(0)$, explain how to find the value of Q at a future time $t \geq 0$.
6. What is the result of integrating a population growth rate between times $t = a$ and $t = b$, where $b > a$?

7. **Displacement and distance from velocity** Consider the graph shown in the figure, which gives the velocity of an object moving along a line. Assume time is measured in hours and distance is measured in miles. The areas of three regions bounded by the velocity curve and the t -axis are also given.

- On what intervals is the object moving in the positive direction?
- What is the displacement of the object over the interval $[0, 3]$?
- What is the total distance traveled by the object over the interval $[1, 5]$?
- What is the displacement of the object over the interval $[0, 5]$?
- Describe the position of the object relative to its initial position after 5 hours.

- 8. Displacement and distance from velocity** Consider the velocity function of an object moving along a line (see figure). Assume time is measured in seconds and distance is measured in meters. The areas of four regions bounded by the velocity curve and the t -axis are also given.

- On what intervals is the object moving in the negative direction?
- What is the displacement of the object over the interval $[2, 6]$?
- What is the total distance traveled by the object over the interval $[0, 6]$?
- What is the displacement of the object over the interval $[0, 8]$?
- Describe the position of the object relative to its initial position after 8 seconds.

9–10. Velocity graphs The figures show velocity functions for motion along a line. Assume the motion begins with an initial position of $s(0) = 0$. Determine the following.

- The displacement between $t = 0$ and $t = 5$
- The distance traveled between $t = 0$ and $t = 5$
- The position at $t = 5$
- A piecewise function for $s(t)$

Practice Exercises

- 11. Distance traveled and displacement** Suppose an object moves along a line with velocity (in m/s) $v(t) = 3 \sin 2t$, for $0 \leq t \leq 2\pi$, where t is measured in seconds (see figure).

- Find the distance traveled by the object on the time interval $[0, \pi/2]$.
 - Find the displacement of the object on the time intervals $[0, \pi/2]$, $[0, \pi]$, $[0, 3\pi/2]$, and $[0, 2\pi]$. (Hint: Use your answer to part (a) together with the symmetry of the graph to find the displacement values.)
 - Find the distance traveled by the object on the time interval $[0, 2\pi]$.
- 12. Distance traveled and displacement** Suppose an object moves along a line with velocity (in ft/s) $v(t) = 6 - 2t$, for $0 \leq t \leq 6$, where t is measured in seconds.
- Graph the velocity function on the interval $0 \leq t \leq 6$. Determine when the motion is in the positive direction and when it is in the negative direction on $0 \leq t \leq 6$.
 - Find the displacement of the object on the interval $0 \leq t \leq 6$.
 - Find the distance traveled by the object on the interval $0 \leq t \leq 6$.

13–16. Displacement from velocity Consider an object moving along a line with the given velocity v . Assume time t is measured in seconds and velocities have units of m/s.

- Determine when the motion is in the positive direction and when it is in the negative direction.
- Find the displacement over the given interval.
- Find the distance traveled over the given interval.

13. $v(t) = 3t^2 - 6t$ on $[0, 3]$

14. $v(t) = 4t^3 - 24t^2 + 20t$ on $[0, 5]$

15. $v(t) = 3t^2 - 18t + 24$ on $[0, 5]$

16. $v(t) = 4 \cos \pi t$ on $[0, 2]$

17–22. Position from velocity Consider an object moving along a line with the given velocity v and initial position.

- Determine the position function, for $t \geq 0$, using the antiderivative method.
 - Determine the position function, for $t \geq 0$, using the Fundamental Theorem of Calculus (Theorem 6.1). Check for agreement with the answer to part (a).
- $v(t) = \sin t$ on $[0, 2\pi]$; $s(0) = 1$
 - $v(t) = -t^3 + 3t^2 - 2t$ on $[0, 3]$; $s(0) = 4$
 - $v(t) = 6 - 2t$ on $[0, 5]$; $s(0) = 0$
 - $v(t) = 3 \sin \pi t$ on $[0, 4]$; $s(0) = 1$

21. $v(t) = 9 - t^2$ on $[0, 4]$; $s(0) = -2$

22. $v(t) = \frac{1}{(t+1)^2}$ on $[0, 4]$; $s(0) = -2$

- 23. Oscillating motion** A mass hanging from a spring is set in motion, and its ensuing velocity is given by $v(t) = 2\pi \cos \pi t$, for $t \geq 0$. Assume the positive direction is upward and $s(0) = 0$.

- Determine the position function, for $t \geq 0$.
- Graph the position function on the interval $[0, 4]$.
- At what times does the mass reach its low point the first three times?
- At what times does the mass reach its high point the first three times?

- 24. Cycling distance** A cyclist rides down a long straight road with a velocity (in m/min) given by $v(t) = 400 - 20t$, for $0 \leq t \leq 10$, where t is measured in minutes.

- How far does the cyclist travel in the first 5 min?
- How far does the cyclist travel in the first 10 min?
- How far has the cyclist traveled when her velocity is 250 m/min?

- 25. Flying into a headwind** The velocity (in mi/hr) of an airplane flying into a headwind is given by $v(t) = 30(16 - t^2)$, for $0 \leq t \leq 3$. Assume $s(0) = 0$ and t is measured in hours.

- Determine the position function, for $0 \leq t \leq 3$.
- How far does the airplane travel in the first 2 hr?
- How far has the airplane traveled at the instant its velocity reaches 400 mi/hr?

- 26. Day hike** The velocity (in mi/hr) of a hiker walking along a straight trail is given by $v(t) = 3 \sin^2 \frac{\pi t}{2}$, for $0 \leq t \leq 4$.

Assume $s(0) = 0$ and t is measured in hours.

- Determine the position function, for $0 \leq t \leq 4$.
(Hint: $\sin^2 t = \frac{1 - \cos 2t}{2}$.)
- What is the distance traveled by the hiker in the first 15 min of the hike?
- What is the hiker's position at $t = 3$?

- 27. Piecewise velocity** The velocity of a (fast) automobile on a straight highway is given by the function

$$v(t) = \begin{cases} 3t & \text{if } 0 \leq t < 20 \\ 60 & \text{if } 20 \leq t < 45 \\ 240 - 4t & \text{if } t \geq 45, \end{cases}$$

where t is measured in seconds and v has units of m/s.

- Graph the velocity function, for $0 \leq t \leq 70$. When is the velocity a maximum? When is the velocity zero?
 - What is the distance traveled by the automobile in the first 30 s?
 - What is the distance traveled by the automobile in the first 60 s?
 - What is the position of the automobile when $t = 75$?
- 28. Probe speed** A data collection probe is dropped from a stationary balloon, and it falls with a velocity (in m/s) given by $v(t) = 9.8t$,

neglecting air resistance. After 10 s, a chute deploys and the probe immediately slows to a constant speed of 10 m/s, which it maintains until it enters the ocean.

- Graph the velocity function.
- How far does the probe fall in the first 30 s after it is released?
- If the probe was released from an altitude of 3 km, when does it enter the ocean?

29–34. Position and velocity from acceleration Find the position and velocity of an object moving along a straight line with the given acceleration, initial velocity, and initial position. Use the Fundamental Theorem of Calculus (Theorems 6.1 and 6.2).

29. $a(t) = -32$; $v(0) = 70$; $s(0) = 10$

30. $a(t) = -32$; $v(0) = 50$; $s(0) = 0$

31. $a(t) = -9.8$; $v(0) = 20$; $s(0) = 0$

32. $a(t) = \sin \pi t$; $v(0) = 2$; $s(0) = 1$

33. $a(t) = -0.01t$; $v(0) = 10$; $s(0) = 0$

34. $a(t) = \cos 2t$; $v(0) = 5$; $s(0) = 7$

- 35. Acceleration** A drag racer accelerates at $a(t) = 88 \text{ ft/s}^2$. Assume $v(0) = 0$, $s(0) = 0$, and t is measured in seconds.

- Determine the position function, for $t \geq 0$.
- How far does the racer travel in the first 4 seconds?
- At this rate, how long will it take the racer to travel $\frac{1}{4}$ mi?
- How long does it take the racer to travel 300 ft?
- How far has the racer traveled when it reaches a speed of 178 ft/s?

- 36. Deceleration** A car slows down with an acceleration of $a(t) = -15 \text{ ft/s}^2$. Assume $v(0) = 60 \text{ ft/s}$, $s(0) = 0$, and t is measured in seconds.

- Determine the position function, for $t \geq 0$.
- How far does the car travel in the time it takes to come to rest?

- 37. Approaching a station** At $t = 0$, a train approaching a station begins decelerating from a speed of 80 mi/hr according to the acceleration function $a(t) = -1280(1 + 8t)^{-3}$, where $t \geq 0$ is measured in hours. How far does the train travel between $t = 0$ and $t = 0.2$? Between $t = 0.2$ and $t = 0.4$? The units of acceleration are mi/hr^2 .

38–40. Population growth

- 38.** Starting with an initial value of $P(0) = 55$, the population of a prairie dog community grows at a rate of $P'(t) = 20 - t/5$ (prairie dogs/month), for $0 \leq t \leq 200$, where t is measured in months.

- What is the population 6 months later?
- Find the population $P(t)$, for $0 \leq t \leq 200$.

- 39.** When records were first kept ($t = 0$), the population of a rural town was 250 people. During the following years, the population grew at a rate of $P'(t) = 30(1 + \sqrt{t})$, where t is measured in years.

- What is the population after 20 years?
- Find the population $P(t)$ at any time $t \geq 0$.

40. The population of a community of foxes is observed to fluctuate on a 10-year cycle due to variations in the availability of prey. When population measurements began ($t = 0$), the population was 35 foxes. The growth rate in units of foxes/year was observed to be

$$P'(t) = 5 + 10 \sin \frac{\pi t}{5}.$$

- What is the population 15 years later? 35 years later?
- Find the population $P(t)$ at any time $t \geq 0$.

41. **Oil production** An oil refinery produces oil at a variable rate given by

$$Q'(t) = \begin{cases} 800 & \text{if } 0 \leq t < 30 \\ 2600 - 60t & \text{if } 30 \leq t < 40 \\ 200 & \text{if } t \geq 40, \end{cases}$$

where t is measured in days and Q is measured in barrels.

- How many barrels are produced in the first 35 days?
- How many barrels are produced in the first 50 days?
- Without using integration, determine the number of barrels produced over the interval $[60, 80]$.

42. **Flow rates in the Spokane River** The daily discharge of the Spokane River as it flows through Spokane, Washington, in April and June is modeled by the functions

$$r_1(t) = 0.25t^2 + 37.46t + 722.47 \text{ (April) and}$$

$$r_2(t) = 0.90t^2 - 69.06t + 2053.12 \text{ (June),}$$

where the discharge is measured in millions of cubic feet per day, and $t = 0$ corresponds to the beginning of the first day of the month (see figure).

- Determine the total amount of water that flows through Spokane in April (30 days).
 - Determine the total amount of water that flows through Spokane in June (30 days).
 - The Spokane River flows out of Lake Coeur d'Alene, which contains approximately 0.67 mi^3 of water. Determine the percentage of Lake Coeur d'Alene's volume that flows through Spokane in April and June.
43. **Two runners** At noon ($t = 0$), Alicia starts running along a long straight road at 4 mi/hr. Her velocity decreases according to the function $v(t) = 4/(t+1)^2$, for $t \geq 0$. At noon, Boris also starts running along the same road with a 1-mi head start on Alicia; his velocity is given by $u(t) = 2/(t+1)^2$, for $t \geq 0$. Assume t is measured in hours.

- Find the position functions for Alicia and Boris, where $s = 0$ corresponds to Alicia's starting point.
- When, if ever, does Alicia overtake Boris?
- How much of a head start would Boris need to stay ahead of Alicia indefinitely?

44. **Filling a tank** A 2000-liter cistern is empty when water begins flowing into it (at $t = 0$) at a rate (in L/min) given by $Q'(t) = 3\sqrt{t}$, where t is measured in minutes.

- How much water flows into the cistern in 1 hour?
- Find the function that gives the amount of water in the tank at any time $t \geq 0$.
- When will the tank be full?

- T 45. Filling a reservoir** A reservoir with a capacity of 2500 m^3 is filled with a single inflow pipe. The reservoir is empty when the inflow pipe is opened at $t = 0$. Letting $Q(t)$ be the amount of water in the reservoir at time t , the flow rate of water into the reservoir (in m^3/hr) oscillates on a 24-hr cycle (see figure) and is given by

$$Q'(t) = 20 \left(1 + \cos \frac{\pi t}{12} \right).$$

- How much water flows into the reservoir in the first 2 hr?
 - Find the function that gives the amount of water in the reservoir over the interval $[0, t]$, where $t \geq 0$.
 - When is the reservoir full?
46. **Blood flow** A typical human heart pumps 70 mL of blood (the stroke volume) with each beat. Assuming a heart rate of 60 beats/min (1 beat/s), a reasonable model for the outflow rate of the heart is $V'(t) = 70(1 + \sin 2\pi t)$, where $V(t)$ is the amount of blood (in milliliters) pumped over the interval $[0, t]$, $V(0) = 0$, and t is measured in seconds.
- Verify that the amount of blood pumped over a one-second interval is 70 mL.
 - Find the function that gives the total blood pumped between $t = 0$ and a future time $t > 0$.
 - What is the cardiac output over a period of 1 min? (Use calculus; then check your answer with algebra.)
47. **Air flow in the lungs** A simple model (with different parameters for different people) for the flow of air in and out of the lungs is

$$V'(t) = -\frac{\pi}{2} \sin \frac{\pi t}{2},$$

where $V(t)$ (measured in liters) is the volume of air in the lungs at time $t \geq 0$, t is measured in seconds, and $t = 0$ corresponds to a time at which the lungs are full and exhalation begins. Only a fraction of the air in the lungs is exchanged with each breath. The amount that is exchanged is called the *tidal volume*.

- Find the volume function V assuming $V(0) = 6$ L.
- What is the breathing rate in breaths/min?
- What is the tidal volume and what is the total capacity of the lungs?

48. **Oscillating growth rates** Some species have growth rates that oscillate with an (approximately) constant period P . Consider the growth rate function

$$N'(t) = r + A \sin \frac{2\pi t}{P},$$

where A and r are constants with units of individuals/yr, and t is measured in years. A species becomes extinct if its population ever reaches 0 after $t = 0$.

- Suppose $P = 10$, $A = 20$, and $r = 0$. If the initial population is $N(0) = 10$, does the population ever become extinct? Explain.
- Suppose $P = 10$, $A = 20$, and $r = 0$. If the initial population is $N(0) = 100$, does the population ever become extinct? Explain.
- Suppose $P = 10$, $A = 50$, and $r = 5$. If the initial population is $N(0) = 10$, does the population ever become extinct? Explain.
- Suppose $P = 10$, $A = 50$, and $r = -5$. Find the initial population $N(0)$ needed to ensure that the population never becomes extinct.

49. **Power and energy** The terms *power* and *energy* are often used interchangeably, but they are quite different. **Energy** is what makes matter move or heat up and is measured in units of **joules** (J) or **Calories** (Cal), where $1 \text{ Cal} = 4184 \text{ J}$. One hour of walking consumes roughly 10^6 J , or 250 Cal . On the other hand, **power** is the rate at which energy is used and is measured in **watts** (W; $1 \text{ W} = 1 \text{ J/s}$). Other useful units of power are **kilowatts** ($1 \text{ kW} = 10^3 \text{ W}$) and **megawatts** ($1 \text{ MW} = 10^6 \text{ W}$). If energy is used at a rate of 1 kW for 1 hr , the total amount of energy used is 1 kilowatt-hour (kWh), which is $3.6 \times 10^6 \text{ J}$.

Suppose the power function of a large city over a 24-hr period is given by

$$P(t) = E'(t) = 300 - 200 \sin \frac{\pi t}{12},$$

where P is measured in megawatts and $t = 0$ corresponds to 6:00 P.M. (see figure).

- How much energy is consumed by this city in a typical 24-hr period? Express the answer in megawatt-hours and in joules.
- Burning 1 kg of coal produces about 450 kWh of energy. How many kilograms of coal are required to meet the energy needs of the city for 1 day? For 1 year?
- Fission of 1 gram of uranium-235 (U-235) produces about 16,000 kWh of energy. How many grams of uranium are needed to meet the energy needs of the city for 1 day? For 1 year?
- A typical wind turbine generates electrical power at a rate of about 200 kW. Approximately how many wind turbines are needed to meet the average energy needs of the city?

50. **Carbon uptake** An important process in the study of global warming and greenhouse gases is the *net ecosystem exchange*, which is the rate at which carbon leaves an ecosystem and enters the atmosphere in a particular geographic region. Let $N(t)$ equal the net ecosystem exchange on an average July day in a high-altitude coniferous forest, where $N(t)$ is measured in grams of carbon per square meter per hour and t is the number of hours past midnight so that $0 \leq t \leq 24$ (see figure). Negative values of N correspond to times when the amount of carbon in the atmosphere decreases, and positive values of N occur when the amount of carbon in the atmosphere increases.

- Trees and other plants help reduce carbon emissions in the atmosphere by using photosynthesis to absorb carbon dioxide and release oxygen. Give a possible explanation why N is negative on the interval $5 < t < 17$.
- The *cumulative net carbon uptake*, $\int_0^{24} N(t) dt$, is the net change in the amount of carbon in the atmosphere over a 24-hour period in the coniferous forest. Use a midpoint Riemann sum with $n = 12$ subintervals to estimate the cumulative net carbon uptake in the coniferous forest and interpret the result. (Source: *Forest Carbon Uptake and the Fundamental Theorem of Calculus*, *The College Mathematics Journal*, 44, 5, Nov 2013)

- 51–54. **Marginal cost** Consider the following marginal cost functions.

- Find the additional cost incurred in dollars when production is increased from 100 units to 150 units.
- Find the additional cost incurred in dollars when production is increased from 500 units to 550 units.

51. $C'(x) = 2000 - 0.5x$ 52. $C'(x) = 200 - 0.05x$

53. $C'(x) = 300 + 10x - 0.01x^2$

54. $C'(x) = 3000 - x - 0.001x^2$

- 55. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- The distance traveled by an object moving along a line is the same as the displacement of the object.
 - When the velocity is positive on an interval, the displacement and the distance traveled on that interval are equal.
 - Consider a tank that is filled and drained at a flow rate of $V'(t) = 1 - \frac{t^2}{100}$ (gal/min), for $t \geq 0$, where t is measured in minutes. It follows that the volume of water in the tank increases for 10 min and then decreases until the tank is empty.
 - A particular marginal cost function has the property that it is positive and decreasing. The cost of increasing production from A units to $2A$ units is greater than the cost of increasing production from $2A$ units to $3A$ units.

56–59. Equivalent constant velocity Consider the following velocity functions. In each case, complete the sentence: The same distance could have been traveled over the given time period at a constant velocity of _____.

56. $v(t) = 2t + 6$, for $0 \leq t \leq 8$

57. $v(t) = 1 - \frac{t^2}{16}$, for $0 \leq t \leq 4$

58. $v(t) = 2 \sin t$, for $0 \leq t \leq \pi$

59. $v(t) = t(25 - t^2)^{1/2}$, for $0 \leq t \leq 5$

Explorations and Challenges

- 60. Where do they meet?** Kelly started at noon ($t = 0$) riding a bike from Niwot to Berthoud, a distance of 20 km, with velocity $v(t) = \frac{15}{(t+1)^2}$ (decreasing because of fatigue). Sandy started at noon ($t = 0$) riding a bike in the opposite direction from Berthoud to Niwot with velocity $u(t) = \frac{20}{(t+1)^2}$ (also decreasing because of fatigue). Assume distance is measured in kilometers and time is measured in hours.
- Make a graph of Kelly's distance from Niwot as a function of time.
 - Make a graph of Sandy's distance from Berthoud as a function of time.
 - When do they meet? How far has each person traveled when they meet?
 - More generally, if the riders' speeds are $v(t) = \frac{A}{(t+1)^2}$ and $u(t) = \frac{B}{(t+1)^2}$ and the distance between the towns is D , what conditions on A , B , and D must be met to ensure that the riders will pass each other?
 - Looking ahead: With the velocity functions given in part (d), make a conjecture about the maximum distance each person can ride (given unlimited time).

- 61. Bike race** Theo and Sasha start at the same place on a straight road, riding bikes with the following velocities (measured in mi/hr). Assume t is measured in hours.

Theo: $v_T(t) = 10$, for $t \geq 0$

Sasha: $v_S(t) = 15t$, for $0 \leq t \leq 1$, and $v_S(t) = 15$, for $t > 1$

- Graph the velocity function for both riders.
- If the riders ride for 1 hr, who rides farther? Interpret your answer geometrically using the graphs of part (a).
- If the riders ride for 2 hr, who rides farther? Interpret your answer geometrically using the graphs of part (a).
- Which rider arrives first at the 10-, 15-, and 20-mile markers of the race? Interpret your answers geometrically using the graphs of part (a).
- Suppose Sasha gives Theo a head start of 0.2 mi and the riders ride for 20 mi. Who wins the race?
- Suppose Sasha gives Theo a head start of 0.2 hr and the riders ride for 20 mi. Who wins the race?

- 62. Variable gravity** At Earth's surface, the acceleration due to gravity is approximately $g = 9.8 \text{ m/s}^2$ (with local variations). However, the acceleration decreases with distance from the surface according to Newton's law of gravitation. At a distance of y meters from Earth's surface, the acceleration is given by

$$a(y) = -\frac{g}{(1 + y/R)^2},$$

where $R = 6.4 \times 10^6 \text{ m}$ is the radius of Earth.

- Suppose a projectile is launched upward with an initial velocity of $v_0 \text{ m/s}$. Let $v(t)$ be its velocity and $y(t)$ its height (in meters) above the surface t seconds after the launch. Neglecting forces such as air resistance, explain why $\frac{dv}{dt} = a(y)$ and $\frac{dy}{dt} = v(t)$.
- Use the Chain Rule to show that $\frac{dv}{dt} = \frac{1}{2} \frac{d}{dy}(v^2)$.
- Show that the equation of motion for the projectile is $\frac{1}{2} \frac{d}{dy}(v^2) = a(y)$, where $a(y)$ is given previously.
- Integrate both sides of the equation in part (c) with respect to y using the fact that when $y = 0$, $v = v_0$. Show that
$$\frac{1}{2}(v^2 - v_0^2) = gR \left(\frac{1}{1 + y/R} - 1 \right).$$
- When the projectile reaches its maximum height, $v = 0$. Use this fact to determine that the maximum height is
$$y_{\max} = \frac{Rv_0^2}{2gR - v_0^2}.$$
- Graph $y_{\max}$ as a function of v_0 . What is the maximum height when $v_0 = 500 \text{ m/s}$, 1500 m/s , and 5 km/s ?
- Show that the value of v_0 needed to put the projectile into orbit (called the escape velocity) is $\sqrt{2gR}$.

- 63.** Suppose f and g have continuous derivatives on an interval $[a, b]$. Prove that if $f(a) = g(a)$ and $f(b) = g(b)$, then
$$\int_a^b f'(x) dx = \int_a^b g'(x) dx.$$
- 64.** Use Exercise 63 to prove that if two runners start and finish at the same time and place, then *regardless of the velocities at which they run*, their displacements are equal.
- 65.** Use Exercise 63 to prove that if two trails start at the same place and finish at the same place, then *regardless of the ups and downs of the trails*, they have the same net change in elevation.

66. Without evaluating integrals, prove that

$$\int_0^2 \frac{d}{dx} (12 \sin \pi x^2) dx = \int_0^2 \frac{d}{dx} (x^{10}(2-x)^3) dx.$$

QUICK CHECK ANSWERS

1. Displacement = -20 mi (20 mi south); distance traveled = 100 mi 2. Suppose the object moves in the positive direction, for $0 \leq t \leq 3$, and then moves in the negative direction, for $3 < t \leq 5$. 3. A function; a number

4. Displacement = 0; distance traveled = 1 5. 1720 m
6. The production cost would increase more between 9000 and 12,000 books than between 12,000 and 15,000 books. Graph C' and look at the area under the curve. ◀

Figure 6.11

6.2 Regions Between Curves

In this section, the method for finding the area of a region bounded by a single curve is generalized to regions bounded by two or more curves. Consider two functions f and g continuous on an interval $[a, b]$ on which $f(x) \geq g(x)$ (Figure 6.11). The goal is to find the area A of the region bounded by the two curves and the vertical lines $x = a$ and $x = b$.

Once again, we rely on the *slice-and-sum* strategy (Section 5.2) for finding areas by Riemann sums. The interval $[a, b]$ is partitioned into n subintervals using uniformly spaced grid points separated by a distance $\Delta x = (b - a)/n$ (Figure 6.12). On each subinterval, we build a rectangle extending from the lower curve to the upper curve. On the k th subinterval, a point x_k^* is chosen, and the height of the corresponding rectangle is taken to be $f(x_k^*) - g(x_k^*)$. Therefore, the area of the k th rectangle is $(f(x_k^*) - g(x_k^*))\Delta x$ (Figure 6.13). Summing the areas of the n rectangles gives an approximation to the area of the region between the curves:

$$A \approx \sum_{k=1}^n (f(x_k^*) - g(x_k^*))\Delta x.$$

Figure 6.12

Figure 6.13

As the number of grid points increases, Δx approaches zero and these sums approach the area of the region between the curves; that is,

$$A = \lim_{n \rightarrow \infty} \sum_{k=1}^n (f(x_k^*) - g(x_k^*))\Delta x.$$

The limit of these Riemann sums is a definite integral of the function $f - g$.

- It is helpful to interpret the area formula: $f(x) - g(x)$ is the height of a rectangle and dx represents its width. We sum (integrate) the areas of the rectangles $(f(x) - g(x)) dx$ to obtain the area of the region.

QUICK CHECK 1 In the area formula for a region between two curves, verify that if the lower curve is $g(x) = 0$, the formula becomes the usual formula for the area of the region bounded by $y = f(x)$ and the x -axis. ◀

Figure 6.14

QUICK CHECK 2 Interpret the area formula when it is written in the form $A = \int_a^b f(x) dx - \int_a^b g(x) dx$, where $f(x) \geq g(x) \geq 0$ on $[a, b]$. ◀

DEFINITION Area of a Region Between Two Curves

Suppose f and g are continuous functions with $f(x) \geq g(x)$ on the interval $[a, b]$. The area of the region bounded by the graphs of f and g on $[a, b]$ is

$$A = \int_a^b (f(x) - g(x)) dx.$$

EXAMPLE 1 Area between curves Find the area of the region bounded by the graphs of $f(x) = 5 - x^2$ and $g(x) = x^2 - 3$ (Figure 6.14).

SOLUTION A key step in the solution of many area problems is finding the intersection points of the boundary curves, which often determine the limits of integration. The intersection points of these two curves satisfy the equation $5 - x^2 = x^2 - 3$. The solutions of this equation are $x = -2$ and $x = 2$, which become the lower and upper limits of integration, respectively. The graph of f is the upper curve and the graph of g is the lower curve on the interval $[-2, 2]$. Therefore, the area of the region is

$$\begin{aligned} A &= \int_{-2}^2 ((5 - x^2) - (x^2 - 3)) dx && \text{Substitute for } f \text{ and } g. \\ &= \int_{-2}^2 (8 - 2x^2) dx && \text{Simplify and use symmetry.} \\ &= 2 \left(8x - \frac{2}{3}x^3 \right) \Big|_0^2 && \text{Fundamental Theorem} \\ &= \frac{64}{3}. && \text{Simplify.} \end{aligned}$$

Notice how the symmetry of the problem simplifies the integration. Additionally, note that the area formula $A = \int_a^b (f(x) - g(x)) dx$ is valid even if one or both curves lie below the x -axis, as long as $f(x) \geq g(x)$ on $[a, b]$.

Related Exercises 9–10 ◀

EXAMPLE 2 Compound region Find the area of the region bounded by the graphs of $f(x) = -x^2 + 3x + 6$ and $g(x) = |2x|$ (Figure 6.15a).

SOLUTION The lower boundary of the region consists of two different branches of the absolute value function. In situations like this, the region is divided into two (or more) subregions whose areas are found independently and then summed; these subregions are labeled R_1 and R_2 (Figure 6.15b). By the definition of absolute value,

$$g(x) = |2x| = \begin{cases} 2x & \text{if } x \geq 0 \\ -2x & \text{if } x < 0. \end{cases}$$

(a)

(b)

Figure 6.15

- The solution $x = 6$ corresponds to the intersection of the parabola $y = -x^2 + 3x + 6$ and the line $y = -2x$ in the fourth quadrant, not shown in Figure 6.15 because $g(x) = -2x$ only when $x < 0$.

The left intersection point of f and g satisfies $-2x = -x^2 + 3x + 6$, or $x^2 - 5x - 6 = 0$. Solving for x , we find that $(x + 1)(x - 6) = 0$, which implies $x = -1$ or $x = 6$; only the first solution is relevant. The right intersection point of f and g satisfies $2x = -x^2 + 3x + 6$; you should verify that the relevant solution in this case is $x = 3$.

Given these points of intersection, we see that the region R_1 is bounded by $y = -x^2 + 3x + 6$ and $y = -2x$ on the interval $[-1, 0]$. Similarly, region R_2 is bounded by $y = -x^2 + 3x + 6$ and $y = 2x$ on $[0, 3]$ (Figure 6.15b). Therefore,

$$\begin{aligned}
 A &= \underbrace{\int_{-1}^0 ((-x^2 + 3x + 6) - (-2x)) \, dx}_{\text{area of region } R_1} + \underbrace{\int_0^3 ((-x^2 + 3x + 6) - 2x) \, dx}_{\text{area of region } R_2} \\
 &= \int_{-1}^0 (-x^2 + 5x + 6) \, dx + \int_0^3 (-x^2 + x + 6) \, dx && \text{Simplify.} \\
 &= \left(-\frac{x^3}{3} + \frac{5}{2}x^2 + 6x \right) \Big|_{-1}^0 + \left(-\frac{x^3}{3} + \frac{1}{2}x^2 + 6x \right) \Big|_0^3 && \text{Fundamental Theorem} \\
 &= 0 - \left(\frac{1}{3} + \frac{5}{2} - 6 \right) + \left(-9 + \frac{9}{2} + 18 \right) - 0 = \frac{50}{3}. && \text{Simplify.}
 \end{aligned}$$

Related Exercises 15–16 ◀

Integrating with Respect to y

There are occasions when it is convenient to reverse the roles of x and y . Consider the regions shown in Figure 6.16 that are bounded by the graphs of $x = f(y)$ and $x = g(y)$, where $f(y) \geq g(y)$, for $c \leq y \leq d$ (which implies that the graph of f lies to the right of the graph of g). The lower and upper boundaries of the regions are $y = c$ and $y = d$, respectively.

Figure 6.17

- This area formula is analogous to the one given on p. 365; it is now expressed with respect to the y -axis. In this case, $f(y) - g(y)$ is the length of a rectangle and dy represents its width. We sum (integrate) the areas of the rectangles $(f(y) - g(y)) \, dy$ to obtain the area of the region.

Figure 6.16

In cases such as these, we treat y as the independent variable and divide the interval $[c, d]$ into n subintervals of width $\Delta y = (d - c)/n$ (Figure 6.17). On the k th subinterval, a point y_k^* is selected, and we construct a rectangle that extends from the left curve to the right curve. The k th rectangle has length $f(y_k^*) - g(y_k^*)$, so the area of the k th rectangle is $(f(y_k^*) - g(y_k^*)) \Delta y$. The area of the region is approximated by the sum of the areas of the rectangles. In the limit as $n \rightarrow \infty$ and $\Delta y \rightarrow 0$, the area of the region is given as the definite integral

$$A = \lim_{n \rightarrow \infty} \sum_{k=1}^n (f(y_k^*) - g(y_k^*)) \Delta y = \int_c^d (f(y) - g(y)) \, dy.$$

DEFINITION Area of a Region Between Two Curves with Respect to y

Suppose f and g are continuous functions with $f(y) \geq g(y)$ on the interval $[c, d]$. The area of the region bounded by the graphs $x = f(y)$ and $x = g(y)$ on $[c, d]$ is

$$A = \int_c^d (f(y) - g(y)) \, dy.$$

EXAMPLE 3 Integrating with respect to y Find the area of the region R bounded by the graphs of $y = x^3$, $y = x + 6$, and the x -axis.

SOLUTION The area of this region could be found by integrating with respect to x . But this approach requires splitting the region into two pieces (Figure 6.18). Alternatively, we can view y as the independent variable, express the bounding curves as functions of y , and make horizontal slices parallel to the x -axis (Figure 6.19).

Figure 6.18

Figure 6.19

► You may use synthetic division or a root finder to factor the cubic polynomial in Example 3. Then the quadratic formula shows that the equation

$$y^2 - 10y + 27 = 0$$

has no real roots.

Solving for x in terms of y , the right curve $y = x^3$ becomes $x = f(y) = y^{1/3}$. The left curve $y = x + 6$ becomes $x = g(y) = y - 6$. The intersection point of the curves satisfies the equation $y^{1/3} = y - 6$, or $y = (y - 6)^3$. Expanding this equation gives the cubic equation

$$y^3 - 18y^2 + 107y - 216 = (y - 8)(y^2 - 10y + 27) = 0,$$

whose only real root is $y = 8$. As shown in Figure 6.19, the areas of the slices through the region are summed from $y = 0$ to $y = 8$. Therefore, the area of the region is given by

$$\begin{aligned} \int_0^8 (y^{1/3} - (y - 6)) dy &= \left(\frac{3}{4} y^{4/3} - \frac{y^2}{2} + 6y \right) \Big|_0^8 && \text{Fundamental Theorem} \\ &= \left(\frac{3}{4} \cdot 16 - 32 + 48 \right) - 0 = 28. && \text{Simplify.} \end{aligned}$$

Related Exercises 19–20 ◀

QUICK CHECK 3 The region R is bounded by the curve $y = \sqrt{x}$, the line $y = x - 2$, and the x -axis. Express the area of R in terms of (a) integral(s) with respect to x and (b) integral(s) with respect to y . ◀

Figure 6.20

EXAMPLE 4 Calculus and geometry Find the area of the region R in the first quadrant bounded by the curves $y = x^{2/3}$ and $y = x - 4$ (Figure 6.20).

SOLUTION Slicing the region vertically and integrating with respect to x requires two integrals. Slicing the region horizontally requires a single integral with respect to y . The second approach appears to involve less work.

Slicing horizontally, the right bounding curve is $x = y + 4$ and the left bounding curve is $x = y^{3/2}$. The two curves intersect at $(8, 4)$, so the limits of integration are $y = 0$ and $y = 4$. The area of R is

$$\int_0^4 ((y + 4) - y^{3/2}) dy = \left(\frac{y^2}{2} + 4y - \frac{2}{5} y^{5/2} \right) \Big|_0^4 = \frac{56}{5}.$$

right curve left curve

Can this area be found using a different approach? Sometimes it helps to use geometry. Notice that the region R can be formed by taking the entire region under the curve

- To find the point of intersection in Example 4, solve $y^{3/2} = y + 4$ by first squaring both sides of the equation.

$y = x^{2/3}$ on the interval $[0, 8]$ and then removing a triangle whose base is the interval $[4, 8]$ (Figure 6.21). The area of the region R_1 under the curve $y = x^{2/3}$ is

$$\int_0^8 x^{2/3} dx = \frac{3}{5} x^{5/3} \Big|_0^8 = \frac{96}{5}.$$

The triangle R_2 has a base of length 4 and a height of 4, so its area is $\frac{1}{2} \cdot 4 \cdot 4 = 8$. Therefore, the area of R is $\frac{96}{5} - 8 = \frac{56}{5}$, which agrees with the first calculation.

QUICK CHECK 4 An alternative way to determine the area of the region in Example 3 (Figure 6.18) is to compute $18 + \int_0^2 (x + 6 - x^3) dx$. Why? ◀

SECTION 6.2 EXERCISES

Getting Started

- Set up a sum of two integrals that equals the area of the shaded region bounded by the graphs of the functions f and g on $[a, c]$ (see figure). Assume the curves intersect at $x = b$.

- Set up an integral that equals the area of the region (see figure) in the following two ways. Do not evaluate the integrals.
 - Using integration with respect to x .
 - Using integration with respect to y .

- Make a sketch to show a case in which the area bounded by two curves is most easily found by integrating with respect to x .
- Make a sketch to show a case in which the area bounded by two curves is most easily found by integrating with respect to y .
- Find the area of the region (see figure) in two ways.
 - Using integration with respect to x
 - Using geometry

- Find the area of the region (see figure) in two ways.
 - By integrating with respect to y
 - Using geometry

7. Express the area of the shaded region in Exercise 5 as the sum of two integrals with respect to y . Do not evaluate the integrals.
8. Express the area of the shaded region in Exercise 6 as the sum of two integrals with respect to x . Do not evaluate the integrals.

Practice Exercises

9–30. Finding area Determine the area of the shaded region in the following figures.

31–32. Two approaches Express the area of the following shaded regions in terms of (a) one or more integrals with respect to x and (b) one or more integrals with respect to y . You do not need to evaluate the integrals.

33. Area between velocity curves Two runners, starting at the same location, run along a straight road for 1 hour. The velocity of one runner is $v_1(t) = 7t$ and the velocity of the other runner is $v_2(t) = 10\sqrt{t}$. Assume t is measured in hours and the velocities $v_1(t)$ and $v_2(t)$ are measured in km/hr. Determine the area between the curves $y = v_1(t)$ and $y = v_2(t)$, for $0 \leq t \leq 1$. Interpret the physical meaning of this area.

34–36. Calculus and geometry For the given regions R_1 and R_2 , complete the following steps.

- Find the area of region R_1 .
- Find the area of region R_2 using geometry and the answer to part (a).

34. R_1 is the region in the first quadrant bounded by the y -axis and the curves $y = 2x^2$ and $y = 3 - x$; R_2 is the region in the first quadrant bounded by the x -axis and the curves $y = 2x^2$ and $y = 3 - x$ (see figure).

35. R_1 is the region in the first quadrant bounded by the line $x = 1$ and the curve $y = 6x(2 - x^2)^2$; R_2 is the region in the first quadrant bounded by the curve $y = 6x(2 - x^2)^2$ and the line $y = 6x$.

36. R_1 is the region in the first quadrant bounded by the coordinate axes and the curve $x = \cos y$; R_2 is the region bounded by the lines $y = \frac{\pi}{2}$ and $x = 1$, and the curve $x = \cos y$.

37–62. Regions between curves Find the area of the region described in the following exercises.

37. The region bounded by $y = 4x + 4$, $y = 6x + 6$, and $x = 4$
38. The region bounded by $y = \cos x$ and $y = \sin x$ on the interval $\left[\frac{\pi}{4}, \frac{5\pi}{4}\right]$
39. The region bounded by $y = 2x^2$ and $y = x^2 + 4$
40. The region bounded by $y = 6x$ and $y = 3x^2 - 6x$
41. The region bounded by $y = 2x$ and $y = 2x^2 - 4$
42. The region bounded by $y = 24\sqrt{x}$ and $y = 3x^2$
43. The region bounded by $y = x$, $y = 1/x^2$, $y = 0$, and $x = 2$
44. The region in the first quadrant on the interval $[0, 2]$ bounded by $y = 4x - x^2$ and $y = 4x - 4$
45. The region bounded by $y = 2 - |x|$ and $y = x^2$
46. The region bounded by $y = x^3$ and $y = 9x$
47. The region bounded by $y = |x - 3|$ and $y = \frac{x}{2}$
48. The region bounded by $y = 3x - x^3$ and $y = -x$
49. The region in the first quadrant bounded by $y = x^{2/3}$ and $y = 4$
50. The region in the first quadrant bounded by $y = 2$ and $y = 2 \sin x$ on the interval $[0, \pi/2]$
51. The region bounded by $y = x/4$ and $x = y^3$
- 52.** The region below the line $y = 2$ and above the curve $y = \sec^2 x$ on the interval $[0, \pi/4]$
- 53.** The region between the line $y = x$ and the curve $y = 2x\sqrt{1 - x^2}$ in the first quadrant
54. The region bounded by $x = y^2 - 4$ and $y = \frac{x}{3}$
55. The region bounded by $y = \sqrt{x}$, $y = 2x - 15$, and $y = 0$
56. The region bounded by $y = 2$ and $y = x^{2/3} + 1$
57. The region bounded by $y = x^2 - 2x + 1$ and $y = 5x - 9$
58. The region bounded by $x = y(y - 1)$ and $x = -y(y - 1)$
59. The region bounded by $x = y(y - 1)$ and $y = \frac{x}{3}$
60. The region bounded by $y = \sin x$ and $y = x(x - \pi)$ on the interval $[0, \pi]$
61. The region bounded by $y = 1 - \cos x$ and $y = \sin x$ on the interval $[\pi/2, 2\pi]$
62. The region in the first quadrant bounded by $y = x^{-2}$, $y = 8x$, and $y = x/8$

63–64. Complicated regions Find the area of the shaded regions in the following figures.

65. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- The area of the region bounded by $y = x$ and $x = y^2$ can be found only by integrating with respect to x .
 - The area of the region between $y = \sin x$ and $y = \cos x$ on the interval $[0, \pi/2]$ is $\int_0^{\pi/2} (\cos x - \sin x) dx$.
 - $\int_0^1 (x - x^2) dx = \int_0^1 (\sqrt{y} - y) dy$.

Explorations and Challenges

66. **Differences of even functions** Assume f and g are even, integrable functions on $[-a, a]$, where $a > 1$. Suppose $f(x) > g(x) > 0$ on $[-a, a]$ and that the area bounded by the graphs of f and g on $[-a, a]$ is 10. What is the value of $\int_0^a x(f(x^2) - g(x^2)) dx$?
67. **Area of a curve defined implicitly** Determine the area of the shaded region bounded by the curve $x^2 = y^4(1 - y^3)$ (see figure).

68–71. Roots and powers Find the area of the following regions, expressing your results in terms of the positive integer $n \geq 2$.

68. The region bounded by $f(x) = x$ and $g(x) = x^n$, for $x \geq 0$
69. The region bounded by $f(x) = x$ and $g(x) = x^{1/n}$, for $x \geq 0$

70. The region bounded by $f(x) = x^{1/n}$ and $g(x) = x^n$, for $x \geq 0$

71. Let A_n be the area of the region bounded by $f(x) = x^{1/n}$ and $g(x) = x^n$ on the interval $[0, 1]$, where n is a positive integer. Evaluate $\lim_{n \rightarrow \infty} A_n$ and interpret the result.

72–73. Bisecting regions For each region R , find the horizontal line $y = k$ that divides R into two subregions of equal area.

72. R is the region bounded by $y = 1 - x$, the x -axis, and the y -axis.

73. R is the region bounded by $y = 1 - |x - 1|$ and the x -axis.

74. Geometric probability Suppose a dartboard occupies the square $\{(x, y): 0 \leq |x| \leq 1, 0 \leq |y| \leq 1\}$. A dart is thrown randomly at the board many times (meaning it is equally likely to land at any point in the square). What fraction of the darts throw land closer to the edge of the board than to the center? Equivalently, what is the probability that the dart lands closer to the edge of the board than to the center? Proceed as follows.

- a. Argue that by symmetry it is necessary to consider only one quarter of the board, say the region $R: \{(x, y): |x| \leq y \leq 1\}$.

- b. Find the curve C in this region that is equidistant from the center of the board and the top edge of the board (see figure).
c. The probability that the dart lands closer to the edge of the board than to the center is the ratio of the area of the region R_1 above C to the area of the entire region R . Compute this probability.

75. Lorenz curves and the Gini index A Lorenz curve is given by $y = L(x)$, where $0 \leq x \leq 1$ represents the lowest fraction of the population of a society in terms of wealth, and $0 \leq y \leq 1$ represents the fraction of the total wealth that is owned by that fraction of the society. For example, the Lorenz curve in the figure shows that $L(0.5) = 0.2$, which means that the lowest 0.5 (50%) of the society owns 0.2 (20%) of the wealth. (See Guided Project *Distribution of Wealth* for more on Lorenz curves.)

- a. A Lorenz curve $y = L(x)$ is accompanied by the line $y = x$, called the **line of perfect equality**. Explain why this line is given this name.
b. Explain why a Lorenz curve satisfies the conditions $L(0) = 0$, $L(1) = 1$, $L(x) \leq x$, and $L'(x) \geq 0$ on $[0, 1]$.
c. Graph the Lorenz curves $L(x) = x^p$ corresponding to $p = 1.1, 1.5, 2, 3$, and 4 . Which value of p corresponds to the *most* equitable distribution of wealth (closest to the line of perfect equality)? Which value of p corresponds to the *least* equitable distribution of wealth? Explain.
d. The information in the Lorenz curve is often summarized in a single measure called the **Gini index**, which is defined as follows. Let A be the area of the region between $y = x$ and $y = L(x)$ (see figure) and let B be the area of the region between $y = L(x)$ and the x -axis. Then the Gini index is $G = \frac{A}{A + B}$. Show that $G = 2A = 1 - 2 \int_0^1 L(x) dx$.
e. Compute the Gini index for the cases $L(x) = x^p$ and $p = 1.1, 1.5, 2, 3$, and 4 .
f. What is the smallest interval $[a, b]$ on which values of the Gini index lie for $L(x) = x^p$ with $p \geq 1$? Which endpoints of $[a, b]$ correspond to the least and most equitable distribution of wealth?
g. Consider the Lorenz curve described by $L(x) = \frac{5x^2}{6} + \frac{x}{6}$. Show that it satisfies the conditions $L(0) = 0$, $L(1) = 1$, and $L'(x) \geq 0$ on $[0, 1]$. Find the Gini index for this function.

76. Equal area properties for parabolas Consider the parabola $y = x^2$. Let P, Q , and R be points on the parabola with R between P and Q on the curve. Let ℓ_P, ℓ_Q , and ℓ_R be the lines tangent to the parabola at P, Q , and R , respectively (see figure). Let P' be the intersection point of ℓ_Q and ℓ_R , let Q' be the intersection point of ℓ_P and ℓ_R , and let R' be the intersection point of ℓ_P and ℓ_Q . Prove that $\text{Area } \triangle PQR = 2 \cdot \text{Area } \triangle P'Q'R'$ in the following cases. (In fact, the property holds for any three points on any parabola.) (Source: *Mathematics Magazine*, 81, 2, Apr 2008)

- a. $P(-a, a^2)$, $Q(a, a^2)$, and $R(0, 0)$, where a is a positive real number
b. $P(-a, a^2)$, $Q(b, b^2)$, and $R(0, 0)$, where a and b are positive real numbers
c. $P(-a, a^2)$, $Q(b, b^2)$, and R is any point between P and Q on the curve

77. Roots and powers Consider the functions $f(x) = x^n$ and $g(x) = x^{1/n}$, where $n \geq 2$ is a positive integer.

- a. Graph f and g for $n = 2, 3$, and 4 , for $x \geq 0$.

- b. Give a geometric interpretation of the area function

$$A_n(x) = \int_0^x (f(s) - g(s)) ds, \text{ for } n = 2, 3, 4, \dots \text{ and } x > 0.$$

- c. Find the positive root of $A_n(x) = 0$ in terms of n . Does the root increase or decrease with n ?

78. Shifting sines Consider the functions $f(x) = a \sin 2x$ and

$$g(x) = \frac{\sin x}{a}, \text{ where } a > 0 \text{ is a real number.}$$

- Graph the two functions on the interval $[0, \frac{\pi}{2}]$, for $a = \frac{1}{2}, 1$, and 2 .
- Show that the curves have an intersection point x^* (other than $x = 0$) on $[0, \frac{\pi}{2}]$ that satisfies $\cos x^* = \frac{1}{2a^2}$, provided $a > 1/\sqrt{2}$.
- Find the area of the region between the two curves on $[0, x^*]$ when $a = 1$.
- Show that as $a \rightarrow 1/\sqrt{2}^+$, the area of the region between the two curves on $[0, x^*]$ approaches zero.

QUICK CHECK ANSWERS

- If $g(x) = 0$ and $f(x) \geq 0$, then the area between the curves is $\int_a^b (f(x) - 0) dx = \int_a^b f(x) dx$, which is the area between $y = f(x)$ and the x -axis.
- $\int_a^b f(x) dx$ is the area of the region between the graph of f and the x -axis. $\int_a^b g(x) dx$ is the area of the region between the graph of g and the x -axis. The difference of the two integrals is the area of the region between the graphs of f and g .
- a. $\int_0^2 \sqrt{x} dx + \int_2^4 (\sqrt{x} - x + 2) dx$
b. $\int_0^2 (y + 2 - y^2) dy$
- The area of the triangle to the left of the y -axis is 18. The area of the region to the right of the y -axis is given by the integral. ◀

6.3 Volume by Slicing

We have seen that integration is used to compute the area of two-dimensional regions bounded by curves. Integrals are also used to find the volume of three-dimensional regions (or solids). Once again, the slice-and-sum method is the key to solving these problems.

General Slicing Method

Consider a solid object that extends in the x -direction from $x = a$ to $x = b$. Imagine making a vertical cut through the solid, perpendicular to the x -axis at a particular point x , and suppose the area of the cross section created by the cut is given by a known integrable function A (Figure 6.22).

To find the volume of this solid, we first divide $[a, b]$ into n subintervals of length $\Delta x = (b - a)/n$. The endpoints of the subintervals are the grid points $x_0 = a, x_1, x_2, \dots, x_n = b$. We now make vertical cuts through the solid perpendicular to the x -axis at each grid point, which produces n slices of thickness Δx . (Imagine cutting a loaf of bread to create n slices of equal width.) On each subinterval, an arbitrary point x_k^* is identified. The k th slice through the solid has a thickness Δx , and we take $A(x_k^*)$ as a representative cross-sectional area of the slice. Therefore, the volume of the k th slice is approximately $A(x_k^*)\Delta x$ (Figure 6.23). Summing the volumes of the slices, the approximate volume of the solid is

$$V \approx \sum_{k=1}^n A(x_k^*) \Delta x.$$

Figure 6.22

Figure 6.23

As the number of slices increases ($n \rightarrow \infty$) and the thickness of each slice goes to zero ($\Delta x \rightarrow 0$), the exact volume V is obtained in terms of a definite integral (Figure 6.24):

$$V = \lim_{n \rightarrow \infty} \sum_{k=1}^n A(x_k^*) \Delta x = \int_a^b A(x) dx.$$

Figure 6.24

We summarize the important general slicing method, which is also the basis of other volume formulas to follow.

► The factors in this volume integral have meaning: $A(x)$ is the cross-sectional area of a slice and dx represents its thickness. Summing (integrating) the volumes of the slices $A(x) dx$ gives the volume of the solid.

QUICK CHECK 1 Why is the volume, as given by the general slicing method, equal to the average value of the area function A on $[a, b]$ multiplied by $b - a$? ◀

General Slicing Method

Suppose a solid object extends from $x = a$ to $x = b$, and the cross section of the solid perpendicular to the x -axis has an area given by a function A that is integrable on $[a, b]$. The volume of the solid is

$$V = \int_a^b A(x) dx.$$

EXAMPLE 1 **Volume of a “parabolic cube”** Let R be the region in the first quadrant bounded by the coordinate axes and the curve $y = 1 - x^2$. A solid has a base R , and cross sections through the solid perpendicular to the base and parallel to the y -axis are squares (Figure 6.25a). Find the volume of the solid.

SOLUTION Focus on a cross section through the solid at a point x , where $0 \leq x \leq 1$. That cross section is a square with sides of length $1 - x^2$. Therefore, the area of a typical cross section is $A(x) = (1 - x^2)^2$. Using the general slicing method, the volume of the solid is

$$\begin{aligned} V &= \int_0^1 A(x) dx && \text{General slicing method} \\ &= \int_0^1 (1 - x^2)^2 dx && \text{Substitute for } A(x). \\ &= \int_0^1 (1 - 2x^2 + x^4) dx && \text{Expand integrand.} \\ &= \frac{8}{15}. && \text{Evaluate.} \end{aligned}$$

The actual solid with a square cross section is shown in Figure 6.25b.

Figure 6.25

Related Exercises 11–12 ◀

EXAMPLE 2 Volume of a “parabolic hemisphere” A solid has a base that is bounded by the curves $y = x^2$ and $y = 2 - x^2$ in the xy -plane. Cross sections through the solid perpendicular to the base and parallel to the y -axis are semicircular disks. Find the volume of the solid.

SOLUTION Because a typical cross section perpendicular to the x -axis is a semicircular disk (Figure 6.26), the area of a cross section is $\frac{1}{2}\pi r^2$, where r is the radius of the cross section.

Figure 6.26

The key observation is that this radius is one-half of the distance between the upper bounding curve $y = 2 - x^2$ and the lower bounding curve $y = x^2$. So the radius at the point x is

$$r = \frac{1}{2}((2 - x^2) - x^2) = 1 - x^2.$$

This means that the area of the semicircular cross section at the point x is

$$A(x) = \frac{1}{2}\pi r^2 = \frac{\pi}{2}(1 - x^2)^2.$$

The intersection points of the two bounding curves satisfy $2 - x^2 = x^2$, which has solutions $x = \pm 1$. Therefore, the cross sections lie between $x = -1$ and $x = 1$. Integrating the cross-sectional areas, the volume of the solid is

$$\begin{aligned} V &= \int_{-1}^1 A(x) \, dx && \text{General slicing method} \\ &= \int_{-1}^1 \frac{\pi}{2} (1 - x^2)^2 \, dx && \text{Substitute for } A(x). \\ &= \frac{\pi}{2} \int_{-1}^1 (1 - 2x^2 + x^4) \, dx && \text{Expand integrand.} \\ &= \frac{8\pi}{15}. && \text{Evaluate.} \end{aligned}$$

QUICK CHECK 2 In Example 2, what is the cross-sectional area function $A(x)$ if cross sections perpendicular to the base are squares rather than semicircles? ◀

QUICK CHECK 3 What solid results when the region R is revolved about the x -axis if (a) R is a square with vertices $(0, 0)$, $(0, 2)$, $(2, 0)$, and $(2, 2)$, and (b) R is a triangle with vertices $(0, 0)$, $(0, 2)$, and $(2, 0)$? ◀

Figure 6.29

The Disk Method

We now consider a specific type of solid known as a **solid of revolution**. Suppose f is a continuous function with $f(x) \geq 0$ on an interval $[a, b]$. Let R be the region bounded by the graph of f , the x -axis, and the lines $x = a$ and $x = b$ (Figure 6.27). Now revolve R (out of the page) around the x -axis. As R revolves once about the x -axis, it sweeps out a three-dimensional solid of revolution (Figure 6.28). The goal is to find the volume of this solid, which may be done using the general slicing method.

Figure 6.28

With a solid of revolution, the cross-sectional area function has a special form because all cross sections perpendicular to the x -axis are *circular disks* with radius $f(x)$ (Figure 6.29). Therefore, the cross section at the point x , where $a \leq x \leq b$, has area

$$A(x) = \pi(\text{radius})^2 = \pi f(x)^2.$$

By the general slicing method, the volume of the solid is

$$V = \int_a^b A(x) \, dx = \int_a^b \pi f(x)^2 \, dx.$$

Because each slice through the solid is a circular disk, the resulting method is called the **disk method**.

Disk Method about the x -Axis

Let f be continuous with $f(x) \geq 0$ on the interval $[a, b]$. If the region R bounded by the graph of f , the x -axis, and the lines $x = a$ and $x = b$ is revolved about the x -axis, the volume of the resulting solid of revolution is

$$V = \int_a^b \underbrace{\pi f(x)^2}_{\substack{\text{disk} \\ \text{radius}}} \, dx.$$

EXAMPLE 3 Disk method at work Let R be the region bounded by the curve $f(x) = (x + 1)^2$, the x -axis, and the lines $x = 0$ and $x = 2$ (Figure 6.30a). Find the volume of the solid of revolution obtained by revolving R about the x -axis.

Figure 6.30

Figure 6.32

SOLUTION When the region R is revolved about the x -axis, it generates a solid of revolution (Figure 6.30b). A cross section perpendicular to the x -axis at the point $0 \leq x \leq 2$ is a circular disk of radius $f(x)$. Therefore, a typical cross section has area

$$A(x) = \pi f(x)^2 = \pi((x+1)^2)^2.$$

Integrating these cross-sectional areas between $x = 0$ and $x = 2$ gives the volume of the solid:

$$\begin{aligned} V &= \int_0^2 A(x) \, dx = \int_0^2 \pi \underbrace{((x+1)^2)^2}_{\text{disk radius}} \, dx && \text{Substitute for } A(x). \\ &= \int_0^2 \pi (x+1)^4 \, dx && \text{Simplify.} \\ &= \pi \frac{u^5}{5} \Big|_1^3 = \frac{242\pi}{5}. && \text{Let } u = x+1 \text{ and evaluate.} \end{aligned}$$

Related Exercises 17, 19 ◀

Washer Method

A slight variation on the disk method enables us to compute the volume of more exotic solids of revolution. Suppose R is the region bounded by the graphs of f and g between $x = a$ and $x = b$, where $f(x) \geq g(x) \geq 0$ (Figure 6.31). If R is revolved about the x -axis to generate a solid of revolution, the resulting solid generally has a hole through it.

Figure 6.31

Once again we apply the general slicing method. In this case, a cross section through the solid perpendicular to the x -axis is a circular *washer* with an outer radius of $r_o = f(x)$ and an inner radius of $r_i = g(x)$, where $a \leq x \leq b$. The area of the cross section is the area of the entire disk minus the area of the hole, or

$$A(x) = \pi(r_o^2 - r_i^2) = \pi(f(x)^2 - g(x)^2)$$

(Figure 6.32). The general slicing method gives the volume of the solid.

Washer Method about the x -Axis

Let f and g be continuous functions with $f(x) \geq g(x) \geq 0$ on $[a, b]$. Let R be the region bounded by $y = f(x)$, $y = g(x)$, and the lines $x = a$ and $x = b$. When R is revolved about the x -axis, the volume of the resulting solid of revolution is

$$V = \int_a^b \pi \underbrace{(f(x)^2)}_{\text{outer radius}} - \underbrace{(g(x)^2)}_{\text{inner radius}} \, dx.$$

QUICK CHECK 4 Show that when $g(x) = 0$ in the washer method, the result is the disk method. ◀

- The washer method is really two applications of the disk method. We compute the volume of the entire solid without the hole (by the disk method) and then subtract the volume of the hole (also computed by the disk method).

- Ignoring the factor of π , the integrand in the washer method integral is $f(x)^2 - g(x)^2$, which is not equal to $(f(x) - g(x))^2$.

EXAMPLE 4 Volume by the washer method The region R is bounded by the graphs of $f(x) = \sqrt{x}$ and $g(x) = x^2$ between $x = 0$ and $x = 1$. What is the volume of the solid that results when R is revolved about the x -axis?

SOLUTION The region R is bounded by the graphs of f and g with $f(x) \geq g(x)$ on $[0, 1]$, so the washer method is applicable (Figure 6.33). The area of a typical cross section at the point x is

$$A(x) = \pi(f(x)^2 - g(x)^2) = \pi(\underbrace{(\sqrt{x})^2}_{\substack{\text{outer} \\ \text{radius}}} - \underbrace{(x^2)^2}_{\substack{\text{inner} \\ \text{radius}}}) = \pi(x - x^4).$$

Therefore, the volume of the solid is

$$\begin{aligned} V &= \int_0^1 \pi(x - x^4) \, dx && \text{Washer method} \\ &= \pi \left(\frac{x^2}{2} - \frac{x^5}{5} \right) \bigg|_0^1 = \frac{3\pi}{10}. && \text{Fundamental Theorem} \end{aligned}$$

Figure 6.33

Related Exercises 21–22 ◀

QUICK CHECK 5 Suppose the region in Example 4 is revolved about the line $y = -1$ instead of the x -axis. (a) What is the inner radius of a typical washer? (b) What is the outer radius of a typical washer? ◀

Revolving about the y -Axis

Everything you learned about revolving regions about the x -axis applies to revolving regions about the y -axis. Consider a region R bounded by the curve $x = p(y)$ on the right, the curve $x = q(y)$ on the left, and the horizontal lines $y = c$ and $y = d$ (Figure 6.34a).

To find the volume of the solid generated when R is revolved about the y -axis, we use the general slicing method—now with respect to the y -axis (Figure 6.34b). The area of a typical cross section is $A(y) = \pi(p(y)^2 - q(y)^2)$, where $c \leq y \leq d$. As before, integrating these cross-sectional areas of the solid gives the volume.

Figure 6.34

- The disk/washer method about the y -axis is the disk/washer method about the x -axis with x replaced with y .

Disk and Washer Methods about the y -Axis

Let p and q be continuous functions with $p(y) \geq q(y) \geq 0$ on $[c, d]$. Let R be the region bounded by $x = p(y)$, $x = q(y)$, and the lines $y = c$ and $y = d$. When R is revolved about the y -axis, the volume of the resulting solid of revolution is given by

$$V = \int_c^d \pi \underbrace{(p(y))^2}_{\text{outer radius}} - \underbrace{(q(y))^2}_{\text{inner radius}} dy.$$

If $q(y) = 0$, the disk method results:

$$V = \int_c^d \pi \underbrace{(p(y))^2}_{\text{disk radius}} dy.$$

EXAMPLE 5 Which solid has greater volume? Let R be the region in the first quadrant bounded by the graphs of $x = y^3$ and $x = 4y$. Which is greater, the volume of the solid generated when R is revolved about the x -axis or the y -axis?

SOLUTION Solving $y^3 = 4y$, or equivalently, $y(y^2 - 4) = 0$, we find that the bounding curves of R intersect at the points $(0, 0)$ and $(8, 2)$. When the region R (Figure 6.35a) is revolved about the y -axis, it generates a funnel with a curved inner surface (Figure 6.35b). Washer-shaped cross sections perpendicular to the y -axis extend from $y = 0$ to $y = 2$. The outer radius of the cross section at the point y is determined by the line $x = p(y) = 4y$. The inner radius of the cross section at the point y is determined by the curve $x = q(y) = y^3$. Applying the washer method, the volume of this solid is

$$\begin{aligned} V &= \int_0^2 \pi(p(y)^2 - q(y)^2) dy && \text{Washer method} \\ &= \int_0^2 \pi(16y^2 - y^6) dy && \text{Substitute for } p \text{ and } q. \\ &= \pi \left(\frac{16}{3} y^3 - \frac{y^7}{7} \right) \Big|_0^2 && \text{Fundamental Theorem} \\ &= \frac{512\pi}{21}. && \text{Evaluate.} \end{aligned}$$

Figure 6.35

When the region R is revolved about the x -axis, it generates a different funnel (Figure 6.36). Vertical slices through the solid between $x = 0$ and $x = 8$ produce washers. The outer radius of the washer at the point x is determined by the curve $x = y^3$, or $y = f(x) = x^{1/3}$. The inner radius is determined by $x = 4y$, or $y = g(x) = x/4$. The volume of the resulting solid is

$$\begin{aligned}
 V &= \int_0^8 \pi(f(x)^2 - g(x)^2) dx && \text{Washer method} \\
 &= \int_0^8 \pi\left(x^{2/3} - \frac{x^2}{16}\right) dx && \text{Substitute for } f \text{ and } g. \\
 &= \pi\left(\frac{3}{5}x^{5/3} - \frac{x^3}{48}\right)\bigg|_0^8 && \text{Fundamental Theorem} \\
 &= \frac{128\pi}{15}. && \text{Evaluate.}
 \end{aligned}$$

We see that revolving the region about the y -axis produces a solid of greater volume.

Figure 6.36

QUICK CHECK 6 The region in the first quadrant bounded by $y = x$ and $y = x^3$ is revolved about the y -axis. Give the integral for the volume of the solid that is generated. ◀

Related Exercises 43–44 ◀

The disk and washer methods may be generalized to handle situations in which a region R is revolved about a line parallel to one of the coordinate axes. The next example discusses three such cases.

EXAMPLE 6 Revolving about other lines Let $f(x) = \sqrt{x} + 1$ and $g(x) = x^2 + 1$.

- Find the volume of the solid generated when the region R_1 bounded by the graph of f and the line $y = 2$ on the interval $[0, 1]$ is revolved about the line $y = 2$.
- Find the volume of the solid generated when the region R_2 bounded by the graphs of f and g on the interval $[0, 1]$ is revolved about the line $y = -1$.
- Find the volume of the solid generated when the region R_2 bounded by the graphs of f and g on the interval $[0, 1]$ is revolved about the line $x = 2$.

SOLUTION

- a. Figure 6.37a shows the region R_1 and the axis of revolution. Applying the disk method, we see that a disk located at a point x has a radius of $2 - f(x) = 2 - (\sqrt{x} + 1) = 1 - \sqrt{x}$. Therefore, the volume of the solid generated when R_1 is revolved about $y = 2$ is

$$\int_0^1 \pi \underbrace{(1 - \sqrt{x})^2}_{\text{disk radius}} dx = \pi \int_0^1 (1 - 2\sqrt{x} + x) dx = \frac{\pi}{6}.$$

Figure 6.37

- b. When the graph of f is revolved about $y = -1$, it sweeps out a solid of revolution whose radius at a point x is $f(x) + 1 = \sqrt{x} + 2$. Similarly, when the graph of g is revolved about $y = -1$, it sweeps out a solid of revolution whose radius at a point x is $g(x) + 1 = x^2 + 2$ (Figure 6.37b). Using the washer method, the volume of the solid generated when R_2 is revolved about $y = -1$ is

$$\begin{aligned} \int_0^1 \pi \left(\underbrace{(\sqrt{x} + 2)^2}_{\text{outer radius}} - \underbrace{(x^2 + 2)^2}_{\text{inner radius}} \right) dx & \quad \text{Washer method} \\ &= \pi \int_0^1 (-x^4 - 4x^2 + x + 4\sqrt{x}) dx \quad \text{Simplify integrand.} \\ &= \frac{49\pi}{30}. \quad \text{Evaluate integral.} \end{aligned}$$

- c. When the region R_2 is revolved about the line $x = 2$, we use the washer method and integrate in the y -direction. First note that the graph of f is described by $y = \sqrt{x} + 1$, or equivalently, $x = (y - 1)^2$, for $y \geq 1$. Also, the graph of g is described by $y = x^2 + 1$, or equivalently, $x = \sqrt{y - 1}$ for $y \geq 1$ (Figure 6.37c). When the graph of f is revolved about the line $x = 2$, the radius of a typical disk at a point y is $2 - (y - 1)^2$. Similarly, when the graph of g is revolved about $x = 2$, the radius of a typical disk at a point y is $2 - \sqrt{y - 1}$. Finally, observe that the extent of the region R_2 in the y -direction is the interval $1 \leq y \leq 2$.

Applying the washer method, simplifying the integrand, and integrating powers of y , the volume of the solid of revolution is

$$\int_1^2 \pi \left(\underbrace{(2 - (y - 1)^2)^2}_{\text{outer radius}} - \underbrace{(2 - \sqrt{y - 1})^2}_{\text{inner radius}} \right) dy = \frac{31\pi}{30}.$$

SECTION 6.3 EXERCISES

Getting Started

- Suppose a cut is made through a solid object perpendicular to the x -axis at a particular point x . Explain the meaning of $A(x)$.
- A solid has a circular base; cross sections perpendicular to the base are squares. What method should be used to find the volume of the solid?
- Consider a solid whose base is the region in the first quadrant bounded by the curve $y = \sqrt{3 - x}$ and the line $x = 2$, and whose cross sections through the solid perpendicular to the x -axis are squares.
 - Find an expression for the area $A(x)$ of a cross section of the solid at a point x in $[0, 2]$.
 - Write an integral for the volume of the solid.

- Why is the disk method a special case of the general slicing method?
- Let R be the region bounded by the curve $y = \sqrt{\cos x}$ and the x -axis on $[0, \pi/2]$. A solid of revolution is obtained by revolving R about the x -axis (see figures).
 - Find an expression for the radius of a cross section of the solid of revolution at a point x in $[0, \pi/2]$.
 - Find an expression for the area $A(x)$ of a cross section of the solid at a point x in $[0, \pi/2]$.
 - Write an integral for the volume of the solid.

- Let R be the region bounded by the curve $x = \cos y$ and the x -axis on $[0, 1]$. A solid of revolution is obtained by revolving R about the y -axis (see figures).

- Find an expression for the radius of a cross section of the solid at a point y in $[0, \pi/2]$.
- Find an expression for the area $A(y)$ of a cross section of the solid at a point y in $[0, \pi/2]$.
- Write an integral for the volume of the solid.

7–10. Use the region R that is bounded by the graphs of $y = 1 + \sqrt{x}$, $x = 4$, and $y = 1$ to complete the exercises.

- Region R is revolved about the x -axis to form a solid of revolution whose cross sections are washers.
 - What is the outer radius of a cross section of the solid at a point x in $[0, 4]$?
 - What is the inner radius of a cross section of the solid at a point x in $[0, 4]$?
 - What is the area $A(x)$ of a cross section of the solid at a point x in $[0, 4]$?
 - Write an integral for the volume of the solid.
- Region R is revolved about the y -axis to form a solid of revolution whose cross sections are washers.
 - What is the outer radius of a cross section of the solid at a point y in $[1, 3]$?
 - What is the inner radius of a cross section of the solid at a point y in $[1, 3]$?
 - What is the area $A(y)$ of a cross section of the solid at a point y in $[1, 3]$?
 - Write an integral for the volume of the solid.

9. Region R is revolved about the line $y = 1$ to form a solid of revolution.
- What is the radius of a cross section of the solid at a point x in $[0, 4]$?
 - What is the area $A(x)$ of a cross section of the solid at a point x in $[0, 4]$?
 - Write an integral for the volume of the solid.
10. Region R is revolved about the line $x = 4$ to form a solid of revolution.
- What is the radius of a cross section of the solid at a point y in $[1, 3]$?
 - What is the area $A(y)$ of a cross section of the solid at a point y in $[1, 3]$?
 - Write an integral for the volume of the solid.
14. The solid with a semicircular base of radius 5 whose cross sections perpendicular to the base and parallel to the diameter are squares
15. The solid whose base is the triangle with vertices $(0, 0)$, $(2, 0)$, and $(0, 2)$, and whose cross sections perpendicular to the base and parallel to the y -axis are semicircles
16. The solid whose base is the region bounded by $y = x^2$ and the line $y = 1$, and whose cross sections perpendicular to the base and parallel to the y -axis are squares
- 17–40. Solids of revolution** Let R be the region bounded by the following curves. Find the volume of the solid generated when R is revolved about the given axis.
17. $y = 2x$, $y = 0$, and $x = 3$; about the x -axis (Verify that your answer agrees with the volume formula for a cone.)

Practice Exercises

11–16. General slicing method Use the general slicing method to find the volume of the following solids.

11. The solid whose base is the region bounded by the semicircle $y = \sqrt{1 - x^2}$ and the x -axis, and whose cross sections through the solid perpendicular to the x -axis are squares

12. The solid whose base is the region bounded by the curves $y = x^2$ and $y = 2 - x^2$, and whose cross sections through the solid perpendicular to the x -axis are squares

13. The solid whose base is the region bounded by the curve $y = \sqrt{\cos x}$ and the x -axis on $[-\pi/2, \pi/2]$, and whose cross sections through the solid perpendicular to the x -axis are isosceles right triangles with a horizontal leg in the xy -plane and a vertical leg above the x -axis

18. $y = 2 - 2x$, $y = 0$, and $x = 0$; about the x -axis (Verify that your answer agrees with the volume formula for a cone.)

19. $y = 4 - x^2$, $y = 0$, and $x = 0$; about the x -axis

20. $y = \frac{1}{x^2}$, $y = 0$, $x = 1$, and $x = 4$; about the x -axis

21. $y = x$ and $y = 2\sqrt{x}$; about the x -axis

22. $y = x$ and $y = \sqrt[4]{x}$; about the x -axis

23. $y = \sin x$, $y = 1 - \sin x$, $x = \pi/6$, and $x = 5\pi/6$; about the x -axis

24. $y = x$, $y = x + 2$, $x = 0$, and $x = 4$; about the x -axis

25. $y = x^3$, $y = 0$, and $x = 1$; about the y -axis

26. $y = x$, $y = 2x$, and $y = 6$; about the y -axis

27. $y = \cos x$ on $[0, \pi/2]$, $y = 0$, and $x = 0$; about the x -axis
(Hint: Recall that $\cos^2 x = \frac{1 + \cos 2x}{2}$.)

28. $y = \sqrt{25 - x^2}$ and $y = 0$; about the x -axis (Verify that your answer agrees with the volume formula for a sphere.)

29. $y = \sin x$ on $[0, \pi]$ and $y = 0$; about the x -axis
(Hint: Recall that $\sin^2 x = \frac{1 - \cos 2x}{2}$.)

30. $y = \sec x$, $y = 0$, $x = 0$, and $x = \pi/4$; about the x -axis

31. $y = 2 + \sqrt{x}$, $y = 2 - \sqrt{x}$, and $x = 4$; about the y -axis

32. $y = \sqrt{\sin x}$, $y = 1$, and $x = 0$; about the x -axis

33. $y = \sin x$ and $y = \sqrt{\sin x}$, for $0 \leq x \leq \pi/2$; about the x -axis

34. $y = |x|$ and $y = 2 - x^2$; about the x -axis
 35. $y = \sqrt{x}$, $y = 0$, and $x = 4$; about the y -axis
 36. $y = 4 - x^2$, $x = 2$, and $y = 4$; about the y -axis
 37. $y = x^{-3/2}$, $y = 1$, $x = 1$, and $x = 6$; about the x -axis
 38. $y = x^2$, $y = 2 - x$, and $y = 0$; about the y -axis
 39. $y = x^{1/3}$, $y = 4 - x^{1/3}$, and $x = 0$; about the y -axis
 40. $y = x^{-1}$, $y = 0$, $x = 1$, and $x = p > 0$; about the x -axis (Is the volume bounded as $p \rightarrow \infty$?)

41–44. Which is greater? For the following regions R , determine which is greater: the volume of the solid generated when R is revolved about the x -axis or about the y -axis.

41. R is bounded by $y = 2x$, the x -axis, and $x = 5$.
 42. R is bounded by $y = 4 - 2x$, the x -axis, and the y -axis.
 43. R is bounded by $y = 1 - x^3$, the x -axis, and the y -axis.
 44. R is bounded by $y = x^2$ and $y = \sqrt{8x}$.

45–55. Revolution about other axes Let R be the region bounded by the following curves. Find the volume of the solid generated when R is revolved about the given line.

45. $y = 1 - \sqrt{x}$, $y = 1$, and $x = 1$; about $y = 1$

46. $y = \sqrt{x} + 2$, $y = 2$, and $x = 1$; about $y = 2$
 47. $x = 2 - \sec y$, $x = 2$, $y = \frac{\pi}{3}$, and $y = 0$; about $x = 2$

48. $y = 1 - \sqrt{x}$, $x = 1$, and $y = 1$; about $x = 1$
 49. $x = 0$, $y = \sqrt{x}$, and $y = 1$; about $y = 1$
 50. $x = 0$, $y = \sqrt{x}$, and $y = 2$; about $x = 4$
 51. $y = 2 \sin x$ and $y = 0$ on $[0, \pi]$; about $y = -2$

52. $y = x^2/4$ and the y -axis on the interval $0 \leq y \leq 1$; about $x = -1$
 53. $y = \sin x$ and $y = 1 - \sin x$ on the interval $\frac{\pi}{6} \leq x \leq \frac{5\pi}{6}$; about $y = -1$
 54. $y = x$ and $y = 1 + \frac{x}{2}$; about $y = 3$
 55. $y = 2 - x$ and $y = 2 - 2x$; about $x = 3$
 56. **Comparing volumes** The region R is bounded by the graph of $f(x) = 2x(2 - x)$ and the x -axis. Which is greater, the volume of the solid generated when R is revolved about the line $y = 2$ or the volume of the solid generated when R is revolved about the line $y = 0$? Use integration to justify your answer.
 57. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 a. A pyramid is a solid of revolution.
 b. The volume of a hemisphere can be computed using the disk method.
 c. Let R_1 be the region bounded by $y = \cos x$ and the x -axis on $[-\pi/2, \pi/2]$. Let R_2 be the region bounded by $y = \sin x$ and the x -axis on $[0, \pi]$. The volumes of the solids generated when R_1 and R_2 are revolved about the x -axis are equal.

Explorations and Challenges

58. Use calculus to find the volume of a tetrahedron (pyramid with four triangular faces), all of whose edges have length 4.
 59. **Fermat's volume calculation (1636)** Let R be the region bounded by the curve $y = \sqrt{x + a}$ (with $a > 0$), the y -axis, and the x -axis. Let S be the solid generated by rotating R about the y -axis. Let T be the inscribed cone that has the same circular base as S and height $\sqrt{a}$. Show that $\frac{\text{volume}(S)}{\text{volume}(T)} = \frac{8}{5}$.
 60. **Solid from a piecewise function** Let

$$f(x) = \begin{cases} x & \text{if } 0 \leq x \leq 2 \\ 2x - 2 & \text{if } 2 < x \leq 5 \\ -2x + 18 & \text{if } 5 < x \leq 6. \end{cases}$$

Find the volume of the solid formed when the region bounded by the graph of f , the x -axis, and the line $x = 6$ is revolved about the x -axis.

- 61. Solids from integrals** Sketch a solid of revolution whose volume by the disk method is given by the following integrals. Indicate the function that generates the solid. Solutions are not unique.

a. $\int_0^{\pi} \pi \sin^2 x \, dx$

b. $\int_0^2 \pi(x^2 + 2x + 1) \, dx$

- 62. Volume of a cup** A 6-inch-tall plastic cup is shaped like a surface obtained by rotating a line segment in the first quadrant about the x -axis. Given that the radius of the base of the cup is 1 inch, the radius of the top of the cup is 2 inches, and the cup is filled to the brim with water, use integration to approximate the volume of the water in the cup.

- 63. Estimating volume** Suppose the region bounded by the curve $y = f(x)$ from $x = 0$ to $x = 4$ (see figure) is revolved about the x -axis to form a solid of revolution. Use left, right, and midpoint Riemann sums, with $n = 4$ subintervals of equal length, to estimate the volume of the solid of revolution.

- 64. Volume of a wooden object** A solid wooden object turned on a lathe has a length of 50 cm and the diameters (measured in cm) shown in the figure. (A lathe is a tool that spins and cuts a block of wood so that it has circular cross sections.) Use left Riemann sums with uniformly spaced grid points to estimate the volume of the object.

- 65. Cylinder, cone, hemisphere** A right circular cylinder with height R and radius R has a volume of $V_C = \pi R^3$ (height = radius).

- Find the volume of the cone that is inscribed in the cylinder with the same base as the cylinder and height R . Express the volume in terms of V_C .
- Find the volume of the hemisphere that is inscribed in the cylinder with the same base as the cylinder. Express the volume in terms of V_C .

- 66. Water in a bowl** A hemispherical bowl of radius 8 inches is filled to a depth of h inches, where $0 \leq h \leq 8$. Find the volume of water in the bowl as a function of h . (Check the special cases $h = 0$ and $h = 8$.)

- 67. A torus (doughnut)** Find the volume of the torus formed when the circle of radius 2 centered at $(3, 0)$ is revolved about the y -axis. Use geometry to evaluate the integral.

- 68. Which is greater?** Let R be the region bounded by $y = x^2$ and $y = \sqrt{x}$. Use integration to determine which is greater: the volume of the solid generated when R is revolved about the x -axis or about the line $y = 1$.

- 69. Cavalieri's principle** Cavalieri's principle states that if two solids with equal altitudes have the same cross-sectional areas at every height, then they have equal volumes (see figure).

- Use the general slicing method to justify Cavalieri's principle.
- Use Cavalieri's principle to find the volume of a circular cylinder of radius r and height h whose axis is at an angle of $\frac{\pi}{4}$ to the base (see figure).

- 70. Limiting volume** Consider the region R in the first quadrant bounded by $y = x^{1/n}$ and $y = x^n$, where $n > 1$ is a positive number.
- Find the volume $V(n)$ of the solid generated when R is revolved about the x -axis. Express your answer in terms of n .
 - Evaluate $\lim_{n \rightarrow \infty} V(n)$. Interpret this limit geometrically.

QUICK CHECK ANSWERS

1. The average value of A on $[a, b]$ is $\bar{A} = \frac{1}{b-a} \int_a^b A(x) dx$.
Therefore, $V = (b-a)\bar{A}$. 2. $A(x) = (2 - 2x^2)^2$

3. (a) A cylinder with height 2 and radius 2; (b) a cone with height 2 and base radius 2. 4. When $g(x) = 0$, the washer method $V = \int_a^b \pi(f(x)^2 - g(x)^2) dx$ reduces to the disk method $V = \int_a^b \pi(f(x)^2) dx$. 5. (a) Inner radius $= x^2 + 1$; (b) outer radius $= \sqrt{x} + 1$. 6. $\int_0^1 \pi(y^{2/3} - y^2) dy$ ◀

► Why another method? Suppose R is the region in the first quadrant bounded by the graph of $y = x^2 - x^3$ and the x -axis (Figure 6.38). When R is revolved about the y -axis, the resulting solid has a volume that is difficult to compute using the washer method. The volume is much easier to compute using the shell method.

Figure 6.38

Figure 6.39

6.4 Volume by Shells

You can solve many challenging volume problems using the disk/washer method. There are, however, some volume problems that are difficult to solve with this method. For this reason, we extend our discussion of volume problems to the *shell method*, which—like the disk/washer method—is used to compute the volume of solids of revolution.

Cylindrical Shells

Let R be a region bounded by the graph of f , the x -axis, and the lines $x = a$ and $x = b$, where $0 \leq a < b$ and $f(x) \geq 0$ on $[a, b]$. When R is revolved about the y -axis, a solid is generated (Figure 6.39) whose volume is computed with the slice-and-sum strategy.

We divide $[a, b]$ into n subintervals of length $\Delta x = (b - a)/n$ and identify an arbitrary point x_k^* on the k th subinterval, for $k = 1, \dots, n$. Now observe the rectangle built on the k th subinterval with a height of $f(x_k^*)$ and a width Δx (Figure 6.40). As it revolves about the y -axis, this rectangle sweeps out a thin *cylindrical shell*.

Figure 6.40

When the k th cylindrical shell is unwrapped (Figure 6.41), it approximates a thin rectangular slab. The approximate length of the slab is the circumference of a circle with radius x_k^* , which is $2\pi x_k^*$. The height of the slab is the height of the original rectangle $f(x_k^*)$ and its thickness is Δx ; therefore, the volume of the k th shell is approximately

$$\underbrace{2\pi x_k^*}_{\text{length}} \cdot \underbrace{f(x_k^*)}_{\text{height}} \cdot \underbrace{\Delta x}_{\text{thickness}} = 2\pi x_k^* f(x_k^*) \Delta x.$$

Summing the volumes of the n cylindrical shells gives an approximation to the volume of the entire solid:

$$V \approx \sum_{k=1}^n 2\pi x_k^* f(x_k^*) \Delta x.$$

Figure 6.41

As n increases and Δx approaches 0 (Figure 6.42), we obtain the exact volume of the solid as a definite integral:

$$V = \lim_{n \rightarrow \infty} \sum_{k=1}^n \underbrace{2\pi}_{\text{circumference}} \underbrace{x_k^*}_{\text{shell radius}} \underbrace{f(x_k^*)}_{\text{shell height}} \underbrace{\Delta x}_{\text{shell thickness}} = \int_a^b 2\pi x f(x) dx.$$

- Rather than memorizing, think of the meaning of the factors in this formula: $f(x)$ is the height of a single cylindrical shell, $2\pi x$ is the circumference of the shell, and dx corresponds to the thickness of a shell. Therefore, $2\pi x f(x) dx$ represents the volume of a single shell, and we sum the volumes from $x = a$ to $x = b$. Notice that the integrand for the shell method is the function $A(x)$ that gives the surface area of the shell of radius x , for $a \leq x \leq b$.

Figure 6.42

Before doing examples, we generalize this method as we did for the disk method. Suppose the region R is bounded by two curves, $y = f(x)$ and $y = g(x)$, where $f(x) \geq g(x)$ on $[a, b]$ (Figure 6.43). What is the volume of the solid generated when R is revolved about the y -axis?

Figure 6.43

The situation is similar to the case we just considered. A typical rectangle in R sweeps out a cylindrical shell, but now the height of the k th shell is $f(x_k^*) - g(x_k^*)$, for $k = 1, \dots, n$. As before, we take the radius of the k th shell to be x_k^* , which means the volume of the k th shell is approximated by $2\pi x_k^* (f(x_k^*) - g(x_k^*)) \Delta x$ (Figure 6.43). Summing the volumes of all the shells gives an approximation to the volume of the entire solid:

$$V \approx \sum_{k=1}^n \underbrace{2\pi x_k^*}_{\text{shell circumference}} \underbrace{(f(x_k^*) - g(x_k^*))}_{\text{shell height}} \Delta x.$$

Taking the limit as $n \rightarrow \infty$ (which implies that $\Delta x \rightarrow 0$), the exact volume is the definite integral

$$V = \lim_{n \rightarrow \infty} \sum_{k=1}^n 2\pi x_k^* (f(x_k^*) - g(x_k^*)) \Delta x = \int_a^b 2\pi x (f(x) - g(x)) dx.$$

We now have the formula for the shell method.

- An analogous formula for the shell method when R is revolved about the x -axis is obtained by reversing the roles of x and y :

$$V = \int_c^d 2\pi y (p(y) - q(y)) dy.$$

We assume R is bounded by the curves $x = p(y)$ and $x = q(y)$ where $p(y) \geq q(y)$ on $[c, d]$.

Volume by the Shell Method

Let f and g be continuous functions with $f(x) \geq g(x)$ on $[a, b]$. If R is the region bounded by the curves $y = f(x)$ and $y = g(x)$ between the lines $x = a$ and $x = b$, the volume of the solid generated when R is revolved about the y -axis is

$$V = \int_a^b \underbrace{2\pi x}_{\text{shell circumference}} \underbrace{(f(x) - g(x))}_{\text{shell height}} dx.$$

Figure 6.44

EXAMPLE 1 A sine bowl Let R be the region bounded by the graph of $f(x) = \sin x^2$, the x -axis, and the vertical line $x = \sqrt{\pi}/2$ (Figure 6.44). Find the volume of the solid generated when R is revolved about the y -axis.

SOLUTION Revolving R about the y -axis produces a bowl-shaped region (Figure 6.45). The radius of a typical cylindrical shell is x and its height is $f(x) = \sin x^2$. Therefore, the volume by the shell method is

$$V = \int_a^b \underbrace{2\pi x}_{\text{shell circumference}} \underbrace{f(x)}_{\text{shell height}} dx = \int_0^{\sqrt{\pi}/2} 2\pi x \sin x^2 dx.$$

Figure 6.45

- When computing volumes using the shell method, it is best to sketch the region R in the xy -plane and draw a slice through the region that generates a typical shell.

QUICK CHECK 1 The triangle bounded by the x -axis, the line $y = 2x$, and the line $x = 1$ is revolved about the y -axis. Give an integral that equals the volume of the resulting solid using the shell method. ◀

Figure 6.46

- In Example 2, we could use the disk/washer method to compute the volume, but notice that this approach requires splitting the region into two subregions. A better approach is to use the shell method and integrate along the y -axis.

Now we make the change of variables $u = x^2$, which means that $du = 2x \, dx$. The lower limit $x = 0$ becomes $u = 0$, and the upper limit $x = \sqrt{\pi/2}$ becomes $u = \pi/2$. The volume of the solid is

$$\begin{aligned} V &= \int_0^{\sqrt{\pi/2}} \underbrace{2\pi x}_{\text{shell circumference}} \underbrace{\sin x^2}_{\text{shell height}} dx = \pi \int_0^{\pi/2} \sin u \, du && u = x^2, du = 2x \, dx \\ &= \pi(-\cos u) \Big|_0^{\pi/2} && \text{Fundamental Theorem} \\ &= \pi(0 - (-1)) = \pi. && \text{Simplify.} \end{aligned}$$

Related Exercises 10, 17 ◀

EXAMPLE 2 Shells about the x -axis Let R be the region in the first quadrant bounded by the graph of $y = \sqrt{x-2}$ and the line $y = 2$. Find the volume of the solid generated when R is revolved about the x -axis.

SOLUTION The revolution is about the x -axis, so the integration in the shell method is with respect to y . A typical shell runs parallel to the x -axis and has radius y , where $0 \leq y \leq 2$; the shells extend from the y -axis to the curve $y = \sqrt{x-2}$ (Figure 6.46). Solving $y = \sqrt{x-2}$ for x , we have $x = y^2 + 2$, which is the height of the shell at the point y (Figure 6.47). Integrating with respect to y , the volume of the solid is

$$V = \int_0^2 \underbrace{2\pi y}_{\text{shell circumference}} \underbrace{(y^2 + 2)}_{\text{shell height}} dy = 2\pi \int_0^2 (y^3 + 2y) dy = 16\pi.$$

Figure 6.47

Related Exercises 13, 21 ◀

EXAMPLE 3 Volume of a drilled sphere A cylindrical hole with radius r is drilled symmetrically through the center of a sphere with radius a , where $0 \leq r \leq a$. What is the volume of the remaining material?

SOLUTION The y -axis is chosen to coincide with the axis of the cylindrical hole. We let R be the region in the xy -plane bounded above by $f(x) = \sqrt{a^2 - x^2}$, the upper half of a circle of radius a , and bounded below by $g(x) = -\sqrt{a^2 - x^2}$, the lower half of a circle of radius a , for $r \leq x \leq a$ (Figure 6.48a). Slices are taken perpendicular to the x -axis from $x = r$ to $x = a$. When a slice is revolved about the y -axis, it sweeps out a cylindrical shell that is concentric with the hole through the sphere (Figure 6.48b). The radius of a

Figure 6.48

typical shell is x and its height is $f(x) - g(x) = 2\sqrt{a^2 - x^2}$. Therefore, the volume of the material that remains in the sphere is

$$\begin{aligned}
 V &= \int_r^a \underbrace{2\pi x}_{\text{circumference}} \underbrace{(2\sqrt{a^2 - x^2})}_{\text{height}} dx \\
 &= -2\pi \int_{a^2 - r^2}^0 \sqrt{u} du \quad u = a^2 - x^2, du = -2x dx \\
 &= 2\pi \left(\frac{2}{3} u^{3/2} \right) \bigg|_0^{a^2 - r^2} \quad \text{Fundamental Theorem} \\
 &= \frac{4\pi}{3} (a^2 - r^2)^{3/2}. \quad \text{Simplify.}
 \end{aligned}$$

It is important to check the result by examining special cases. In the case that $r = a$ (the radius of the hole equals the radius of the sphere), our calculation gives a volume of 0, which is correct. In the case that $r = 0$ (no hole in the sphere), our calculation gives the correct volume of a sphere, $\frac{4}{3}\pi a^3$.

Related Exercises 62–63 ◀

EXAMPLE 4 Revolving about other lines Let R be the region bounded by the curve $y = \sqrt{x}$, the line $y = 1$, and the y -axis (Figure 6.49a).

- Use the shell method to find the volume of the solid generated when R is revolved about the line $x = -\frac{1}{2}$ (Figure 6.49b).
- Use the disk/washer method to find the volume of the solid generated when R is revolved about the line $y = 1$ (Figure 6.49c).

SOLUTION

- Using the shell method, we must imagine taking slices through R parallel to the y -axis. A typical slice through R at a point x , where $0 \leq x \leq 1$, has height $1 - \sqrt{x}$. When that slice is revolved about the line $x = -\frac{1}{2}$, it sweeps out a cylindrical shell with a radius of $x + \frac{1}{2}$ and a height of $1 - \sqrt{x}$ (Figure 6.50). A slight modification of the standard shell method gives the volume of the solid:

$$\begin{aligned}
 \int_0^1 \underbrace{2\pi \left(x + \frac{1}{2} \right)}_{\text{shell circumference}} \underbrace{(1 - \sqrt{x})}_{\text{shell height}} dx &= 2\pi \int_0^1 \left(x - x^{3/2} + \frac{1}{2} - \frac{x^{1/2}}{2} \right) dx \quad \text{Expand integrand.} \\
 &= 2\pi \left(\frac{1}{2}x^2 - \frac{2}{5}x^{5/2} + \frac{1}{2}x - \frac{1}{3}x^{3/2} \right) \bigg|_0^1 = \frac{8\pi}{15}. \quad \text{Evaluate integrand.}
 \end{aligned}$$

Figure 6.49

- If we instead revolved about the y -axis ($x = 0$), the radius of the shell would be x . Because we are revolving about the line $x = -\frac{1}{2}$, the radius of the shell is $x + \frac{1}{2}$.

Figure 6.50

- b. Using the disk/washer method, we take slices through R parallel to the y -axis. Consider a typical slice at a point x , where $0 \leq x \leq 1$. Its length, now measured with respect to the line $y = 1$, is $1 - \sqrt{x}$. When that slice is revolved about the line $y = 1$, it sweeps out a disk of radius $1 - \sqrt{x}$ (Figure 6.51). By the disk/washer method, the volume of the solid is

- The disk/washer method can also be used for part (a), and the shell method can also be used for part (b).

$$\begin{aligned}
 \int_0^1 \underbrace{\pi(1 - \sqrt{x})^2}_{\text{disk radius}} dx &= \pi \int_0^1 (1 - 2\sqrt{x} + x) dx && \text{Expand integrand.} \\
 &= \pi \left(x - \frac{4}{3}x^{3/2} + \frac{1}{2}x^2 \right) \Big|_0^1 && \text{Evaluate integral.} \\
 &= \frac{\pi}{6}.
 \end{aligned}$$

Related Exercises 32–33 ◀

Restoring Order

After working with slices, disks, washers, and shells, you may feel somewhat overwhelmed. How do you choose a method, and which method is best?

Notice that the disk method is just a special case of the washer method. So for solids of revolution, the choice is between the washer method and the shell method. In *principle*, either method can be used. In *practice*, one method usually produces an integral that is easier to evaluate than the other method. The following table summarizes these methods.

SUMMARY Disk/Washer and Shell Methods**Integration with respect to x** 

Disk/washer method about the x -axis
Disks/washers are *perpendicular* to the x -axis.

$$\int_a^b \pi \underbrace{(f(x))^2}_{\text{outer radius}} - \underbrace{(g(x))^2}_{\text{inner radius}} dx$$

Shell method about the y -axis
Shells are *parallel* to the y -axis.

$$\int_a^b 2\pi x \underbrace{(f(x) - g(x))}_{\text{shell height}} dx$$

Integration with respect to y 

Disk/washer method about the y -axis
Disks/washers are *perpendicular* to the y -axis.

$$\int_c^d \pi \underbrace{(p(y))^2}_{\text{outer radius}} - \underbrace{(q(y))^2}_{\text{inner radius}} dy$$

Shell method about the x -axis
Shells are *parallel* to the x -axis.

$$\int_c^d 2\pi y \underbrace{(p(y) - q(y))}_{\text{shell height}} dy$$

Figure 6.52

The following example shows that while two methods may be used on the same problem, one of them may be preferable.

EXAMPLE 5 **Volume by which method?** The region R is bounded by the graphs of $f(x) = 2x - x^2$ and $g(x) = x$ on the interval $[0, 1]$ (Figure 6.52). Use the washer method and the shell method to find the volume of the solid formed when R is revolved about the x -axis.

SOLUTION Solving $f(x) = g(x)$, we find that the curves intersect at the points $(0, 0)$ and $(1, 1)$. Using the washer method, the upper bounding curve is the graph of f , the lower

bounding curve is the graph of g , and a typical washer is perpendicular to the x -axis (Figure 6.53). Therefore, the volume is

$$\begin{aligned}
 V &= \int_0^1 \pi \left(\underbrace{(2x - x^2)^2}_{\text{outer radius}} - \underbrace{x^2}_{\text{inner radius}} \right) dx && \text{Washer method} \\
 &= \pi \int_0^1 (x^4 - 4x^3 + 3x^2) dx && \text{Expand integrand.} \\
 &= \pi \left(\frac{x^5}{5} - x^4 + x^3 \right) \Big|_0^1 = \frac{\pi}{5}. && \text{Evaluate integral.}
 \end{aligned}$$

► To solve $y = 2x - x^2$ for x , write the equation as $x^2 - 2x + y = 0$ and complete the square or use the quadratic formula.

The shell method requires expressing the bounding curves in the form $x = p(y)$ for the right curve and $x = q(y)$ for the left curve. The right curve is $x = y$. Solving $y = 2x - x^2$ for x , we find that $x = 1 - \sqrt{1 - y}$ describes the left curve. A typical shell is parallel to the x -axis (Figure 6.54). Therefore, the volume is

$$V = \int_0^1 \underbrace{2\pi y}_{\text{shell circumference}} \underbrace{(y - (1 - \sqrt{1 - y}))}_{\text{shell height}} dy.$$

This integral equals $\frac{\pi}{5}$, but it is more difficult to evaluate than the integral required by the washer method. In this case, the washer method is preferable. Of course, the shell method may be preferable for other problems.

SECTION 6.4 EXERCISES

Getting Started

- Assume f and g are continuous, with $f(x) \geq g(x) \geq 0$ on $[a, b]$. The region bounded by the graphs of f and g and the lines $x = a$ and $x = b$ is revolved about the y -axis. Write the integral given by the shell method that equals the volume of the resulting solid.
- Fill in the blanks: A region R is revolved about the y -axis. The volume of the resulting solid could (in principle) be found by using the disk/washer method and integrating with respect to _____ or using the shell method and integrating with respect to _____.
- Fill in the blanks: A region R is revolved about the x -axis. The volume of the resulting solid could (in principle) be found by using the disk/washer method and integrating with respect to _____ or using the shell method and integrating with respect to _____.
- Look again at the region R in Figure 6.38 (p. 387). Explain why it would be difficult to use the washer method to find the volume of the solid of revolution that results when R is revolved about the y -axis.

5. Let R be the region in the first quadrant bounded above by the curve $y = 2 - x^2$ and bounded below by the line $y = x$. Suppose the shell method is used to determine the volume of the solid generated by revolving R about the y -axis.
- What is the radius of a cylindrical shell at a point x in $[0, 2]$?
 - What is the height of a cylindrical shell at a point x in $[0, 2]$?
 - Write an integral for the volume of the solid using the shell method.

- 6–8. Let R be the region bounded by the curves $y = 2 - \sqrt{x}$, $y = 2$, and $x = 4$ in the first quadrant.

6. Suppose the shell method is used to determine the volume of the solid generated by revolving R about the x -axis.
- What is the radius of a cylindrical shell at a point y in $[0, 2]$?
 - What is the height of a cylindrical shell at a point y in $[0, 2]$?
 - Write an integral for the volume of the solid using the shell method.
7. Suppose the shell method is used to determine the volume of the solid generated by revolving R about the line $y = 2$.
- What is the radius of a cylindrical shell at a point y in $[0, 2]$?
 - What is the height of a cylindrical shell at a point y in $[0, 2]$?
 - Write an integral for the volume of the solid using the shell method.
8. Suppose the shell method is used to determine the volume of the solid generated by revolving R about the line $x = 4$.
- What is the radius of a cylindrical shell at a point x in $[0, 4]$?
 - What is the height of a cylindrical shell at a point x in $[0, 4]$?
 - Write an integral for the volume of the solid using the shell method.

Practice Exercises

9–30. Shell method Let R be the region bounded by the following curves. Use the shell method to find the volume of the solid generated when R is revolved about indicated axis.

9. $y = x - x^2$ and $y = 0$; about the y -axis

10. $y = (1 + x^2)^{-2}$, $y = 0$, $x = 0$, and $x = 1$; about the y -axis

11. $y = 3x$, $y = 3$, and $x = 0$; about the y -axis (Use integration and check your answer using the volume formula for a cone.)

12. $y = -x^2 + 4x + 2$ and $y = x^2 - 6x + 10$; about the y -axis

13. $y = \sqrt{x}$, $y = 0$, and $x = 4$; about the x -axis

14. $y = \sqrt{x}$, $y = 2 - x$, and $y = 0$; about the x -axis

15. $y = 4 - x$, $y = 2$, and $x = 0$; about the x -axis

16. $x = \frac{1}{2\sqrt{y}}$, $x = \frac{1}{2}$ and $y = \frac{1}{4}$; about the x -axis

17. $y = \cos x^2$ and $y = 0$, for $0 \leq x \leq \sqrt{\pi/2}$; about the y -axis
18. $y = 6 - x$, $y = 0$, $x = 2$, and $x = 4$; about the y -axis
19. $y = 1 - x^2$, $x = 0$, and $y = 0$, in the first quadrant; about the y -axis
20. $y = \sqrt{x}$, $y = 0$, and $x = 1$; about the y -axis
21. $x = y^2$, $x = 0$, and $y = 3$; about the x -axis
22. $y = x^3$, $y = 1$, and $x = 0$; about the x -axis
23. $y = x$, $y = 2 - x$, and $y = 0$; about the x -axis
24. $y = \sqrt{4 - 2x^2}$, $y = 0$, and $x = 0$, in the first quadrant; about the y -axis

25. $y = \frac{1}{(x^2 + 1)^2}$, $y = 0$, $x = 1$, and $x = 2$; about the y -axis

26. $x = y^2$, $x = 4$, and $y = 0$; about the x -axis

27. $y = 2x^{-3/2}$, $y = 2$, $y = 16$, and $x = 0$; about the x -axis

28. $y = (1 - x)^{-1/2}$, $y = 1$, $y = 2$, and $x = 0$; about the y -axis

29. $y = x^3 - x^8 + 1$ and $y = 1$; about the y -axis

30. $y = \sqrt{50 - 2x^2}$, in the first quadrant; about the x -axis

31–34. Shell and washer methods Let R be the region bounded by the following curves. Use both the shell method and the washer method to find the volume of the solid generated when R is revolved about the indicated axis.

31. $y = x$ and $y = x^{1/3}$, in the first quadrant; about the x -axis

32. $y = \frac{1}{x+1}$ and $y = 1 - \frac{x}{3}$; about the x -axis

33. $y = (x - 2)^3 - 2$, $x = 0$, and $y = 25$; about the y -axis

34. $y = 8$, $y = 2x + 2$, $x = 0$, and $x = 2$; about the y -axis

35–40. Shell method about other lines Let R be the region bounded by $y = x^2$, $x = 1$, and $y = 0$. Use the shell method to find the volume of the solid generated when R is revolved about the following lines.

35. $x = -2$

36. $x = 1$

37. $x = 2$

38. $y = 1$

39. $y = -2$

40. $y = 2$

41–44. Shell and washer methods about other lines Use both the shell method and the washer method to find the volume of the solid that is generated when the region in the first quadrant bounded by $y = x^2$, $y = 1$, and $x = 0$ is revolved about the following lines.

41. $y = -2$

42. $x = -1$

43. $y = 6$

44. $x = 2$

45. **Volume of a sphere** Let R be the region bounded by the upper half of the circle $x^2 + y^2 = r^2$ and the x -axis. A sphere of radius r is obtained by revolving R about the x -axis.

a. Use the shell method to verify that the volume of a sphere of radius r is $\frac{4}{3}\pi r^3$.

b. Repeat part (a) using the disk method.

46. **Comparing American and rugby union footballs** An ellipse

centered at the origin is described by the equation $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, where a and b are positive constants. If the upper half of such an ellipse is revolved about the x -axis, the resulting surface is an ellipsoid.

a. Use the washer method to find the volume of an ellipsoid (in terms of a and b). Check your work using the shell method.

b. Both American and rugby union footballs have the shape of ellipsoids. The maximum regulation size of a rugby union football corresponds to parameters of $a = 6$ in and $b = 3.82$ in, and the maximum regulation size of an American football corresponds to parameters of $a = 5.62$ in and $b = 3.38$ in. Find the volume of each football.

c. Fill in the blank: At their maximum regulation sizes, the volume of a rugby union football has approximately _____ times the volume of an American football.

- 47. A torus (doughnut)** A torus is formed when a circle of radius 2 centered at $(3, 0)$ is revolved about the y -axis.
- Use the shell method to write an integral for the volume of the torus.
 - Use the washer method to write an integral for the volume of the torus.
 - Find the volume of the torus by evaluating one of the two integrals obtained in parts (a) and (b). (*Hint:* Both integrals can be evaluated without using the Fundamental Theorem of Calculus.)

- 48. A cone by two methods** Verify that the volume of a right circular cone with a base radius of r and a height of h is $\pi r^2 h/3$. Use the region bounded by the line $y = rx/h$, the x -axis, and the line $x = h$, where the region is rotated around the x -axis. Then (a) use the disk method and integrate with respect to x , and (b) use the shell method and integrate with respect to y .

49–58. Choose your method Let R be the region bounded by the following curves. Use the method of your choice to find the volume of the solid generated when R is revolved about the given axis.

- $y = x - x^4$ and $y = 0$; about the x -axis
 - $y = x - x^4$ and $y = 0$; about the y -axis
 - $y = x^2$ and $y = 2 - x^2$; about the x -axis
 - $y = \sin x$ and $y = 1 - \sin x$, for $\pi/6 \leq x \leq 5\pi/6$; about the x -axis
 - $y = x$, $y = 2x + 2$, $x = 2$, and $x = 6$; about the x -axis
 - $y = x^3$, $y = 0$, and $x = 2$; about the x -axis
 - $y = 4 - x^2$ and $y = 2 - x$, in the first quadrant; about the y -axis
 - $y = 2$, $y = 2x + 2$, and $x = 6$; about the y -axis
 - $y = x^2$, $y = 2 - x$, and $x = 0$, in the first quadrant; about the y -axis
 - $y = \sqrt{x}$, the x -axis, and $x = 4$; about the x -axis
- 59. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- When using the shell method, the axis of the cylindrical shells is parallel to the axis of revolution.
 - If a region is revolved about the y -axis, then the shell method must be used.
 - If a region is revolved about the x -axis, then in principle, it is possible to use the disk/washer method and integrate with respect to x or to use the shell method and integrate with respect to y .

Explorations and Challenges

60–64. Shell method Use the shell method to find the volume of the following solids.

- The solid formed when a hole of radius 2 is drilled symmetrically along the axis of a right circular cylinder of height 6 and radius 4
- A right circular cone of radius 3 and height 8
- The solid formed when a hole of radius 3 is drilled symmetrically through the center of a sphere of radius 6
- The solid formed when a hole of radius 3 is drilled symmetrically along the axis of a right circular cone of radius 6 and height 9
- A hole of radius $r \leq R$ is drilled symmetrically along the axis of a bullet. The bullet is formed by revolving the parabola $y = 6\left(1 - \frac{x^2}{R^2}\right)$ about the y -axis, where $0 \leq x \leq R$.

65. Equal volumes Consider the region R bounded by the curves $y = ax^2 + 1$, $y = 0$, $x = 0$, and $x = 1$, for $a \geq -1$. Let S_1 and S_2 be solids generated when R is revolved about the x - and y -axes, respectively.

- Find V_1 and V_2 , the volumes of S_1 and S_2 , as functions of a .
- What are the values of $a \geq -1$ for which $V_1(a) = V_2(a)$?

- 66. A spherical cap** Consider the cap of thickness h that has been sliced from a sphere of radius r (see figure). Verify that the volume of the cap is $\frac{\pi}{3}h^2(3r - h)$ using (a) the washer method, (b) the shell method, and (c) the general slicing method. Check for consistency among the three methods and check the special cases $h = r$ and $h = 0$.

- 67. Change of variables** Suppose $f(x) > 0$, for all x , and $\int_0^4 f(x) dx = 10$. Let R be the region in the first quadrant bounded by the coordinate axes, $y = f(x^2)$, and $x = 2$. Find the volume of the solid generated by revolving R around the y -axis.
- 68. Equal integrals** Without evaluating integrals, explain the following equalities. (*Hint:* Draw pictures.)
- $\pi \int_0^4 (8 - 2x)^2 dx = 2\pi \int_0^8 y \left(4 - \frac{y}{2}\right) dy$
 - $\int_0^2 (25 - (x^2 + 1)^2) dx = 2 \int_1^5 y \sqrt{y - 1} dy$
- 69. Volumes without calculus** Solve the following problems with and without calculus. A good picture helps.
- A cube with side length r is inscribed in a sphere, which is inscribed in a right circular cone, which is inscribed in a right circular cylinder. The side length (slant height) of the cone is equal to its diameter. What is the volume of the cylinder?

- b. A cube is inscribed in a right circular cone with a radius of 1 and a height of 3. What is the volume of the cube?
- c. A cylindrical hole 10 in long is drilled symmetrically through the center of a sphere. How much material is left in the sphere? (Enough information is given).

70. **Wedge from a tree** Imagine a cylindrical tree of radius a . A wedge is cut from the tree by making two cuts: one in a horizontal plane P perpendicular to the axis of the cylinder, and one that makes an angle θ with P , intersecting P along a diameter of the tree (see figure). What is the volume of the wedge?

71. **Different axes of revolution** Suppose R is the region bounded by $y = f(x)$ and $y = g(x)$ on the interval $[a, b]$, where $f(x) \geq g(x) \geq 0$.

- a. Show that if R is revolved about the horizontal line $y = y_0$ that lies below R , then by the washer method, the volume of the resulting solid is

$$V = \int_a^b \pi ((f(x) - y_0)^2 - (g(x) - y_0)^2) dx.$$

- b. How is this formula changed if the line $y = y_0$ lies above R ?

72. **Different axes of revolution** Suppose R is the region bounded by $y = f(x)$ and $y = g(x)$ on the interval $[a, b]$, where $f(x) \geq g(x)$.

- a. Show that if R is revolved about the vertical line $x = x_0$, where $x_0 < a$, then by the shell method, the volume of the resulting solid is $V = \int_a^b 2\pi(x - x_0)(f(x) - g(x)) dx$.

- b. How is this formula changed if $x_0 > b$?

QUICK CHECK ANSWERS

1. $\int_0^1 2\pi x(2x) dx$ 2. $V = \int_0^1 \pi(36 - (\sqrt{x} + 5)^2) dx$
 3. The shell method is easier. ◀

6.5 Length of Curves

The space station orbits Earth in an elliptical path. How far does it travel in one orbit? A baseball slugger launches a home run into the upper deck and the sportscaster claims it landed 480 feet from home plate. But how far did the ball actually travel along its flight path? These questions deal with the length of trajectories or, more generally, with *arc length*. As you will see, their answers can be found by integration.

There are two common ways to formulate problems about arc length: The curve may be given explicitly in the form $y = f(x)$ or it may be defined *parametrically*. In this section, we deal with the first case. Parametric curves and the associated arc length problem are discussed in Section 12.1.

Arc Length for $y = f(x)$

Suppose a curve is given by $y = f(x)$, where f is a function with a continuous first derivative on the interval $[a, b]$. The goal is to determine how far you would travel if you walked along the curve from $(a, f(a))$ to $(b, f(b))$. This distance is the arc length, which we denote L .

As shown in Figure 6.55, we divide $[a, b]$ into n subintervals of length $\Delta x = (b - a)/n$, where x_k is the right endpoint of the k th subinterval, for $k = 1, \dots, n$.

Figure 6.55

- More generally, we may choose any point in the k th subinterval and Δx may vary from one subinterval to the next. Using right endpoints, as we do here, simplifies the discussion and leads to the same result.

- Notice that Δx is the same for each subinterval, but Δy_k depends on the subinterval.

Joining the corresponding points on the curve by line segments, we obtain a polygonal line with n line segments. If n is large and Δx is small, the length of the polygonal line is a good approximation to the length of the actual curve. The strategy is to find the length of the polygonal line and then let n increase, while Δx goes to zero, to get the exact length of the curve.

Consider the k th subinterval $[x_{k-1}, x_k]$ and the line segment between the points $(x_{k-1}, f(x_{k-1}))$ and $(x_k, f(x_k))$. We let the change in the y -coordinate between these points be

$$\Delta y_k = f(x_k) - f(x_{k-1}).$$

The k th line segment is the hypotenuse of a right triangle with sides of length Δx and $|\Delta y_k| = |f(x_k) - f(x_{k-1})|$. The length of each line segment is

$$\sqrt{(\Delta x)^2 + |\Delta y_k|^2}, \quad \text{for } k = 1, 2, \dots, n.$$

Summing these lengths, we obtain the length of the polygonal line, which approximates the length L of the curve:

$$L \approx \sum_{k=1}^n \sqrt{(\Delta x)^2 + |\Delta y_k|^2}.$$

In previous applications of the integral, we would, at this point, take the limit as $n \rightarrow \infty$ and $\Delta x \rightarrow 0$ to obtain a definite integral. However, because of the presence of the Δy_k term, we must complete one additional step before taking a limit. Notice that the slope of the line segment on the k th subinterval is $\Delta y_k / \Delta x$ (rise over run). By the Mean Value Theorem (see the margin figure and Section 4.2), this slope equals $f'(x_k^*)$ for some point x_k^* on the k th subinterval. Therefore,

$$\begin{aligned} L &\approx \sum_{k=1}^n \sqrt{(\Delta x)^2 + |\Delta y_k|^2} \\ &= \sum_{k=1}^n \sqrt{(\Delta x)^2 \left(1 + \left(\frac{\Delta y_k}{\Delta x} \right)^2 \right)} && \text{Factor out } (\Delta x)^2. \\ &= \sum_{k=1}^n \sqrt{1 + \left(\frac{\Delta y_k}{\Delta x} \right)^2} \Delta x && \text{Bring } \Delta x \text{ out of the square root.} \\ &= \sum_{k=1}^n \sqrt{1 + f'(x_k^*)^2} \Delta x. && \text{Mean Value Theorem} \end{aligned}$$

Now we have a Riemann sum. As n increases and as Δx approaches zero, the sum approaches a definite integral, which is also the exact length of the curve. We have

$$L = \lim_{n \rightarrow \infty} \sum_{k=1}^n \sqrt{1 + f'(x_k^*)^2} \Delta x = \int_a^b \sqrt{1 + f'(x)^2} dx.$$

- Note that $1 + f'(x)^2$ is positive, so the square root in the integrand is defined whenever f' exists. To ensure that $\sqrt{1 + f'(x)^2}$ is integrable on $[a, b]$, we require that f' be continuous.

QUICK CHECK 1 What does the arc length formula give for the length of the line $y = x$ between $x = 0$ and $x = a$, where $a \geq 0$? ◀

DEFINITION Arc Length for $y = f(x)$

Let f have a continuous first derivative on the interval $[a, b]$. The length of the curve from $(a, f(a))$ to $(b, f(b))$ is

$$L = \int_a^b \sqrt{1 + f'(x)^2} dx.$$

Figure 6.56

EXAMPLE 1 Arc length Find the length of the curve $f(x) = x^{3/2}$ between $x = 0$ and $x = 4$ (Figure 6.56).

SOLUTION Notice that $f'(x) = \frac{3}{2}x^{1/2}$, which is continuous on the interval $[0, 4]$. Using the arc length formula, we have

$$\begin{aligned}
 L &= \int_a^b \sqrt{1 + f'(x)^2} \, dx = \int_0^4 \sqrt{1 + \left(\frac{3}{2}x^{1/2}\right)^2} \, dx && \text{Substitute for } f'(x). \\
 &= \int_0^4 \sqrt{1 + \frac{9}{4}x} \, dx && \text{Simplify.} \\
 &= \frac{4}{9} \int_1^{10} \sqrt{u} \, du && u = 1 + \frac{9x}{4}, \, du = \frac{9}{4} \, dx \\
 &= \frac{4}{9} \left(\frac{2}{3} u^{3/2} \right) \Big|_1^{10} && \text{Fundamental Theorem} \\
 &= \frac{8}{27} (10^{3/2} - 1). && \text{Simplify.}
 \end{aligned}$$

The length of the curve is $\frac{8}{27} (10^{3/2} - 1) \approx 9.1$ units.

Related Exercise 11 ◀

Figure 6.57

EXAMPLE 2 Arc length calculation Find the length of the curve $f(x) = x^3 + \frac{1}{12x}$ on the interval $[\frac{1}{2}, 2]$ (Figure 6.57).

SOLUTION We first calculate $f'(x) = 3x^2 - \frac{1}{12x^2}$ and $f'(x)^2 = 9x^4 - \frac{1}{2} + \frac{1}{144x^4}$.

The length of the curve on $[\frac{1}{2}, 2]$ is

$$\begin{aligned}
 L &= \int_{1/2}^2 \sqrt{1 + f'(x)^2} \, dx = \int_{1/2}^2 \sqrt{1 + \left(9x^4 - \frac{1}{2} + \frac{1}{144x^4}\right)} \, dx && \text{Substitute.} \\
 &= \int_{1/2}^2 \sqrt{\left(3x^2 + \frac{1}{12x^2}\right)^2} \, dx && \text{Factor.} \\
 &= \int_{1/2}^2 \left(3x^2 + \frac{1}{12x^2}\right) \, dx && \text{Simplify.} \\
 &= \left(x^3 - \frac{1}{12x}\right) \Big|_{1/2}^2 = 8. && \text{Evaluate the integral.}
 \end{aligned}$$

Related Exercise 10 ◀

EXAMPLE 3 Looking ahead Consider the segment of the parabola $f(x) = x^2$ on the interval $[0, 2]$.

- Write the integral for the length of the curve.
- Use a calculator to evaluate the integral.

SOLUTION

- Noting that $f'(x) = 2x$, the arc length integral is

$$\int_0^2 \sqrt{1 + f'(x)^2} \, dx = \int_0^2 \sqrt{1 + 4x^2} \, dx.$$

- Using integration techniques presented so far, this integral cannot be evaluated (the required method is given in Section 8.4). This is typical of arc length integrals—even simple functions can lead to arc length integrals that are difficult to evaluate analytically. Without an analytical method, we may use numerical integration to *approximate*

► When relying on technology, it is a good idea to check whether an answer is plausible. In Example 3, we found that the arc length of $y = x^2$ on $[0, 2]$ is approximately 4.647. The straight-line distance between $(0, 0)$ and $(2, 4)$ is $\sqrt{20} \approx 4.472$, so our answer is reasonable.

the value of a definite integral (Section 8.8). Many calculators have built-in functions for this purpose. For this integral, the approximate arc length is

$$\int_0^2 \sqrt{1 + 4x^2} \, dx \approx 4.647.$$

Related Exercises 21, 24 ◀

Arc Length for $x = g(y)$

Sometimes it is advantageous to describe a curve as a function of y —that is, $x = g(y)$. The arc length formula in this case is derived exactly as in the case of $y = f(x)$, switching the roles of x and y . The result is the following arc length formula.

QUICK CHECK 2 What does the arc length formula give for the length of the line $x = y$ between $y = c$ and $y = d$, where $d \geq c$? Is the result consistent with the result given by the Pythagorean theorem? ◀

DEFINITION Arc Length for $x = g(y)$

Let $x = g(y)$ have a continuous first derivative on the interval $[c, d]$. The length of the curve from $(g(c), c)$ to $(g(d), d)$ is

$$L = \int_c^d \sqrt{1 + g'(y)^2} \, dy.$$

Figure 6.58

EXAMPLE 4 Arc length Find the length of the curve $y = f(x) = x^{2/3}$ between $x = 0$ and $x = 8$ (Figure 6.58).

SOLUTION The derivative of $f(x) = x^{2/3}$ is $f'(x) = \frac{2}{3}x^{-1/3}$, which is undefined at $x = 0$. Therefore, the arc length formula with respect to x cannot be used, yet the curve certainly appears to have a well-defined length.

The key is to describe the curve with y as the independent variable. Solving $y = x^{2/3}$ for x , we have $x = g(y) = \pm y^{3/2}$. Notice that when $x = 8$, $y = 8^{2/3} = 4$, which says that we should use the positive branch of $\pm y^{3/2}$. Therefore, finding the length of the curve $y = f(x) = x^{2/3}$ from $x = 0$ to $x = 8$ is equivalent to finding the length of the curve $x = g(y) = y^{3/2}$ from $y = 0$ to $y = 4$. This is precisely the problem solved in Example 1. The arc length is $\frac{8}{27}(10^{3/2} - 1) \approx 9.1$ units.

Related Exercises 18–19 ◀

QUICK CHECK 3 Write the integral for the length of the curve $x = \sin y$ on the interval $0 \leq y \leq \pi$. ◀

SECTION 6.5 EXERCISES

Getting Started

1. Explain the steps required to find the length of a curve $y = f(x)$ between $x = a$ and $x = b$.
2. Explain the steps required to find the length of a curve $x = g(y)$ between $y = c$ and $y = d$.

3–6. Setting up arc length integrals Write and simplify, but do not evaluate, an integral with respect to x that gives the length of the following curves on the given interval.

3. $y = x^3 + 2$ on $[-2, 5]$ 4. $y = 2 \cos 3x$ on $[-\pi, \pi]$

5. $y = \frac{1}{x^2}$ on $[1, 2]$ 6. $y = \sin \pi x$ on $[0, 1]$

7. Find the arc length of the line $y = 2x + 1$ on $[1, 5]$ using calculus and verify your answer using geometry.

8. Find the arc length of the line $y = 4 - 3x$ on $[-3, 2]$ using calculus and verify your answer using geometry.

Practice Exercises

9–20. Arc length calculations Find the arc length of the following curves on the given interval.

9. $y = -8x - 3$ on $[-2, 6]$ (Use calculus.)

10. $y = \frac{x^3}{3} + \frac{1}{4x}$ on $[1, 5]$ 11. $y = \frac{x^{3/2}}{3}$ on $[0, 60]$

12. $y = \frac{3}{10}x^{1/3} - \frac{3}{2}x^{5/3}$ on $[1, 3]$

13. $y = \frac{(x^2 + 2)^{3/2}}{3}$ on $[0, 1]$ 14. $y = \frac{x^{3/2}}{3} - x^{1/2}$ on $[4, 16]$

15. $y = \frac{x^4}{4} + \frac{1}{8x^2}$ on $[1, 2]$ 16. $y = \frac{2}{3}x^{3/2} - \frac{1}{2}x^{1/2}$ on $[1, 9]$

17. $x = \frac{(y^2 - 2)^{3/2}}{3}$, for $3 \leq y \leq 6$

18. $x = \frac{9}{4}y^{2/3} - \frac{1}{8}y^{4/3}$, for $1 \leq y \leq 2$

19. $x = 2y - 4$, for $-3 \leq y \leq 4$ (Use calculus, but check your work using geometry.)

20. $x = \frac{y^5}{5} + \frac{1}{12y^3}$, for $2 \leq y \leq 4$

21–30. Arc length by calculator

- a. Write and simplify the integral that gives the arc length of the following curves on the given interval.
b. If necessary, use technology to evaluate or approximate the integral.

21. $y = x^2$, for $-1 \leq x \leq 1$ 22. $y = \sin x$, for $0 \leq x \leq \pi$

23. $y = \tan x$, for $0 \leq x \leq \pi/4$ 24. $y = \frac{x^3}{3}$, for $-1 \leq x \leq 1$

25. $x = \sqrt{y - 2}$, for $3 \leq y \leq 4$

26. $y = \frac{8}{x^2}$, for $1 \leq x \leq 4$

27. $y = \cos 2x$, for $0 \leq x \leq \pi$

28. $y = 4x - x^2$, for $0 \leq x \leq 4$

29. $y = \frac{1}{x}$, for $1 \leq x \leq 10$

30. $x = \frac{1}{y^2 + 1}$, for $-5 \leq y \leq 5$

- 31. Golden Gate cables** The profile of the cables on a suspension bridge may be modeled by a parabola. The central span of the Golden Gate Bridge (see figure) is 1280 m long and 152 m high. The parabola $y = 0.00037x^2$ gives a good fit to the shape of the cables, where $|x| \leq 640$, and x and y are measured in meters. Approximate the length of the cables that stretch between the tops of the two towers.

- 32. Gateway Arch** The shape of the Gateway Arch in St. Louis (with a height and a base length of 630 ft) is modeled by the function $y = 630\left(1 - \left(\frac{x}{315}\right)^2\right)$, where $|x| \leq 315$, and x and y are measured in feet (see figure). Estimate the length of the Gateway Arch.

- 33. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- a. $\int_a^b \sqrt{1 + f'(x)^2} dx = \int_a^b (1 + f'(x)) dx$
b. Assuming f' is continuous on the interval $[a, b]$, the length of the curve $y = f(x)$ on $[a, b]$ is the area under the curve $y = \sqrt{1 + f'(x)^2}$ on $[a, b]$.
c. Arc length may be negative if $f(x) < 0$ on part of the interval in question.

- 34. Arc length for a line** Consider the segment of the line $y = mx + c$ on the interval $[a, b]$. Use the arc length formula to show that the length of the line segment is $(b - a)\sqrt{1 + m^2}$. Verify this result by computing the length of the line segment using the distance formula.

- 35. Functions from arc length** What differentiable functions have an arc length on the interval $[a, b]$ given by the following integrals? Note that the answers are not unique. Give a family of functions that satisfy the conditions.

a. $\int_a^b \sqrt{1 + 16x^4} dx$ b. $\int_a^b \sqrt{1 + 36 \cos^2 2x} dx$

- 36. Function from arc length** Find a curve that passes through the point $(1, 5)$ and has an arc length on the interval $[2, 6]$ given by $\int_2^6 \sqrt{1 + 16x^{-6}} dx$.

- 37. Cosine vs. parabola** Which curve has the greater length on the interval $[-1, 1]$, $y = 1 - x^2$ or $y = \cos \frac{\pi x}{2}$?

- 38. Function defined as an integral** Write the integral that gives the length of the curve $y = f(x) = \int_0^x \sin t dt$ on the interval $[0, \pi]$.

Explorations and Challenges

- 39. Lengths of related curves** Suppose the graph of f on the interval $[a, b]$ has length L , where f' is continuous on $[a, b]$. Evaluate the following integrals in terms of L .

a. $\int_{a/2}^{b/2} \sqrt{1 + f'(2x)^2} dx$

b. $\int_{a/c}^{b/c} \sqrt{1 + f'(cx)^2} dx$ if $c \neq 0$

40. Lengths of symmetric curves Suppose a curve is described by $y = f(x)$ on the interval $[-b, b]$, where f' is continuous on $[-b, b]$. Show that if f is odd or f is even, then the length of the curve $y = f(x)$ from $x = -b$ to $x = b$ is twice the length of the curve from $x = 0$ to $x = b$. Use a geometric argument and prove it using integration.

41. A family of algebraic functions

a. Show that the arc length integral for the function

$$f(x) = ax^n + \frac{1}{4an(n-2)x^{n-2}}, \text{ where } a \text{ and } n \text{ are positive}$$

real numbers with $n \neq 2$, may be integrated using methods you already know.

b. Verify that the arc length of the curve $y = f(x)$ on the interval $[1, 2]$ is

$$a(2^n - 1) + \frac{1 - 2^{2-n}}{4an(n-2)}.$$

42. Bernoulli's "parabolas" Johann Bernoulli (1667–1748) evaluated the arc length of curves of the form $y = x^{(2n+1)/2n}$, where n is a positive integer, on the interval $[0, a]$.

a. Write the arc length integral.

b. Make the change of variables $u^2 = 1 + \left(\frac{2n+1}{2n}\right)^2 x^{1/n}$ to obtain a new integral with respect to u .

c. Use the Binomial Theorem to expand this integrand and evaluate the integral.

d. The case $n = 1$ ($y = x^{3/2}$) was done in Example 1. With $a = 1$, compute the arc length in the cases $n = 2$ and $n = 3$. Does the arc length increase or decrease with n ?

e. Graph the arc length of the curves for $a = 1$ as a function of (treat n as a real number when graphing).

QUICK CHECK ANSWERS

1. $\sqrt{2}a$ (the length of the line segment joining the points)

2. $\sqrt{2}(d - c)$ (the length of the line segment joining the points)

3. $L = \int_0^\pi \sqrt{1 + \cos^2 y} dy$ ◀

6.6 Surface Area

In Sections 6.3 and 6.4, we introduced solids of revolution and presented methods for computing the volume of such solids. We now consider a related problem: computing the *area* of the surface of a solid of revolution. Surface area calculations are important in aerodynamics (computing the lift on an airplane wing) and biology (computing transport rates across cell membranes), to name just two applications. Here is an interesting observation: A surface area problem is “between” a volume problem (which is three-dimensional) and an arc length problem (which is one-dimensional). For this reason, you will see ideas that appear in both volume and arc length calculations as we develop the surface area integral.

Some Preliminary Calculations

Consider a curve $y = f(x)$ on an interval $[a, b]$, where f is a nonnegative function with a continuous first derivative on $[a, b]$. Now imagine revolving the curve about the x -axis to generate a *surface of revolution* (Figure 6.59). Our objective is to find the area of this surface.

Figure 6.59

Before tackling this problem, we consider a preliminary problem upon which we build a general surface area formula. First consider the graph of $f(x) = rx/h$ on the interval $[0, h]$, where $h > 0$ and $r > 0$. When this line segment is revolved about the x -axis, it generates the surface of a cone of radius r and height h (Figure 6.60). A formula from geometry states that the surface area of a right circular cone of radius r and height h (excluding the base) is $\pi r \sqrt{r^2 + h^2} = \pi r \ell$, where ℓ is the slant height of the cone (the length of the slanted “edge” of the cone).

- One way to derive the formula for the surface area of a cone (not including the base) is to cut the cone on a line from its base to its vertex. When the cone is unfolded, it forms a sector of a circular disk of radius ℓ with a curved edge of length $2\pi r$. This sector is a fraction $\frac{2\pi r}{2\pi \ell} = \frac{r}{\ell}$ of a full circular disk of radius ℓ . So the area of the sector, which is also the surface area of the cone, is $\pi \ell^2 \cdot \frac{r}{\ell} = \pi r \ell$.

Figure 6.60

With this result, we can solve a preliminary problem that will be useful. Consider the linear function $f(x) = cx$ on the interval $[a, b]$, where $0 < a < b$ and $c > 0$. When this line segment is revolved about the x -axis, it generates a *frustum of a cone* (a cone whose top has been sliced off). The goal is to find S , the surface area of the frustum. Figure 6.61 shows that S is the difference between the surface area S_b of the cone that extends over the interval $[0, b]$ and the surface area S_a of the cone that extends over the interval $[0, a]$.

QUICK CHECK 1 Which is greater, the surface area of a cone of height 10 and radius 20 or the surface area of a cone of height 20 and radius 10 (excluding the bases)? ◀

- Surface area of frustum:
 $S = \pi(f(b) + f(a))\ell$
 $= \pi(r_2 + r_1)\ell$

Figure 6.61

Notice that the radius of the cone on $[0, b]$ is $r = f(b) = cb$, and its height is $h = b$. Therefore, this cone has surface area

$$S_b = \pi r \sqrt{r^2 + h^2} = \pi(bc) \sqrt{(bc)^2 + b^2} = \pi b^2 c \sqrt{c^2 + 1}.$$

Similarly, the cone on $[0, a]$ has radius $r = f(a) = ca$ and height $h = a$, so its surface area is

$$S_a = \pi(ac) \sqrt{(ac)^2 + a^2} = \pi a^2 c \sqrt{c^2 + 1}.$$

The difference of the surface areas $S_b - S_a$ is the surface area S of the frustum on $[a, b]$:

$$\begin{aligned} S &= S_b - S_a = \pi b^2 c \sqrt{c^2 + 1} - \pi a^2 c \sqrt{c^2 + 1} \\ &= \pi c(b^2 - a^2) \sqrt{c^2 + 1}. \end{aligned}$$

A slightly different form of this surface area formula will be useful. Observe that the line segment from $(a, f(a))$ to $(b, f(b))$ (which is the slant height of the frustum in Figure 6.61) has length

$$\ell = \sqrt{(b-a)^2 + (bc-ac)^2} = (b-a) \sqrt{c^2 + 1}.$$

Therefore, the surface area of the frustum can also be written

$$\begin{aligned} S &= \pi c(b^2 - a^2) \sqrt{c^2 + 1} \\ &= \pi c(b+a)(b-a) \sqrt{c^2 + 1} && \text{Factor } b^2 - a^2. \\ &= \pi(\underbrace{cb}_{f(b)} + \underbrace{ca}_{f(a)})(b-a) \sqrt{c^2 + 1} && \text{Expand } c(b+a). \\ &= \pi(f(b) + f(a))\ell. \end{aligned}$$

QUICK CHECK 2 What is the surface area of the frustum of a cone generated when the graph of $f(x) = 3x$ on the interval $[2, 5]$ is revolved about the x -axis? ◀

This result can be generalized to *any* linear function $g(x) = cx + d$ that is positive on the interval $[a, b]$. That is, the surface area of the frustum generated by revolving the line segment between $(a, g(a))$ and $(b, g(b))$ about the x -axis is given by $\pi(g(b) + g(a))\ell$ (Exercise 38).

Surface Area Formula

With the surface area formula for a frustum of a cone, we now derive a general area formula for a surface of revolution. We assume f is a nonnegative function with a continuous first derivative on $[a, b]$. The surface is generated by revolving the graph of f on the interval $[a, b]$ about the x -axis. We begin by subdividing the interval $[a, b]$ into n subintervals of equal length $\Delta x = \frac{b-a}{n}$. The grid points in this partition are

$$x_0 = a, x_1, x_2, \dots, x_{n-1}, x_n = b.$$

Now consider the k th subinterval $[x_{k-1}, x_k]$ and the line segment between the points $(x_{k-1}, f(x_{k-1}))$ and $(x_k, f(x_k))$ (Figure 6.62). We let the change in the y -coordinates between these points be $\Delta y_k = f(x_k) - f(x_{k-1})$.

Figure 6.62

Figure 6.63

When this line segment is revolved about the x -axis, it generates a frustum of a cone (Figure 6.63). The slant height of this frustum is the length of the hypotenuse of a right triangle whose sides have lengths Δx and $|\Delta y_k|$. Therefore, the slant height of the k th frustum is

$$\sqrt{(\Delta x)^2 + |\Delta y_k|^2} = \sqrt{(\Delta x)^2 + (\Delta y_k)^2}$$

and its surface area is

$$S_k = \pi(f(x_k) + f(x_{k-1}))\sqrt{(\Delta x)^2 + (\Delta y_k)^2}.$$

It follows that the area S of the entire surface of revolution is approximately the sum of the surface areas of the individual frustums S_k , for $k = 1, \dots, n$; that is,

$$S \approx \sum_{k=1}^n S_k = \sum_{k=1}^n \pi(f(x_k) + f(x_{k-1}))\sqrt{(\Delta x)^2 + (\Delta y_k)^2}.$$

We would like to identify this sum as a Riemann sum. However, one more step is required to put it in the correct form. We apply the Mean Value Theorem on the k th subinterval $[x_{k-1}, x_k]$ and observe that

$$\frac{f(x_k) - f(x_{k-1})}{\Delta x} = f'(x_k^*),$$

for some number x_k^* in the interval (x_{k-1}, x_k) , for $k = 1, \dots, n$. It follows that $\Delta y_k = f(x_k) - f(x_{k-1}) = f'(x_k^*)\Delta x$.

► Notice that f is assumed to be differentiable on $[a, b]$; therefore, it satisfies the conditions of the Mean Value Theorem. Recall that a similar argument was used to derive the arc length formula in Section 6.5.

We now replace Δy_k with $f'(x_k^*)\Delta x$ in the expression for the approximate surface area. The result is

$$\begin{aligned} S &\approx \sum_{k=1}^n S_k = \sum_{k=1}^n \pi(f(x_k) + f(x_{k-1}))\sqrt{(\Delta x)^2 + (\Delta y_k)^2} \\ &= \sum_{k=1}^n \pi(f(x_k) + f(x_{k-1}))\sqrt{(\Delta x)^2(1 + f'(x_k^*)^2)} && \text{Mean Value Theorem} \\ &= \sum_{k=1}^n \pi(f(x_k) + f(x_{k-1}))\sqrt{1 + f'(x_k^*)^2} \Delta x. && \text{Factor out } \Delta x. \end{aligned}$$

When Δx is small, we have $x_{k-1} \approx x_k \approx x_k^*$, and by the continuity of f , it follows that $f(x_{k-1}) \approx f(x_k) \approx f(x_k^*)$, for $k = 1, \dots, n$. These observations allow us to write

$$\begin{aligned} S &\approx \sum_{k=1}^n \pi(f(x_k^*) + f(x_k^*))\sqrt{1 + f'(x_k^*)^2} \Delta x \\ &= \sum_{k=1}^n 2\pi f(x_k^*)\sqrt{1 + f'(x_k^*)^2} \Delta x. \end{aligned}$$

This approximation to S , which has the form of a Riemann sum, improves as the number of subintervals increases and as the length of the subintervals approaches 0. Specifically, as $n \rightarrow \infty$ and as $\Delta x \rightarrow 0$, we obtain an integral for the surface area:

$$\begin{aligned} S &= \lim_{n \rightarrow \infty} \sum_{k=1}^n 2\pi f(x_k^*)\sqrt{1 + f'(x_k^*)^2} \Delta x \\ &= \int_a^b 2\pi f(x)\sqrt{1 + f'(x)^2} dx. \end{aligned}$$

QUICK CHECK 3 Let $f(x) = c$, where $c > 0$. What surface is generated when the graph of f on $[a, b]$ is revolved about the x -axis? Without using calculus, what is the area of the surface? ◀

DEFINITION Area of a Surface of Revolution

Let f be a nonnegative function with a continuous first derivative on the interval $[a, b]$. The area of the surface generated when the graph of f on the interval $[a, b]$ is revolved about the x -axis is

$$S = \int_a^b 2\pi f(x)\sqrt{1 + f'(x)^2} dx.$$

Figure 6.64

EXAMPLE 1 Using the surface area formula The graph of $f(x) = 2\sqrt{x}$ on the interval $[1, 3]$ is revolved about the x -axis. What is the area of the surface generated (Figure 6.64)?

SOLUTION Noting that $f'(x) = \frac{1}{\sqrt{x}}$, the surface area formula gives

$$\begin{aligned} S &= \int_a^b 2\pi f(x)\sqrt{1 + f'(x)^2} dx \\ &= 2\pi \int_1^3 2\sqrt{x}\sqrt{1 + \frac{1}{x}} dx && \text{Substitute for } f \text{ and } f'. \\ &= 4\pi \int_1^3 \sqrt{x+1} dx && \text{Simplify.} \\ &= \frac{8\pi}{3} (x+1)^{3/2} \Big|_1^3 = \frac{16\pi}{3} (4 - \sqrt{2}). && \text{Integrate and simplify.} \end{aligned}$$

Related Exercise 9 ◀

EXAMPLE 2 Surface area of a spherical zone A spherical zone is produced when a sphere of radius a is sliced by two parallel planes. In this example, we compute the surface area of the spherical zone that results when the first plane is oriented vertically and cuts the sphere in half while the second plane lies h units to the right, where $0 \leq h < a$

(Figure 6.65a). Show that the area of this spherical zone of width h cut from a sphere of radius a is $2\pi ah$, and use the result to show that the surface area of the sphere is $4\pi a^2$.

Figure 6.65

SOLUTION To generate the spherical zone, we revolve the curve $f(x) = \sqrt{a^2 - x^2}$ on the interval $[0, h]$ about the x -axis (Figure 6.65b). Noting that $f'(x) = -x(a^2 - x^2)^{-1/2}$, the surface area of the spherical zone of width h is

$$\begin{aligned}
 S &= \int_a^b 2\pi f(x) \sqrt{1 + f'(x)^2} \, dx \\
 &= 2\pi \int_0^h \sqrt{a^2 - x^2} \sqrt{1 + (-x(a^2 - x^2)^{-1/2})^2} \, dx && \text{Substitute for } f \text{ and } f'. \\
 &= 2\pi \int_0^h \sqrt{a^2 - x^2} \sqrt{\frac{a^2}{a^2 - x^2}} \, dx && \text{Simplify.} \\
 &= 2\pi \int_0^h a \, dx = 2\pi ah. && \text{Simplify and integrate.}
 \end{aligned}$$

To find the surface area of the entire sphere, it is tempting to integrate over the interval $[-a, a]$. However, f is not differentiable at $\pm a$, so we cannot use the surface area formula on p. 407. Instead, we use the formula for the area of the spherical zone and let h approach a from the left to find the area of the associated hemisphere:

$$\begin{aligned}
 \text{Area of zone} &= 2\pi ah, \text{ so} \\
 \text{Area of hemisphere} &= \lim_{h \rightarrow a^-} 2\pi ah = 2\pi a^2.
 \end{aligned}$$

Therefore, the surface area of a sphere of radius a is $2(2\pi a^2) = 4\pi a^2$.

Related Exercise 13 ◀

EXAMPLE 3 Painting a funnel The curved surface of a funnel is generated by revolving the graph of $y = f(x) = x^3 + \frac{1}{12x}$ on the interval $[1, 2]$ about the x -axis (Figure 6.66).

Approximately what volume of paint is needed to cover the outside of the funnel with a layer of paint 0.05 cm thick? Assume x and y are measured in centimeters.

SOLUTION Note that $f'(x) = 3x^2 - \frac{1}{12x^2}$. Therefore, the surface area of the funnel in cm^2 is

$$\begin{aligned}
 S &= \int_a^b 2\pi f(x) \sqrt{1 + f'(x)^2} \, dx \\
 &= 2\pi \int_1^2 \left(x^3 + \frac{1}{12x}\right) \sqrt{1 + \left(3x^2 - \frac{1}{12x^2}\right)^2} \, dx && \text{Substitute for } f \text{ and } f'. \\
 &= 2\pi \int_1^2 \left(x^3 + \frac{1}{12x}\right) \sqrt{\left(3x^2 + \frac{1}{12x^2}\right)^2} \, dx && \text{Expand and factor under square root.} \\
 &= 2\pi \int_1^2 \left(x^3 + \frac{1}{12x}\right) \left(3x^2 + \frac{1}{12x^2}\right) \, dx && \text{Simplify.} \\
 &= \frac{12,289}{192} \pi. && \text{Evaluate integral.}
 \end{aligned}$$

Figure 6.66

Because the paint layer is 0.05 cm thick, the volume of paint needed is approximately

$$\left(\frac{12,289\pi}{192} \text{ cm}^2\right)(0.05 \text{ cm}) \approx 10.1 \text{ cm}^3.$$

Related Exercises 21–22 ◀

The derivation that led to the surface area integral may be used when a curve is revolved about the y -axis (rather than the x -axis). The result is the same integral, where x is replaced with y . For example, if the curve $x = g(y)$ on the interval $[c, d]$ is revolved about the y -axis, the area of the surface generated is

$$S = \int_c^d 2\pi g(y) \sqrt{1 + g'(y)^2} dy.$$

To use this integral, we must first describe the given curve as a differentiable function of y .

EXAMPLE 4 Change of perspective Consider the curve defined by the equation $4y^3 - 10x\sqrt{y} + 5 = 0$, for $1 \leq y \leq 2$. Find the area of the surface generated when this curve is revolved about the y -axis (Figure 6.67).

SOLUTION We solve the equation $4y^3 - 10x\sqrt{y} + 5 = 0$ for x so that the curve is expressed as a function of y :

$$\begin{aligned} 4y^3 - 10x\sqrt{y} + 5 &= 0 \\ 10x\sqrt{y} &= 4y^3 + 5 && \text{Rearrange terms.} \\ x = g(y) &= \frac{2}{5}y^{5/2} + \frac{1}{2}y^{-1/2}. && \text{Divide by } 10\sqrt{y}. \end{aligned}$$

Note that $g'(y) = y^{3/2} - \frac{1}{4}y^{-3/2}$ and that the interval of integration on the y -axis is $[1, 2]$. The area of the surface is

$$\begin{aligned} S &= \int_c^d 2\pi g(y) \sqrt{1 + g'(y)^2} dy \\ &= 2\pi \int_1^2 \left(\frac{2}{5}y^{5/2} + \frac{1}{2}y^{-1/2} \right) \sqrt{1 + \left(y^{3/2} - \frac{1}{4}y^{-3/2} \right)^2} dy && \text{Substitute for } g \text{ and } g'. \\ &= 2\pi \int_1^2 \left(\frac{2}{5}y^{5/2} + \frac{1}{2}y^{-1/2} \right) \sqrt{\left(y^{3/2} + \frac{1}{4}y^{-3/2} \right)^2} dy && \text{Expand and factor.} \\ &= 2\pi \int_1^2 \left(\frac{2}{5}y^4 + \frac{3}{5}y + \frac{1}{8}y^{-2} \right) dy && \text{Simplify.} \\ &= 2\pi \left(\frac{2}{25}y^5 + \frac{3}{10}y^2 - \frac{1}{8y} \right) \Big|_1^2 = \frac{1377}{200}\pi. && \text{Integrate and evaluate.} \end{aligned}$$

SECTION 6.6 EXERCISES

Getting Started

- What is the area of the curved surface of a right circular cone of radius 3 and height 4?
- A frustum of a cone is generated by revolving the graph of $y = 4x$ on the interval $[2, 6]$ about the x -axis. What is the area of the surface of the frustum?
- Assume f is a nonnegative function with a continuous first derivative on $[a, b]$. The curve $y = f(x)$ on $[a, b]$ is revolved about the x -axis. Explain how to find the area of the surface that is generated.
- Assume g is a nonnegative function with a continuous first derivative on $[c, d]$. The curve $x = g(y)$ on $[c, d]$ is revolved about the y -axis. Explain how to find the area of the surface that is generated.
- A surface is generated by revolving the line $f(x) = 2 - x$, for $0 \leq x \leq 2$, about the x -axis. Find the area of the resulting surface in the following ways.
 - Using calculus
 - Using geometry, after first determining the shape and dimensions of the surface

6. A surface is generated by revolving the line $x = 3$, for $0 \leq y \leq 8$, about the y -axis. Find the area of the resulting surface in the following ways.
- Using calculus with $g(y) = 3$
 - Using geometry, after first determining the shape and dimensions of the surface

Practice Exercises

7–20. Computing surface areas Find the area of the surface generated when the given curve is revolved about the given axis.

- $y = 3x + 4$, for $0 \leq x \leq 6$; about the x -axis
- $y = 12 - 3x$, for $1 \leq x \leq 3$; about the x -axis
- $y = 8\sqrt{x}$, for $9 \leq x \leq 20$; about the x -axis
- $y = x^3$, for $0 \leq x \leq 1$; about the x -axis
- $y = (3x)^{1/3}$, for $0 \leq x \leq \frac{8}{3}$; about the y -axis
- $y = \frac{x^2}{4}$, for $2 \leq x \leq 4$; about the y -axis
- $y = \sqrt{1 - x^2}$, for $-\frac{1}{2} \leq x \leq \frac{1}{2}$; about the x -axis
- $x = \sqrt{-y^2 + 6y - 8}$, for $3 \leq y \leq \frac{7}{2}$; about the y -axis
- $y = 4x - 1$, for $1 \leq x \leq 4$; about the y -axis (*Hint: Integrate with respect to y .*)
- $y = \sqrt{4x + 6}$, for $0 \leq x \leq 5$; about the x -axis
- $y = \sqrt{-x^2 + 6x - 5}$, for $2 \leq x \leq 3$; about the x -axis
- $y = \sqrt{5x - x^2}$, for $1 \leq x \leq 4$; about the x -axis
- $x = \sqrt{12y - y^2}$, for $2 \leq y \leq 10$; about the y -axis
- $y = 1 + \sqrt{1 - x^2}$ between the points $(1, 1)$ and $(\frac{\sqrt{3}}{2}, \frac{3}{2})$; about the y -axis

21–22. Painting surfaces A 1.5-mm layer of paint is applied to one side of the following surfaces. Find the approximate volume of paint needed. Assume x and y are measured in meters.

- The spherical zone generated when the curve $y = \sqrt{8x - x^2}$ on the interval $1 \leq x \leq 7$ is revolved about the x -axis
- The spherical zone generated when the upper portion of the circle $x^2 + y^2 = 100$ on the interval $-8 \leq x \leq 8$ is revolved about the x -axis
- Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - If the curve $y = f(x)$ on the interval $[a, b]$ is revolved about the y -axis, the area of the surface generated is

$$\int_{f(a)}^{f(b)} 2\pi f(y) \sqrt{1 + f'(y)^2} dy.$$
 - If f is not one-to-one on the interval $[a, b]$, then the area of the surface generated when the graph of f on $[a, b]$ is revolved about the x -axis is not defined.
 - Let $f(x) = 12x^2$. The area of the surface generated when the graph of f on $[-4, 4]$ is revolved about the x -axis is twice the area of the surface generated when the graph of f on $[0, 4]$ is revolved about the x -axis.

- Let $f(x) = 12x^2$. The area of the surface generated when the graph of f on $[-4, 4]$ is revolved about the y -axis is twice the area of the surface generated when the graph of f on $[0, 4]$ is revolved about the y -axis.

24–28. Surface area using technology Consider the following curves on the given intervals.

- Write the integral that gives the area of the surface generated when the curve is revolved about the given axis.
- Use a calculator or software to approximate the surface area.

- $y = x^5$, for $0 \leq x \leq 1$; about the x -axis
- $y = \cos x$, for $0 \leq x \leq \frac{\pi}{2}$; about the x -axis
- $y = (2x + 3)^2$, for $0 \leq x \leq 1$; about the y -axis
- $y = \tan x$, for $0 \leq x \leq \frac{\pi}{4}$; about the x -axis
- $y = \sqrt{\sin \pi x}$, for $0 \leq x \leq \frac{1}{2}$; about the x -axis

29. Revolving an astroid Consider the upper half of the astroid described by $x^{2/3} + y^{2/3} = a^{2/3}$, where $a > 0$ and $|x| \leq a$. Find the area of the surface generated when this curve is revolved about the x -axis. Note that the function describing the curve is not differentiable at 0. However, the surface area integral can be evaluated using symmetry and methods you know.

30. Cones and cylinders The volume of a cone of radius r and height h is one-third the volume of a cylinder with the same radius and height. Does the surface area of a cone of radius r and height h equal one-third the surface area of a cylinder with the same radius and height? If not, find the correct relationship. Exclude the bases of the cone and cylinder.

Explorations and Challenges

31–35. Challenging surface area calculations Find the area of the surface generated when the given curve is revolved about the given axis.

- $y = x^{3/2} - \frac{x^{1/2}}{3}$, for $1 \leq x \leq 2$; about the x -axis
- $y = \frac{x^4}{8} + \frac{1}{4x^2}$, for $1 \leq x \leq 2$; about the x -axis
- $y = \frac{x^3}{3} + \frac{1}{4x}$, for $\frac{1}{2} \leq x \leq 2$; about the x -axis
- $y = \frac{1}{2}(1 - \sqrt{1 - 4x^2})$ between the points $(\frac{\sqrt{3}}{4}, \frac{1}{4})$ and $(\frac{1}{2}, \frac{1}{2})$; about the y -axis
- $x = 4y^{3/2} - \frac{y^{1/2}}{12}$, for $1 \leq y \leq 4$; about the y -axis
- Surface area of an ellipsoid** If the top half of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is revolved about the x -axis, the result is an *ellipsoid* whose axis along the x -axis has length $2a$, whose axis along the y -axis has length $2b$, and whose axis perpendicular to the xy -plane has length $2b$. We assume that $0 < b < a$ (see figure). Use the following steps to find the surface area S of this ellipsoid.

- a. Use the surface area formula to show that

$$S = \frac{4\pi b}{a} \int_0^a \sqrt{a^2 - c^2 x^2} dx, \text{ where } c^2 = 1 - \frac{b^2}{a^2}.$$

- b. Use the change of variables $u = cx$ to show that

$$S = \frac{4\pi b}{\sqrt{a^2 - b^2}} \int_0^{\sqrt{a^2 - b^2}} \sqrt{a^2 - u^2} du.$$

- T c.** Use the integral formula in part (b) together with a calculator or software to approximate the surface area of an ellipsoid if $a = 4$ and $b = 3$.
- T d.** The surface area of the ellipsoid can be estimated by the Knud Thomsen formula

$$S \approx 4\pi \left(\frac{2(ab)^p + b^{2p}}{3} \right)^{1/p},$$

where $p = 1.6075$. Use this formula to estimate the surface area of an ellipsoid, where $a = 4$ and $b = 3$. Compare this approximation with the result found in part (c).

- e. Use part (a) to show that if $a = b$, then $S = 4\pi a^2$, which is the surface area of a sphere of radius a .
- f. How accurate is the formula in part (d) if $a = b$?
- 37. Zones of a sphere** Suppose a sphere of radius r is sliced by two horizontal planes h units apart (see figure). Show that the surface area of the resulting zone on the sphere is $2\pi rh$, independent of the location of the cutting planes.

- 38. Surface area of a frustum** Show that the surface area of the frustum of a cone generated by revolving the line segment between $(a, g(a))$ and $(b, g(b))$ about the x -axis is $\pi(g(b) + g(a))\ell$, for any linear function $g(x) = cx + d$ that is positive on the interval $[a, b]$, where ℓ is the slant height of the frustum.

- 39. Scaling surface area** Let f be a nonnegative function with a continuous first derivative on $[a, b]$ and suppose $g(x) = cf(x)$ and $h(x) = f(cx)$, where $c > 0$. When the curve $y = f(x)$ on $[a, b]$ is revolved about the x -axis, the area of the resulting surface is A . Evaluate the following integrals in terms of A and c .

a. $\int_a^b 2\pi g(x) \sqrt{c^2 + g'(x)^2} dx$

b. $\int_{a/c}^{b/c} 2\pi h(x) \sqrt{c^2 + h'(x)^2} dx$

- 40. Surface plus cylinder** Suppose f is a nonnegative function with a continuous first derivative on $[a, b]$. Let L equal the length of the graph of f on $[a, b]$ and let S be the area of the surface generated by revolving the graph of f on $[a, b]$ about the x -axis. For a positive constant C , assume the curve $y = f(x) + C$ is revolved about the x -axis. Show that the area of the resulting surface equals the sum of S and the surface area of a right circular cylinder of radius C and height L .

- 41. Surface-area-to-volume ratio (SAV)** In the design of solid objects (both artificial and natural), the ratio of the surface area to the volume of the object is important. Animals typically generate heat at a rate proportional to their volume and lose heat at a rate proportional to their surface area. Therefore, animals with a low SAV ratio tend to retain heat whereas animals with a high SAV ratio (such as children and hummingbirds) lose heat relatively quickly.

- a. What is the SAV ratio of a cube with side lengths R ?
- b. What is the SAV ratio of a ball with radius R ?
- c. For a fixed constant $h > 0$, consider a ball of radius $\sqrt[3]{h/4}$ and an ellipsoid with a long axis of length $2\sqrt[3]{h}$ and short axes that are each half the length of the long axis. Show that the ball and ellipsoid have the same volume. (Hint: The volume of an ellipsoid is $\frac{4}{3}\pi ABC$, where the axes have lengths $2A$, $2B$, and $2C$.)
- T d.** Create a table to compare SAV ratios of the balls and ellipsoids of equal volume described in part (c) using values of $h = 1.1, 5, 10$, and 20 . (Hint: Find the surface area of the ellipsoids using the integral in part (b) of Exercise 36 together with a calculator or other technology.)
- e. Among all ellipsoids of a fixed volume, which one would you choose for the shape of an animal if the goal is to minimize heat loss?

QUICK CHECK ANSWERS

1. The surface area of the first cone ($200\sqrt{5}\pi$) is twice as great as the surface area of the second cone ($100\sqrt{5}\pi$).
2. The surface area is $63\sqrt{10}\pi$. 3. The surface is a cylinder of radius c and height $b - a$. The area of the curved surface is $2\pi c(b - a)$. ◀

6.7 Physical Applications

We conclude this chapter on applications of integration with several problems from physics and engineering. The physical themes in these problems are mass, work, force, and pressure. The common mathematical theme is the use of the slice-and-sum strategy, which always leads to a definite integral.

- In Chapter 16, we return to mass calculations for two- and three-dimensional objects (plates and solids).

Figure 6.68

QUICK CHECK 1 In Figure 6.68, suppose $a = 0$, $b = 3$, and the density of the rod in g/cm is $\rho(x) = (4 - x)$.

- (a) Where is the rod lightest and heaviest? (b) What is the density at the middle of the bar? ◀

Figure 6.69

- Note that the units of the integral work out as they should: ρ has units of mass per length and dx has units of length, so $\rho(x) dx$ has units of mass.

QUICK CHECK 2 A thin bar occupies the interval $0 \leq x \leq 2$ and has a density in kg/m of $\rho(x) = (1 + x^2)$. Using the minimum value of the density, what is a lower bound for the mass of the object? Using the maximum value of the density, what is an upper bound for the mass of the object? ◀

Density and Mass

Density is the concentration of mass in an object and is usually measured in units of mass per volume (for example, g/cm³). An object with *uniform* density satisfies the basic relationship

$$\text{mass} = \text{density} \cdot \text{volume}.$$

When the density of an object *varies*, this formula no longer holds, and we must appeal to calculus.

In this section, we introduce mass calculations for thin objects that can be viewed as line segments (such as wires or thin bars). The bar shown in Figure 6.68 has a density ρ that varies along its length. For one-dimensional objects, we use *linear density* with units of mass per length (for example, g/cm). What is the mass of such an object?

We begin by dividing the bar, represented by the interval $a \leq x \leq b$, into n subintervals of equal length $\Delta x = (b - a)/n$ (Figure 6.69). Let x_k^* be any point in the k th subinterval, for $k = 1, \dots, n$. The mass of the k th segment of the bar m_k is approximately the density at x_k^* multiplied by the length of the interval, or $m_k \approx \rho(x_k^*)\Delta x$. So the approximate mass of the entire bar is

$$\sum_{k=1}^n m_k \approx \sum_{k=1}^n \underbrace{\rho(x_k^*)\Delta x}_{m_k}.$$

The exact mass is obtained by taking the limit as $n \rightarrow \infty$ and as $\Delta x \rightarrow 0$, which produces a definite integral.

DEFINITION Mass of a One-Dimensional Object

Suppose a thin bar or wire is represented by the interval $a \leq x \leq b$ with a density function ρ (with units of mass per length). The **mass** of the object is

$$m = \int_a^b \rho(x) dx.$$

EXAMPLE 1 Mass from variable density A thin, two-meter bar, represented by the interval $0 \leq x \leq 2$, is made of an alloy whose density in units of kg/m is given by $\rho(x) = (1 + x^2)$. What is the mass of the bar?

SOLUTION The mass of the bar in kilograms is

$$m = \int_a^b \rho(x) dx = \int_0^2 (1 + x^2) dx = \left(x + \frac{x^3}{3} \right) \Big|_0^2 = \frac{14}{3}.$$

Related Exercises 14–15 ◀

Work

Work can be described as the change in energy when a force causes a displacement of an object. When you carry a basket of laundry up a flight of stairs or push a stalled car, you apply a force that results in the displacement of an object, and work is done. If a *constant* force F displaces an object a distance d in the direction of the force, the work done is the force multiplied by the distance:

$$\text{work} = \text{force} \cdot \text{distance}.$$

Figure 6.70

QUICK CHECK 3 Explain why the sum of the work over n subintervals is only an approximation of the total work. ◀

It is easiest to use metric units for force and work. A newton (N) is the force required to give a 1-kg mass an acceleration of 1 m/s^2 . A joule (J) is 1 newton-meter (N-m), the work done by a 1-N force acting over a distance of 1 m.

Calculus enters the picture with *variable* forces. Suppose an object is moved along the x -axis by a variable force F that is directed along the x -axis (Figure 6.70). How much work is done in moving the object between $x = a$ and $x = b$? Once again, we use the slice-and-sum strategy.

The interval $[a, b]$ is divided into n subintervals of equal length $\Delta x = (b - a)/n$. We let x_k^* be any point in the k th subinterval, for $k = 1, \dots, n$. On that subinterval, the force is approximately constant with a value of $F(x_k^*)$. Therefore, the work done in moving the object across the k th subinterval is approximately $F(x_k^*)\Delta x$ (force $\cdot$ distance). Summing the work done over each of the n subintervals, the total work over the interval $[a, b]$ is approximately

$$W \approx \sum_{k=1}^n F(x_k^*)\Delta x.$$

This approximation becomes exact when we take the limit as $n \rightarrow \infty$ and $\Delta x \rightarrow 0$. The total work done is the integral of the force over the interval $[a, b]$ (or, equivalently, the net area under the force curve in Figure 6.70).

DEFINITION Work

The work done by a variable force F moving an object along a line from $x = a$ to $x = b$ in the direction of the force is

$$W = \int_a^b F(x) \, dx.$$

An application of force and work that is easy to visualize is the stretching and compression of a spring. Suppose an object is attached to a spring on a frictionless horizontal surface; the object slides back and forth under the influence of the spring. We say that the spring is at *equilibrium* when it is neither compressed nor stretched. It is convenient to let x be the position of the object, where $x = 0$ is the equilibrium position (Figure 6.71).

Figure 6.71

Figure 6.72

According to **Hooke's law**, the force required to keep the spring in a compressed or stretched position x units from the equilibrium position is $F(x) = kx$, where the positive spring constant k measures the stiffness of the spring. Note that to stretch the spring to a position $x > 0$, a force $F > 0$ (in the positive direction) is required. To compress the spring to a position $x < 0$, a force $F < 0$ (in the negative direction) is required (Figure 6.72). In other words, the force required to displace the spring is always in the direction of the displacement.

EXAMPLE 2 Compressing a spring Suppose a force of 10 N is required to stretch a spring 0.1 m from its equilibrium position and hold it in that position.

- Assuming the spring obeys Hooke's law, find the spring constant k .
- How much work is needed to *compress* the spring 0.5 m from its equilibrium position?
- How much work is needed to *stretch* the spring 0.25 m from its equilibrium position?
- How much additional work is required to stretch the spring 0.25 m if it has already been stretched 0.1 m from its equilibrium position?

SOLUTION

- The fact that a force of 10 N is required to keep the spring stretched at $x = 0.1$ m means (by Hooke's law) that $F(0.1) = k(0.1 \text{ m}) = 10$ N. Solving for the spring constant, we find that $k = 100 \text{ N/m}$. Therefore, Hooke's law for this spring is $F(x) = 100x$.
- The work in joules required to compress the spring from $x = 0$ to $x = -0.5$ is

$$W = \int_a^b F(x) dx = \int_0^{-0.5} 100x dx = 50x^2 \Big|_0^{-0.5} = 12.5.$$

- The work in joules required to stretch the spring from $x = 0$ to $x = 0.25$ is

$$W = \int_a^b F(x) dx = \int_0^{0.25} 100x dx = 50x^2 \Big|_0^{0.25} = 3.125.$$

- The work in joules required to stretch the spring from $x = 0.1$ to $x = 0.35$ is

$$W = \int_a^b F(x) dx = \int_{0.1}^{0.35} 100x dx = 50x^2 \Big|_{0.1}^{0.35} = 5.625.$$

Comparing parts (c) and (d), we see that more work is required to stretch the spring 0.25 m starting at $x = 0.1$ than starting at $x = 0$.

Related Exercises 23–24 ◀

- Hooke's law was proposed by the English scientist Robert Hooke (1635–1703), who also coined the biological term *cell*. Hooke's law works well for springs made of many common materials. However, some springs obey more complicated spring laws (see Exercise 59).
- Notice again that the units in the integral are consistent. If F has units of N and x has units of m, then W has units of $F dx$, or N·m, which are the units of work (1 N·m = 1 J).

QUICK CHECK 4 In Example 2, explain why more work is needed in part (d) than in part (c), even though the displacement is the same. ◀

Figure 6.73

- The units of ρ , Δy , g , and $L - y_k^*$ are kg/m, m, m/s², and m, respectively. When multiplied, they yield $\frac{\text{kg m}^2}{\text{s}^2}$, which are the units of a joule.

Lifting Problems Another common work problem arises when the motion is vertical and the force is due to gravity. The gravitational force exerted on an object with mass m (measured in kg) is $F = mg$, where $g = 9.8 \text{ m/s}^2$ is the acceleration due to gravity near the surface of Earth. The work in joules required to lift an object of mass m a vertical distance of y meters is

$$\text{work} = \text{force} \cdot \text{distance} = mgy.$$

This type of problem becomes interesting when the object being lifted is a rope, a chain, or a cable. In these situations, different parts of the object are lifted different distances, so integration is necessary.

Imagine a chain of length L meters with a constant density of ρ kg/m hanging vertically from a scaffolding platform at a construction site. To compute the work done in lifting the chain to the platform, we introduce a coordinate system where $y = 0$ corresponds to the bottom of the chain and $y = L$ corresponds to the top of the chain (Figure 6.73). We then divide the interval $[0, L]$ into n subintervals of equal length Δy and choose a point y_k^* from each subinterval $[y_{k-1}, y_k]$, for $k = 1, \dots, n$.

The mass of each segment of the chain is $m = \rho \Delta y$, and the point y_k^* in the k th segment is lifted a distance of $L - y_k^*$. Therefore, the work required to lift the k th segment is approximately

$$W_k = \underbrace{\rho \Delta y g}_{\text{force}} \cdot \underbrace{(L - y_k^*)}_{\text{distance}},$$

so the total work required to lift the chain is

$$W \approx \sum_{k=1}^n \rho g (L - y_k^*) \Delta y.$$

As the length of each segment Δy tends to zero and the number of segments tends to infinity, we obtain a definite integral for the total work in the limit:

$$W = \lim_{n \rightarrow \infty} \sum_{k=1}^n \rho g (L - y_k^*) \Delta y = \int_0^L \rho g (L - y) dy. \quad (1)$$

The function $L - y$ in equation (1) measures the distance through which a point y on the chain moves. Recognize that this function changes depending on the location of the origin relative to the chain, as illustrated in Example 3 (and Quick Check 6).

(a)

(b)

Figure 6.74

EXAMPLE 3 Lifting a chain and bucket A ten-meter chain with density of 1.5 kg/m hangs from a platform at a construction site that is 11 meters above the ground (Figure 6.74a).

- Compute the work required to lift the chain to the platform.
- Several packages of nails are placed in a one-meter-tall bucket that rests on the ground; the mass of the bucket and nails together is 15 kg, and the chain is attached to the bucket (Figure 6.74b). How much work is required to lift the bucket to the platform?

SOLUTION

- We use a coordinate system with $y = 0$ placed at the bottom of the chain. By equation (1), the work in joules required to lift the chain to the platform is

$$\begin{aligned} W &= \int_0^L \rho g (L - y) dy = 1.5g \int_0^{10} (10 - y) dy \quad L = 10 \text{ m}; \rho = 1.5 \text{ kg/m} \\ &= 1.5g \left(10y - \frac{y^2}{2} \right) \Big|_0^{10} \quad \text{Integrate.} \\ &= 1.5g \left(100 - \frac{100}{2} \right) \quad \text{Evaluate.} \\ &= 735. \quad \text{Simplify; } g = 9.8 \text{ m/s}^2. \end{aligned}$$

Had we instead chosen a coordinate system with $y = 0$ corresponding to the ground, the work integral would be

$$W = \int_1^{11} 1.5g(11 - y) dy$$

because the chain would then lie in the interval $[1, 11]$, and a point y on the chain would move a distance of $(11 - y)$ m before reaching the platform. You can verify that the value of this definite integral is also 735 joules.

- This time we use a coordinate system with $y = 0$ placed on the ground at the bottom of the bucket; we compute the work required to lift the chain and bucket separately. As shown in part (a), the work needed to lift the chain is 735 joules. Integration is not necessary to compute the work needed to lift the bucket (see Quick Check 5). We simply note that the bucket has a mass of 15 kg and every point in the bucket moves a distance of 11 m, so the work in joules required to lift it is

$$W = mgy = 15(9.8)(11) = 1617.$$

The work required to lift both the chain and the bucket is $735 + 1617 = 2352$ joules.

Related Exercises 31–32 ◀

QUICK CHECK 5 In Example 3b, the bucket occupies the interval $[0, 1]$ and the chain occupies the interval $[1, 11]$ (Figure 6.74b). Why is integration used to compute the work needed to lift the chain but not to compute the work needed to lift the bucket? ◀

QUICK CHECK 6 Set up and evaluate the work integral in Example 3a using a coordinate system with $y = 0$ placed at the top of the chain and with a positive y -axis that points downward. ◀

► The choice of a coordinate system is somewhat arbitrary and may depend on the geometry of the problem. You can let the y -axis point upward or downward, and there are usually several logical choices for the location of $y = 0$. You should experiment with different coordinate systems.

Pumping Problems The chains and cables encountered in the lifting problems from the previous pages can be modeled as one-dimensional objects. An extra layer of complexity is added when investigating the work required to pump fluid from a tank, although the same principles remain in play.

Suppose a fluid such as water is pumped out of a tank to a height h above the bottom of the tank. How much work is required, assuming the tank is full of water? Three key observations lead to the solution.

- Water from different levels of the tank is lifted different vertical distances, requiring different amounts of work.
- Two equal volumes of water from the same horizontal plane are lifted the same distance and require the same amount of work.
- A volume V of water has mass ρV , where $\rho = 1 \text{ g/cm}^3 = 1000 \text{ kg/m}^3$ is the density of water.

To solve this problem, we let the y -axis point upward with $y = 0$ at the bottom of the tank. The body of water that must be lifted extends from $y = 0$ to $y = b$ (which *may* be the top of the tank). The level to which the water must be raised is $y = h$, where $h \geq b$ (Figure 6.75). We now slice the water into n horizontal layers, each having thickness Δy . The k th layer occupying the interval $[y_{k-1}, y_k]$, for $k = 1, \dots, n$, is approximately y_k^* units above the bottom of the tank, where y_k^* is any point in $[y_{k-1}, y_k]$.

Figure 6.75

The cross-sectional area of the k th layer at y_k^* , denoted $A(y_k^*)$, is determined by the shape of the tank; the solution depends on being able to find A for all values of y . Because the volume of the k th layer is approximately $A(y_k^*)\Delta y$, the force on the k th layer (its weight) is

$$F_k = mg \approx \underbrace{A(y_k^*)\Delta y}_{\text{volume}} \cdot \underbrace{\rho}_{\text{density}} \cdot g.$$

To reach the level $y = h$, the k th layer is lifted an approximate distance $(h - y_k^*)$ (Figure 6.75). So the work in lifting the k th layer to a height h is approximately

$$W_k = \underbrace{A(y_k^*)\Delta y \rho g}_{\text{force}} \cdot \underbrace{(h - y_k^*)}_{\text{distance}}.$$

Summing the work required to lift all the layers to a height h , the total work is

$$W \approx \sum_{k=1}^n W_k = \sum_{k=1}^n A(y_k^*) \rho g (h - y_k^*) \Delta y.$$

This approximation becomes more accurate as the width of the layers Δy tends to zero and the number of layers tends to infinity. In this limit, we obtain a definite integral from $y = 0$ to $y = b$. The total work required to empty the tank is

$$W = \lim_{n \rightarrow \infty} \sum_{k=1}^n A(y_k^*) \rho g (h - y_k^*) \Delta y = \int_0^b \rho g A(y) (h - y) dy.$$

This derivation assumes the *bottom* of the tank is at $y = 0$, in which case the distance that the slice at level y must be lifted is $D(y) = h - y$. If you choose a different location for the origin, the function D will be different. Here is a general procedure for any choice of origin.

PROCEDURE Solving Pumping Problems

1. Draw a y -axis in the vertical direction (parallel to gravity) and choose a convenient origin. Assume the interval $[a, b]$ corresponds to the vertical extent of the fluid.
2. For $a \leq y \leq b$, find the cross-sectional area $A(y)$ of the horizontal slices and the distance $D(y)$ the slices must be lifted.
3. The work required to lift the water is

$$W = \int_a^b \rho g A(y) D(y) dy.$$

► Notice that the work integral for pumping problems reduces to the work integral for lifting problems given in equation (1) on p. 415 when we take $A(y) = 1$.

Figure 6.76

► Recall that $g \approx 9.8 \text{ m/s}^2$. You should verify that the units are consistent in this calculation: The units of ρ , g , $A(y)$, $D(y)$, and dy are kg/m^3 , m/s^2 , m^2 , m , and m , respectively. The resulting units of W are $\text{kg m}^2/\text{s}^2$, or J. A more convenient unit for large amounts of work and energy is the kilowatt-hour, which is 3.6 million joules.

QUICK CHECK 7 In Example 4, how would the integral change if the outflow pipe were at the top of the tank? ◀

We now use this procedure to solve two pumping problems.

EXAMPLE 4 Pumping water How much work is needed to pump all the water out of a cylindrical tank with a height of 10 m and a radius of 5 m? The water is pumped to an outflow pipe 15 m above the bottom of the tank.

SOLUTION Figure 6.76 shows the cylindrical tank filled to capacity and the outflow 15 m above the bottom of the tank. We let $y = 0$ represent the bottom of the tank and $y = 10$ represent the top of the tank. In this case, all horizontal slices are circular disks of radius $r = 5$ m. Therefore, for $0 \leq y \leq 10$, the cross-sectional area is

$$A(y) = \pi r^2 = \pi 5^2 = 25\pi.$$

Note that the water is pumped to a level $h = 15$ m above the bottom of the tank, so the lifting distance is $D(y) = 15 - y$. The resulting work integral is

$$W = \int_0^{10} \underbrace{\rho g A(y)}_{25\pi} \underbrace{D(y)}_{15-y} dy = 25\pi \rho g \int_0^{10} (15 - y) dy.$$

Substituting $\rho = 1000 \text{ kg/m}^3$ and $g = 9.8 \text{ m/s}^2$, the total work in joules is

$$\begin{aligned} W &= 25\pi \rho g \int_0^{10} (15 - y) dy \\ &= 25\pi \underbrace{(1000)}_{\rho} \underbrace{(9.8)}_{g} \left(15y - \frac{1}{2}y^2 \right) \bigg|_0^{10} \\ &\approx 7.7 \times 10^7. \end{aligned}$$

The work required to pump the water out of the tank is approximately 77 million joules.

Related Exercises 36–37 ◀

EXAMPLE 5 Pumping gasoline A cylindrical tank with a length of 10 m and a radius of 5 m is on its side and half full of gasoline (Figure 6.77). How much work is required to empty the tank through an outlet pipe at the top of the tank? (The density of gasoline is $\rho = 737 \text{ kg/m}^3$.)

Figure 6.77

► Again, there are several choices for the location of the origin. The location in this example makes $A(y)$ easy to compute.

SOLUTION In this problem, we choose a different origin by letting $y = 0$ and $y = -5$ correspond to the center and the bottom of the tank, respectively. For $-5 \leq y \leq 0$, a horizontal layer of gasoline located at a depth y is a rectangle with a length of 10 and a width of $2\sqrt{25 - y^2}$ (Figure 6.77). Therefore, the cross-sectional area of the layer at depth y is

$$A(y) = 20\sqrt{25 - y^2}.$$

The distance the layer at level y must be lifted to reach the top of the tank is $D(y) = 5 - y$, where $-5 \leq y \leq 0$; note that $5 \leq D(y) \leq 10$. The resulting work integral is

$$W = \underbrace{737}_{\rho} \underbrace{(9.8)}_g \int_{-5}^0 \underbrace{20\sqrt{25 - y^2}}_{A(y)} \underbrace{(5 - y)}_{D(y)} dy = 144,452 \int_{-5}^0 \sqrt{25 - y^2} (5 - y) dy.$$

This integral is evaluated by splitting the integrand into two pieces and recognizing that one piece is the area of a quarter circle of radius 5:

$$\begin{aligned} \int_{-5}^0 \sqrt{25 - y^2} (5 - y) dy &= 5 \int_{-5}^0 \sqrt{25 - y^2} dy - \int_{-5}^0 y \sqrt{25 - y^2} dy \\ &\quad \text{area of quarter circle} \quad \text{let } u = 25 - y^2; du = -2y dy \\ &= 5 \cdot \frac{25\pi}{4} + \frac{1}{2} \int_0^{25} \sqrt{u} du \\ &= \frac{125\pi}{4} + \frac{1}{3} u^{3/2} \Big|_0^{25} = \frac{375\pi + 500}{12}. \end{aligned}$$

Multiplying this result by $20\rho g = 144,452$, we find that the work required is approximately 20.2 million joules.

Related Exercises 42–44 ◀

Force and Pressure

Another application of integration deals with the force exerted on a surface by a body of water. Again, we need a few physical principles.

Pressure is a force per unit area, measured in units such as newtons per square meter (N/m^2). For example, the pressure of the atmosphere on the surface of Earth is about 14 lb/in^2 (approximately 100 kilopascals, or 10^5 N/m^2). As another example, if

you stood on the bottom of a swimming pool, you would feel pressure due to the weight (force) of the column of water above your head. If your head is flat and has surface area $A \text{ m}^2$ and it is h meters below the surface, then the column of water above your head has volume $Ah \text{ m}^3$. That column of water exerts a force (its weight)

$$F = \text{mass} \cdot \text{acceleration} = \underbrace{\text{volume} \cdot \text{density}}_{\text{mass}} \cdot g = Ah\rho g,$$

where ρ is the density of water and g is the acceleration due to gravity. Therefore, the pressure on your head is the force divided by the surface area of your head:

$$\text{pressure} = \frac{\text{force}}{A} = \frac{Ah\rho g}{A} = \rho gh.$$

This pressure is called **hydrostatic pressure** (meaning the pressure of *water at rest*), and it has the following important property: *It has the same magnitude in all directions*. Specifically, the hydrostatic pressure on a vertical wall of the swimming pool at a depth h is also ρgh . This is the only fact needed to find the total force on vertical walls such as dams and swimming pools. We assume the water completely covers the face of the dam.

The first step in finding the force on the face of the dam is to introduce a coordinate system. We choose a y -axis pointing upward with $y = 0$ corresponding to the base of the dam and $y = a$ corresponding to the top of the dam (Figure 6.78). Because the pressure varies with depth (y -direction), the dam is sliced horizontally into n strips of equal thickness Δy . The k th strip corresponds to the interval $[y_{k-1}, y_k]$, and we let y_k^* be any point in that interval. The depth of that strip is approximately $h = a - y_k^*$, so the hydrostatic pressure on that strip is approximately $\rho g(a - y_k^*)$.

The crux of any dam problem is finding the width of the strips as a function of y , which we denote $w(y)$. Each dam has its own width function; however, once the width function is known, the solution follows directly. The approximate area of the k th strip is its width multiplied by its thickness, or $w(y_k^*)\Delta y$. The force on the k th strip (which is the area of the strip multiplied by the pressure) is approximately

$$F_k = \underbrace{\rho g(a - y_k^*)}_{\text{pressure}} \underbrace{w(y_k^*)\Delta y}_{\text{area of strip}}.$$

Summing the forces over the n strips, the total force is

$$F \approx \sum_{k=1}^n F_k = \sum_{k=1}^n \rho g(a - y_k^*)w(y_k^*)\Delta y.$$

To find the exact force, we let the thickness of the strips tend to zero and the number of strips tend to infinity, which produces a definite integral. The limits of integration correspond to the base ($y = 0$) and top ($y = a$) of the dam. Therefore, the total force on the dam is

$$F = \lim_{n \rightarrow \infty} \sum_{k=1}^n \rho g(a - y_k^*)w(y_k^*)\Delta y = \int_0^a \rho g(a - y)w(y) dy.$$

► We have chosen $y = 0$ to be the base of the dam. Depending on the geometry of the problem, it may be more convenient (less computation) to let $y = 0$ be at the top of the dam. Note that the depth function $D(y) = a - y$ varies with the chosen coordinate system. Experiment with different choices.

PROCEDURE Solving Force-on-Dam Problems

1. Draw a y -axis on the face of the dam in the vertical direction and choose a convenient origin (often taken to be the base of the dam).
2. Find the width function $w(y)$ for each value of y on the face of the dam.
3. If the base of the dam is at $y = 0$ and the top of the dam is at $y = a$, then the total force on the dam is

$$F = \int_0^a \underbrace{\rho g(a - y)}_{\text{depth}} \underbrace{w(y)}_{\text{width}} dy.$$

Figure 6.78

Figure 6.79

- You should check the width function: $w(0) = 20$ (the width of the dam at its base) and $w(30) = 40$ (the width of the dam at its top).

Figure 6.80

EXAMPLE 6 Force on a dam A large vertical dam in the shape of a symmetric trapezoid has a height of 30 m, a width of 20 m at its base, and a width of 40 m at the top (Figure 6.79). What is the total force on the face of the dam when the reservoir is full?

SOLUTION We place the origin at the center of the base of the dam (Figure 6.80). The right slanted edge of the dam is a segment of the line that passes through the points $(10, 0)$ and $(20, 30)$. An equation of that line is

$$y - 0 = \frac{30}{10}(x - 10) \quad \text{or} \quad y = 3x - 30 \quad \text{or} \quad x = \frac{1}{3}(y + 30).$$

Notice that at a depth of y , where $0 \leq y \leq 30$, the width of the dam is

$$w(y) = 2x = \frac{2}{3}(y + 30).$$

Using $\rho = 1000 \text{ kg/m}^3$ and $g = 9.8 \text{ m/s}^2$, the total force on the dam (in newtons) is

$$\begin{aligned} F &= \int_0^a \rho g(a - y)w(y) dy && \text{Force integral} \\ &= \rho g \int_0^{30} \underbrace{(30 - y)}_{a - y} \underbrace{\frac{2}{3}(y + 30)}_{w(y)} dy && \text{Substitute.} \\ &= \frac{2}{3} \rho g \int_0^{30} (900 - y^2) dy && \text{Simplify.} \\ &= \frac{2}{3} \rho g \left(900y - \frac{y^3}{3} \right) \Big|_0^{30} && \text{Fundamental Theorem} \\ &\approx 1.18 \times 10^8. \end{aligned}$$

The force of $1.18 \times 10^8 \text{ N}$ on the dam amounts to about 26 million pounds, or 13,000 tons.

Related Exercises 46–47 ◀

SECTION 6.7 EXERCISES

Getting Started

- Suppose a 1-m cylindrical bar has a constant density of 1 g/cm for its left half and a constant density of 2 g/cm for its right half. What is its mass?
- Explain how to find the mass of a one-dimensional object with a variable density ρ .
- How much work is required to move an object from $x = 0$ to $x = 5$ (measured in meters) in the presence of a constant force of 5 N acting along the x -axis?
- Why is integration used to find the work done by a variable force?
- Why is integration used to find the work required to pump water out of a tank?
- Why is integration used to find the total force on the face of a dam?
- What is the pressure on a horizontal surface with an area of 2 m^2 that is 4 m underwater?
- Explain why you integrate in the vertical direction (parallel to the acceleration due to gravity) rather than the horizontal direction to find the force on the face of a dam.

9–12. Consider the cylindrical tank in Example 4 that has a height of 10 m and a radius of 5 m. Recall that if the tank is full of water, then $\int_0^{10} 25\pi\rho g(15 - y) dy$ equals the work required to pump all the water out of the tank through an outflow pipe that is 15 m above the bottom of the tank. Revise this work integral for the following scenarios. (Do not evaluate the integrals.)

- The work required to empty the top half of the tank
- The work required to empty the tank if it is half full
- The work required to empty the tank through an outflow pipe at the top of the tank
- The work required to empty the tank if the water in the tank is only 3 m deep and the outflow pipe is at the top of the tank

Practice Exercises

13–20. Mass of one-dimensional objects Find the mass of the following thin bars with the given density function.

- $\rho(x) = 1 + \sin x$, for $0 \leq x \leq \pi$
- $\rho(x) = 1 + x^3$, for $0 \leq x \leq 1$

15. $\rho(x) = 2 - \frac{x}{2}$, for $0 \leq x \leq 2$
16. $\rho(x) = 1 + 3 \sin x$, for $0 \leq x \leq \pi$
17. $\rho(x) = x\sqrt{2 - x^2}$, for $0 \leq x \leq 1$
18. $\rho(x) = \begin{cases} 1 & \text{if } 0 \leq x \leq 2 \\ 2 & \text{if } 2 < x \leq 3 \end{cases}$
19. $\rho(x) = \begin{cases} 1 & \text{if } 0 \leq x \leq 2 \\ 1 + x & \text{if } 2 < x \leq 4 \end{cases}$
20. $\rho(x) = \begin{cases} x^2 & \text{if } 0 \leq x \leq 1 \\ x(2 - x) & \text{if } 1 < x \leq 2 \end{cases}$
21. **Work from force** How much work is required to move an object from $x = 0$ to $x = 3$ (measured in meters) in the presence of a force (in N) given by $F(x) = 2x$ acting along the x -axis?
22. **Work from force** How much work is required to move an object from $x = 1$ to $x = 3$ (measured in meters) in the presence of a force (in N) given by $F(x) = \frac{2}{x^2}$ acting along the x -axis?
23. **Compressing and stretching a spring** Suppose a force of 30 N is required to stretch and hold a spring 0.2 m from its equilibrium position.
 - a. Assuming the spring obeys Hooke's law, find the spring constant k .
 - b. How much work is required to compress the spring 0.4 m from its equilibrium position?
 - c. How much work is required to stretch the spring 0.3 m from its equilibrium position?
 - d. How much additional work is required to stretch the spring 0.2 m if it has already been stretched 0.2 m from its equilibrium position?
24. **Compressing and stretching a spring** Suppose a force of 15 N is required to stretch and hold a spring 0.25 m from its equilibrium position.
 - a. Assuming the spring obeys Hooke's law, find the spring constant k .
 - b. How much work is required to compress the spring 0.2 m from its equilibrium position?
 - c. How much additional work is required to stretch the spring 0.3 m if it has already been stretched 0.25 m from its equilibrium position?
25. **Work done by a spring** A spring on a horizontal surface can be stretched and held 0.5 m from its equilibrium position with a force of 50 N.
 - a. How much work is done in stretching the spring 1.5 m from its equilibrium position?
 - b. How much work is done in compressing the spring 0.5 m from its equilibrium position?
26. **Shock absorber** A heavy-duty shock absorber is compressed 2 cm from its equilibrium position by a mass of 500 kg. How much work is required to compress the shock absorber 4 cm from its equilibrium position? (A mass of 500 kg exerts a force (in newtons) of $500g$, where $g = 9.8 \text{ m/s}^2$.)
27. **Calculating work for different springs** Calculate the work required to stretch the following springs 0.5 m from their equilibrium positions. Assume Hooke's law is obeyed.
 - a. A spring that requires a force of 50 N to be stretched 0.2 m from its equilibrium position
 - b. A spring that requires 50 J of work to be stretched 0.2 m from its equilibrium position
28. **Calculating work for different springs** Calculate the work required to stretch the following springs 0.4 m from their equilibrium positions. Assume Hooke's law is obeyed.
 - a. A spring that requires a force of 50 N to be stretched 0.1 m from its equilibrium position
 - b. A spring that requires 2 J of work to be stretched 0.1 m from its equilibrium position
29. **Calculating work for different springs** Calculate the work required to stretch the following springs 1.25 m from their equilibrium positions. Assume Hooke's law is obeyed.
 - a. A spring that requires 100 J of work to be stretched 0.5 m from its equilibrium position
 - b. A spring that requires a force of 250 N to be stretched 0.5 m from its equilibrium position
30. **Work function** A spring has a restoring force given by $F(x) = 25x$. Let $W(x)$ be the work required to stretch the spring from its equilibrium position ($x = 0$) to a variable distance x . Find and graph the work function. Compare the work required to stretch the spring x units from equilibrium to the work required to compress the spring x units from equilibrium.
31. **Winding a chain** A 30-m-long chain hangs vertically from a cylinder attached to a winch. Assume there is no friction in the system and the chain has a density of 5 kg/m.
 - a. How much work is required to wind the entire chain onto the cylinder using the winch?
 - b. How much work is required to wind the chain onto the cylinder if a 50-kg block is attached to the end of the chain?
32. **Coiling a rope** A 60-m-long, 9.4-mm-diameter rope hangs freely from a ledge. The density of the rope is 55 g/m. How much work is needed to pull the entire rope to the ledge?
33. **Winding part of a chain** A 20-m-long, 50-kg chain hangs vertically from a cylinder attached to a winch. How much work is needed to wind the upper half of the chain onto the winch?
34. **Leaky bucket** A 1-kg bucket resting on the ground contains 3 kg of water. How much work is required to raise the bucket vertically a distance of 10 m if water leaks out of the bucket at a constant rate of $\frac{1}{5} \text{ kg/m}$? Assume the weight of the rope used to raise the bucket is negligible. (*Hint:* Use the definition of work, $W = \int_a^b F(y) dy$, where F is the variable force required to lift an object along a vertical line from $y = a$ to $y = b$.)
35. **Emptying a swimming pool** A swimming pool has the shape of a box with a base that measures 25 m by 15 m and a uniform depth of 2.5 m. How much work is required to pump the water out of the pool (to the level of the top of the pool) when it is full?
36. **Emptying a cylindrical tank** A cylindrical water tank has height 8 m and radius 2 m (see figure).
 - a. If the tank is full of water, how much work is required to pump the water to the level of the top of the tank and out of the tank?

- b. Is it true that it takes half as much work to pump the water out of the tank when it is half full as when it is full? Explain.

37. **Emptying a half-full cylindrical tank** Suppose the water tank in Exercise 36 is half full of water. Determine the work required to empty the tank by pumping the water to a level 2 m above the top of the tank.

38. **Emptying a partially filled swimming pool** If the water in the swimming pool in Exercise 35 is 2 m deep, then how much work is required to pump all the water to a level 3 m above the bottom of the pool?

39. **Emptying a conical tank** A water tank is shaped like an inverted cone with height 6 m and base radius 1.5 m (see figure).
- If the tank is full, how much work is required to pump the water to the level of the top of the tank and out of the tank?
 - Is it true that it takes half as much work to pump the water out of the tank when it is filled to half its depth as when it is full? Explain.

40. **Upper and lower half** A cylinder with height 8 m and radius 3 m is filled with water and must be emptied through an outlet pipe 2 m above the top of the cylinder.

- Compute the work required to empty the water in the top half of the tank.
- Compute the work required to empty the (equal amount of) water in the lower half of the tank.
- Interpret the results of parts (a) and (b).

41. **Filling a spherical tank** A spherical water tank with an inner radius of 8 m has its lowest point 2 m above the ground. It is filled by a pipe that feeds the tank at its lowest point (see figure). Neglecting the volume of the inflow pipe, how much work is required to fill the tank if it is initially empty?

42. **Emptying a water trough** A water trough has a semicircular cross section with a radius of 0.25 m and a length of 3 m (see figure).

- How much work is required to pump the water out of the trough (to the level of the top of the trough) when it is full?
- If the length is doubled, is the required work doubled? Explain.
- If the radius is doubled, is the required work doubled? Explain.

43. **Emptying a water trough** A cattle trough has a trapezoidal cross section with a height of 1 m and horizontal sides of length $\frac{1}{2}$ m and 1 m. Assume the length of the trough is 10 m (see figure).

- How much work is required to pump the water out of the trough (to the level of the top of the trough) when it is full?
- If the length is doubled, is the required work doubled? Explain.

44. **Pumping water** Suppose the tank in Example 5 is full of water (rather than half full of gasoline). Determine the work required to pump all the water to an outlet pipe 15 m above the bottom of the tank.

45. **Emptying a conical tank** An inverted cone (base above the vertex) is 2 m high and has a base radius of $\frac{1}{2}$ m. If the tank is full, how much work is required to pump the water to a level 1 m above the top of the tank?

46–49. **Force on dams** The following figures show the shapes and dimensions of small dams. Assuming the water level is at the top of the dam, find the total force on the face of the dam.

50. **Parabolic dam** The lower edge of a dam is defined by the parabola $y = x^2/16$ (see figure). Use a coordinate system with $y = 0$ at the bottom of the dam to determine the total force of the water on the dam. Lengths are measured in meters. Assume the water level is at the top of the dam.

51. **Force on a triangular plate** A plate shaped like an isosceles triangle with a height of 1 m is placed on a vertical wall 1 m below the surface of a pool filled with water (see figure). Compute the force on the plate.

- 52–54. **Force on a window** A diving pool that is 4 m deep and full of water has a viewing window on one of its vertical walls. Find the force on the following windows.

52. The window is a square, 0.5 m on a side, with the lower edge of the window on the bottom of the pool.
53. The window is a square, 0.5 m on a side, with the lower edge of the window 1 m from the bottom of the pool.
54. The window is circular, with a radius of 0.5 m, tangent to the bottom of the pool.
55. **Force on a building** A large building shaped like a box is 50 m high with a face that is 80 m wide. A strong wind blows directly at the face of the building, exerting a pressure of 150 N/m^2 at the ground and increasing with height according to $P(y) = 150 + 2y$, where y is the height above the ground. Calculate the total force on the building, which is a measure of the resistance that must be included in the design of the building.
56. **Force on the end of a tank** Determine the force on a circular end of the tank in Figure 6.77 if the tank is full of gasoline. The density of gasoline is $\rho = 737 \text{ kg/m}^3$.
57. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- a. The mass of a thin wire is the length of the wire times its average density over its length.

- b. The work required to stretch a linear spring (that obeys Hooke's law) 100 cm from equilibrium is the same as the work required to compress it 100 cm from equilibrium.
- c. The work required to lift a 10-kg object vertically 10 m is the same as the work required to lift a 20-kg object vertically 5 m.
- d. The total force on a 10-ft^2 region on the (horizontal) floor of a pool is the same as the total force on a 10-ft^2 region on a (vertical) wall of the pool.

Explorations and Challenges

58. **Mass of two bars** Two bars of length L have densities $\rho_1(x) = 4(x+1)^{-2}$ and $\rho_2(x) = 6(x+1)^{-3}$, for $0 \leq x \leq L$.
- a. For what values of L is bar 1 heavier than bar 2?
- b. As the lengths of the bars increase, do their masses increase without bound? Explain.
59. **A nonlinear spring** Hooke's law is applicable to idealized (linear) springs that are not stretched or compressed too far from their equilibrium positions. Consider a nonlinear spring whose restoring force is given by $F(x) = 16x - 0.1x^3$, for $|x| \leq 7$.
- a. Graph the restoring force and interpret it.
- b. How much work is done in stretching the spring from its equilibrium position ($x = 0$) to $x = 1.5$?
- c. How much work is done in compressing the spring from its equilibrium position ($x = 0$) to $x = -2$?
60. **A vertical spring** A 10-kg mass is attached to a spring that hangs vertically and is stretched 2 m from the equilibrium position of the spring. Assume a linear spring with $F(x) = kx$.
- a. How much work is required to compress the spring and lift the mass 0.5 m?
- b. How much work is required to stretch the spring and lower the mass 0.5 m?
61. **Leaky cement bucket** A 350 kg-bucket containing 4650 kg of cement is resting on the ground when a crane begins lifting it at a constant rate of 5 m/min. As the crane raises the bucket, cement leaks out of the bucket at a constant rate of 100 kg/min. How much work is required to lift the bucket a distance of 30 m if we ignore the weight of the crane cable attached to the bucket?
62. **Emptying a real swimming pool** A swimming pool is 20 m long and 10 m wide, with a bottom that slopes uniformly from a depth of 1 m at one end to a depth of 2 m at the other end (see figure). Assuming the pool is full, how much work is required to pump the water to a level 0.2 m above the top of the pool?

63. **Drinking juice** A glass has circular cross sections that taper (linearly) from a radius of 5 cm at the top of the glass to a radius of 4 cm at the bottom. The glass is 15 cm high and full of orange juice. How much work is required to drink all the juice through a straw if your mouth is 5 cm above the top of the glass? Assume the density of orange juice equals the density of water.

64. Lifting a pendulum A body of mass m is suspended by a rod of length L that pivots without friction (see figure). The mass is slowly lifted along a circular arc to a height h .

- Assuming the only force acting on the mass is the gravitational force, show that the component of this force acting along the arc of motion is $F = mg \sin \theta$.
- Noting that an element of length along the path of the pendulum is $ds = L d\theta$, evaluate an integral in θ to show that the work done in lifting the mass to a height h is mgh .

65. Critical depth A large tank has a plastic window on one wall that is designed to withstand a force of 90,000 N. The square window is 2 m on a side, and its lower edge is 1 m from the bottom of the tank.

- If the tank is filled to a depth of 4 m, will the window withstand the resulting force?
- What is the maximum depth to which the tank can be filled without the window failing?

66. Orientation and force A plate shaped like an equilateral triangle 1 m on a side is placed on a vertical wall 1 m below the surface of a pool filled with water. On which plate in the figure is the force greater? Try to anticipate the answer and then compute the force on each plate.

67. Orientation and force A square plate 1 m on a side is placed on a vertical wall 1 m below the surface of a pool filled with water. On which plate in the figure is the force greater? Try to anticipate the answer and then compute the force on each plate.

68. Work by two different integrals A rigid body with a mass of 2 kg moves along a line due to a force that produces a position function $x(t) = 4t^2$, where x is measured in meters and t is measured in seconds. Find the work done during the first 5 s in two ways.

- Note that $x''(t) = 8$; then use Newton's second law ($F = ma = mx''(t)$) to evaluate the work integral $W = \int_{x_0}^{x_f} F(x) dx$, where x_0 and x_f are the initial and final positions, respectively.
- Change variables in the work integral and integrate with respect to t . Be sure your answer agrees with part (a).

69. Work in a gravitational field For large distances from the surface of Earth, the gravitational force is given by $F(x) = \frac{GMm}{(x + R)^2}$, where $G = 6.7 \times 10^{-11} \text{ N}\cdot\text{m}^2/\text{kg}^2$ is the gravitational constant, $M = 6 \times 10^{24} \text{ kg}$ is the mass of Earth, m is the mass of the object in the gravitational field, $R = 6.378 \times 10^6 \text{ m}$ is the radius of Earth, and $x \geq 0$ is the distance above the surface of Earth (in meters).

- How much work is required to launch a rocket with a mass of 500 kg in a vertical flight path to a height of 2500 km (from Earth's surface)?
- Find the work required to launch the rocket to a height of x kilometers, for $x > 0$.
- How much work is required to reach outer space ($x \rightarrow \infty$)?
- Equate the work in part (c) to the initial kinetic energy of the rocket, $\frac{1}{2}mv^2$, to compute the escape velocity of the rocket.

70. Buoyancy Archimedes' principle says that the buoyant force exerted on an object that is (partially or totally) submerged in water is equal to the weight of the water displaced by the object (see figure). Let $\rho_w = 1 \text{ g/cm}^3 = 1000 \text{ kg/m}^3$ be the density of water and let ρ be the density of an object in water. Let $f = \rho/\rho_w$. If $0 < f \leq 1$, then the object floats with a fraction f of its volume submerged; if $f > 1$, then the object sinks. Consider a cubical box with sides 2 m long floating in water with one-half of its volume submerged ($\rho = \rho_w/2$). Find the force required to fully submerge the box (so its top surface is at the water level). (See the Guided Project *Buoyancy and Archimedes' Principle* for further explorations of buoyancy problems.)

QUICK CHECK ANSWERS

1. a. The bar is heaviest at the left end and lightest at the right end. **b.** $\rho = 2.5 \text{ g/cm}^3$. **2.** Minimum mass = 2 kg; maximum mass = 10 kg **3.** We assume the force is constant over each subinterval, when, in fact, it varies over each subinterval. **4.** The restoring force of the spring increases as the spring is stretched ($f(x) = 100x$). Greater restoring forces are encountered on the interval $[0.1, 0.35]$ than on the interval $[0, 0.25]$. **5.** The chain is a flexible object, and different points on the chain are lifted different distances as it is pulled to the platform. The bucket, however, is a rigid object, and every point in the bucket is lifted 11 m when it goes from resting on the ground to resting on the platform (in other words, it can be treated as a point mass). **6.** $\int_0^{10} 1.5gy \, dy = 735 \text{ joules}$. **7.** The factor $(15 - y)$ in the integral is replaced with $(10 - y)$. ◀

CHAPTER 6 REVIEW EXERCISES

1. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - a. A region R is revolved about the y -axis to generate a solid S . To find the volume of S , you could either use the disk/washer method and integrate with respect to y or use the shell method and integrate with respect to x .
 - b. Given only the velocity of an object moving on a line, it is possible to find its displacement, but not its position.
 - c. If water flows into a tank at a constant rate (for example, 6 gal/min), the volume of water in the tank increases according to a linear function of time.
- 2–3. **Displacement, distance, and position** Consider an object moving along a line with the following velocities and initial positions. Assume time t is measured in seconds and velocities have units of m/s.
 - a. Over the given interval, determine when the object is moving in the positive direction and when it is moving in the negative direction.
 - b. Find the displacement over the given interval.
 - c. Find the distance traveled over the given interval.
 - d. Determine the position function $s(t)$ using the Fundamental Theorem of Calculus (Theorem 6.1). Check your answer by finding the position function using the antiderivative method.
2. $v(t) = 1 - 2 \cos(\pi t/3)$, for $0 \leq t \leq 3$; $s(0) = 0$
3. $v(t) = 12t^2 - 30t + 12$, for $0 \leq t \leq 3$; $s(0) = 1$
4. **Displacement from velocity** The velocity of an object moving along a line is given by $v(t) = 20 \cos \pi t$ (in ft/s). What is the displacement of the object after 1.5 s?
5. **Position, displacement, and distance** A projectile is launched vertically from the ground at $t = 0$, and its velocity in flight (in m/s) is given by $v(t) = 20 - 10t$. Find the position, displacement, and distance traveled after t seconds, for $0 \leq t \leq 4$.
6. **Deceleration** At $t = 0$, a car begins decelerating from a velocity of 80 ft/s at a constant rate of 5 ft/s². Find its position function assuming $s(0) = 0$.
7. **An oscillator** The acceleration of an object moving along a line is given by $a(t) = 2 \sin \frac{\pi t}{4}$. The initial velocity and position are $v(0) = -\frac{8}{\pi}$ and $s(0) = 0$.
 - a. Find the velocity and position for $t \geq 0$.
 - b. What are the minimum and maximum values of s ?
 - c. Find the average velocity and average position over the interval $[0, 8]$.
8. **A race** Starting at the same point on a straight road, Anna and Benny begin running with velocities (in mi/hr) given by $v_A(t) = 2t + 1$ and $v_B(t) = 4 - t$, respectively.
 - a. Graph the velocity functions, for $0 \leq t \leq 4$.
 - b. If the runners run for 1 hr, who runs farther? Interpret your conclusion geometrically using the graph in part (a).
 - c. If the runners run for 6 mi, who wins the race? Interpret your conclusion geometrically using the graph in part (a).
9. **Fuel consumption** A small plane in flight consumes fuel at a rate (in gal/min) given by
 - a. Find a function R that gives the total fuel consumed, for $0 \leq t \leq 8$.
 - b. Find a function R that gives the total fuel consumed, for $t \geq 0$.
 - c. If the fuel tank capacity is 150 gal, when does the fuel run out?
10. **Decreasing velocity** A projectile is fired upward, and its velocity (in m/s) is given by $v(t) = \frac{200}{\sqrt{t+1}}$, for $t \geq 0$.
 - a. Graph the velocity function, for $t \geq 0$.
 - b. Find and graph the position function for the projectile, for $t \geq 0$, assuming $s(0) = 0$.
 - c. Given unlimited time, can the projectile travel 2500 m? If so, at what time does the distance traveled equal 2500 m?
11. Explain why $\int_0^2 x^2 dx = \int_0^4 (2 - \sqrt{y}) dy$ without evaluating the integrals.
- 12–23. **Areas of regions** Determine the area of the given region.

15. The region bounded by $y = x$, $y = \sqrt{x-1}$, $y = 2$, and $y = 0$
16. The region bounded by $y = \sin \frac{x}{2}$ and $y = \cos \frac{x}{2}$ on $\left[-\frac{3\pi}{2}, \frac{5\pi}{2}\right]$

$$R'(t) = \begin{cases} 4t^{1/3} & \text{if } 0 \leq t \leq 8 \quad (\text{take-off}) \\ 2 & \text{if } t > 8 \quad (\text{cruising}). \end{cases}$$

- T 17.** The region in the first quadrant bounded by $y = 4x$ and $y = x\sqrt{25 - x^2}$
- 18.** The region bounded by $y = 6 - 3x^2$ and $y = 6x - 3$
- 19.** The region bounded by $y = x^2$, $y = 2x^2 - 4x$, and $y = 0$
- 20.** The region in the first quadrant bounded by the curve $\sqrt{x} + \sqrt{y} = 1$
- 21.** The region in the first quadrant bounded by $y = x/6$ and $y = 1 - |x/2 - 1|$
- 22.** The region in the first quadrant bounded by $y = x^p$ and $y = \sqrt[p]{x}$, where $p = 100$ and $p = 1000$ (two area calculations)
- 23.** The region bounded by $y = 2x^2 - 6x + 5$ and $y = 1$
- 24.** Determine the area of the region bounded by the curves $x = y^2$ and $x = (2 - y^2)^2$ (see figure).

25–31. Multiple regions The regions R_1 , R_2 , and R_3 (see figure) are formed by the graphs of $y = 2\sqrt{x}$, $y = 3 - x$, and $x = 3$.

- 25.** Find the area of each of the regions R_1 , R_2 , and R_3 .
- 26.** Find the volume of the solid obtained by revolving region R_1 about the x -axis.
- 27.** Find the volume of the solid obtained by revolving region R_1 about the y -axis.
- 28.** Find the volume of the solid obtained by revolving region R_2 about the y -axis.
- 29.** Find the volume of the solid obtained by revolving region R_2 about the x -axis.
- 30.** Use the disk method to find an integral, or sum of integrals, that equals the volume of the solid obtained by revolving region R_3 about the line $x = 3$. Do not evaluate the integral.
- 31.** Use the shell method to find an integral, or sum of integrals, that equals the volume of the solid obtained by revolving region R_3 about the line $x = 3$. Do not evaluate the integral.

- 32. Area and volume** The region R is bounded by the curves $x = y^2 + 2$, $y = x - 4$, and $y = 0$ (see figure).
- Write a single integral that gives the area of R .
 - Write a single integral that gives the volume of the solid generated when R is revolved about the x -axis.
 - Write a single integral that gives the volume of the solid generated when R is revolved about the y -axis.
 - Suppose S is a solid whose base is R and whose cross sections perpendicular to R and parallel to the x -axis are semicircles. Write a single integral that gives the volume of S .

33–36. Area and volume Let R be the region in the first quadrant bounded by the graph of $f(x) = \begin{cases} 1 & \text{if } 0 \leq x \leq 1 \\ 2 - \sqrt{x} & \text{if } 1 < x \leq 4. \end{cases}$

- 33.** Find the area of the region R .
- 34.** Find the volume of the solid generated when R is revolved about the x -axis.
- 35.** Find the volume of the solid generated when R is revolved about the y -axis.
- T 36.** Find the area of the surface generated when the curve $y = f(x)$, for $0 \leq x \leq 4$, is revolved about the x -axis.

T 37. Find the area of the shaded regions R_1 and R_2 shown in the figure.

38. An area function Let $R(x)$ be the area of the shaded region between the graphs of $y = f(t)$ and $y = g(t)$ on the interval $[a, x]$ (see figure).

- Sketch a plausible graph of R , for $a \leq x \leq c$.
- Give expressions for $R(x)$ and $R'(x)$, for $a \leq x \leq c$.

- 39. An area function** Consider the functions $y = \frac{x^2}{a}$ and $y = \sqrt{\frac{x}{a}}$, where $a > 0$. Find $A(a)$, the area of the region between the curves.
- 40. Two methods** The region R in the first quadrant bounded by the parabola $y = 4 - x^2$ and coordinate axes is revolved about the y -axis to produce a dome-shaped solid. Find the volume of the solid in the following ways:
- Apply the disk method and integrate with respect to y .
 - Apply the shell method and integrate with respect to x .
- 41–55. Volumes of solids** Choose the general slicing method, the disk/washer method, or the shell method to answer the following questions.
- 41.** What is the volume of the solid whose base is the region in the first quadrant bounded by $y = \sqrt{x}$, $y = 2 - x$, and the x -axis, and whose cross sections perpendicular to the base and parallel to the y -axis are squares?
- 42.** What is the volume of the solid whose base is the region in the first quadrant bounded by $y = \sqrt{x}$, $y = 2 - x$, and the x -axis, and whose cross sections perpendicular to the base and parallel to the y -axis are semicircles?
- 43.** What is the volume of the solid whose base is the region in the first quadrant bounded by $y = \sqrt{x}$, $y = 2 - x$, and the y -axis, and whose cross sections perpendicular to the base and parallel to the x -axis are squares?
- 44.** The region bounded by the curves $y = -x^2 + 2x + 2$ and $y = 2x^2 - 4x + 2$ is revolved about the x -axis. What is the volume of the solid that is generated?
- 45.** The region bounded by the curve $y = 1 + \sqrt{x}$, the curve $y = 1 - \sqrt{x}$, and the line $x = 1$ is revolved about the y -axis. Find the volume of the resulting solid by (a) integrating with respect to x and (b) integrating with respect to y . Be sure your answers agree.
- 46.** The region bounded by the curves $y = x + 1$, $y = 12/x$, and $y = 1$ is revolved about the x -axis. What is the volume of the solid that is generated?
- 47.** The region bounded by $y = 1/x^3$, $y = 0$, $x = 2$, and $x = 4$ is revolved about the y -axis. What is the volume of the solid that is generated?
- 48.** The region bounded by the curves $y = \sec x$ and $y = 2$, for $0 \leq x \leq \frac{\pi}{3}$, is revolved about the x -axis. What is the volume of the solid that is generated?
- 49.** The region bounded by $y = (1 - x^2)^{-1/2}$ and the x -axis over the interval $[0, \sqrt{3}/2]$ is revolved about the y -axis. What is the volume of the solid that is generated?
- 50.** The region bounded by the graph of $y = 4 - x^2$ and the x -axis on the interval $[-2, 2]$ is revolved about the line $x = -2$. What is the volume of the solid that is generated?
- 51.** The region bounded by the graphs of $y = (x - 2)^2$ and $y = 4$ is revolved about the line $y = 4$. What is the volume of the resulting solid?
- 52.** The region bounded by the graphs of $y = 6x$ and $y = x^2 + 5$ is revolved about the line $y = -1$ and the line $x = -1$. Find the volumes of the resulting solids. Which one is greater?
- 53.** The region bounded by the graphs of $y = 2x$, $y = 6 - x$, and $y = 0$ is revolved about the line $y = -2$ and the line $x = -2$. Find the volumes of the resulting solids. Which one is greater?
- 54.** The region bounded by $y = 4/\sqrt{x+1}$, $y = 1$, and $x = 0$ is revolved about the y -axis. What is the volume of the solid that is generated?
- 55.** The region in the first quadrant bounded by $y = \sec x$, $y = 2$, and $x = 0$ is revolved about the x -axis. What is the volume of the solid that is generated?
- 56. Comparing volumes** Let R be the region in the first quadrant bounded by the y -axis and the graphs of $y = 3x$ and $y = 4 - x^2$. Answer the following questions by finding the volumes of the described solids.
- Which is greater, the volume of the solid obtained by revolving R about the x -axis or the line $y = 5$?
 - Which is greater, the volume of the solid obtained by revolving R about the y -axis or the line $x = 1$?
- 57. Comparing volumes** Let R be the region bounded by the graph of $f(x) = cx(1 - x)$ and the x -axis on $[0, 1]$. Find the positive value of c such that the volume of the solid generated by revolving R about the x -axis equals the volume of the solid generated by revolving R about the y -axis.
- 58–60. Arc length** Find the length of the following curves.
- 58.** $y = 2x + 4$ on $[-2, 2]$ (Use calculus.)
- 59.** $y = x^{1/2} - x^{3/2}/3$ on $[1, 3]$
- 60.** $y = \frac{x^3}{6} + \frac{1}{2x}$ on $[1, 2]$
- 61–65. Arc length by calculator** Write and simplify the integral that gives the arc length of the following curves on the given interval. Then use technology to approximate the integral.
- 61.** $y = (x + 1)^2$ on $[2, 4]$
- 62.** $y = \sin \pi x$ on $[0, 1]$
- 63.** $y = \sqrt{x^4 + x^2}$ on $[0, 1]$
- 64.** $y = \frac{x^3}{3} + \frac{x^2}{2}$ on $[0, 2]$
- 65.** $y = \cot x$ on $\left[-\frac{\pi}{2}, -\frac{\pi}{4}\right]$
- 66. Surface area and volume** Let $f(x) = \frac{1}{3}x^3$ and let R be the region bounded by the graph of f and the x -axis on the interval $[0, 2]$.
- Find the area of the surface generated when the graph of f on $[0, 2]$ is revolved about the x -axis.
 - Find the volume of the solid generated when R is revolved about the y -axis.
 - Find the volume of the solid generated when R is revolved about the x -axis.
- 67. Surface area and volume** Let $f(x) = \sqrt{3x - x^2}$ and let R be the region bounded by the graph of f and the x -axis on the interval $[0, 3]$.
- Find the area of the surface generated when the graph of f on $[0, 3]$ is revolved about the x -axis.
 - Find the volume of the solid generated when R is revolved about the x -axis.

- 68. Surface area of a cone** Find the surface area of a cone (excluding the base) with radius 4 and height 8 using integration and a surface area integral.

- 69. Surface area and more** Let $f(x) = \frac{x^4}{2} + \frac{1}{16x^2}$ and let R be

the region bounded by the graph of f and the x -axis on the interval $[1, 2]$.

- Find the area of the surface generated when the graph of f on $[1, 2]$ is revolved about the x -axis. Use technology to evaluate or approximate the integral.
- Find the length of the curve $y = f(x)$ on $[1, 2]$.
- Find the volume of the solid generated when R is revolved about the x -axis. Use technology to evaluate or approximate the integral.

70–72. Variable density in one dimension Find the mass of the following thin bars.

- 70.** A bar on the interval $0 \leq x \leq 9$ with a density (in g/m) given by $\rho(x) = 3 + 2\sqrt{x}$

- 71.** A 3-m bar with a density (in g/m) of $\rho(x) = 150 - \sqrt{3x}$, for $0 \leq x \leq 3$

- 72.** A bar on the interval $0 \leq x \leq 6$ with a density

$$\rho(x) = \begin{cases} 1 & \text{if } 0 \leq x < 2 \\ 2 & \text{if } 2 \leq x < 4 \\ 4 & \text{if } 4 \leq x \leq 6 \end{cases}$$

73. Spring work

- It takes 50 J of work to stretch a spring 0.2 m from its equilibrium position. How much work is needed to stretch it an additional 0.5 m?
- It takes 50 N of force to stretch a spring 0.2 m from its equilibrium position. How much work is needed to stretch it an additional 0.5 m?

- 74. Leaky bucket** A 1-kg bucket resting on the ground initially contains 6 kg of water. The bucket is lifted from the ground at a constant rate, and while it is rising, water leaks out of the bucket at a constant rate of $\frac{1}{4}$ kg/m. How much work is required to lift the bucket a vertical distance of 8 m? Assume the weight of the rope used to raise the bucket is negligible.

- 75. Lifting problem** A 10-m, 20-kg chain hangs vertically from a cylinder attached to a winch.

- How much work is required to wind the entire chain onto the cylinder using the winch?
- How much work is required to wind the upper 4 m of the chain onto the cylinder using the winch?

- 76. Lifting problem** A 4-kg mass is attached to the bottom of a 5-m, 15-kg chain. If the chain hangs from a platform, how much work is required to pull the chain and the mass onto the platform?

- 77. Pumping water** A water tank has the shape of a box that is 2 m wide, 4 m long, and 6 m high.

- If the tank is full, how much work is required to pump the water to the level of the top of the tank?
- If the water in the tank is 2 m deep, how much work is required to pump the water to a level of 1 m above the top of the tank?

- 78. Pumping water** A cylindrical water tank has a height of 6 m and a radius of 4 m. How much work is required to empty the full tank by pumping the water to an outflow pipe at the top of the tank?

- 79. Pumping water** A water tank that is full of water has the shape of an inverted cone with a height of 6 m and a radius of 4 m (see figure). Assume the water is pumped out to the level of the top of the tank.

- How much work is required to pump out the water?
- Which requires more work, pumping out the top 3 m of water or the bottom 3 m of water?

- 80. Pumping water** A water tank that has the shape of a sphere with a radius of 2 m is half full of water. How much work is required to pump the water to the level of the top of the tank?

- 81. Pumping water** A tank has the shape of the surface obtained by revolving the curve $y = x^2$, for $0 \leq x \leq 3$, about the y -axis. (Assume x and y are in meters.) If the tank is full of water, how much work is required to pump the water to an outflow pipe 1 m above the top of the tank?

82–84. Fluid forces Suppose the following plates are placed on a vertical wall so that the top of the plate is 2 m below the surface of a pool that is filled with water. Compute the force on each plate.

- 82.** A square plate with side length of 1 m, oriented so that the top and bottom sides of the square are horizontal

- 83.** A plate shaped like an isosceles triangle with a height of 1 m and a base of length $\frac{1}{2}$ m (see figure)

- 84.** A circular plate with a radius of 2 m

- 85. Force on a dam** Find the total force on the face of a semicircular dam with a radius of 20 m when its reservoir is full of water. The diameter of the semicircle is the top of the dam.

86. Equal area property for parabolas Let $f(x) = ax^2 + bx + c$ be an arbitrary quadratic function and choose two points $x = p$ and $x = q$. Let L_1 be the line tangent to the graph of f at the point $(p, f(p))$ and let L_2 be the line tangent to the graph at the point $(q, f(q))$. Let $x = s$ be the vertical line through the intersection

point of L_1 and L_2 . Finally, let R_1 be the region bounded by $y = f(x)$, L_1 , and the vertical line $x = s$, and let R_2 be the region bounded by $y = f(x)$, L_2 , and the vertical line $x = s$. Prove that the area of R_1 equals the area of R_2 .

Chapter 6 Guided Projects

Applications of the material in this chapter and related topics can be found in the following Guided Projects. For additional information, see the Preface.

- Geometric probability
- Mathematics of the CD player
- Designing a water clock
- Buoyancy and Archimedes' principle

Logarithmic and Exponential Functions

- 7.1 Inverse Functions
- 7.2 The Natural Logarithmic and Exponential Functions
- 7.3 Logarithmic and Exponential Functions with Other Bases
- 7.4 Exponential Models
- 7.5 Inverse Trigonometric Functions
- 7.6 L'Hôpital's Rule and Growth Rates of Functions
- 7.7 Hyperbolic Functions

Chapter Preview In Chapter 1, we presented a catalog of elementary functions that included polynomial, algebraic, and trigonometric functions. Until now, we have studied the calculus of these three families of functions, exploring their applications along the way. However, many areas of mathematics rely on other functions, such as exponential and logarithmic functions, which are known to you from algebra. It turns out that an exponential function of the form b^x , where $b > 0$, is the *inverse function* of the logarithmic function $\log_b x$ (and vice versa). In light of this fact, the chapter opens with a general discussion of inverse functions. The *natural logarithmic function* is introduced next, along with its inverse, the *natural exponential function*. We then develop the various derivatives and integrals associated with these functions. Inverse functions are again put to work to define the inverse trigonometric functions and to produce their derivative and integral properties. With exponential and logarithmic functions in the picture, we can resume the discussion of l'Hôpital's Rule that began in Chapter 4. New indeterminate forms are explored, leading to a ranking of functions by their growth rates. Finally, the chapter concludes with a study of *hyperbolic functions* and their inverses; these functions are related to exponential, logarithmic and trigonometric functions. Throughout the chapter, we emphasize many practical applications of each of these families of functions.

7.1 Inverse Functions

From your study of algebra, you know that when a function has an *inverse function*, the two functions are related in special ways. Roughly speaking, the action of one function undoes the action of the other. In this section, we begin with a review of inverse functions: when they exist, how to find them, and how to graph them. We then investigate the relationship between the derivative of a function and the derivative of its inverse function. With this background, we devote much of the rest of the chapter to developing new functions that arise as the inverses of familiar functions.

Existence of Inverse Functions

Consider the linear function $f(x) = 2x$, which takes any value of x and doubles it. The function that reverses this process by taking any value of $f(x) = 2x$ and mapping it back to x is called the *inverse function* of f , denoted f^{-1} . In this case, the inverse function is $f^{-1}(x) = x/2$. The effect of applying these two functions in succession looks like this:

$$x \xrightarrow{f} 2x \xrightarrow{f^{-1}} x.$$

We now generalize this idea.

DEFINITION Inverse Function

Given a function f , its inverse (if it exists) is a function f^{-1} such that whenever $y = f(x)$, then $f^{-1}(y) = x$ (Figure 7.1).

Figure 7.1

QUICK CHECK 1 What is the inverse of $f(x) = \frac{1}{3}x$? What is the inverse of $f(x) = x - 7$? ◀

Because the inverse “undoes” the original function, if we start with a value of x , apply f to it, and then apply f^{-1} to the result, we recover the original value of x ; that is,

Similarly, if we apply f^{-1} to a value of y and then apply f to the result, we recover the original value of y ; that is,

- The notation f^{-1} for the inverse can be confusing. The inverse is not the reciprocal; that is, $f^{-1}(x)$ is not $1/f(x) = (f(x))^{-1}$. We adopt the common convention of using simply *inverse* to mean *inverse function*.

One-to-One Functions We have defined the inverse of a function but said nothing about when it exists. To ensure that f has an inverse on a domain, f must be *one-to-one* on that domain. This property means that every output of the function f corresponds to exactly one input. The one-to-one property is checked graphically by using the *horizontal line test*.

- The vertical line test determines whether f is a function. The horizontal line test determines whether f is one-to-one.

DEFINITION One-to-One Functions and the Horizontal Line Test

A function f is **one-to-one** on a domain D if each value of $f(x)$ corresponds to exactly one value of x in D . More precisely, f is one-to-one on D if $f(x_1) \neq f(x_2)$ whenever $x_1 \neq x_2$, for x_1 and x_2 in D . The **horizontal line test** says that every horizontal line intersects the graph of a one-to-one function at most once (Figure 7.2).

Figure 7.2

For example, in Figure 7.3, some horizontal lines intersect the graph of $f(x) = x^2$ twice. Therefore, f does not have an inverse function on the interval $(-\infty, \infty)$. However, if the domain of f is restricted to one of the intervals $(-\infty, 0]$ or $[0, \infty)$, then the graph of f passes the horizontal line test, and f is one-to-one on these intervals.

Figure 7.3

EXAMPLE 1 One-to-one functions Determine the (largest possible) intervals on which the function $f(x) = 2x^2 - x^4$ (Figure 7.4) is one-to-one.

Figure 7.4

SOLUTION The function is not one-to-one on the entire real line because it fails the horizontal line test. However, on the intervals $(-\infty, -1]$, $[-1, 0]$, $[0, 1]$, and $[1, \infty)$, f is one-to-one. The function is also one-to-one on any subinterval of these four intervals.

Related Exercises 5–6 ◀

Conditions for the Existence of Inverse Functions Figure 7.5a illustrates the actions of a one-to-one function f and its inverse f^{-1} . We see that f maps a value of x to a unique value of y . In turn, f^{-1} maps that value of y back to the original value of x . This procedure cannot be carried out if f is not one-to-one (Figure 7.5b).

Figure 7.5

- The statement that a one-to-one function has an inverse may be plausible based on its graph. However, the proof of this theorem is fairly technical and is omitted.

THEOREM 7.1 Existence of Inverse Functions

Let f be a one-to-one function on a domain D with a range R . Then f has a unique inverse f^{-1} with domain R and range D such that

$$f^{-1}(f(x)) = x \quad \text{and} \quad f(f^{-1}(y)) = y,$$

where x is in D and y is in R .

QUICK CHECK 2 The function that gives degrees Fahrenheit in terms of degrees Celsius is $F = \frac{9}{5}C + 32$. Why does this function have an inverse? ◀

EXAMPLE 2 Does an inverse exist? Determine the largest intervals on which $f(x) = x^2 - 1$ has an inverse function.

SOLUTION On the interval $(-\infty, \infty)$ the function does not pass the horizontal line test and is not one-to-one (Figure 7.6). However, if the domain of f is restricted to the interval $(-\infty, 0]$ or $[0, \infty)$, then f is one-to-one and an inverse exists.

Related Exercises 20, 22 ◀

Figure 7.6

Finding Inverse Functions The crux of finding an inverse for a function f is solving the equation $y = f(x)$ for x in terms of y . If it is possible to do so, then we have found a relationship of the form $x = f^{-1}(y)$. Interchanging x and y in $x = f^{-1}(y)$ so that x is the independent variable (which is the customary role for x), the inverse has the form $y = f^{-1}(x)$. Notice that if f is not one-to-one, this process leads to more than one inverse function.

PROCEDURE Finding an Inverse Function

Suppose f is one-to-one on an interval I . To find f^{-1} , use the following steps.

1. Solve $y = f(x)$ for x . If necessary, restrict the resulting function so that x lies in I .
2. Interchange x and y and write $y = f^{-1}(x)$.

- Once you find a formula for f^{-1} , you can check your work by verifying that $f^{-1}(f(x)) = x$ and $f(f^{-1}(x)) = x$.

- A constant function (whose graph is a horizontal line) fails the horizontal line test and does not have an inverse.

EXAMPLE 3 Finding inverse functions Find the inverse(s) of the following functions. Restrict the domain of f if necessary.

a. $f(x) = 2x + 6$ b. $f(x) = x^2 - 1$

SOLUTION

- a. Linear functions (except constant linear functions) are one-to-one on the entire real line. Therefore, an inverse function for f exists for all values of x .

Step 1: Solve $y = f(x)$ for x : We see that $y = 2x + 6$ implies that $2x = y - 6$, or $x = \frac{1}{2}y - 3$.

Step 2: Interchange x and y and write $y = f^{-1}(x)$:

$$y = f^{-1}(x) = \frac{1}{2}x - 3.$$

It is instructive to verify that the inverse relations $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$ are satisfied:

$$f(f^{-1}(x)) = f\left(\frac{1}{2}x - 3\right) = 2\left(\frac{1}{2}x - 3\right) + 6 = x - 6 + 6 = x, \text{ and}$$

$\underbrace{2\left(\frac{1}{2}x - 3\right)}_{f(x) = 2x + 6}$

$$f^{-1}(f(x)) = f^{-1}(2x + 6) = \frac{1}{2}(2x + 6) - 3 = x + 3 - 3 = x.$$

$\underbrace{\frac{1}{2}(2x + 6)}_{f^{-1}(x) = \frac{1}{2}x - 3}$

- b. As shown in Example 2, the function $f(x) = x^2 - 1$ is not one-to-one on the entire real line; however, it is one-to-one on $(-\infty, 0]$ and on $[0, \infty)$ (Figure 7.7a). If we restrict our attention to either of these intervals, then an inverse function can be found.

Figure 7.7

Step 1: Solve $y = f(x)$ for x :

$$\begin{aligned} y &= x^2 - 1 \\ x^2 &= y + 1 \\ x &= \begin{cases} \sqrt{y + 1} \\ -\sqrt{y + 1} \end{cases} \end{aligned}$$

Each branch of the square root corresponds to an inverse function.

Step 2: Interchange x and y and write $y = f^{-1}(x)$:

$$y = f^{-1}(x) = \sqrt{x+1} \quad \text{or} \quad y = f^{-1}(x) = -\sqrt{x+1}.$$

The interpretation of this result is important. Taking the positive branch of the square root, the inverse function $y = f^{-1}(x) = \sqrt{x+1}$ gives positive values of y ; it corresponds to the branch of $f(x) = x^2 - 1$ on the interval $[0, \infty)$ (Figure 7.7b). The negative branch of the square root, $y = f^{-1}(x) = -\sqrt{x+1}$, is another inverse function that gives negative values of y ; it corresponds to the branch of $f(x) = x^2 - 1$ on the interval $(-\infty, 0]$.

QUICK CHECK 3 On what interval(s) does the function $f(x) = x^3$ have an inverse? ◀

Related Exercises 31–32 ◀

Graphing Inverse Functions

The graphs of a function and its inverse have a special relationship, which is illustrated in the following example.

EXAMPLE 4 Graphing inverse functions Plot f and f^{-1} on the same coordinate axes.

a. $f(x) = 2x + 6$ b. $f(x) = \sqrt{x-1}$

SOLUTION

a. The inverse of $f(x) = 2x + 6$, found in Example 3, is

$$y = f^{-1}(x) = \frac{1}{2}x - 3.$$

The graphs of f and f^{-1} are shown in Figure 7.8. Notice that both f and f^{-1} are increasing linear functions that intersect at $(-6, -6)$.

Figure 7.8

Figure 7.9

b. The domain of $f(x) = \sqrt{x-1}$ is $[1, \infty)$, and its range is $[0, \infty)$. On this domain, f is one-to-one and has an inverse. It can be found in two steps:

Step 1: Solve $y = \sqrt{x-1}$ for x :

$$y^2 = x - 1 \quad \text{or} \quad x = y^2 + 1.$$

Step 2: Interchange x and y and write $y = f^{-1}(x)$:

$$y = f^{-1}(x) = x^2 + 1.$$

The graphs of f and f^{-1} are shown in Figure 7.9; notice that the domain of f^{-1} (which is $x \geq 0$) corresponds to the range of f (which is $y \geq 0$).

Related Exercises 24–25 ◀

Figure 7.10

Looking closely at the graphs in Figure 7.8 and Figure 7.9, you see a symmetry that always occurs when a function and its inverse are plotted on the same set of axes. In each figure, one curve is the reflection of the other curve across the line $y = x$. These curves are *symmetric about the line $y = x$* , which means that the point (a, b) is on one curve whenever the point (b, a) is on the other curve (Figure 7.10).

The explanation for the symmetry comes directly from the definition of the inverse. Suppose that the point (a, b) is on the graph of $y = f(x)$, which means that $b = f(a)$. By the definition of the inverse function, we know that $a = f^{-1}(b)$, which means that the point (b, a) is on the graph of $y = f^{-1}(x)$. This argument applies to all relevant points (a, b) , so whenever (a, b) is on the graph of f , (b, a) is on the graph of f^{-1} . As a consequence, the graphs are symmetric about the line $y = x$.

Now suppose a function f is continuous and one-to-one on an interval I . Reflecting the graph of f through the line $y = x$ generates the graph of f^{-1} . The reflection process introduces no discontinuities in the graph of f^{-1} , so it is plausible (and indeed, true) that f^{-1} is continuous on the interval corresponding to I . We state this fact without a formal proof.

THEOREM 7.2 Continuity of Inverse Functions

If a function f is continuous on an interval I and has an inverse on I , then its inverse f^{-1} is also continuous (on the interval consisting of the points $f(x)$, where x is in I).

Derivatives of Inverse Functions

Here is an important question that bears on upcoming work: Given a differentiable function f that is one-to-one on an interval, how do we evaluate the derivative of f^{-1} ? The key to finding the derivative of the inverse function lies in the symmetry of the graphs of f and f^{-1} .

EXAMPLE 5 Linear functions, inverses, and derivatives Consider the general linear function $y = f(x) = mx + b$, where $m \neq 0$ and b are constants.

- Write the inverse of f in the form $y = f^{-1}(x)$.
- Find the derivative of the inverse $\frac{d}{dx}(f^{-1}(x))$.
- Consider the specific case $f(x) = 2x - 12$. Graph f and f^{-1} , and find the slope of each line.

SOLUTION

- a. Solving $y = mx + b$ for x , we find that $mx = y - b$, or

$$x = \frac{y}{m} - \frac{b}{m}.$$

Writing this function in the form $y = f^{-1}(x)$ (by reversing the roles of x and y), we have

$$y = f^{-1}(x) = \frac{x}{m} - \frac{b}{m},$$

which describes a line with slope $1/m$.

- b. The derivative of f^{-1} is

$$(f^{-1})'(x) = \frac{1}{m}.$$

Notice that $f'(x) = m$, so the derivative of f^{-1} is the reciprocal of f' .

- c. In the case that $f(x) = 2x - 12$, we have $f^{-1}(x) = x/2 + 6$. The graphs of these two lines are symmetric about the line $y = x$ (Figure 7.11). Furthermore, the slope of the line $y = f(x)$ is 2 and the slope of $y = f^{-1}(x)$ is $\frac{1}{2}$; that is, the slopes (and therefore the derivatives) are reciprocals of each other.

Figure 7.11

Related Exercises 39–40 ◀

The reciprocal property obeyed by f' and $(f^{-1})'$ in Example 5 holds for all differentiable functions with inverses. Figure 7.12 shows the graphs of a typical one-to-one function and its inverse. It also shows a pair of symmetric points— (x_0, y_0) on the graph of f and (y_0, x_0) on the graph of f^{-1} —along with the tangent lines at these points.

Figure 7.12

Notice that as the lines tangent to the graph of f get steeper (as x increases), the corresponding lines tangent to the graph of f^{-1} get less steep. The next theorem makes this relationship precise.

THEOREM 7.3 Derivative of the Inverse Function

Let f be differentiable and have an inverse on an interval I . If x_0 is a point of I at which $f'(x_0) \neq 0$, then f^{-1} is differentiable at $y_0 = f(x_0)$ and

$$(f^{-1})'(y_0) = \frac{1}{f'(x_0)}, \quad \text{where } y_0 = f(x_0).$$

► The result of Theorem 7.3 is also written in the form

$$(f^{-1})'(f(x_0)) = \frac{1}{f'(x_0)}$$

or

$$(f^{-1})'(y_0) = \frac{1}{f'(f^{-1}(y_0))}.$$

To understand this theorem, suppose that (x_0, y_0) is a point on the graph of f , which means that (y_0, x_0) is the corresponding point on the graph of f^{-1} . Then the slope of the line tangent to the graph of f^{-1} at the point (y_0, x_0) is the reciprocal of the slope of the line tangent to the graph of f at the point (x_0, y_0) . Importantly, the theorem says that we can evaluate the derivative of the inverse function without finding the inverse function itself.

Proof: Before doing a short calculation, we note two facts:

- At a point x_0 where f is differentiable, $y_0 = f(x_0)$ and $x_0 = f^{-1}(y_0)$.
- Because f is differentiable at x_0 , f is continuous at x_0 (Theorem 3.1), which implies that f^{-1} is also continuous at y_0 (Theorem 7.2). Therefore, as $y \rightarrow y_0$, $x \rightarrow x_0$.

Using the definition of the derivative, we have

$$\begin{aligned}
 (f^{-1})'(y_0) &= \lim_{y \rightarrow y_0} \frac{f^{-1}(y) - f^{-1}(y_0)}{y - y_0} && \text{Definition of derivative of } f^{-1} \\
 &= \lim_{x \rightarrow x_0} \frac{x - x_0}{f(x) - f(x_0)} && y = f(x) \text{ and } x = f^{-1}(y); x \rightarrow x_0 \text{ as } y \rightarrow y_0 \\
 &= \lim_{x \rightarrow x_0} \frac{1}{\frac{f(x) - f(x_0)}{x - x_0}} && \frac{a}{b} = \frac{1}{b/a} \\
 &= \frac{1}{f'(x_0)}. && \text{Definition of derivative of } f
 \end{aligned}$$

QUICK CHECK 4 Sketch the graphs of $f(x) = x^3$ and $f^{-1}(x) = x^{1/3}$. Then verify that Theorem 7.3 holds at the point $(1, 1)$. ◀

We have shown that $(f^{-1})'(y_0)$ exists (f^{-1} is differentiable at y_0) and that it equals the reciprocal of $f'(x_0)$. ▶

EXAMPLE 6 Derivative of an inverse function The function $f(x) = \sqrt{x} + x^2 + 1$ is one-to-one, for $x \geq 0$, and has an inverse on that interval. Find the slope of the curve $y = f^{-1}(x)$ at the point $(3, 1)$.

SOLUTION The point $(1, 3)$ is on the graph of f ; therefore, $(3, 1)$ is on the graph of f^{-1} . In this case, the slope of the curve $y = f^{-1}(x)$ at the point $(3, 1)$ is the reciprocal of the slope of the curve $y = f(x)$ at $(1, 3)$ (Figure 7.13).

Figure 7.13

Note that $f'(x) = \frac{1}{2\sqrt{x}} + 2x$, which means that $f'(1) = \frac{1}{2} + 2 = \frac{5}{2}$. Therefore,

$$(f^{-1})'(3) = \frac{1}{f'(1)} = \frac{1}{5/2} = \frac{2}{5}.$$

Observe that it is not necessary to find a formula for f^{-1} to evaluate its derivative at a point.

Related Exercises 47–48 ▶

EXAMPLE 7 Derivatives of an inverse function Use the values of a one-to-one differentiable function f in Table 7.1 to compute the indicated derivatives or state that the derivative cannot be determined.

Table 7.1

x	-1	0	1	2	3
$f(x)$	2	3	5	6	7
$f'(x)$	$1/2$	2	$3/2$	1	$2/3$

- a. $(f^{-1})'(5)$ b. $(f^{-1})'(2)$ c. $(f^{-1})'(1)$

SOLUTION We use the relationship $(f^{-1})'(y_0) = \frac{1}{f'(x_0)}$, where $y_0 = f(x_0)$.

- a. In this case, $y_0 = f(x_0) = 5$. Using Table 7.1, we see that $x_0 = 1$ and $f'(1) = \frac{3}{2}$.

$$\text{Therefore, } (f^{-1})'(5) = \frac{1}{f'(1)} = \frac{2}{3}.$$

- b. In this case, $y_0 = f(x_0) = 2$, which implies that $x_0 = -1$ and $f'(-1) = \frac{1}{2}$.

$$\text{Therefore, } (f^{-1})'(2) = \frac{1}{f'(-1)} = 2.$$

- c. With $y_0 = f(x_0) = 1$, Table 7.1 does not supply a value of x_0 . Therefore, neither $f'(x_0)$ nor $(f^{-1})'(1)$ can be determined.

Related Exercises 53–54 ◀

SECTION 7.1 EXERCISES

Getting Started

- Explain why a function that is not one-to-one on an interval I cannot have an inverse function on I .
- Give an example of a function that is one-to-one on the entire real number line.
- Sketch a graph of a function that is one-to-one on the interval $(-\infty, 0]$ but is not one-to-one on $(-\infty, \infty)$.
- Sketch a graph of a function that is one-to-one on the intervals $(-\infty, -2]$ and $[-2, \infty)$ but is not one-to-one on $(-\infty, \infty)$.
- Find three intervals on which f is one-to-one, making each interval as large as possible.

6. Find four intervals on which f is one-to-one, making each interval as large as possible.

- Find the inverse of the function $f(x) = 2x$. Verify that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.
- Find the inverse of the function $f(x) = \sqrt{x}$. Verify that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

9. Sketch the graph of the inverse of f .

10. Sketch the graph of the inverse of f .

11–12. The parabola $y = x^2 + 1$ consists of two one-to-one functions, $g_1(x)$ and $g_2(x)$. Complete each exercise and confirm that your answers are consistent with the graphs displayed in the figure.

11. Find formulas for $g_1(x)$ and $g_1^{-1}(x)$. State the domain and range of each function.
12. Find formulas for $g_2(x)$ and $g_2^{-1}(x)$. State the domain and range of each function.

13. Use the graph of f to find $f^{-1}(2)$, $f^{-1}(9)$, and $f^{-1}(12)$.

14. Explain how to find $(f^{-1})'(y_0)$ given that $y_0 = f(x_0)$.
15. Suppose f is a one-to-one function with $f(2) = 8$ and $f'(2) = 4$. What is the value of $(f^{-1})'(8)$?
16. Suppose f is a one-to-one function and $y = 3x - 2$ is the line tangent to the graph of f at the point $(1, 3)$. Evaluate $(f^{-1})'(3)$.

Practice Exercises

17–22. Where do inverses exist? Use analytical and/or graphical methods to determine the largest possible sets of points on which the following functions have an inverse.

17. $f(x) = 3x + 4$ 18. $f(x) = |2x + 1|$
19. $f(x) = 1/(x - 5)$ 20. $f(x) = -(6 - x)^2$
21. $f(x) = 1/x^2$ 22. $f(x) = x^2 - 2x + 8$
(Hint: Complete the square.)

23–28. Graphing inverse functions Find the inverse function (on the given interval, if specified) and graph both f and f^{-1} on the same set of axes. Check your work by looking for the required symmetry in the graphs.

23. $f(x) = 8 - 4x$ 24. $f(x) = 3x + 5$
25. $f(x) = \sqrt{x + 2}$ 26. $f(x) = \sqrt{3 - x}$
27. $f(x) = (x - 2)^2 - 1$, for $x \geq 2$
28. $f(x) = x^2 + 4$, for $x \geq 0$

29–36. Finding inverse functions

- a. Find the inverse of each function (on the given interval, if specified) and write it in the form $y = f^{-1}(x)$.
- b. Verify the relationships $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

29. $f(x) = 6 - 4x$ 30. $f(x) = 3x^3$
31. $f(x) = (x - 7)^{5/3}$ 32. $f(x) = x^4 - 16$, for $x \leq 0$
33. $f(x) = 1 - \frac{1}{x}$ 34. $f(x) = 2/(x^2 + 1)$, for $x \geq 0$
35. $f(x) = 6/(x^2 - 9)$, for $x > 3$
36. $f(x) = x/(x - 2)$, for $x > 2$

- 37. Splitting up curves** The unit circle $x^2 + y^2 = 1$ consists of four one-to-one functions, $f_1(x)$, $f_2(x)$, $f_3(x)$, and $f_4(x)$ (see figure).

- a. Find the domain and a formula for each function.
b. Find the inverse of each function and write it as $y = f^{-1}(x)$.

- 38. Splitting up curves** The equation $y^4 = 4x^2$ is associated with four one-to-one functions, $f_1(x)$, $f_2(x)$, $f_3(x)$, and $f_4(x)$ (see figure).

- a. Find the domain and a formula for each function.
b. Find the inverse of each function and write it as $y = f^{-1}(x)$.

- 39–44. Derivatives of inverse functions at a point** Find the derivative of the inverse of the following functions at the specified point on the graph of the inverse function. You do not need to find f^{-1} .

39. $f(x) = 3x + 4$; $(16, 4)$ 40. $f(x) = \frac{1}{2}x + 8$; $(10, 4)$

41. $f(x) = -5x + 4$; $(-1, 1)$

42. $f(x) = x^2 + 1$, for $x \geq 0$; $(5, 2)$

43. $f(x) = \tan x$; $(1, \pi/4)$

44. $f(x) = x^2 - 2x - 3$, for $x \leq 1$; $(12, -3)$

- 45–48. Slopes of tangent lines** Given the function f , find the slope of the line tangent to the graph of f^{-1} at the specified point on the graph of f^{-1} .

45. $f(x) = \sqrt{x}$; $(2, 4)$ 46. $f(x) = x^3$; $(8, 2)$

47. $f(x) = (x + 2)^2$, for $x \geq -2$; $(36, 4)$

48. $f(x) = -x^2 + 8$, for $x \geq 0$; $(7, 1)$

- 49–52. Derivatives and inverse functions**

49. Find $(f^{-1})'(3)$, where $f(x) = x^3 + x + 1$.

50. Suppose the slope of the curve $y = f(x)$ at $(7, 4)$ is $\frac{2}{3}$. Find the slope of the curve $y = f^{-1}(x)$ at $(4, 7)$.

51. Suppose the slope of the curve $y = f^{-1}(x)$ at $(4, 7)$ is $\frac{4}{5}$. Find $f'(7)$.

52. Suppose the slope of the curve $y = f(x)$ at $(4, 7)$ is $\frac{1}{5}$. Find $(f^{-1})'(7)$.

- 53–54. Derivatives of inverse functions from a table** Use the following tables to determine the indicated derivatives or state that the derivative cannot be determined.

53.	x	-2	-1	0	1	2
	$f(x)$	2	3	4	6	7
	$f'(x)$	1	$1/2$	2	$3/2$	1

- a. $(f^{-1})'(4)$ b. $(f^{-1})'(6)$ c. $(f^{-1})'(1)$ d. $f'(1)$

54.	x	-4	-2	0	2	4
	$f(x)$	0	1	2	3	4
	$f'(x)$	5	4	3	2	1

- a. $f'(f(0))$ b. $(f^{-1})'(0)$ c. $(f^{-1})'(1)$ d. $(f^{-1})'(f(4))$

- 55. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- a. If $f(x) = x^2 + 1$, then $f^{-1}(x) = 1/(x^2 + 1)$.
b. If $f(x) = 1/x$, then $f^{-1}(x) = 1/x$.
c. When restricted to the largest possible intervals, the function $f(x) = x^3 + x$ has three different inverses.
d. When restricted to the largest possible intervals, a tenth-degree polynomial could have ten different inverses.
e. If $f(x) = 1/x$, then $(f^{-1})'(x) = -1/x^2$.

- 56. Piecewise linear function** Consider the function $f(x) = |x| - 2|x - 1|$.

- a. Find the largest possible intervals on which f is one-to-one.
b. Find explicit formulas for the inverse of f on the intervals in part (a).

- 57–60. Finding all inverses** Find all the inverses associated with the following functions and state their domains.

57. $f(x) = (x + 1)^3$

58. $f(x) = (x - 4)^2$

59. $f(x) = 2/(x^2 + 2)$

60. $f(x) = 2x/(x + 2)$

- 61–68. Derivatives of inverse functions** Consider the following functions (on the given interval, if specified). Find the inverse function, express it as a function of x , and find the derivative of the inverse function.

61. $f(x) = 3x - 4$

62. $f(x) = |x + 2|$, for $x \leq -2$

63. $f(x) = x^2 - 4$, for $x \geq 0$

64. $f(x) = \frac{x}{x + 5}$

65. $f(x) = \sqrt{x + 2}$

66. $f(x) = x^{2/3}$, for $x \geq 0$

67. $f(x) = x^{-1/2}$

68. $f(x) = x^3 + 3$

- 69–72. Geometry functions** Each function describes the volume V or surface area S of a three-dimensional solid in terms of its radius. Find the inverse of each function that gives the radius in terms of V or S . Assume that r , V , and S are nonnegative. Express your answer in the form $r = f^{-1}(S)$ or $r = f^{-1}(V)$.

69. Sphere: $V = \frac{4}{3}\pi r^3$

70. Sphere: $S = 4\pi r^2$

71. Cylinder with height 10: $V = 10\pi r^2$

72. Cone with height 12: $V = 4\pi r^2$

Explorations and Challenges

- 73. Inverses of a quartic** Consider the quartic polynomial $y = f(x) = x^4 - x^2$.

- Graph f and find the largest intervals on which it is one-to-one. The goal is to find the inverse function on each of these intervals.
- Make the substitution $u = x^2$ to solve the equation $y = f(x)$ for x in terms of y . Be sure you have included all possible solutions.
- Write each inverse function in the form $y = f^{-1}(x)$ for each of the intervals found in part (a).

74. Inverse of composite functions

- Let $g(x) = 2x + 3$ and $h(x) = x^3$. Consider the composite function $f(x) = g(h(x))$. Find f^{-1} directly and then express it in terms of g^{-1} and h^{-1} .
- Let $g(x) = x^2 + 1$ and $h(x) = \sqrt{x}$. Consider the composite function $f(x) = g(h(x))$. Find f^{-1} directly and then express it in terms of g^{-1} and h^{-1} .
- Explain why if g and h are one-to-one, the inverse of $f(x) = g(h(x))$ exists.

75–76. Inverses of (some) cubics Finding the inverse of a cubic polynomial is equivalent to solving a cubic equation. A special case that is

simpler than the general case is the cubic $f(x) = x^3 + ax$. Find the inverse of the following cubics using the substitution (known as Vieta's substitution) $x = z - a/(3z)$. Be sure to determine where the function is one-to-one.

75. $f(x) = x^3 + 2x$

76. $f(x) = x^3 + 4x - 1$

- 77. Tangents and inverses** Suppose $y = L(x) = ax + b$ (with $a \neq 0$) is the equation of the line tangent to the graph of a one-to-one function f at (x_0, y_0) . Also, suppose that $y = M(x) = cx + d$ is the equation of the line tangent to the graph of f^{-1} at (y_0, x_0) .
- Express a and b in terms of x_0 and y_0 .
 - Express c in terms of a , and d in terms of a , x_0 and y_0 .
 - Prove that $L^{-1}(x) = M(x)$.

QUICK CHECK ANSWERS

- 1.** $f^{-1}(x) = 3x$; $f^{-1}(x) = x + 7$ **2.** For every Fahrenheit temperature, there is exactly one Celsius temperature, and vice versa. The given relation is also a linear function. It is one-to-one, so it has an inverse function. **3.** The function $f(x) = x^3$ is one-to-one on $(-\infty, \infty)$, so it has an inverse for all values of x . **4.** $f'(1) = 3$, $(f^{-1})'(1) = \frac{1}{3}$ ◀

7.2 The Natural Logarithmic and Exponential Functions

- Logarithms were invented around 1600 for computational purposes by the Scotsman John Napier and the Englishman Henry Briggs. Unfortunately, the word *logarithm*, derived from the Greek for “reasoning (*logos*) with numbers (*arithmos*),” doesn’t help with the meaning of the word. **When you see *logarithm*, you should think *exponent*.**

Your understanding of logarithms and exponentials as algebraic operations is important, and it will be put to use in the coming pages. For example, you may recall the following relationship that will be used frequently: If b denotes a *base* with $b > 0$ and $b \neq 1$, then

$$y = b^x \quad \text{if and only if} \quad x = \log_b y.$$

However, to do calculus with logarithms and exponentials, we must view them not just as operations, but as functions. Once we define logarithmic and exponential *functions*, many important questions follow.

- What are the domains of b^x and $\log_b x$?
- How do we assign meaning to expressions such as 2^π or $\log_3 \pi$?
- Are these functions continuous on their domains?
- What are their derivatives?
- What new integrals can be evaluated using these functions?

It all begins with the *natural logarithmic function*, which is defined in terms of a definite integral, after which we use the theory of inverse functions (Section 7.1) to develop the *natural exponential function*. Our objective in this section is to place these important functions on a solid foundation by presenting a rigorous development of their properties.

Before embarking on this program, we offer a roadmap to help guide you through the section. We carry out the following three steps.

- 1.** We first define the natural logarithmic function, denoted $\ln x$, in terms of an integral, and then derive the properties of $\ln x$ directly from this new definition.
- 2.** Next, the natural exponential function e^x is introduced as the inverse of $\ln x$, and the properties of e^x are developed by appealing to this inverse relationship. We also present derivative and integral formulas associated with these functions.
- 3.** Finally, we define the general exponential function b^x in terms of e^x so that two crucial properties of the natural logarithmic and exponential functions can be extended to all real numbers. One of these properties is used to derive a limit definition of e that is used to approximate e .

After establishing the properties of the natural logarithmic and exponential functions, we conclude the section with derivative and integral formulas associated with e^x , and we present the technique of logarithmic differentiation.

Step 1: The Natural Logarithm

Our aim is to develop the properties of the natural logarithm using definite integrals. We begin with the following definition.

DEFINITION The Natural Logarithm

The **natural logarithm** of a number $x > 0$ is $\ln x = \int_1^x \frac{1}{t} dt$.

All the familiar geometric and algebraic properties of the natural logarithmic function follow directly from this integral definition.

Properties of the Natural Logarithm

Domain, range, and sign Because the natural logarithm is defined as a definite integral, its value is the net area under the curve $y = 1/t$ between $t = 1$ and $t = x$. The integrand is undefined at $t = 0$, so the domain of $\ln x$ is $(0, \infty)$. On the interval $(1, \infty)$, $\ln x$ is positive because the net area of the region under the curve is positive (Figure 7.14a). On $(0, 1)$, we have $\int_1^x \frac{1}{t} dt = -\int_x^1 \frac{1}{t} dt$, which implies $\ln x$ is negative (Figure 7.14b). As expected, when $x = 1$, we have $\ln 1 = \int_1^1 \frac{1}{t} dt = 0$. The net area interpretation of $\ln x$ also implies that the range of $\ln x$ is $(-\infty, \infty)$. (See Exercise 112 for an outline of a proof.)

Figure 7.14

Derivative The derivative of the natural logarithm follows immediately from its definition and the Fundamental Theorem of Calculus:

$$\frac{d}{dx}(\ln x) = \frac{d}{dx} \int_1^x \frac{1}{t} dt = \frac{1}{x}, \quad \text{for } x > 0.$$

► By the Fundamental Theorem of Calculus,

$$\frac{d}{dx} \int_a^x f(t) dt = f(x).$$

We have two important consequences:

- Because its derivative is defined for $x > 0$, $\ln x$ is a differentiable function for $x > 0$, which means it is continuous on its domain (Theorem 3.1).
- Because $1/x > 0$ for $x > 0$, $\ln x$ is strictly increasing and one-to-one on its domain; therefore, it has a well-defined inverse.

The Chain Rule allows us to extend the derivative property to all nonzero real numbers (Exercise 110). By differentiating $\ln(-x)$ for $x < 0$, we find that

$$\frac{d}{dx}(\ln |x|) = \frac{1}{x}, \quad \text{for } x \neq 0.$$

QUICK CHECK 1 What is the domain of $\ln |x|$? ◀

Figure 7.15

More generally, by the Chain Rule,

$$\frac{d}{dx}(\ln |u(x)|) = \frac{d}{du}(\ln |u(x)|)u'(x) = \frac{u'(x)}{u(x)}.$$

Graph of $\ln x$ As noted before, $\ln x$ is continuous and strictly increasing for $x > 0$. The second derivative, $\frac{d^2}{dx^2}(\ln x) = -\frac{1}{x^2}$, is negative for $x > 0$, which implies the graph of $\ln x$ is concave down for $x > 0$. As demonstrated in Exercise 112,

$$\lim_{x \rightarrow \infty} \ln x = \infty \quad \text{and} \quad \lim_{x \rightarrow 0^+} \ln x = -\infty.$$

This information, coupled with the fact that $\ln 1 = 0$, gives the graph of $y = \ln x$ (Figure 7.15). The graphs of $y = \ln x$, $y = \ln |x|$, and their derivatives are shown in Figure 7.16.

Figure 7.16

Logarithm of a product The familiar logarithm property

$$\ln xy = \ln x + \ln y, \quad \text{for } x > 0, \quad y > 0,$$

may be proved using the integral definition:

$$\begin{aligned} \ln xy &= \int_1^{xy} \frac{dt}{t} && \text{Definition of } \ln xy \\ &= \int_1^x \frac{dt}{t} + \int_x^{xy} \frac{dt}{t} && \text{Additive property of integrals} \\ &= \int_1^x \frac{dt}{t} + \int_1^y \frac{du}{u} && \text{Substitute } u = t/x \text{ in second integral.} \\ &= \ln x + \ln y. && \text{Definition of the natural logarithm} \end{aligned}$$

Logarithm of a quotient Assuming $x > 0$ and $y > 0$, the product property and a bit of algebra give

$$\ln x = \ln \left(y \cdot \frac{x}{y} \right) = \ln y + \ln \frac{x}{y}.$$

Solving for $\ln(x/y)$, we have

$$\ln \frac{x}{y} = \ln x - \ln y,$$

which is the quotient property for logarithms. (Also see Exercise 72.)

Logarithm of a power Assuming $x > 0$ and p is an integer, we have

$$\begin{aligned}\ln x^p &= \int_1^{x^p} \frac{dt}{t} && \text{Definition of } \ln x^p \\ &= p \int_1^x \frac{du}{u} && \text{Let } t = u^p; dt = pu^{p-1} du. \\ &= p \ln x. && \text{By definition, } \ln x = \int_1^x \frac{du}{u}.\end{aligned}$$

This argument relies on the Power Rule ($dt = pu^{p-1} du$), which we proved only for integer exponents in Sections 3.3 and 3.4. Later in this section, we prove that $\ln x^p = p \ln x$ for all real values of p .

Integrals Because $\frac{d}{dx}(\ln |x|) = \frac{1}{x}$, we have

$$\int \frac{1}{x} dx = \ln |x| + C.$$

We have shown that the following properties of $\ln x$ follow from its integral definition.

THEOREM 7.4 Properties of the Natural Logarithm

1. The domain and range of $\ln x$ are $(0, \infty)$ and $(-\infty, \infty)$, respectively.
2. $\ln xy = \ln x + \ln y$, for $x > 0, y > 0$
3. $\ln (x/y) = \ln x - \ln y$, for $x > 0, y > 0$
4. $\ln x^p = p \ln x$, for $x > 0$ and p an integer
5. $\frac{d}{dx}(\ln |x|) = \frac{1}{x}$, for $x \neq 0$
6. $\frac{d}{dx}(\ln |u(x)|) = \frac{u'(x)}{u(x)}$, for $u(x) \neq 0$
7. $\int \frac{1}{x} dx = \ln |x| + C$

EXAMPLE 1 Derivatives involving $\ln x$ Find $\frac{dy}{dx}$ for the following functions.

a. $y = \ln 4x$ b. $y = x \ln x$ c. $y = \ln |\sec x|$ d. $y = \frac{\ln x^2}{x^2}$

SOLUTION

a. Using the Chain Rule,

$$\frac{dy}{dx} = \frac{d}{dx}(\ln 4x) = \frac{1}{4x} \cdot 4 = \frac{1}{x}.$$

An alternative method uses a property of logarithms before differentiating:

$$\begin{aligned}\frac{d}{dx}(\ln 4x) &= \frac{d}{dx}(\ln 4 + \ln x) && \ln xy = \ln x + \ln y \\ &= 0 + \frac{1}{x} = \frac{1}{x}. && \ln 4 \text{ is a constant.}\end{aligned}$$

b. By the Product Rule,

$$\frac{dy}{dx} = \frac{d}{dx}(x \ln x) = 1 \cdot \ln x + x \cdot \frac{1}{x} = \ln x + 1.$$

c. Using property 6 of Theorem 7.4,

$$\frac{dy}{dx} = \frac{1}{\sec x} \left(\frac{d}{dx}(\sec x) \right) = \frac{1}{\sec x} (\sec x \tan x) = \tan x.$$

► Because $\ln x$ and $\ln 4x$ differ by a constant ($\ln 4x = \ln x + \ln 4$), the derivatives of $\ln x$ and $\ln 4x$ are equal.

QUICK CHECK 2 Find $\frac{d}{dx}(\ln x^p)$, where $x > 0$ and p is an integer, in two ways: (1) using the Chain Rule and (2) by first using a property of logarithms. ◀

d. The Quotient Rule and Chain Rule give

$$\frac{dy}{dx} = \frac{x^2 \left(\frac{1}{x^2} \cdot 2x \right) - (\ln x^2) 2x}{(x^2)^2} = \frac{2x - 2x \ln x^2}{x^4} = \frac{2(1 - \ln x^2)}{x^3}.$$

Related Exercises 17–18, 21–22 ◀

EXAMPLE 2 Integrals with $\ln x$ Evaluate $\int_0^4 \frac{x}{x^2 + 9} dx$.

SOLUTION

$$\begin{aligned} \int_0^4 \frac{x}{x^2 + 9} dx &= \frac{1}{2} \int_9^{25} \frac{du}{u} && \text{Let } u = x^2 + 9; du = 2x dx. \\ &= \frac{1}{2} \ln |u| \Big|_9^{25} && \text{Fundamental Theorem} \\ &= \frac{1}{2} (\ln 25 - \ln 9) && \text{Evaluate.} \\ &= \ln \frac{5}{3} && \text{Properties of logarithms} \end{aligned}$$

Related Exercise 44 ◀

Step 2: The Exponential Function

We have established that $f(x) = \ln x$ is a continuous, increasing function on the interval $(0, \infty)$. Therefore, it is one-to-one and its inverse function exists on $(0, \infty)$. We denote the inverse function $f^{-1}(x) = \exp(x)$. Its graph is obtained by reflecting the graph of $f(x) = \ln x$ about the line $y = x$ (Figure 7.17). The domain of $\exp(x)$ is $(-\infty, \infty)$ because the range of $\ln x$ is $(-\infty, \infty)$, and the range of $\exp(x)$ is $(0, \infty)$ because the domain of $\ln x$ is $(0, \infty)$.

Figure 7.17

The usual relationships between a function and its inverse also hold:

- $y = \exp(x)$ if and only if $x = \ln y$
- $\exp(\ln x) = x$, for $x > 0$, and $\ln(\exp(x)) = x$, for all x .

We now appeal to the properties of $\ln x$ and use the inverse relations between $\ln x$ and $\exp(x)$ to show that $\exp(x)$ satisfies the expected properties of any exponential function. For example, if $x_1 = \ln y_1$ and $x_2 = \ln y_2$, then it follows that $y_1 = \exp(x_1)$, $y_2 = \exp(x_2)$, and

$$\begin{aligned}\exp(x_1 + x_2) &= \exp(\underbrace{\ln y_1 + \ln y_2}_{\ln y_1 y_2}) && \text{Substitute } x_1 = \ln y_1, x_2 = \ln y_2. \\ &= \exp(\ln y_1 y_2) && \text{Properties of logarithms} \\ &= y_1 y_2 && \text{Inverse property of } \exp(x) \text{ and } \ln x \\ &= \exp(x_1) \exp(x_2). && y_1 = \exp(x_1), y_2 = \exp(x_2)\end{aligned}$$

Therefore, $\exp(x)$ satisfies the property of exponential functions $b^{x_1+x_2} = b^{x_1}b^{x_2}$. Similar arguments show that $\exp(x)$ satisfies other characteristic properties of exponential functions (Exercise 111):

$$\begin{aligned}\exp(0) &= 1, \\ \exp(x_1 - x_2) &= \frac{\exp(x_1)}{\exp(x_2)}, \quad \text{and} \\ (\exp(x))^p &= \exp(px), \quad \text{for integers } p.\end{aligned}$$

Suspecting that $\exp(x)$ is an exponential function, we proceed to identify its base. Let's consider the real number $\exp(1)$, and with a bit of forethought, call it e . The inverse relationship between $\ln x$ and $\exp(x)$ implies that

$$\text{if } e = \exp(1), \text{ then } \ln e = \ln(\exp(1)) = 1.$$

Using the fact that $\ln e = 1$ and the integral definition of $\ln x$, we now formally define e .

► The constant e was identified and named by the Swiss mathematician Leonhard Euler (1707–1783) (pronounced “oilier”).

DEFINITION The Number e

The number e is the real number that satisfies $\ln e = \int_1^e \frac{dt}{t} = 1$.

Figure 7.18

The number e has the property that the area of the region bounded by the graph of $y = \frac{1}{t}$ and the t -axis on the interval $[1, e]$ is 1 (Figure 7.18). Note that $\ln 2 < 1$ and $\ln 3 > 1$ (Exercise 113). Because $\ln x$ is continuous on its domain, the Intermediate Value Theorem ensures that there is a number e with $2 < e < 3$ such that $\ln e = 1$.

We can now show that indeed $\exp(x)$ is the exponential function e^x . Assume that p is an integer and note that $e^p > 0$. By property 4 of Theorem 7.4 we have

$$\ln e^p = p \underbrace{\ln e}_1 = p.$$

Using the inverse relationship between $\ln x$ and $\exp(x)$, we also know that

$$\ln \exp(p) = p.$$

Equating these two expressions for p , we conclude that $\ln e^p = \ln \exp(p)$. Because $\ln x$ is a one-to-one function, it follows that

$$e^p = \exp(p), \text{ for integers } p,$$

and we conclude that $\exp(x)$ is the exponential function with base e . We already know how to evaluate e^x when x is rational. For example, $e^3 = e \cdot e \cdot e$, $e^{-2} = \frac{1}{e \cdot e}$, and $e^{1/2} = \sqrt{e}$. But how do we evaluate e^x when x is irrational? We proceed as follows. The function $x = \ln y$ is defined for $y > 0$ and its range is all real numbers. Therefore, the domain of its inverse $y = \exp(x)$ is all real numbers; that is, $\exp(x)$ is defined for all real numbers. We now define e^x to be $\exp(x)$ when x is irrational.

► Because $\exp(x)$ is the exponential function with base e , we conclude that its inverse $\ln x$ is the logarithmic function with base e . That is

$$\ln x = \log_e x.$$

DEFINITION The Exponential Function

For real numbers $x, y = e^x = \exp(x)$, where $x = \ln y$.

We may now dispense with the notation $\exp(x)$ and use e^x as the inverse of $\ln x$. The usual inverse relationships between e^x and $\ln x$ hold, and the properties of $\exp(x)$ can now be written for e^x .

THEOREM 7.5 Properties of e^x

The exponential function e^x satisfies the following properties, all of which result from the integral definition of $\ln x$. Let x and y be real numbers.

1. $e^{x+y} = e^x e^y$
2. $e^{x-y} = e^x / e^y$
3. $(e^x)^p = e^{xp}$, where p is an integer
4. $\ln(e^x) = x$, for all x
5. $e^{\ln x} = x$, for $x > 0$

Step 3: General Exponential Functions

It is now a short step to define the exponential function b^x for positive bases with $b \neq 1$ and for all real numbers x . By properties 3 and 5 of Theorem 7.5, if x is an integer, then

$$b^x = \underbrace{(e^{\ln b})^x}_b = e^{x \ln b};$$

this important relationship expresses b^x in terms of e^x . Because e^x is defined for all real x , we use this relationship to define b^x for all real x .

DEFINITION Exponential Functions with General Bases

Let b be a positive real number with $b \neq 1$. Then for all real x ,

$$b^x = e^{x \ln b}.$$

This definition comes with an immediate and important consequence. We use the definition of b^x to write

$$x^p = e^{p \ln x}, \text{ for } x > 0 \text{ and } p \text{ real.}$$

Taking the natural logarithm of both sides and using the inverse relationship between e^x and $\ln x$, we find that

$$\ln x^p = \ln e^{p \ln x} = p \ln x, \text{ for } x > 0 \text{ and } p \text{ real.}$$

In this way, we extend property 4 of Theorem 7.4 to real powers.

QUICK CHECK 3 Simplify $e^{\ln 2x}$, $\ln(e^{2x})$, $e^{2 \ln x}$, and $\ln(2e^x)$. ◀

► Knowing that $\ln x^p = p \ln x$ for real p , we can also extend property 3 of Theorem 7.5 to real numbers. For real x and y , we take the natural logarithm of both sides of $z = (e^x)^y$, which gives $\ln z = y \ln e^x = xy$, or $z = e^{xy}$. Therefore, $(e^x)^y = e^{xy}$.

Approximating e We have shown that the number e serves as a base for both $\ln x$ and e^x , but how do we approximate its value? Recall that the derivative of $\ln x$ at $x = 1$ is 1. By the definition of the derivative, it follows that

► Because $\frac{d}{dx}(\ln x) = \frac{1}{x}$,
 $\left. \frac{d}{dx}(\ln x) \right|_{x=1} = \frac{1}{1} = 1$.

► Here we rely on Theorem 2.11 of Section 2.6. If f is continuous at $g(a)$ and $\lim_{x \rightarrow a} g(x)$ exists, then $\lim_{x \rightarrow a} f(g(x)) = f(\lim_{x \rightarrow a} g(x))$.

$$\begin{aligned} 1 &= \left. \frac{d}{dx}(\ln x) \right|_{x=1} = \lim_{h \rightarrow 0} \frac{\ln(1+h) - \ln 1}{h} && \text{Derivative of } \ln x \text{ at } x = 1 \\ &= \lim_{h \rightarrow 0} \frac{\ln(1+h)}{h} && \ln 1 = 0 \\ &= \lim_{h \rightarrow 0} \ln(1+h)^{1/h}. && p \ln x = \ln x^p \end{aligned}$$

The natural logarithm is continuous for $x > 0$, so it is permissible to interchange the order of $\lim_{h \rightarrow 0}$ and the evaluation of $\ln(1+h)^{1/h}$. The result is that

$$\ln \left(\underbrace{\lim_{h \rightarrow 0} (1+h)^{1/h}}_e \right) = 1.$$

Observe that the limit within the brackets is e because $\ln e = 1$ and only one number satisfies this equation. Therefore, we have isolated e as a limit:

$$e = \lim_{h \rightarrow 0} (1+h)^{1/h}.$$

It is evident from Table 7.2 that $(1+h)^{1/h} \rightarrow 2.718282 \dots$ as $h \rightarrow 0$.

Table 7.2

h	$(1+h)^{1/h}$	h	$(1+h)^{1/h}$
10^{-1}	2.593742	-10^{-1}	2.867972
10^{-2}	2.704814	-10^{-2}	2.731999
10^{-3}	2.716924	-10^{-3}	2.719642
10^{-4}	2.718146	-10^{-4}	2.718418
10^{-5}	2.718268	-10^{-5}	2.718295
10^{-6}	2.718280	-10^{-6}	2.718283
10^{-7}	2.718282	-10^{-7}	2.718282

The value of this limit is e , and it has been computed to millions of digits. A better approximation,

$$e \approx 2.718281828459045,$$

is obtained by methods introduced in Chapter 11.

Derivatives and Integrals

The derivative of the exponential function follows directly from Theorem 7.3 (derivatives of inverse functions) or by using the Chain Rule. Taking the latter course, we observe that $\ln(e^x) = x$ and then differentiate both sides with respect to x :

$$\begin{aligned} \frac{d}{dx}(\ln e^x) &= \frac{d}{dx}(\underbrace{x}_1) \\ \frac{1}{e^x} \frac{d}{dx}(e^x) &= 1 && \frac{d}{dx}(\ln u(x)) = \frac{u'(x)}{u(x)} \text{ (Chain Rule)} \\ \frac{d}{dx}(e^x) &= e^x. && \text{Solve for } \frac{d}{dx}(e^x). \end{aligned}$$

Figure 7.19

► As shown in Example 5a, the integral formula in Theorem 7.6 can be generalized:

$$\int e^{ax} dx = \frac{1}{a} e^{ax} + C.$$

QUICK CHECK 4 What is the slope of the curve $y = e^x$ at $x = \ln 2$? What is the area of the region bounded by the graph of $y = e^x$ and the x -axis between $x = 0$ and $x = \ln 2$? ◀

We obtain the remarkable result that the exponential function is its own derivative, which implies that the line tangent to the graph of $y = e^x$ at $(0, 1)$ has slope 1 (Figure 7.19). It immediately follows that e^x is its own antiderivative up to an arbitrary constant; that is,

$$\int e^x dx = e^x + C.$$

Extending these results using the Chain Rule, we have the following theorem.

THEOREM 7.6 Derivative and Integral of the Exponential Function

For real numbers x ,

$$\frac{d}{dx}(e^{u(x)}) = e^{u(x)}u'(x) \quad \text{and} \quad \int e^x dx = e^x + C.$$

EXAMPLE 3 Derivatives involving exponential functions Evaluate the following derivatives.

a. $\frac{d}{dx}(3e^{2x} - 4e^x + e^{-3x})$ b. $\frac{d}{dt}\left(\frac{e^t}{e^{2t} - 1}\right)$ c. $\frac{d}{dx}(e^{\cos \pi x}) \Big|_{x=1/2}$

SOLUTION

a.
$$\begin{aligned} \frac{d}{dx}(3e^{2x} - 4e^x + e^{-3x}) &= 3 \frac{d}{dx}(e^{2x}) - 4 \frac{d}{dx}(e^x) + \frac{d}{dx}(e^{-3x}) && \text{Sum and Constant} \\ &= 3 \cdot 2 \cdot e^{2x} - 4e^x + (-3)e^{-3x} && \text{Multiple Rules} \\ &= 6e^{2x} - 4e^x - 3e^{-3x} && \text{Chain Rule} \end{aligned}$$

b.
$$\frac{d}{dt}\left(\frac{e^t}{e^{2t} - 1}\right) = \frac{(e^{2t} - 1)e^t - e^t \cdot 2e^{2t}}{(e^{2t} - 1)^2} = -\frac{e^{3t} + e^t}{(e^{2t} - 1)^2} \quad \text{Simplify.}$$

c. First note that by the Chain Rule, we have

$$\frac{d}{dx}(e^{\cos \pi x}) = -\pi \sin \pi x \cdot e^{\cos \pi x}.$$

Therefore,

$$\frac{d}{dx}(e^{\cos \pi x}) \Big|_{x=1/2} = -\pi \underbrace{\sin(\pi/2)}_1 \cdot \underbrace{e^{\cos(\pi/2)}}_{e^0=1} = -\pi.$$

Related Exercises 33, 35, 37 ◀

EXAMPLE 4 Finding tangent lines

- a. Write an equation of the line tangent to the graph of $f(x) = 2x - \frac{e^x}{2}$ at the point $(0, -\frac{1}{2})$.
 b. Find the point(s) on the graph of f where the tangent line is horizontal.

SOLUTION

a. To find the slope of the tangent line at $(0, -\frac{1}{2})$, we first calculate $f'(x)$:

$$\begin{aligned} f'(x) &= \frac{d}{dx}\left(2x - \frac{e^x}{2}\right) \\ &= \frac{d}{dx}(2x) - \frac{d}{dx}\left(\frac{1}{2}e^x\right) && \text{Difference Rule} \\ &= 2 - \frac{1}{2}e^x. && \text{Evaluate derivatives.} \end{aligned}$$

It follows that the slope of the tangent line at $(0, -\frac{1}{2})$ is

$$f'(0) = 2 - \frac{1}{2}e^0 = \frac{3}{2}.$$

Figure 7.20 shows the tangent line passing through $(0, -\frac{1}{2})$; it has the equation

$$y - \left(-\frac{1}{2}\right) = \frac{3}{2}(x - 0) \quad \text{or} \quad y = \frac{3}{2}x - \frac{1}{2}.$$

Figure 7.20

- b. Because the slope of a horizontal tangent line is 0, our goal is to solve $f'(x) = 2 - \frac{1}{2}e^x = 0$. We multiply both sides of this equation by 2 and rearrange to arrive at the equation $e^x = 4$. Taking the natural logarithm of both sides, we find that $x = \ln 4$. Therefore, $f'(x) = 0$ at $x = \ln 4 \approx 1.39$, and f has a horizontal tangent at $(\ln 4, f(\ln 4)) \approx (1.39, 0.77)$ (Figure 7.20).

Related Exercises 39–40 ◀

EXAMPLE 5 Integrals with e^x Evaluate the following integrals.

a. $\int e^{10x} dx$ b. $\int \frac{e^x}{1 + e^x} dx$

SOLUTION

- a. We let $u = 10x$, which implies $du = 10dx$, or $dx = \frac{1}{10} du$:

$$\begin{aligned} \int \underbrace{e^{10x}}_{e^u} \underbrace{dx}_{\frac{1}{10} du} &= \int e^u \frac{1}{10} du && u = 10x, du = 10dx \\ &= \frac{1}{10} \int e^u du && \int cf(x) dx = c \int f(x) dx \\ &= \frac{1}{10} e^u + C && \text{Antiderivative} \\ &= \frac{1}{10} e^{10x} + C. && \text{Replace } u \text{ with } 10x. \end{aligned}$$

The procedure used here can be generalized by replacing 10 with a nonzero constant a to obtain

$$\int e^{ax} dx = \frac{1}{a} e^{ax} + C.$$

b. The change of variables $u = 1 + e^x$ implies $du = e^x dx$:

$$\begin{aligned}\int \underbrace{\frac{1}{1+e^x}}_u \underbrace{e^x dx}_{du} &= \int \frac{1}{u} du && u = 1 + e^x, du = e^x dx \\ &= \ln |u| + C && \text{Antiderivative of } u^{-1} \\ &= \ln(1 + e^x) + C. && \text{Replace } u \text{ by } 1 + e^x.\end{aligned}$$

Note that the absolute value may be removed from $\ln |u|$ because $1 + e^x > 0$, for all x .

Related Exercises 52, 60 ◀

EXAMPLE 6 Arc length of an exponential curve Find the length of the curve $f(x) = 2e^x + \frac{1}{8}e^{-x}$ on the interval $[0, \ln 2]$.

SOLUTION We first calculate $f'(x) = 2e^x - \frac{1}{8}e^{-x}$ and $f'(x)^2 = 4e^{2x} - \frac{1}{2} + \frac{1}{64}e^{-2x}$. The length of the curve on the interval $[0, \ln 2]$ is

$$\begin{aligned}L &= \int_0^{\ln 2} \sqrt{1 + f'(x)^2} dx = \int_0^{\ln 2} \sqrt{1 + (4e^{2x} - \frac{1}{2} + \frac{1}{64}e^{-2x})} dx \\ &= \int_0^{\ln 2} \sqrt{4e^{2x} + \frac{1}{2} + \frac{1}{64}e^{-2x}} dx && \text{Simplify.} \\ &= \int_0^{\ln 2} \sqrt{(2e^x + \frac{1}{8}e^{-x})^2} dx && \text{Factor.} \\ &= \int_0^{\ln 2} (2e^x + \frac{1}{8}e^{-x}) dx && \text{Simplify.} \\ &= (2e^x - \frac{1}{8}e^{-x}) \Big|_0^{\ln 2} = \frac{33}{16}. && \text{Evaluate the integral.}\end{aligned}$$

Related Exercises 61–62 ◀

Logarithmic Differentiation

Products, quotients, and powers of functions are usually differentiated using the derivative rules of the same name (perhaps combined with the Chain Rule). There are times, however, when the direct computation of a derivative is tedious. Consider the function

$$f(x) = \frac{(x^3 - 1)^4 \sqrt{3x - 1}}{x^2 + 4}.$$

► The properties of logarithms needed for logarithmic differentiation (where $x > 0$, $y > 0$, and z is any real number):

1. $\ln xy = \ln x + \ln y$
2. $\ln (x/y) = \ln x - \ln y$
3. $\ln x^z = z \ln x$

All three properties are used in Example 7.

We would need the Quotient, Product, and Chain Rules just to compute $f'(x)$, and simplifying the result would require additional work. The properties of logarithms developed in this section are useful for differentiating such functions.

EXAMPLE 7 Logarithmic differentiation Let $f(x) = \frac{(x^2 + 1)^4 e^x}{x^2 + 4}$ and compute $f'(x)$.

SOLUTION We begin by taking the natural logarithm of both sides and simplifying the result:

$$\begin{aligned}\ln f(x) &= \ln \left(\frac{(x^2 + 1)^4 e^x}{x^2 + 4} \right) \\ &= \ln (x^2 + 1)^4 + \ln e^x - \ln (x^2 + 4) && \ln xy = \ln x + \ln y \\ &= 4 \ln (x^2 + 1) + x - \ln (x^2 + 4). && \ln x^y = y \ln x; \ln e^x = x\end{aligned}$$

We now differentiate both sides using the Chain Rule; specifically, the derivative of the left side is $\frac{d}{dx} (\ln f(x)) = \frac{f'(x)}{f(x)}$. Therefore,

$$\frac{f'(x)}{f(x)} = 4 \cdot \frac{1}{x^2 + 1} \cdot 2x + 1 - \frac{1}{x^2 + 4} \cdot 2x.$$

► In the event that $f(x) \leq 0$ for some values of x , $\ln f(x)$ is not defined. In that case, we generally find the derivative of $|y| = |f(x)|$.

Solving for $f'(x)$, we have

$$f'(x) = f(x) \left(\frac{8x}{x^2 + 1} + 1 - \frac{2x}{x^2 + 4} \right).$$

Finally, we replace $f(x)$ with the original function:

$$f'(x) = \frac{(x^2 + 1)^4 e^x}{x^2 + 4} \left(\frac{8x}{x^2 + 1} - \frac{2x}{x^2 + 4} + 1 \right).$$

Related Exercises 63, 67 ◀

Logarithmic differentiation also provides a method for finding derivatives of tower functions, which are functions of the form $g(x)^{h(x)}$. For example, the derivative of $f(x) = x^x$ is computed as follows, assuming $x > 0$:

$$f(x) = x^x$$

$$\ln f(x) = \ln x^x = x \ln x \quad \text{Take logarithms of both sides; use properties.}$$

$$\frac{1}{f(x)} f'(x) = 1 \cdot \ln x + x \cdot \frac{1}{x} \quad \text{Differentiate both sides.}$$

$$f'(x) = f(x)(\ln x + 1) \quad \text{Solve for } f'(x) \text{ and simplify.}$$

$$f'(x) = x^x (\ln x + 1). \quad \text{Replace } f(x) \text{ with } x^x.$$

SECTION 7.2 EXERCISES

Getting Started

- What are the domain and range of $\ln x$?
- Give a geometrical interpretation of the function $\ln x = \int_1^x \frac{dt}{t}$.
- Differentiate both sides of $x = e^y$ with respect to x to show that $\frac{d}{dx}(\ln x) = \frac{1}{x}$, for $x > 0$.
- Sketch the graph of $f(x) = \ln |x|$ and explain how the graph shows that $f'(x) = 1/x$.
- Show that $\frac{d}{dx}(\ln kx) = \frac{d}{dx}(\ln x)$, where $x > 0$ and k is a positive real number.
- Explain the general procedure of logarithmic differentiation.

7–10. Finding inverse functions Find the inverse $f^{-1}(x)$ of each function.

- $f(x) = e^{2x+6}$
- $f(x) = 4e^{5x}$
- $f(x) = \ln(3x + 1)$
- $f(x) = 1/(e^x + 1)$

11–14. Solving equations Solve the following equations.

- $\ln x = -1$
- $\ln y = 3$
- $e^{3x+1} = 10$
- $e^{-2x} = 6$

- 15. Using inverse relations** One hundred grams of a particular radioactive substance decays according to the function $m(t) = 100e^{-t/650}$, where $t > 0$ measures time in years. When does the mass reach 50 grams?

- 16. Mass of juvenile desert tortoises** In a study conducted at the University of New Mexico, it was found that the mass $m(t)$ (in grams) of juvenile desert tortoises t days after a switch to a particular diet is accurately described by the function $m(t) = m_0 e^{0.004t}$, where m_0 is the mass of the tortoise at the time of the diet switch. According to this function, how long does it take a juvenile desert tortoise to reach a mass of 150 g if it had a mass of 64 g when its diet was switched? (Based on *Physiological and Biochemical Zoology*, 85, 1, 2012)

Practice Exercises

17–38. Derivatives Find the following derivatives.

- $\frac{d}{dx}(\ln 7x)$
- $\frac{d}{dx}(x^2 \ln x)$
- $\frac{d}{dx}(\ln x^2)$
- $\frac{d}{dx}(\ln 2x^8)$
- $\frac{d}{dx}(\ln |\sin x|)$
- $\frac{d}{dx}\left(\frac{\ln x^2}{x}\right)$
- $\frac{d}{dx}\left(\ln\left(\frac{x+1}{x-1}\right)\right)$
- $\frac{d}{dx}(e^x \ln x)$
- $\frac{d}{dx}((x^2 + 1) \ln x)$
- $\frac{d}{dx}(\ln |x^2 - 1|)$
- $\frac{d}{dx}(\ln(\ln x))$
- $\frac{d}{dx}(\ln(\cos^2 x))$
- $\frac{d}{dx}\left(\frac{\ln x}{\ln x + 1}\right)$
- $\frac{d}{dx}\left(\frac{\ln x}{x}\right)$

31. $\frac{d}{dx}\left(\frac{e^x}{e^x + 1}\right)$

32. $\frac{d}{dx}\left(\frac{2e^x - 1}{2e^x + 1}\right)$

33. $\frac{d}{dx}(9e^{-x} - 5e^{2x} - 6e^x)$

34. $\frac{d}{dx}(xe^{-x} - e^{2x})$

35. $\frac{d}{dx}\left(\frac{e^{2x}}{e^{-x} + 2}\right)$

36. $\frac{d}{dx}(\cot e^x)$

37. $\frac{d}{dx}(e^{\sin 2x})\Big|_{x=\pi/4}$

38. $\frac{d}{dx}(\ln(e^{2x} + 1))\Big|_{x=\ln 2}$

39–40. Equations of tangent lines Find an equation of the line tangent to the following curves at the point $(a, f(a))$.

39. $y = \frac{e^x}{4} - x; a = 0$

40. $y = 2e^x - 1; a = \ln 3$

41–60. Integrals Evaluate the following integrals. Include absolute values only when needed.

41. $\int \frac{3}{x-10} dx$

42. $\int \frac{dx}{4x-3}$

43. $\int \left(\frac{2}{x-4} - \frac{3}{2x+1}\right) dx$

44. $\int \frac{x^2}{2x^3+1} dx$

45. $\int_0^3 \frac{2x-1}{x+1} dx$

46. $\int \frac{\sec^2 x}{\tan x} dx$

47. $\int_3^4 \frac{dx}{2x \ln x \ln^3(\ln x)}$

48. $\int_0^{\pi/2} \frac{\sin x}{1+\cos x} dx$

49. $\int \frac{dx}{x \ln x \ln(\ln x)}$

50. $\int_0^1 y \ln^4(y^2+1) dy$

51. $\int \frac{e^{2x} - e^{-2x}}{2} dx$

52. $\int 3e^{-4t} dt$

53. $\int (e^{2x} + 1) dx$

54. $\frac{1}{2} \int_0^{\ln 2} e^x dx$

55. $\int_0^{\ln 3} e^x(e^{3x} + e^{2x} + e^x) dx$

56. $\int (2e^{-10z} + 3e^{5z}) dz$

57. $\int \frac{e^x + e^{-x}}{e^x - e^{-x}} dx$

58. $\int \frac{e^{\sin x}}{\sec x} dx$

59. $\int \frac{e^{\sqrt{x}}}{\sqrt{x}} dx$

60. $\int_{-2}^2 \frac{e^{z/2}}{e^{z/2} + 1} dz$

61–62. Arc length Find the length of the following curves.

61. $x = 2e^{\sqrt{2}y} + \frac{1}{16}e^{-\sqrt{2}y}$, for $0 \leq y \leq \frac{\ln 2}{\sqrt{2}}$

62. $y = \frac{1}{2}(e^x + e^{-x})$, for $-\ln 2 \leq x \leq \ln 2$

63–70. Logarithmic differentiation Use logarithmic differentiation to evaluate $f'(x)$.

63. $f(x) = \frac{(x+1)^{10}}{(2x-4)^8}$

64. $f(x) = x^2 \cos x$

65. $f(x) = x^{\ln x}$

66. $f(x) = \frac{\tan^{10} x}{(5x+3)^6}$

67. $f(x) = \frac{(x+1)^{3/2}(x-4)^{5/2}}{(5x+3)^{2/3}}$

68. $f(x) = \frac{x^8 \cos^3 x}{\sqrt{x-1}}$

69. $f(x) = (\sin x)^{\tan x}$

70. $f(x) = \left(1 + \frac{1}{x}\right)^{2x}$

71. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample. Assume $x > 0$ and $y > 0$.

a. $\ln xy = \ln x + \ln y$.

b. $\ln 0 = 1$.

c. $\ln(x+y) = \ln x + \ln y$.

d. $\frac{d}{dx}(e^3) = e^3$.

e. $\frac{d}{dx}(e^x) = xe^{x-1}$.

f. $\frac{d^n}{dx^n}(e^{3x}) = 3^n e^{3x}$, for any integer $n \geq 1$.

g. The area between the curve $y = 1/x$ and the x -axis on the interval $[1, e]$ is 1.

72. Logarithm properties Use the integral definition of the natural logarithm to prove that $\ln(x/y) = \ln x - \ln y$.

73. Looking ahead: Integrals of $\tan x$ and $\cot x$

Use a change of variables to verify each integral.

a. $\int \tan x dx = -\ln |\cos x| + C = \ln |\sec x| + C$

b. $\int \cot x dx = \ln |\sin x| + C$

74. Behavior at the origin Using calculus and accurate sketches, explain how the graphs of $f(x) = x^p \ln x$ differ as $x \rightarrow 0^+$ for $p = \frac{1}{2}, 1$, and 2 .

75. Average value What is the average value of $f(x) = 1/x$ on the interval $[1, p]$ for $p > 1$? What is the average value of f as $p \rightarrow \infty$?

76–97. Miscellaneous derivatives and integrals. Evaluate the following derivatives and integrals.

76. $\frac{d}{dx}(x^{2x})$

77. $\frac{d}{dx}(e^{-10x^2})$

78. $\frac{d}{dx}(x^{\tan x})$

79. $\frac{d}{dx}(\ln \sqrt{10x})$

80. $\frac{d}{dx}(x^e + e^x)$

81. $\frac{d}{dx}\left(\frac{(x^2+1)(x-3)}{(x+2)^3}\right)$

82. $\frac{d}{dx}(\ln(\sec^4 x \tan^2 x))$

83. $\frac{d}{dx}(\sin(\sin(e^x)))$

84. $\frac{d}{dx}(\sin^2(e^{3x+1}))$

85. $\frac{d}{dx}\left(\frac{xe^x}{x+1}\right)$

86. $\frac{d}{dx}\left(\left(\frac{e^x}{x+1}\right)^8\right)$

87. $\int x^2 e^{x^3} dx$

88. $\int_0^\pi e^{\sin x} \cos x dx$

89. $\int_1^{2e} \frac{e^{\ln x}}{x} dx$

90. $\int \frac{\sin(\ln x)}{4x} dx$

91. $\int_1^{e^2} \frac{\ln^5 x}{x} dx$

92. $\int \frac{\ln^2 x + 2 \ln x - 1}{x} dx$

93. $\int \frac{x}{x-2} dx$ (Hint: Let $u = x - 2$.)

94. $\int_0^{\ln 4} \frac{e^x}{3 + 2e^x} dx$

95. $\int_0^{\pi/6} \frac{\sin 2y}{\sin^2 y + 2} dy$ (Hint: $\sin 2y = 2 \sin y \cos y$.)

96. $\int \frac{e^{2x}}{e^{2x} + 1} dx$

97. $\int \frac{dt}{t \ln t^2}$

98–99. First and second derivative analysis

- Find the critical points of f .
- Use the First Derivative Test to locate the local maximum and minimum values.
- Determine the intervals on which f is concave up or concave down. Identify any inflection points.

98. $f(x) = x^4 e^{-x}$

99. $f(x) = x e^{-x^2/2}$

100–101. Linear approximation

- Find the linear approximation L to the function f at the point a .
- Graph f and L on the same set of axes.
- Use the linear approximation to estimate the given quantity.

100. $f(x) = \ln(1+x)$; $a = 0$; $\ln 1.9$

101. $f(x) = e^{-x}$; $a = \ln 2$; $1/e$

102. Solid of revolution The region bounded by the graphs of $x = 0$, $x = \sqrt{\ln y}$, and $x = \sqrt{2 - \ln y}$ in the first quadrant is revolved about the y -axis. What is the volume of the resulting solid?

Explorations and Challenges

103. Probability as an integral Two points P and Q are chosen randomly, one on each of two adjacent sides of a unit square (see figure). What is the probability that the area of the triangle formed by the sides of the square and the line segment PQ is less than one-fourth the area of the square? Begin by showing that x and y must satisfy $xy < \frac{1}{2}$ in order for the area condition to be met.

Then argue that the required probability is $\frac{1}{2} + \int_{1/2}^1 \frac{dx}{2x}$ and evaluate the integral.

104–107. Logistic growth Scientists often use the logistic growth function $P(t) = \frac{P_0 K}{P_0 + (K - P_0)e^{-r_0 t}}$ to model population growth,

where P_0 is the initial population at time $t = 0$, K is the **carrying capacity**, and r_0 is the **base growth rate**. The carrying capacity is a theoretical upper bound on the total population that the surrounding

environment can support. The figure shows the sigmoid (S -shaped) curve associated with a typical logistic model.

T 104. Population crash The logistic model can be used for situations in which the initial population P_0 is above the carrying capacity K . For example, consider a deer population of 1500 on an island where a fire has reduced the carrying capacity to 1000 deer.

- Assuming a base growth rate of $r_0 = 0.1$ and an initial population of $P(0) = 1500$, write a logistic growth function for the deer population and graph it. Based on the graph, what happens to the deer population in the long run?
- How fast (in deer per year) is the population declining immediately after the fire at $t = 0$?
- How long does it take the deer population to decline to 1200 deer?

T 105. Gone fishing When a reservoir is created by a new dam, 50 fish are introduced into the reservoir, which has an estimated carrying capacity of 8000 fish. A logistic model of the fish population is

$$P(t) = \frac{400,000}{50 + 7950e^{-0.5t}}, \text{ where } t \text{ is measured in years.}$$

- Graph P using a graphing utility. Experiment with different windows until you produce an S -shaped curve characteristic of the logistic model. What window works well for this function?
- How long does it take the population to reach 5000 fish? How long does it take the population to reach 90% of the carrying capacity?
- How fast (in fish per year) is the population growing at $t = 0$? At $t = 5$?
- Graph P' and use the graph to estimate the year in which the population is growing fastest.

T 106. World population (part 1) The population of the world reached 6 billion in 1999 ($t = 0$). Assume Earth's carrying capacity is 15 billion and the base growth rate is $r_0 = 0.025$ per year.

- Write a logistic growth function for the world's population (in billions), and graph your equation on the interval $0 \leq t \leq 200$ using a graphing utility.
- What will the population be in the year 2020? When will it reach 12 billion?

107. World population (part 2) The *relative growth rate* r of a function f measures the rate of change of the function compared to its value at a particular point. It is computed as $r(t) = f'(t)/f(t)$.

- Confirm that the relative growth rate in 1999 ($t = 0$) for the logistic model in Exercise 106 is $r(0) = P'(0)/P(0) = 0.015$. This means the world's population was growing at 1.5% per year in 1999.

- b. Compute the relative growth rate of the world's population in 2010 and 2020. What appears to be happening to the relative growth rate as time increases?
- c. Evaluate $\lim_{t \rightarrow \infty} r(t) = \lim_{t \rightarrow \infty} \frac{P'(t)}{P(t)}$, where $P(t)$ is the logistic growth function from Exercise 106. What does your answer say about populations that follow a logistic growth pattern?
- 108. Snowplow problem** With snow on the ground and falling at a constant rate, a snowplow began plowing down a long straight road at noon. The plow traveled twice as far in the first hour as it did in the second hour. At what time did the snow start falling? Assume the plowing rate is inversely proportional to the depth of the snow.
- 109. Depletion of natural resources** Suppose that $r(t) = r_0 e^{-kt}$, with $k > 0$, is the rate at which a nation extracts oil, where $r_0 = 10^7$ barrels/yr is the current rate of extraction. Suppose also that the estimate of the total oil reserve is 2×10^9 barrels.
- Find $Q(t)$, the total amount of oil extracted by the nation after t years.
 - Evaluate $\lim_{t \rightarrow \infty} Q(t)$ and explain the meaning of this limit.
 - Find the minimum decay constant k for which the total oil reserves will last forever.
 - Suppose $r_0 = 2 \times 10^7$ barrels/yr and the decay constant k is the minimum value found in part (c). How long will the total oil reserves last?
- 110. Derivative of $\ln |x|$** Differentiate $\ln x$ for $x > 0$ and differentiate $\ln(-x)$ for $x < 0$ to conclude that $\frac{d}{dx}(\ln |x|) = \frac{1}{x}$.
- 111. Properties of e^x** Use the inverse relations between $\ln x$ and e^x ($\exp(x)$) and the properties of $\ln x$ to prove the following properties.
- $\exp(0) = 1$
 - $\exp(x - y) = \frac{\exp(x)}{\exp(y)}$
 - $(\exp(x))^p = \exp(px)$, where p is an integer
- 112. $\ln x$ is unbounded** Use the following argument to show that $\lim_{x \rightarrow \infty} \ln x = \infty$ and $\lim_{x \rightarrow 0^+} \ln x = -\infty$.
- Make a sketch of the function $f(x) = 1/x$ on the interval $[1, 2]$. Explain why the area of the region bounded by $y = f(x)$ and the x -axis on $[1, 2]$ is $\ln 2$.
 - Construct a rectangle over the interval $[1, 2]$ with height $\frac{1}{2}$. Explain why $\ln 2 > \frac{1}{2}$.
- c. Show that $\ln 2^n > n/2$ and $\ln 2^{-n} < -n/2$.
- d. Conclude that $\lim_{x \rightarrow \infty} \ln x = \infty$ and $\lim_{x \rightarrow 0^+} \ln x = -\infty$.
- 113. Bounds on e** Use a left Riemann sum with at least $n = 2$ subintervals of equal length to approximate $\ln 2 = \int_1^2 \frac{dt}{t}$ and show that $\ln 2 < 1$. Use a right Riemann sum with $n = 7$ subintervals of equal length to approximate $\ln 3 = \int_1^3 \frac{dt}{t}$ and show that $\ln 3 > 1$.
- 114. Alternative proof of product property** Assume that $y > 0$ is fixed and that $x > 0$. Show that $\frac{d}{dx}(\ln xy) = \frac{d}{dx}(\ln x)$. Recall that if two functions have the same derivative, then they differ by an additive constant. Set $x = 1$ to evaluate the constant and prove that $\ln xy = \ln x + \ln y$.
- 115. Harmonic sum** In Chapter 10, we will encounter the harmonic sum $1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}$. Use a left Riemann sum to approximate $\int_1^{n+1} \frac{dx}{x}$ (with unit spacing between the grid points) to show that $1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} > \ln(n+1)$. Use this fact to conclude that $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}\right)$ does not exist.
- 116. Tangency question** It is easily verified that the graphs of $y = x^2$ and $y = e^x$ have no point of intersection (for $x > 0$), and the graphs of $y = x^3$ and $y = e^x$ have two points of intersection. It follows that for some real number $2 < p < 3$, the graphs of $y = x^p$ and $y = e^x$ have exactly one point of intersection (for $x > 0$). Using analytical and/or graphical methods, determine p and the coordinates of the single point of intersection.
- 117. Property of exponents** Prove that for real numbers x, a , and $b \neq 0$, $\left(\frac{a}{b}\right)^x = \frac{a^x}{b^x}$.

QUICK CHECK ANSWERS

- $\{x: x \neq 0\}$

7.3 Logarithmic and Exponential Functions with Other Bases

In Section 7.2, we briefly introduced the general exponential function b^x for theoretical purposes, defining it in terms of the base e . It turns out that situations occasionally arise in which it is more convenient to work with bases other than e . In this section, we develop the properties of the function b^x and its inverse, which is the logarithmic function $\log_b x$, where the base b is a positive number with $b \neq 1$. Derivatives and integrals associated with these important functions follow from their relationship to the natural exponential and logarithmic functions. We also return to the Power Rule $\left(\frac{d}{dx}(x^p) = px^{p-1}\right)$ from Chapter 3, now armed with the tools to show that it holds for all real powers p .

QUICK CHECK 1 Is it possible to raise a positive number b to a power and obtain a negative number? Is it possible to obtain zero? ◀

General Exponential Functions

Recall from Section 7.2 that the general exponential function b^x is defined for all real numbers x in terms of the base e :

$$b^x = e^{x \ln b}, \text{ where the base } b \text{ is positive, with } b \neq 1.$$

We begin by establishing the properties of this family of functions.

Properties of $f(x) = b^x$

1. Because $f(x) = b^x$ is defined for all real numbers, the domain of f is $(-\infty, \infty)$. Because $b^x = e^{x \ln b}$ and the range of e^x is $(0, \infty)$, the range of f is $(0, \infty)$.
2. For all $b > 0$, $b^0 = e^{0 \ln b} = 1$. Therefore, $f(0) = 1$.
3. If $b > 1$, then $\ln b > 0$ and $b^x = e^{x \ln b}$ is an increasing function (Figure 7.21). For example, if $b = 2$, then $2^x > 2^y$ whenever $x > y$.

Figure 7.21

Figure 7.22

► The proof of the property

$$\left(\frac{a}{b}\right)^x = \frac{a^x}{b^x}$$

was considered in Exercise 117 of Section 7.2.

QUICK CHECK 2 Explain why $f(x) = (1/3)^x$ is a decreasing function. ◀

4. If $0 < b < 1$, then $\ln b < 0$ and $b^x = e^{x \ln b}$ is a decreasing function (Figure 7.22).

For example, if $b = \frac{1}{2}$, then

$$f(x) = \left(\frac{1}{2}\right)^x = \frac{1}{2^x} = 2^{-x},$$

and because 2^x increases with x , 2^{-x} decreases with x .

The graphs of b^x for various values of b are horizontal scalings of the graph of $y = e^x$ (recall from Section 1.2 that the graph of $y = f(ax)$ is a horizontal scaling of the graph of $y = f(x)$ and note that $b^x = e^{x \ln b}$).

General Logarithmic Functions

Everything we learned about inverse functions is now applied to the exponential function $f(x) = b^x$. For any $b > 0$, with $b \neq 1$, this function is one-to-one on the interval $(-\infty, \infty)$. Therefore, it has an inverse.

DEFINITION Logarithmic Function Base b

For any base $b > 0$, with $b \neq 1$, the **logarithmic function base b** , denoted $\log_b x$, is the inverse of the exponential function b^x .

The inverse relationship between logarithmic and exponential functions may be stated concisely in several ways. First, we have

$$y = \log_b x \quad \text{if and only if} \quad b^y = x.$$

Combining these two conditions results in two important relations.

Inverse Relations for Exponential and Logarithmic Functions

For any base $b > 0$, with $b \neq 1$, the following inverse relations hold.

- I1.** $b^{\log_b x} = x$, for $x > 0$
- I2.** $\log_b b^x = x$, for all x

The graph of the logarithmic function is generated using the symmetry of the graphs of a function and its inverse. **Figure 7.23** shows how the graph of $y = b^x$, for $b > 1$, is reflected across the line $y = x$ to obtain the graph of $y = \log_b x$.

Figure 7.23

The graphs of $y = \log_b x$ are shown (**Figure 7.24**) for several bases $b > 1$. Logarithms with bases $0 < b < 1$, although well defined, are generally not used (and they can be expressed in terms of bases with $b > 1$).

Figure 7.24

Logarithmic functions with base $b > 0$ satisfy properties that parallel the properties of the exponential functions given earlier.

Properties of $\log_b x$

1. Because the range of b^x is $(0, \infty)$, the domain of $\log_b x$ is $(0, \infty)$.
2. The domain of b^x is $(-\infty, \infty)$, which implies that the range of $\log_b x$ is $(-\infty, \infty)$.
3. Because $b^0 = 1$, it follows that $\log_b 1 = 0$.
4. If $b > 1$, then $\log_b x$ is an increasing function of x . For example, if $b = e$, then $\ln x > \ln y$ whenever $x > y$ (Figure 7.24).

QUICK CHECK 3 What is the domain of $f(x) = \log_b(x^2)$? What is the range of $f(x) = \log_b(x^2)$? ◀

EXAMPLE 1 Using inverse relations One thousand grams of a particular radioactive substance decays according to the function $m(t) = 1000e^{-t/850}$, where $t \geq 0$ measures time in years and m is measured in grams.

- a. When does the mass of the substance reach the safe level, deemed to be 1 g?
- b. Write the mass function with a base of $\frac{1}{2}$.

SOLUTION

► Provided the arguments are positive, we can take the $\log_b$ of both sides of an equation and produce an equivalent equation.

- a. Setting $m(t) = 1$, we solve $1000e^{-t/850} = 1$ by dividing both sides by 1000 and taking the natural logarithm of both sides:

$$\ln(e^{-t/850}) = \ln \frac{1}{1000}.$$

This equation is simplified by calculating $\ln(1/1000) \approx -6.908$ and observing that

$$\ln(e^{-t/850}) = -\frac{t}{850} \text{ (inverse property I2). Therefore,}$$

$$-\frac{t}{850} \approx -6.908,$$

which implies that $t \approx (-850)(-6.908) \approx 5872$ years.

- b. We seek a function $p(t)$ such that $m(t) = 1000e^{-t/850} = 1000\left(\frac{1}{2}\right)^{p(t)}$. Canceling 1000 and taking the natural logarithm of both sides, we proceed as follows:

$$\begin{aligned} \ln(e^{-t/850}) &= \ln\left(\frac{1}{2}\right)^{p(t)} \\ -\frac{t}{850} &= p(t) \ln \frac{1}{2} = -p(t) \ln 2 && \text{Properties of logarithms} \\ p(t) &= \frac{t}{850 \ln 2}. && \text{Solve for } p(t). \end{aligned}$$

The mass function can be written $m(t) = 1000\left(\frac{1}{2}\right)^{t/(850 \ln 2)}$, which says that when t increases by $850 \ln 2 \approx 589$ years, the mass decreases by a factor of $\frac{1}{2}$.

Related Exercises 15, 18 ◀

The Derivative of b^x

A rule similar to $\frac{d}{dx}(e^x) = e^x$ exists for computing the derivative of b^x , where $b > 0$. Because $b^x = e^{x \ln b}$, the derivative of b^x is

$$\frac{d}{dx}(b^x) = \frac{d}{dx}(e^{x \ln b}) = \underbrace{e^{x \ln b}}_{b^x} \cdot \ln b. \quad \text{Chain Rule}$$

► Check that when $b = e$, Theorem 7.7 becomes

$$\frac{d}{dx}(e^x) = e^x$$

Noting that $e^{x \ln b} = b^x$ results in the following theorem.

THEOREM 7.7 Derivative of b^x
If $b > 0$ and $b \neq 1$, then for all x ,
$$\frac{d}{dx}(b^x) = b^x \ln b.$$

Figure 7.25

Notice that when $b > 1$, $\ln b > 0$ and the graph of $y = b^x$ has tangent lines with positive slopes for all x . When $0 < b < 1$, $\ln b < 0$ and the graph of $y = b^x$ has tangent lines with negative slopes for all x . In either case, the tangent line at $(0, 1)$ has slope $\ln b$ (Figure 7.25).

EXAMPLE 2 Derivatives with b^x Find the derivative of the following functions.

- a. $f(x) = 3^x$ b. $g(t) = 108 \cdot 2^{t/12}$

SOLUTION

- a. Using Theorem 7.7, $f'(x) = 3^x \ln 3$.

b.

$$\begin{aligned} g'(t) &= 108 \frac{d}{dt}(2^{t/12}) && \text{Constant Multiple Rule} \\ &= 108 \cdot \ln 2 \cdot 2^{t/12} \underbrace{\frac{d}{dt}\left(\frac{t}{12}\right)}_{1/12} && \text{Chain Rule} \\ &= 9 \ln 2 \cdot 2^{t/12} && \text{Simplify.} \end{aligned}$$

Related Exercises 23–25 ◀

EXAMPLE 3 An exponential model Table 7.3 and Figure 7.26 show how the incidence of Down syndrome in newborn infants increases with the age of the mother.

Table 7.3

Mother's Age	Incidence of Down Syndrome	Decimal Equivalent

49	1 in 12	0.08333

(Based on E.G. Hook and A. Lindsjo, *The American Journal of Human Genetics*, 30, Jan 1978)

Figure 7.26

► The model in Example 3 was created using a method called *exponential regression*. The parameters A and B are chosen so that the function $P(a) = A \cdot B^a$ fits the data as closely as possible.

The data can be modeled with the exponential function $P(a) = \frac{1}{1,613,000} 1.2733^a$, where a is the age of the mother (in years) and $P(a)$ is the incidence (number of children with Down syndrome per total births).

- According to the model, at what age is the incidence of Down syndrome equal to 0.01 (that is, 1 in 100)?
- Compute $P'(a)$.
- Find $P'(35)$ and $P'(46)$, and interpret each.

SOLUTION

- We let $P(a) = 0.01$ and solve for a :

$$0.01 = \frac{1}{1,613,000} 1.2733^a$$

$$\ln 16,130 = \ln (1.2733^a)$$

$$\ln 16,130 = a \ln 1.2733$$

$$a = \frac{\ln 16,130}{\ln 1.2733} \approx 40 \text{ (years old).}$$

Multiply both sides by 1,613,000 and take logarithms of both sides.
Property of logarithms

Solve for a .

$$\begin{aligned} \text{b. } P'(a) &= \frac{1}{1,613,000} \frac{d}{da} (1.2733^a) \\ &= \frac{1}{1,613,000} 1.2733^a \ln 1.2733 \\ &\approx \frac{1}{6,676,000} 1.2733^a \end{aligned}$$

- The derivative measures the rate of change of the incidence with respect to age. For a 35-year-old woman,

$$P'(35) = \frac{1}{6,676,000} 1.2733^{35} \approx 0.0007,$$

which means the incidence increases at a rate of about 0.0007/year. By age 46, the rate of change is

$$P'(46) = \frac{1}{6,676,000} 1.2733^{46} \approx 0.01,$$

which is a significant increase over the rate of change of the incidence at age 35.

QUICK CHECK 4 Suppose

$A = 500(1.045)^t$. Compute $\frac{dA}{dt}$. ◀

Integral of b^x

The fact that $\frac{d}{dx}(b^x) = b^x \ln b$ leads immediately to the following indefinite integral result.

THEOREM 7.8 Indefinite integral of b^x

For $b > 0$ and $b \neq 1$, $\int b^x dx = \frac{1}{\ln b} b^x + C$.

EXAMPLE 4 Integrals involving exponentials with other bases Evaluate the following integrals.

a. $\int x 3^{x^2} dx$ b. $\int_1^4 \frac{6^{-\sqrt{x}}}{\sqrt{x}} dx$

SOLUTION

a. $\int x 3^{x^2} dx = \frac{1}{2} \int 3^u du \quad u = x^2, du = 2x dx$
 $= \frac{1}{2} \frac{1}{\ln 3} 3^u + C$ Integrate.
 $= \frac{1}{2 \ln 3} 3^{x^2} + C$ Substitute $u = x^2$.

b. $\int_1^4 \frac{6^{-\sqrt{x}}}{\sqrt{x}} dx = -2 \int_{-1}^{-2} 6^u du \quad u = -\sqrt{x}, du = -\frac{1}{2\sqrt{x}} dx$
 $= -\frac{2}{\ln 6} 6^u \Big|_{-1}^{-2}$ Fundamental Theorem
 $= \frac{5}{18 \ln 6}$ Simplify.

Related Exercises 40, 43 ◀

The General Power Rule

In Theorem 3.8 of Section 3.4, we claimed that the Power Rule for derivatives, $\frac{d}{dx}(x^p) = px^{p-1}$, is valid for real powers p . We now have the tools to prove this important result.

THEOREM 7.9 General Power Rule

For real numbers p and for $x > 0$,

$$\frac{d}{dx}(x^p) = px^{p-1}.$$

Furthermore, if u is a positive differentiable function on its domain, then

$$\frac{d}{dx}(u(x)^p) = p(u(x))^{p-1} \cdot u'(x).$$

Proof: For $x > 0$ and real numbers p , the derivative of x^p is computed as follows:

$$\begin{aligned} \frac{d}{dx}(x^p) &= \frac{d}{dx}(e^{p \ln x}) & x^p &= e^{p \ln x} \\ &= \underbrace{e^{p \ln x}}_{x^p} \cdot \frac{p}{x} & \text{Chain Rule; } \frac{d}{dx}(p \ln x) &= p \cdot \frac{1}{x} \\ &= x^p \cdot \frac{p}{x} & e^{p \ln x} &= x^p \\ &= px^{p-1}. & \text{Simplify.} \end{aligned}$$

We see that $\frac{d}{dx}(x^p) = px^{p-1}$, for all real powers p . The second part of the General Power Rule follows from the Chain Rule. ▶

EXAMPLE 5 Computing derivatives Find the derivative of the following functions.

a. $y = x^\pi$ b. $y = \pi^x$ c. $y = (x^2 + 4)^e$

SOLUTION

a. With $y = x^\pi$, we have a power function with an irrational exponent; by the General Power Rule,

$$\frac{dy}{dx} = \pi x^{\pi-1}, \quad \text{for } x > 0.$$

b. Here we have an exponential function with base $b = \pi$. By Theorem 7.7,

$$\frac{dy}{dx} = \pi^x \ln \pi.$$

c. The Chain Rule and General Power Rule are required:

$$\frac{dy}{dx} = e(x^2 + 4)^{e-1} \cdot 2x = 2ex(x^2 + 4)^{e-1}.$$

Because $x^2 + 4 > 0$ for all x , the result is valid for all x .

Related Exercises 45–46 ◀

► Recall that power functions have the variable in the base, while exponential functions have the variable in the exponent.

► Recall that the derivative of the tower function $f(x) = x^x$ was determined using logarithmic differentiation in Section 7.2. Examples 6 and 7 offer an alternative method for differentiating such functions. Either method is acceptable; in fact, they are equivalent.

Functions of the form $f(x) = (g(x))^{h(x)}$, where both g and h are nonconstant functions, are neither exponential functions nor power functions (they are sometimes called *tower functions*). To compute their derivatives, we use the identity $b^x = e^{x \ln b}$ to rewrite f with base e :

$$f(x) = (g(x))^{h(x)} = e^{h(x) \ln g(x)}.$$

This function carries the restriction $g(x) > 0$. The derivative of f is then computed using the methods developed in this section.

EXAMPLE 6 Tower function Let $f(x) = x^{\sin x}$, for $x > 0$.

a. Find $f'(x)$. b. Evaluate $f'\left(\frac{\pi}{2}\right)$.

SOLUTION

a. The key step is to use $b^x = e^{x \ln b}$ to write f in the form

$$f(x) = x^{\sin x} = e^{(\sin x) \ln x}.$$

We now differentiate:

$$\begin{aligned} f'(x) &= e^{\sin x \ln x} \frac{d}{dx}((\sin x) \ln x) && \text{Chain Rule} \\ &= \underbrace{e^{(\sin x) \ln x}}_{x^{\sin x}} \left((\cos x) \ln x + \frac{\sin x}{x} \right) && \text{Product Rule} \\ &= x^{\sin x} \left((\cos x) \ln x + \frac{\sin x}{x} \right). \end{aligned}$$

b. Letting $x = \frac{\pi}{2}$, we find that

$$\begin{aligned} f'\left(\frac{\pi}{2}\right) &= \left(\frac{\pi}{2}\right)^{\sin(\pi/2)} \left(\underbrace{\left(\cos \frac{\pi}{2}\right)}_0 \ln \frac{\pi}{2} + \underbrace{\frac{\sin(\pi/2)}{\pi/2}}_{2/\pi} \right) && \text{Substitute } x = \frac{\pi}{2}. \\ &= \frac{\pi}{2} \left(0 + \frac{2}{\pi} \right) = 1. \end{aligned}$$

Related Exercises 51–52 ◀

EXAMPLE 7 Finding a horizontal tangent line Determine whether the graph of $f(x) = x^x$, for $x > 0$, has any horizontal tangent lines.

SOLUTION A horizontal tangent occurs when $f'(x) = 0$. To find the derivative, we first write $f(x) = x^x = e^{x \ln x}$:

$$\begin{aligned}\frac{d}{dx}(x^x) &= \frac{d}{dx}(e^{x \ln x}) \\ &= \underbrace{e^{x \ln x}}_{x^x} \left(1 \cdot \ln x + x \cdot \frac{1}{x} \right) && \text{Chain Rule; Product Rule} \\ &= x^x (\ln x + 1). && \text{Simplify; } e^{x \ln x} = x^x.\end{aligned}$$

The equation $f'(x) = 0$ implies that $x^x = 0$ or $\ln x + 1 = 0$. The first equation has no solution because $x^x = e^{x \ln x} > 0$, for all $x > 0$. We solve the second equation, $\ln x + 1 = 0$, as follows:

$$\begin{aligned}\ln x &= -1 \\ e^{\ln x} &= e^{-1} && \text{Exponentiate both sides.} \\ x &= \frac{1}{e}. && e^{\ln x} = x\end{aligned}$$

Therefore, the graph of $f(x) = x^x$ has a single horizontal tangent at $(e^{-1}, f(e^{-1})) \approx (0.368, 0.692)$. Using the First Derivative Test and Theorem 4.9, we could verify what the graph of f shows (**Figure 7.27**): The absolute minimum of f occurs at $x = 1/e$.

Related Exercises 69–70 ◀

Figure 7.27

Derivatives of General Logarithmic Functions

The general exponential function $f(x) = b^x$ is one-to-one when $b > 0$ with $b \neq 1$. The inverse function $f^{-1}(x) = \log_b x$ is the logarithmic function with base b . To find the derivative of the logarithmic function, we begin with the inverse relationship

$$y = \log_b x \iff x = b^y.$$

Differentiating both sides of $x = b^y$ with respect to x , we obtain

$$\begin{aligned}1 &= b^y \ln b \cdot \frac{dy}{dx} && \text{Implicit differentiation} \\ \frac{dy}{dx} &= \frac{1}{b^y \ln b} && \text{Solve for } \frac{dy}{dx}. \\ \frac{dy}{dx} &= \frac{1}{x \ln b}. && b^y = x\end{aligned}$$

► An alternative proof of Theorem 7.10 uses the change-of-base formula $\log_b x = \frac{\ln x}{\ln b}$ (see Exercise 112 for a proof of this formula). Differentiating both sides of this equation gives the same result.

QUICK CHECK 5 Compute dy/dx for $y = \log_3 x$. ◀

THEOREM 7.10 Derivative of $\log_b x$

If $b > 0$ and $b \neq 1$, then

$$\frac{d}{dx}(\log_b x) = \frac{1}{x \ln b}, \quad \text{for } x > 0 \quad \text{and} \quad \frac{d}{dx}(\log_b |x|) = \frac{1}{x \ln b}, \quad \text{for } x \neq 0.$$

EXAMPLE 8 Derivatives with general logarithms Compute the derivative of the following functions.

- a. $f(x) = \log_5(2x + 1)$ b. $T(n) = n \log_2 n$

SOLUTION

a. We use Theorem 7.10 with the Chain Rule assuming $2x + 1 > 0$:

$$f'(x) = \frac{1}{(2x + 1) \ln 5} \cdot 2 = \frac{2}{\ln 5} \cdot \frac{1}{2x + 1} \quad \text{Chain Rule}$$

b.
$$T'(n) = \log_2 n + n \cdot \frac{1}{n \ln 2} = \log_2 n + \frac{1}{\ln 2} \quad \text{Product Rule}$$

► The function in Example 8b is used in computer science as an estimate on the computing time needed to carry out a *sorting algorithm* on a list of n items.

QUICK CHECK 6 Show that the derivative computed in Example 8b can be expressed in base 2 as $T'(n) = \log_2(en)$. ◀

We can change bases and write the result in base e :

$$T'(n) = \frac{\ln n}{\ln 2} + \frac{1}{\ln 2} = \frac{\ln n + 1}{\ln 2}.$$

SECTION 7.3 EXERCISES**Getting Started**

- State the derivative rule for the exponential function $f(x) = b^x$. How does it differ from the derivative formula for e^x ?
- State the derivative rule for the logarithmic function $f(x) = \log_b x$. How does it differ from the derivative formula for $\ln x$?
- Explain why $b^x = e^{x \ln b}$.
- Express the function $f(x) = g(x)^{h(x)}$ in terms of the natural logarithmic and natural exponential functions (base e).
- Evaluate $\frac{d}{dx}(7^x)$.
- What is the inverse function of b^x , and what are its domain and range?
- Express 3^x , x^π , and $x^{\sin x}$ using the base e .
- Evaluate $\int 4^x dx$.
- Evaluate $\frac{d}{dx}(x^e)$ and $\frac{d}{dx}(e^x)$.
- Evaluate $\int x^\pi dx$ and $\int \pi^x dx$.

31. $y = 2^{3 + \sin x}$

32. $y = 10^{\ln 2x}$

33. $y = \frac{2^x}{2^x + 1}$

34. $y = 10^x(\ln 10^x - 1)$

35. **Exponential model** The following table shows the *time of useful consciousness* at various altitudes in the situation where a pressurized airplane suddenly loses pressure. The change in pressure drastically reduces available oxygen, and hypoxia sets in. The upper value of each time interval is roughly modeled by $T = 10 \cdot 2^{-0.274a}$, where T measures time in minutes and a is the altitude over 22,000 in thousands of feet ($a = 0$ corresponds to 22,000 ft).

Altitude (in ft)	Time of Useful Consciousness
22,000	5 to 10 min
25,000	3 to 5 min
28,000	2.5 to 3 min
30,000	1 to 2 min
35,000	30 to 60 s
40,000	15 to 20 s
45,000	9 to 15 s

- A Learjet flying at 38,000 ft ($a = 16$) suddenly loses pressure when the seal on a window fails. According to this model, how long do the pilot and passengers have to deploy oxygen masks before they become incapacitated?
- What is the average rate of change of T with respect to a over the interval from 24,000 to 30,000 ft (include units)?
- Find the instantaneous rate of change dT/da , compute it at 30,000 ft, and interpret its meaning.

36. **Magnitude of an earthquake** The energy (in joules) released by an earthquake of magnitude M is given by the equation $E = 25,000 \cdot 10^{1.5M}$. (This equation can be solved for M to define the magnitude of a given earthquake; it is a refinement of the original Richter scale created by Charles Richter in 1935.)

- Compute the energy released by earthquakes of magnitude 1, 2, 3, 4, and 5. Plot the points on a graph and join them with a smooth curve.
- Compute dE/dM and evaluate it for $M = 3$. What does this derivative mean? (M has no units, so the units of the derivative are J per change in magnitude.)

Practice Exercises

11–22. Solving equations Solve the following equations.

- $\log_{10} x = 3$
- $\log_5 x = -1$
- $\log_8 x = \frac{1}{3}$
- $\log_b 125 = 3$
- $7^x = 21$
- $2^x = 55$
- $3^{3x-4} = 15$
- $5^{3x} = 29$
- $10^{x^2-4} = 1$
- $3^{x^2-5x-5} = \frac{1}{3}$
- $2^{|x|} = 16$
- $9^x + 3^{x+1} - 18 = 0$

23–34. Derivatives of b^x Find the derivatives of the following functions.

- $y = 8^x$
- $y = 5^{3t}$
- $y = 5 \cdot 4^x$
- $y = 4^{-x} \sin x$
- $y = x^3 \cdot 3^x$
- $P = \frac{40}{1 + 2^{-t}}$
- $A = 250(1.045)^{4t}$
- $y = \ln 10^x$

37. Diagnostic scanning Iodine-123 is a radioactive isotope used in medicine to test the function of the thyroid gland. If a 350-microcurie (μCi) dose of iodine-123 is administered to a patient, the quantity Q left in the body after t hours is approximately $Q = 350(\frac{1}{2})^{t/13.1}$.

- How long does it take for the level of iodine-123 to drop to $10 \mu\text{Ci}$?
- Find the rate of change of the quantity of iodine-123 at 12 hours, 1 day, and 2 days. What do your answers say about the rate at which iodine decreases as time increases?

38–44. Integrals with general bases Evaluate the following integrals.

38. $\int 2^{3x} dx$

39. $\int_{-1}^1 10^x dx$

40. $\int_0^{\pi/2} 4^{\sin x} \cos x dx$

41. $\int_1^2 (1 + \ln x)x^x dx$

42. $\int_{1/3}^{1/2} \frac{10^{1/p}}{p^2} dp$

43. $\int x^2 6^{x^3+8} dx$

44. $\int \frac{4^{\cot x}}{\sin^2 x} dx$

45–50. General Power Rule Use the General Power Rule where appropriate to find the derivative of the following functions.

45. $g(y) = e^y \cdot y^e$

46. $f(x) = 2x^{\sqrt{2}}$

47. $s(t) = \cos 2^t$

48. $y = \ln(x^3 + 1)^\pi$

49. $f(x) = (2x - 3)x^{3/2}$

50. $y = \tan x^{0.74}$

51–56. Derivatives of tower functions (or g^h) Find the derivative of each function and evaluate the derivative at the given value of a .

51. $f(x) = x^{\cos x}$; $a = \pi/2$

52. $g(x) = x^{\ln x}$; $a = e$

53. $h(x) = x^{\sqrt{x}}$; $a = 4$

54. $f(x) = (x^2 + 1)^x$; $a = 1$

55. $f(x) = (\sin x)^{\ln x}$; $a = \pi/2$

56. $f(x) = (\tan x)^{x-1}$; $a = \pi/4$

57–68. Derivatives Evaluate the derivatives of the following functions.

57. $f(x) = (2x)^{4x}$

58. $f(x) = x^{\sqrt{3}}$

59. $h(x) = 2^{(x^2)}$

60. $h(t) = (\sin t)^{\sqrt{t}}$

61. $H(x) = (x + 1)^{2x}$

62. $p(x) = x^{-\ln x}$

63. $y = 4 \log_3(x^2 - 1)$

64. $y = \log_{10} x$

65. $y = (\cos x) \ln(\cos^2 x)$

66. $y = \log_8 |\tan x|$

67. $y = \frac{1}{\log_4 x}$

68. $y = \log_2(\log_2 x)$

69–72. Tangent lines

69. Find an equation of the line tangent to $y = x^{\sin x}$ at the point $x = 1$.

70. Determine whether the graph of $y = x^{\sqrt{x}}$ has any horizontal tangent lines.

71. The graph of $y = (x^2)^x$ has two horizontal tangent lines. Find equations for both of them.

72. The graph of $y = x^{\ln x}$ has one horizontal tangent line. Find an equation for it.

73. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. The derivative of $\log_2 9$ is $1/(9 \ln 2)$.

b. $\ln(x + 1) + \ln(x - 1) = \ln(x^2 - 1)$, for all x .

c. The exponential function 2^{x+1} can be written in base e as $e^{2 \ln(x+1)}$.

d. $\frac{d}{dx}(\sqrt{2}^x) = x\sqrt{2}^{x-1}$.

e. $\frac{d}{dx}(x^{\sqrt{2}}) = \sqrt{2}x^{\sqrt{2}-1}$.

74. Graphs of exponential functions The following figure shows the graphs of $y = 2^x$, $y = 3^x$, $y = 2^{-x}$, and $y = 3^{-x}$. Match each curve with the correct function.

75. Graphs of logarithmic functions The following figure shows the graphs of $y = \log_2 x$, $y = \log_4 x$, and $y = \log_{10} x$. Match each curve with the correct function.

76. Graphs of modified logarithmic functions Without using a graphing utility, sketch the graph of $y = \log_2 x$. Then on the same set of axes, sketch the graphs of $y = \log_2(x - 1)$, $y = \log_2 x^2$, $y = (\log_2 x)^2$, and $y = \log_2 x + 1$.

77–80. Higher-order derivatives Find the following higher-order derivatives.

77. $\frac{d^2}{dx^2}(\log_{10} x)$

78. $\frac{d^3}{dx^3}(x^{4.2}) \Big|_{x=1}$

79. $\frac{d^3}{dx^3}(x^2 \ln x)$

80. $\frac{d^n}{dx^n}(2^x)$

81–82. Derivatives by different methods Calculate the derivative of the following functions (i) using the fact that $b^x = e^{x \ln b}$ and (ii) by using logarithmic differentiation. Verify that both answers are the same.

81. $y = 1.05^x$

82. $y = (x^2 + 1)^x$

83–88. Derivatives of logarithmic functions Use the properties of logarithms to simplify the following functions before computing $f'(x)$.

83. $f(x) = \ln(3x + 1)^4$

84. $f(x) = \ln \frac{2x}{(x^2 + 1)^3}$

85. $f(x) = \log_{10} \sqrt{10x}$

86. $f(x) = \log_2 \frac{8}{\sqrt{x+1}}$

87. $f(x) = \ln \frac{(2x-1)(x+2)^3}{(1-4x)^2}$

88. $f(x) = \ln(\sec^4 x \tan^2 x)$

89. Tangent line Find the equation of the line tangent to $y = 2^{\sin x}$ at $x = \pi/2$. Graph the function and the tangent line.

90. Horizontal tangents The graph of $y = \cos x \cdot \ln \cos^2 x$ has seven horizontal tangent lines on the interval $[0, 2\pi]$. Find the approximate x -coordinates of all points at which these tangent lines occur.

91–98. Derivatives of tower functions Compute the following derivatives. Use logarithmic differentiation where appropriate.

91. $\frac{d}{dx}(x^{10x})$

92. $\frac{d}{dx}(2x)^{2x}$

93. $\frac{d}{dx}(x^{\cos x})$

94. $\frac{d}{dx}(x^2 + 1)^{-x}$

95. $\frac{d}{dx}\left(1 + \frac{1}{x}\right)^x$

96. $\frac{d}{dx}(1 + x^2)^{\sin x}$

97. $\frac{d}{dx}(x^{(x^{10})})$

98. $\frac{d}{dx}(\ln x)^{x^2}$

99–103. Miscellaneous integrals Evaluate the following integrals.

99. $\int 3^{-2x} dx$

100. $\int_0^5 5^{5x} dx$

101. $\int x^2 10^{x^3} dx$

102. $\int_0^\pi 2^{\sin x} \cos x dx$

103. $\int_1^{2e} \frac{3^{\ln x}}{x} dx$

Explorations and Challenges

104. Triple intersection Graph the functions $f(x) = x^3$, $g(x) = 3^x$, and $h(x) = x^x$ and find their common intersection point (exactly).

105–108. Calculating limits exactly Use the definition of the derivative to evaluate the following limits.

105. $\lim_{x \rightarrow e} \frac{\ln x - 1}{x - e}$

106. $\lim_{h \rightarrow 0} \frac{\ln(e^8 + h) - 8}{h}$

107. $\lim_{h \rightarrow 0} \frac{(3+h)^{3+h} - 27}{h}$

108. $\lim_{x \rightarrow 2} \frac{5^x - 25}{x - 2}$

109. Derivative of $u(x)^{v(x)}$ Use logarithmic differentiation to prove that

$$\frac{d}{dx}(u(x)^{v(x)}) = u(x)^{v(x)} \left(\frac{dv}{dx} \ln u(x) + \frac{v(x)}{u(x)} \frac{du}{dx} \right).$$

110. Tangency question It is easily verified that the graphs of $y = 1.1^x$ and $y = x$ have two points of intersection, while the graphs of $y = 2^x$ and $y = x$ have no point of intersection. It follows that for some real number $1 < p < 2$, the graphs of $y = p^x$ and $y = x$ have exactly one point of intersection. Using analytical and/or graphical methods, determine p and the coordinates of the single point of intersection.

111. Nice property Prove that $(\log_b c)(\log_c b) = 1$, for $b > 0$ and $c > 0$, $b \neq 1$, and $c \neq 1$.

112. Change of base Use the relationship $y = \log_b x \Leftrightarrow b^y = x$ to prove $\log_b x = \frac{\ln x}{\ln b}$.

QUICK CHECK ANSWERS

1. b^x is always positive (and never zero) for all x and for positive bases b . 2. Because $(1/3)^x = 1/3^x$ and 3^x increases as x increases, it follows that $(1/3)^x$ decreases as x increases. 3. $\{x: x \neq 0\}, \mathbb{R}$

4. $\frac{dA}{dt} = 500(1.045)^t \cdot \ln 1.045 \approx 22(1.045)^t$

5. $\frac{dy}{dx} = \frac{1}{x \ln 3}$

6. $T'(n) = \log_2 n + \frac{1}{\ln 2} = \log_2 n + \frac{1}{\log_2 2} = \log_2 n + \log_2 e = \log_2(en) \blacktriangleleft$

7.4 Exponential Models

The uses of exponential functions are wide-ranging. In this section, you will see them applied to problems in finance, medicine, ecology, biology, economics, pharmacokinetics, anthropology, and physics.

Exponential Growth

Imagine a quantity that grows in the following manner: The percent change in the quantity over the span of one year—or over any unit of time—remains constant. For example, suppose the value of a real estate investment increases at 7% per year, or the number of yeast cells in a batch of bread dough grows at 1.3% per minute. In both cases, we can create a simple function that models the growth of the quantity.

Let's focus on the real estate investment growing at 7% per year; we assume its value at time $t = 0$ is y_0 . To compute its value one year later, we simply take 7% of y_0 and add it to y_0 :

$$\text{value at } t = 1: y_0 + 0.07y_0 = y_0(1 + 0.07) = y_0(1.07).$$

The previous calculation shows that multiplication of a quantity by 1.07 is equivalent to increasing the quantity by 7%. Therefore, the value of the real estate investment after two years is

$$\text{value at } t = 2: \underbrace{y_0(1.07)}_{\text{value at } t = 1}(1.07) = y_0(1.07)^2.$$

Already a pattern is emerging. To find the value of the investment at $t = 3$ years, we multiply the value of the investment at $t = 2$ years by 1.07 to arrive at

$$\text{value at } t = 3: \underbrace{y_0(1.07)^2}_{\text{value at } t = 2}(1.07) = y_0(1.07)^3.$$

Building on this pattern, we find that the value of the investment at any time t is given by the exponential function

$$y(t) = y_0(1.07)^t. \quad (1)$$

While the exponential function in equation (1) with base 1.07 adequately describes the value of the real estate investment at any time t , it is generally easier to work with functions expressed in base e . Recall from Section 7.2 that $b^x = e^{x \ln b}$. Therefore, equation (1) can be written as

$$y(t) = y_0(1.07)^t = y_0 e^{t \ln 1.07} \approx y_0 e^{0.0677t}. \quad \ln 1.07 \approx 0.0677$$

It is evident that we could carry out this procedure for any quantity whose percent change from one time unit to the next remains constant; the result would be

$$y(t) = y_0 e^{kt},$$

where the constant k , called the **rate constant**, is determined by the constant percent change in the quantity over one time unit. When $k > 0$, the function $y(t) = y_0 e^{kt}$ is called an *exponential growth function* (Figure 7.28), and it has a special property.

Figure 7.28

Notice that the derivative of y is

$$y'(t) = y_0 k e^{kt} = k \underbrace{(y_0 e^{kt})}_{y(t)}; \quad (2)$$

that is, $y'(t) = ky(t)$. Equation (2) says that the rate of change of an exponential growth function is proportional to its value. If $y(t)$ represents a population, then $y'(t)$ is the **(absolute) growth rate** of the population, with units such as people/month or cells/hr. Because the growth rate is proportional to the value of the function, the larger the population, the faster its growth.

- The derivative $\frac{dy}{dt}$ is the *absolute* growth rate, but it is usually called the *growth rate*.
- A consumer price index that increases at a constant rate of 4% per year increases exponentially. A currency that is devalued at a constant rate of 3% per month decreases exponentially. By contrast, linear growth is characterized by constant absolute growth rates, such as 500 people per year or \$400 per month.

Another way to talk about growth rates is to use the **relative growth rate**, which is the growth rate divided by the current value of the quantity, or $y'(t)/y(t)$. When equation (2) is written in the form $y'(t)/y(t) = k$, it has another interpretation. It says that *a quantity that grows exponentially has a constant relative growth rate*. Constant relative growth rate, or constant percent change, is the hallmark of exponential growth. Returning to equation (1), we see that a constant percent change of 7% per year is equivalent to a rate constant of $k = \ln 1.07 \approx 0.0677$. Example 1 illustrates the difference between exponential growth and linear growth.

EXAMPLE 1 Linear versus exponential growth Suppose the population of the town of Pine is given by $P(t) = 1500 + 125t$, while the population of the town of Spruce is given by $S(t) = 1500e^{0.1t}$, where $t \geq 0$ is measured in years. Find the growth rate and the relative growth rate of each town.

SOLUTION Note that Pine grows according to a linear function, while Spruce grows exponentially (Figure 7.29). The growth rate of Pine is $P'(t) = 125$ people/year, which is constant for all times. The growth rate of Spruce is

$$S'(t) = 0.1(1500e^{0.1t}) = 0.1S(t),$$

showing that the growth rate is proportional to the population. The relative growth rate of Pine is $\frac{P'(t)}{P(t)} = \frac{125}{1500 + 125t}$, which decreases in time. The relative growth rate of Spruce is

$$\frac{S'(t)}{S(t)} = \frac{0.1 \cdot 1500e^{0.1t}}{1500e^{0.1t}} = 0.1,$$

which is constant for all times. In summary, the linear population function has a *constant absolute growth rate* and the exponential population function has a *constant relative growth rate*.

Figure 7.29

QUICK CHECK 1 Population A increases at a constant rate of 4%/yr. Population B increases at a constant rate of 500 people/yr. Which population exhibits exponential growth? What kind of growth is exhibited by the other population? ◀

- The unit time^{-1} is read *per unit time*. For example, month^{-1} is read *per month*.

The rate constant k in $y(t) = y_0e^{kt}$ determines the growth rate of the exponential function. For problems that involve time, the units of k are time^{-1} ; for example, if t is measured in months, the units of k are month^{-1} . In this way, the exponent kt is dimensionless (without units).

Unless there is good reason to do otherwise, it is customary to take $t = 0$ as the reference point for time. Notice that with $y(t) = y_0e^{kt}$, we have $y(0) = y_0$. Therefore, y_0 has a simple meaning: It is the *initial value* of the quantity of interest. In the examples that follow, two pieces of information are typically given: the initial value and clues for determining the rate constant k . The initial value and the rate constant determine an exponential growth function completely.

Exponential Growth Functions

Exponential growth is described by functions of the form $y(t) = y_0 e^{kt}$. The **initial value** of y at $t = 0$ is $y(0) = y_0$, and the **rate constant** $k > 0$ determines the rate of growth. Exponential growth is characterized by a constant relative growth rate.

Because exponential growth is characterized by a constant relative growth rate, the time required for a quantity to double (a 100% increase) is constant. Therefore, one way to describe an exponentially growing quantity is to give its *doubling time*. To compute the time it takes the function $y(t) = y_0 e^{kt}$ to double in value, say from y_0 to $2y_0$, we find the value of t that satisfies

$$2y_0 = y_0 e^{kt}.$$

Canceling y_0 from the equation $2y_0 = y_0 e^{kt}$ leaves the equation $2 = e^{kt}$. Taking logarithms of both sides, we have $\ln 2 = \ln e^{kt}$, or $\ln 2 = kt$, which has the solution $t = \frac{\ln 2}{k}$. We denote this doubling time T_2 so that $T_2 = \frac{\ln 2}{k}$. If y increases exponentially, the time it takes to double from 100 to 200 is the same as the time it takes to double from 1000 to 2000.

► Note that the initial value y_0 appears on both sides of this equation. It may be canceled, meaning that the doubling time is independent of the initial condition: *The doubling time is constant for all t .*

DEFINITION Doubling Time

The quantity described by the function $y(t) = y_0 e^{kt}$, for $k > 0$, has a constant **doubling time** of $T_2 = \frac{\ln 2}{k}$, with the same units as t .

QUICK CHECK 2 Verify that the time needed for $y(t) = y_0 e^{kt}$ to double from y_0 to $2y_0$ is the same as the time needed to double from $2y_0$ to $4y_0$. ◀

► World population

1804	1 billion
1927	2 billion
1960	3 billion
1974	4 billion
1987	5 billion
1999	6 billion
2012	7 billion
2050	9 billion (proj.)

EXAMPLE 2 World population Human population growth rates vary geographically and fluctuate over time. The overall growth rate for world population peaked at an annual rate of 2.1% per year in the 1960s. Assume a world population of 6.0 billion in 1999 ($t = 0$) and 7.4 billion in 2017 ($t = 18$).

- Find an exponential growth function for the world population that fits the two data points.
- Find the doubling time for the world population using the model in part (a).
- Find the (absolute) growth rate $y'(t)$ and graph it, for $0 \leq t \leq 50$.
- According to the growth model, how fast is the population expected to be growing in 2020 ($t = 21$)?

SOLUTION

- Let $y(t)$ be world population measured in billions of people t years after 1999. We use the growth function $y(t) = y_0 e^{kt}$, where y_0 and k must be determined. The initial value is $y_0 = 6$ (billion). To determine the rate constant k , we use the fact that $y(18) = 7.4$. Substituting $t = 18$ into the growth function with $y_0 = 6$ implies

$$y(18) = 6e^{18k} = 7.4.$$

Solving for k yields the rate constant $k = \frac{\ln(7.4/6)}{18} \approx 0.01165 \text{ year}^{-1}$.

Therefore, the growth function is

$$y(t) = 6e^{0.01165t}.$$

- The doubling time of the population is

$$T_2 = \frac{\ln 2}{k} \approx \frac{\ln 2}{0.01165} \approx 59.5 \text{ years}.$$

c. Working with the growth function $y(t) = 6e^{0.01165t}$, we find that

$$y'(t) = 6(0.01165)e^{0.01165t} = 0.0699e^{0.01165t},$$

which has units of *billions of people/year*. As shown in Figure 7.30 the growth rate itself increases exponentially.

Figure 7.30

d. In 2020 ($t = 21$), the growth rate is expected to be

$$y'(21) = 0.0699e^{(0.01165)(21)} \approx 0.0893 \text{ billion people/year,}$$

or roughly 89 million people/year.

Related Exercises 16–17 ◀

QUICK CHECK 3 Assume $y(t) = 100e^{0.05t}$. By (exactly) what percentage does y increase when t increases by 1 unit? ◀

- Converted to a daily rate (dividing by 365), the world population in 2020 is expected to increase at a rate of roughly 244,600 people per day.
- The concept of continuous compounding is explained in Exercise 61 of Section 7.6.

A Financial Model Exponential functions are used in many financial applications, several of which are explored in the exercises. For now, consider a simple savings account in which an initial deposit earns interest that is reinvested in the account. Interest payments are made on a regular basis (for example, annually, monthly, daily), or interest may be compounded continuously. In all cases, the balance in the account increases exponentially at a rate that can be determined from the advertised **annual percentage yield** (or **APY**) of the account. Assuming no additional deposits are made, the balance in the account is given by the exponential growth function $y(t) = y_0e^{kt}$, where y_0 is the initial deposit, t is measured in years, and k is determined by the annual percentage yield.

EXAMPLE 3 Compounding The APY of a savings account is the percentage increase in the balance over the course of a year. Suppose you deposit \$500 in a savings account that has an APY of 6.18% per year. Assume the interest rate remains constant and no additional deposits or withdrawals are made. How long will it take the balance to reach \$2500?

SOLUTION Because the balance grows by a fixed percentage every year, it grows exponentially. Letting $y(t)$ be the balance t years after the initial deposit of $y_0 = \$500$, we have $y(t) = y_0e^{kt}$, where the rate constant k must be determined. Note that if the initial balance is y_0 , one year later the balance is 6.18% more, or

$$y(1) = 1.0618y_0 = y_0e^k.$$

Solving for k , we find that the rate constant is

$$k = \ln 1.0618 \approx 0.060 \text{ yr}^{-1}.$$

Therefore, the balance at any time $t \geq 0$ is $y(t) = 500e^{0.060t}$. To determine the time required for the balance to reach \$2500, we solve the equation

$$y(t) = 500e^{0.060t} = 2500.$$

- If the balance increases by 6.18% in one year, it increases by a factor of 1.0618 in one year.

Dividing by 500 and taking the natural logarithm of both sides yields

$$0.060t = \ln 5.$$

The balance reaches \$2500 in $t = (\ln 5)/0.060 \approx 26.8$ yr.

Related Exercises 18–19 ◀

Resource Consumption Among the many resources that people use, energy is certainly one of the most important. The basic unit of energy is the **joule** (J), roughly the energy needed to lift a 0.1-kg object (say an orange) 1 m. The *rate* at which energy is consumed is called **power**. The basic unit of power is the **watt** (W), where $1 \text{ W} = 1 \text{ J/s}$. If you turn on a 100-W lightbulb for 1 min, the bulb consumes energy at a rate of 100 J/s, and it uses a total of $100 \text{ J/s} \cdot 60 \text{ s} = 6000 \text{ J}$ of energy.

A more useful measure of energy for large quantities is the **kilowatt-hour** (kWh). A kilowatt is 1000 W, or 1000 J/s. So if you consume energy at the rate of 1 kW for 1 hr (3600 s), you use a total of $1000 \text{ J/s} \cdot 3600 \text{ s} = 3.6 \times 10^6 \text{ J}$, which is 1 kWh. A person running for one hour consumes roughly 1 kWh of energy. A typical house uses on the order of 1000 kWh of energy in a month.

Assume the total energy used (by a person, machine, or city) is given by the function $E(t)$. Because the power $P(t)$ is the rate at which energy is used, we have $P(t) = E'(t)$. Using the ideas of Section 6.1, the total amount of energy used between the times $t = a$ and $t = b$ is

$$\text{total energy used} = \int_a^b E'(t) dt = \int_a^b P(t) dt.$$

We see that energy is the area under the power curve. With this background, we can investigate a situation in which the rate of energy consumption increases exponentially.

EXAMPLE 4 Energy consumption At the beginning of 2010, the rate of energy consumption for the city of Denver was 7000 megawatts (MW), where $1 \text{ MW} = 10^6 \text{ W}$. That rate is expected to increase at an annual growth rate of 2% per year.

- Find the function that gives the power or rate of energy consumption for all times after the beginning of 2010.
- Find the total amount of energy used during 2018.
- Find the function that gives the total (cumulative) amount of energy used by the city between 2010 and any time $t \geq 0$.

SOLUTION

- a. Let $t \geq 0$ be the number of years after the beginning of 2010 and let $P(t)$ be the power function that gives the rate of energy consumption at time t . Because P increases at a constant rate of 2% per year, it increases exponentially. Therefore, $P(t) = P_0 e^{kt}$, where $P_0 = 7000$ MW. We determine k as before by setting $t = 1$; after one year the power is

$$P(1) = P_0 e^k = 1.02P_0. \quad \text{Increase by 2\%, or by a factor of 1.02.}$$

Canceling P_0 and solving for k , we find that $k = \ln 1.02 \approx 0.0198$. Therefore, the power function (Figure 7.31) is

$$P(t) = 7000e^{0.0198t}, \quad \text{for } t \geq 0.$$

- b. The entire year 2018 corresponds to the interval $8 \leq t \leq 9$. Substituting $P(t) = 7000e^{0.0198t}$ reveals that the total energy used in 2018 was

$$\begin{aligned} \int_8^9 P(t) dt &= \int_8^9 7000e^{0.0198t} dt && \text{Substitute for } P(t). \\ &= \frac{7000}{0.0198} e^{0.0198t} \Big|_8^9 && \text{Fundamental Theorem} \\ &\approx 8283. && \text{Evaluate.} \end{aligned}$$

Because the units of P are MW and t is measured in years, the units of energy are MW·yr. To convert to MWh, we multiply by 8760 hr/yr to get the total energy of about 7.26×10^7 MWh (or 7.26×10^{10} kWh).

Figure 7.31

► It is a common mistake to assume that if the annual growth rate is 2% per year, then $k = 2\% = 0.02 \text{ year}^{-1}$. The rate constant k must be calculated, as it is in Example 4a, to give $k \approx 0.0198$. For larger growth rates, the difference between k and the actual growth rate is greater.

Figure 7.32

- c. The total energy used between $t = 0$ and any future time t is given by the future value formula (Section 6.1):

$$E(t) = E(0) + \int_0^t E'(s) ds = E(0) + \int_0^t P(s) ds.$$

Assuming $t = 0$ corresponds to the beginning of 2010, we take $E(0) = 0$. Substituting again for the power function P , the total energy (in MW-yr) at time t is

$$\begin{aligned} E(t) &= E(0) + \int_0^t P(s) ds \\ &= 0 + \int_0^t 7000e^{0.0198s} ds \quad \text{Substitute for } P(s) \text{ and } E(0). \\ &= \frac{7000}{0.0198} e^{0.0198s} \Big|_0^t \quad \text{Fundamental Theorem} \\ &\approx 353,535(e^{0.0198t} - 1). \quad \text{Evaluate.} \end{aligned}$$

As shown in Figure 7.32, when the rate of energy consumption increases exponentially, the total amount of energy consumed also increases exponentially.

Related Exercises 24, 26 ◀

Exponential Decay

Everything you have learned about exponential growth carries over directly to exponential decay. A function that decreases exponentially has the form $y(t) = y_0 e^{kt}$, where $y_0 = y(0)$ is the initial value and $k < 0$ is the rate constant.

Exponential decay is characterized by a constant relative decay rate and by a constant *half-life*. For example, radioactive plutonium has a half-life of 24,000 years. An initial sample of 1 mg decays to 0.5 mg after 24,000 years and to 0.25 mg after 48,000 years. To compute the half-life, denoted $T_{1/2}$, we determine the time required for the quantity $y(t) = y_0 e^{kt}$ to reach one-half of its current value; that is, we solve $y_0/2 = y_0 e^{kt}$ for t . Canceling y_0 and taking logarithms of both sides, we find that

$$\frac{1}{2} = e^{kt} \Rightarrow \ln \frac{1}{2} = kt \Rightarrow t = \frac{\ln(1/2)}{k}.$$

QUICK CHECK 4 If a quantity decreases by a factor of 8 every 30 years, what is its half-life? ◀

Exponential Decay Functions

Exponential decay is described by functions of the form $y(t) = y_0 e^{kt}$. The initial value of y is $y(0) = y_0$, and the rate constant $k < 0$ determines the rate of decay. Exponential decay is characterized by a constant relative decay rate. The constant

half-life is $T_{1/2} = \frac{\ln(1/2)}{k}$, with the same units as t .

► Because $\ln(1/2) < 0$ and $k < 0$, it follows that $T_{1/2} > 0$, as it should be.

Radiometric Dating A powerful method for estimating the age of ancient objects (for example, fossils, bones, meteorites, and cave paintings) relies on the radioactive decay of certain elements. A common version of radiometric dating uses the carbon isotope C-14, which is present in all living matter. When a living organism dies, it ceases to replace C-14, and the C-14 that is present decays with a half-life of about $T_{1/2} = 5730$ years. Comparing the C-14 in a living organism to the amount in a dead sample provides an estimate of its age.

EXAMPLE 5 Radiometric dating Researchers determine that a fossilized bone has 30% of the C-14 of a live bone. Estimate the age of the bone. Assume a half-life for C-14 of 5730 years.

SOLUTION The exponential decay function $y(t) = y_0 e^{kt}$ represents the amount of C-14 in the bone t years after the animal died. By the half-life formula, $T_{1/2} = \ln(1/2)/k$. Substituting $T_{1/2} = 5730$ yr, the rate constant is

$$k = \frac{\ln(1/2)}{T_{1/2}} = \frac{\ln(1/2)}{5730 \text{ yr}} \approx -0.000121 \text{ yr}^{-1}$$

Assume the amount of C-14 in a living bone is y_0 . Over t years, the amount of C-14 in the fossilized bone decays to 30% of its initial value, or $0.3y_0$. Using the decay function, we have

$$0.3y_0 = y_0 e^{-0.000121t}.$$

Solving for t , the age of the bone (in years) is

$$t = \frac{\ln 0.3}{-0.000121} \approx 9950.$$

Related Exercises 34–35 ◀

Pharmacokinetics Pharmacokinetics describes the processes by which drugs are assimilated by the body. The elimination of most drugs from the body may be modeled by an exponential decay function with a known half-life (alcohol is a notable exception). The simplest models assume an entire drug dose is immediately absorbed into the blood. This assumption is a bit of an idealization; more refined mathematical models account for the absorption process.

► **Approximate half-lives of common drugs**

Penicillin	1 hr
Amoxicillin	1 hr
Nicotine	2 hr
Morphine	3 hr
Tetracycline	9 hr
Digitalis	33 hr
Phenobarbital	2–6 days

EXAMPLE 6 Pharmacokinetics An exponential decay function $y(t) = y_0 e^{kt}$ models the amount of drug in the blood t hr after an initial dose of $y_0 = 100$ mg is administered. Assume the half-life of the drug is 16 hours.

- Find the exponential decay function that governs the amount of drug in the blood.
- How much time is required for the drug to reach 1% of the initial dose (1 mg)?
- If a second 100-mg dose is given 12 hr after the first dose, how much time is required for the drug level to reach 1 mg?

SOLUTION

- a. Knowing that the half-life is 16 hr, the rate constant is

$$k = \frac{\ln(1/2)}{T_{1/2}} = \frac{\ln(1/2)}{16 \text{ hr}} \approx -0.0433 \text{ hr}^{-1}.$$

Therefore, the decay function is $y(t) = 100e^{-0.0433t}$.

- b. The time required for the drug to reach 1 mg is the solution of

$$100e^{-0.0433t} = 1.$$

Solving for t , we have

$$t = \frac{\ln 0.01}{-0.0433 \text{ hr}^{-1}} \approx 106 \text{ hr}.$$

It takes more than 4 days for the drug to be reduced to 1% of the initial dose.

- c. Using the exponential decay function of part (a), the amount of drug in the blood after 12 hr is

$$y(12) = 100e^{-0.0433 \cdot 12} \approx 59.5 \text{ mg}.$$

The second 100-mg dose given after 12 hr increases the amount of drug (assuming instantaneous absorption) to 159.5 mg. This amount becomes the new initial value for another exponential decay process (Figure 7.33). Measuring t from the time of the second dose, the amount of drug in the blood is

$$y(t) = 159.5e^{-0.0433t}.$$

The amount of drug reaches 1 mg when

$$y(t) = 159.5e^{-0.0433t} = 1,$$

which implies that

$$t = \frac{-\ln 159.5}{-0.0433 \text{ hr}^{-1}} = 117.1 \text{ hr}.$$

$$\ln \frac{1}{159.5} = -\ln 159.5$$

Approximately 117 hr after the second dose (or 129 hr after the first dose), the amount of drug reaches 1 mg.

Getting Started

1. In terms of relative growth rate, what is the defining property of exponential growth?
2. Give two pieces of information that may be used to formulate an exponential growth or decay function.
3. Explain the meaning of doubling time.
4. Explain the meaning of half-life.
5. How are the rate constant and the doubling time related?
6. How are the rate constant and the half-life related?
7. Suppose a quantity described by the function $y(t) = y_0 e^{kt}$, where t is measured in years, has a doubling time of 20 years. Find the rate constant k .
8. Suppose a quantity is described by the function $y(t) = 30,000e^{-0.05t}$, where t is measured in years. Find the half-life of the quantity.
9. Give two examples of processes that are modeled by exponential growth.
10. Give two examples of processes that are modeled by exponential decay.
11. Because of the absence of predators, the number of rabbits on a small island increases at a rate of 11% per month. If $y(t)$ equals the number of rabbits on the island t months from now, find the rate constant k for the growth function $y(t) = y_0 e^{kt}$.
12. After the introduction of foxes on an island, the number of rabbits on the island decreases by 4.5% per month. If $y(t)$ equals the number of rabbits on the island t months after foxes were introduced, find the rate constant k for the exponential decay function $y(t) = y_0 e^{kt}$.

Practice Exercises

13–14. Absolute and relative growth rates Two functions f and g are given. Show that the growth rate of the linear function is constant and the relative growth rate of the exponential function is constant.

13. $f(t) = 100 + 10.5t$, $g(t) = 100e^{t/10}$
14. $f(t) = 2200 + 400t$, $g(t) = 400 \cdot 2^{t/20}$

15–20. Designing exponential growth functions Complete the following steps for the given situation.

- a. Find the rate constant k and use it to devise an exponential growth function that fits the given data.
 - b. Answer the accompanying question.
15. **Population** The population of a town with a 2016 population of 90,000 grows at a rate of 2.4%/yr. In what year will the population reach 120,000?
 16. **Population** The population of Clark County, Nevada, was about 2.115 million in 2015. Assuming an annual growth rate of 1.5%/yr, what will the county population be in 2025?
 17. **Population** The current population of a town is 50,000 and is growing exponentially. If the population is projected to be 55,000 in 10 years, then what will be the population 20 years from now?

18. **Savings account** An initial deposit of \$1500 is placed in a savings account with an APY of 3.1%. How long will it take until the balance of the account is \$2500? Assume the interest rate remains constant and no additional deposits or withdrawals are made.
19. **Rising costs** Between 2010 and 2016, the average rate of inflation was about 1.6%/yr. If a cart of groceries cost \$100 in 2010, what will it cost in 2025, assuming the rate of inflation remains constant at 1.6%?
20. **Cell growth** The number of cells in a tumor doubles every 6 weeks starting with 8 cells. After how many weeks does the tumor have 1500 cells?
21. **Determining APY** Suppose \$1000 is deposited in a savings account that increases exponentially. Determine the APY if the account increases to \$1200 in 5 years. Assume the interest rate remains constant and no additional deposits or withdrawals are made.
22. **Tortoise growth** In a study conducted at University of New Mexico, it was found that the mass (weight) of juvenile desert tortoises exhibited exponential growth after a diet switch. One of these tortoises had a mass of about 64 g at the time of the diet switch, and 33 days later the mass was 73 g. How many days after the diet switch did the tortoise have a mass of 100 g? (Source: *Physiological and Biochemical Zoology*, 85, 1, 2012)
23. **Projection sensitivity** According to the 2014 national population projections published by the U.S. Census Bureau, the U.S. population is projected to be 334.4 million in 2020 with an estimated growth rate of 0.79%/yr.
 - a. Based on these figures, find the doubling time and the projected population in 2050. Assume the growth rate remains constant.
 - b. Suppose the actual growth rate is instead 0.7%. What are the resulting doubling time and projected 2050 population?
24. **Energy consumption** On the first day of the year ($t = 0$), a city uses electricity at a rate of 2000 MW. That rate is projected to increase at a rate of 1.3% per year.
 - a. Based on these figures, find an exponential growth function for the power (rate of electricity use) for the city.
 - b. Find the total energy (in MW-yr) used by the city over four full years beginning at $t = 0$.
 - c. Find a function that gives the total energy used (in MW-yr) between $t = 0$ and any future time $t > 0$.
25. **Population of Texas** Texas was the third fastest growing state in the United States in 2016. Texas grew from 25.1 million in 2010 to 26.47 million in 2016. Use an exponential growth model to predict the population of Texas in 2025.
26. **Oil consumption** Starting in 2018 ($t = 0$), the rate at which oil is consumed by a small country increases at a rate of 1.5%/yr, starting with an initial rate of 1.2 million barrels/yr.
 - a. How much oil is consumed over the course of the year 2018 (between $t = 0$ and $t = 1$)?
 - b. Find the function that gives the amount of oil consumed between $t = 0$ and any future time t .
 - c. How many years after 2018 will the amount of oil consumed since 2018 reach 10 million barrels?

27–30. Designing exponential decay functions *Devise an exponential decay function that fits the following data; then answer the accompanying questions. Be sure to identify the reference point ($t = 0$) and units of time.*

- 27. Crime rate** The homicide rate decreases at a rate of 3%/yr in a city that had 800 homicides/yr in 2018. At this rate, when will the homicide rate reach 600 homicides/yr?
- 28. Drug metabolism** A drug is eliminated from the body at a rate of 15%/hr. After how many hours does the amount of drug reach 10% of the initial dose?
- 29. Valium metabolism** The drug Valium is eliminated from the bloodstream with a half-life of 36 hr. Suppose a patient receives an initial dose of 20 mg of Valium at midnight. How much Valium is in the patient's blood at noon the next day? When will the Valium concentration reach 10% of its initial level?
- 30. China's population** China's one-child policy was implemented with a goal of reducing China's population to 700 million by 2050 (from 1.2 billion in 2000). Suppose China's population then declined at a rate of 0.5%/yr. Would this rate of decline be sufficient to meet the goal?
- 31. Population of West Virginia** The population of West Virginia decreased from about 1.853 million in 2010 to 1.831 million in 2016. Use an exponential model to predict the population in 2025. Explain why an exponential (decay) model might not be an appropriate long-term model of the population of West Virginia.
- 32. Depreciation of equipment** A large die-casting machine used to make automobile engine blocks is purchased for \$2.5 million. For tax purposes, the value of the machine can be depreciated by 6.8% of its current value each year.
- What is the value of the machine after 10 years?
 - After how many years is the value of the machine 10% of its original value?
- 33. Atmospheric pressure** The pressure of Earth's atmosphere at sea level is approximately 1000 millibars and decreases exponentially with elevation. At an elevation of 30,000 ft (approximately the altitude of Mt. Everest), the pressure is one-third the sea-level pressure. At what elevation is the pressure half the sea-level pressure? At what elevation is it 1% of the sea-level pressure?
- 34. Carbon dating** The half-life of C-14 is about 5730 yr.
- Archaeologists find a piece of cloth painted with organic dyes. Analysis of the dye in the cloth shows that only 77% of the C-14 originally in the dye remains. When was the cloth painted?
 - A well-preserved piece of wood found at an archaeological site has 6.2% of the C-14 that it had when it was alive. Estimate when the wood was cut.
- 35. Uranium dating** Uranium-238 (U-238) has a half-life of 4.5 billion years. Geologists find a rock containing a mixture of U-238 and lead, and they determine that 85% of the original U-238 remains; the other 15% has decayed into lead. How old is the rock?
- 36. Radioiodine treatment** Roughly 12,000 Americans are diagnosed with thyroid cancer every year, which accounts for 1% of all cancer cases. It occurs in women three times as frequently as in men. Fortunately, thyroid cancer can be treated successfully in many cases with radioactive iodine, or I-131. This unstable form of iodine has a half-life of 8 days and is given in small doses measured in millicuries.

- Suppose a patient is given an initial dose of 100 millicuries. Find the function that gives the amount of I-131 in the body after $t \geq 0$ days.
- How long does it take the amount of I-131 to reach 10% of the initial dose?
- Finding the initial dose to give a particular patient is a critical calculation. How does the time to reach 10% of the initial dose change if the initial dose is increased by 5%?

37–38. Caffeine *After an individual drinks a beverage containing caffeine, the amount of caffeine in the bloodstream can be modeled by an exponential decay function, with a half-life that depends on several factors, including age and body weight. For the sake of simplicity, assume the caffeine in the following drinks immediately enters the bloodstream upon consumption.*

- 37.** An individual consumes an energy drink that contains caffeine. If 80% of the caffeine from the energy drink is still in the bloodstream 2 hours later, find the half-life of caffeine for this individual.
- 38.** An individual consumes two cups of coffee, each containing 90 mg of caffeine, two hours apart. Assume the half-life of caffeine for this individual is 5.7 hours.
- Determine the amount of caffeine in the bloodstream 1 hour after drinking the first cup of coffee.
 - Determine the amount of caffeine in the bloodstream 1 hour after drinking the second cup of coffee.

39–40. LED lighting *LED (light-emitting diode) bulbs are rapidly decreasing in cost, and they are more energy efficient than standard incandescent light bulbs and CFL (compact fluorescent light) bulbs. By some estimates, LED bulbs last more than 40 times longer than incandescent bulbs and more than 8 times longer than CFL bulbs. Haitz's law, which is explored in the following two exercises, predicts that over time, LED bulbs will exponentially increase in efficiency and exponentially decrease in cost.*

- 39.** Haitz's law predicts that the cost per lumen of an LED bulb decreases by a factor of 10 every 10 years. This means that 10 years from now, the cost of an LED bulb will be $1/10$ of its current cost. Predict the cost of a particular LED bulb in 2021 if it costs 4 dollars in 2018.
- 40.** LED packages are assemblies that house LED chips. Haitz's law predicts that the amount of light produced by an LED package increases by a factor of 20 every 10 years. Compared to its current light output, how much more light will an LED package produce 3 years from now?
- 41. Tumor growth** Suppose the cells of a tumor are idealized as spheres, each with a radius of $5 \mu\text{m}$ (micrometers). The number of cells has a doubling time of 35 days. Approximately how long will it take a single cell to grow into a multi-celled spherical tumor with a volume of 0.5 cm^3 ($1 \text{ cm} = 10,000 \mu\text{m}$)? Assume the tumor spheres are tightly packed.
- 42. Tripling time** A quantity increases according to the exponential function $y(t) = y_0 e^{kt}$. What is the tripling time for the quantity? What is the time required for the quantity to increase p -fold?
- 43. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- A quantity that increases at 6%/yr obeys the growth function $y(t) = y_0 e^{0.06t}$.
 - If a quantity increases by 10%/yr, it increases by 30% over 3 years.

- c. A quantity decreases by one-third every month. Therefore, it decreases exponentially.
- d. If the rate constant of an exponential growth function is increased, its doubling time is decreased.
- e. If a quantity increases exponentially, the time required to increase by a factor of 10 remains constant for all time.

Explorations and Challenges

44. A running model A model for the startup of a runner in a short race results in the velocity function $v(t) = a(1 - e^{-t/c})$, where a and c are positive constants, t is measured in seconds, and v has units of m/s. (Source: Joe Keller, *A Theory of Competitive Running*, *Physics Today*, 26, Sep 1973)

- a. Graph the velocity function for $a = 12$ and $c = 2$. What is the runner's maximum velocity?
- b. Using the velocity in part (a) and assuming $s(0) = 0$, find the position function $s(t)$, for $t \geq 0$.
- c. Graph the position function and estimate the time required to run 100 m.

45. Chemotherapy In an experimental study at Dartmouth College, mice with tumors were treated with the chemotherapeutic drug Cisplatin. Before treatment, the tumors consisted entirely of *clonogenic* cells that divide rapidly, causing the tumors to double in size every 2.9 days. Immediately after treatment, 99% of the cells in the tumor became *quiescent* cells which do not divide and lose 50% of their volume every 5.7 days. For a particular mouse, assume the tumor size is 0.5 cm^3 at the time of treatment.

- a. Find an exponential decay function $V_1(t)$ that equals the total volume of the quiescent cells in the tumor t days after treatment.
- b. Find an exponential growth function $V_2(t)$ that equals the total volume of the clonogenic cells in the tumor t days after treatment.
- c. Use parts (a) and (b) to find a function $V(t)$ that equals the volume of the tumor t days after treatment.
- d. Plot a graph of $V(t)$ for $0 \leq t \leq 15$. What happens to the size of the tumor, assuming there are no follow-up treatments with Cisplatin?
- e. In cases where more than one chemotherapy treatment is required, it is often best to give a second treatment just before the tumor starts growing again. For the mice in this exercise, when should the second treatment be given?

(Source: *Motivating Calculus with Biology*, *MAA Notes*, 81, 2013)

46. Overtaking City A has a current population of 500,000 people and grows at a rate of 3%/yr. City B has a current population of 300,000 and grows at a rate of 5%/yr.

- a. When will the cities have the same population?
- b. Suppose City C has a current population of $y_0 < 500,000$ and a growth rate of $p > 3\%$ /yr. What is the relationship between y_0 and p such that Cities A and C have the same population in 10 years?

47. A slowing race Starting at the same time and place, Abe and

Bob race, running at velocities $u(t) = \frac{4}{t+1}$ mi/hr and

$v(t) = 4e^{-t/2}$ mi/hr, respectively, for $t \geq 0$.

- a. Who is ahead after $t = 5$ hr? After $t = 10$ hr?
- b. Find and graph the position functions of both runners. Which runner can run only a finite distance in an unlimited amount of time?

48. Rule of 70 Bankers use the Rule of 70, which says that if an account increases at a fixed rate of $p\%$ /yr, its doubling time is approximately $70/p$. Use linear approximation to explain why and when this is true.

49. Compounded inflation The U.S. government reports the rate of inflation (as measured by the consumer price index) both monthly and annually. Suppose for a particular month, the *monthly* rate of inflation is reported as 0.8%. Assuming this rate remains constant, what is the corresponding *annual* rate of inflation? Is the annual rate 12 times the monthly rate? Explain.

50. Acceleration, velocity, position Suppose the acceleration of an object moving along a line is given by $a(t) = -kv(t)$, where k is a positive constant and v is the object's velocity. Assume the initial velocity and position are given by $v(0) = 10$ and $s(0) = 0$, respectively.

- a. Use $a(t) = v'(t)$ to find the velocity of the object as a function of time.
- b. Use $v(t) = s'(t)$ to find the position of the object as a function of time.
- c. Use the fact that $\frac{dv}{dt} = \frac{dv}{ds} \frac{ds}{dt}$ (by the Chain Rule) to find the velocity as a function of position.

51. Air resistance (adapted from Putnam Exam, 1939) An object moves freely in a straight line, acted on by air resistance, which is proportional to its speed; this means its acceleration is $a(t) = -kv(t)$. The velocity of the object decreases from 1000 ft/s to 900 ft/s over a distance of 1200 ft. Approximate the time required for this deceleration to occur. (Exercise 50 may be useful.)

52. General relative growth rates Define the relative growth rate of the function f over the time interval T to be the relative change in f over an interval of length T :

$$R_T = \frac{f(t+T) - f(t)}{f(t)}.$$

Show that for the exponential function $y(t) = y_0 e^{kt}$, the relative growth rate R_T , for fixed T , is constant for all t .

53. Equivalent growth functions The same exponential growth function can be written in the forms $y(t) = y_0 e^{kt}$, $y(t) = y_0(1+r)^t$, and $y(t) = y_0 2^{t/T_2}$. Write k as a function of r , r as a function of T_2 , and T_2 as a function of k .

54. Geometric means A quantity grows exponentially according to $y(t) = y_0 e^{kt}$. What is the relationship among m , n , and p such that $y(p) = \sqrt{y(m)y(n)}$?

55. Constant doubling time Prove that the doubling time for an exponentially increasing quantity is constant for all time.

QUICK CHECK ANSWERS

1. Population A grows exponentially; population B grows linearly. 3. The function $100e^{0.05t}$ increases by a factor of 1.0513, or by 5.13%, in 1 unit of time. 4. 10 years ◀

7.5 Inverse Trigonometric Functions

We used the idea of an inverse function to relate the natural logarithmic function to the natural exponential function. We now carry out a similar procedure with trigonometric functions. Our goal is to develop the inverses of the sine and cosine in detail. The inverses of the other four trigonometric functions then follow in an analogous way. When we investigate the calculus of inverse trigonometric functions, we discover several new and important derivatives and integrals.

Inverse Sine and Cosine

So far, we have asked this question: Given an angle x , what is $\sin x$ or $\cos x$? Now we ask the opposite question: Given a number y , what is the angle x such that $\sin x = y$? Or what is the angle x such that $\cos x = y$? These are inverse questions.

There are a few things to notice right away. First, these questions do not make sense if $|y| > 1$, because $-1 \leq \sin x \leq 1$ and $-1 \leq \cos x \leq 1$. Next, let's select an acceptable value of y , say, $y = \frac{1}{2}$, and find the angle x that satisfies $\sin x = y = \frac{1}{2}$. It is apparent that infinitely many angles satisfy $\sin x = \frac{1}{2}$; all angles of the form $\pi/6 \pm 2n\pi$ and $5\pi/6 \pm 2n\pi$, where n is an integer, answer the inverse question (Figure 7.34). A similar situation occurs with the cosine function.

These inverse questions do not have unique answers because $\sin x$ and $\cos x$ are not one-to-one on their domains. To define their inverses, these functions are restricted to intervals on which they are one-to-one. For the sine function, the standard choice is $[-\pi/2, \pi/2]$; for cosine, it is $[0, \pi]$ (Figure 7.35). Now when we ask for the angle x on the interval $[-\pi/2, \pi/2]$ such that $\sin x = \frac{1}{2}$, there is one answer: $x = \pi/6$. When we ask for the angle x on the interval $[0, \pi]$ such that $\cos x = -\frac{1}{2}$, there is one answer: $x = 2\pi/3$.

We define the **inverse sine**, or **arcsine**, denoted $y = \sin^{-1} x$ or $y = \arcsin x$, such that y is the angle whose sine is x , with the provision that y lies in the interval $[-\pi/2, \pi/2]$. Similarly, we define the **inverse cosine**, or **arccosine**, denoted $y = \cos^{-1} x$ or $y = \arccos x$, such that y is the angle whose cosine is x , with the provision that y lies in the interval $[0, \pi]$.

Figure 7.34

- The notation for the inverse trigonometric functions invites confusion: $\sin^{-1} x$ and $\cos^{-1} x$ do not mean the reciprocals of $\sin x$ and $\cos x$. The expression $\sin^{-1} x$ should be read “angle whose sine is x ,” and $\cos^{-1} x$ should be read “angle whose cosine is x .” The values of $\sin^{-1} x$ and $\cos^{-1} x$ are angles.

Figure 7.35

DEFINITION Inverse Sine and Cosine

$y = \sin^{-1} x$ is the value of y such that $x = \sin y$, where $-\pi/2 \leq y \leq \pi/2$.

$y = \cos^{-1} x$ is the value of y such that $x = \cos y$, where $0 \leq y \leq \pi$. The domain of both $\sin^{-1} x$ and $\cos^{-1} x$ is $\{x: -1 \leq x \leq 1\}$.

Recall that any invertible function and its inverse satisfy the properties

$$f(f^{-1}(y)) = y \quad \text{and} \quad f^{-1}(f(x)) = x.$$

These properties apply to the inverse sine and cosine, as long as we observe the restrictions on the domains. Here is what we can say:

QUICK CHECK 1 Explain why $\sin^{-1}(\sin 0) = 0$, but $\sin^{-1}(\sin 2\pi) \neq 2\pi$. ◀

- $\sin(\sin^{-1}x) = x$ and $\cos(\cos^{-1}x) = x$, for $-1 \leq x \leq 1$.
- $\sin^{-1}(\sin y) = y$, for $-\pi/2 \leq y \leq \pi/2$.
- $\cos^{-1}(\cos y) = y$, for $0 \leq y \leq \pi$.

EXAMPLE 1 Working with inverse sine and cosine Evaluate the following expressions.

a. $\sin^{-1}(\sqrt{3}/2)$ b. $\cos^{-1}(-\sqrt{3}/2)$ c. $\cos^{-1}(\cos 3\pi)$ d. $\sin^{-1}\left(\sin \frac{3\pi}{4}\right)$

SOLUTION

- a. $\sin^{-1}(\sqrt{3}/2) = \pi/3$ because $\sin(\pi/3) = \sqrt{3}/2$ and $\pi/3$ is in the interval $[-\pi/2, \pi/2]$.
- b. $\cos^{-1}(-\sqrt{3}/2) = 5\pi/6$ because $\cos(5\pi/6) = -\sqrt{3}/2$ and $5\pi/6$ is in the interval $[0, \pi]$.
- c. It's tempting to conclude that $\cos^{-1}(\cos 3\pi) = 3\pi$, but the result of an inverse cosine operation must lie in the interval $[0, \pi]$. Because $\cos(3\pi) = -1$ and $\cos^{-1}(-1) = \pi$, we have

$$\cos^{-1}(\underbrace{\cos 3\pi}_{-1}) = \cos^{-1}(-1) = \pi.$$

d. $\sin^{-1}\left(\underbrace{\sin \frac{3\pi}{4}}_{\sqrt{2}/2}\right) = \sin^{-1}\frac{\sqrt{2}}{2} = \frac{\pi}{4}$

Related Exercises 21–24 ◀

Graphs and Properties Recall from Section 7.1 that the graph of the inverse f^{-1} is obtained by reflecting the graph of f about the identity line $y = x$. This operation produces the graphs of the inverse sine (Figure 7.36) and inverse cosine (Figure 7.37). The graphs make it easy to compare the domain and range of each function and its inverse.

Figure 7.36

Figure 7.37

EXAMPLE 2 Right-triangle relationships

- a. Suppose $\theta = \sin^{-1}(2/5)$. Find $\cos \theta$ and $\tan \theta$.
 b. Find an alternative form for $\cot(\cos^{-1}(x/4))$ in terms of x .

SOLUTION

Figure 7.38

Figure 7.39

- a. Relationships between the trigonometric functions and their inverses are often simplified using a right-triangle sketch. Notice that $0 < \theta < \pi/2$. The right triangle in **Figure 7.38** satisfies the relationship $\sin \theta = \frac{2}{5}$, or, equivalently, $\theta = \sin^{-1} \frac{2}{5}$. We label the angle θ and the lengths of two sides; we then see the length of the third side is $\sqrt{21}$ (by the Pythagorean theorem). Now it is easy to read directly from the triangle:

$$\cos \theta = \frac{\sqrt{21}}{5} \quad \text{and} \quad \tan \theta = \frac{2}{\sqrt{21}}.$$

- b. We draw a right triangle with an angle θ satisfying $\cos \theta = x/4$, or, equivalently, $\theta = \cos^{-1}(x/4)$, where $0 < x < 4$ (**Figure 7.39**). The length of the third side of the triangle is $\sqrt{16 - x^2}$. It now follows that

$$\cot \left(\underbrace{\cos^{-1} \frac{x}{4}}_{\theta} \right) = \frac{x}{\sqrt{16 - x^2}}, \text{ for } 0 < x < 4 \text{ and } \theta \text{ in the first quadrant.}$$

A similar argument with θ in the second quadrant shows this relationship is valid for $|x| < 4$.

Related Exercises 25–26 ◀

Figure 7.40

EXAMPLE 3 A useful identity Use right triangles to explain why $\cos^{-1} x + \sin^{-1} x = \pi/2$.

SOLUTION We draw a right triangle in a unit circle and label the acute angles θ and φ (**Figure 7.40**). These angles satisfy $\cos \theta = x$, or $\theta = \cos^{-1} x$, and $\sin \varphi = x$, or $\varphi = \sin^{-1} x$. Because θ and φ are complementary angles, we have

$$\frac{\pi}{2} = \theta + \varphi = \cos^{-1} x + \sin^{-1} x.$$

This result holds for $0 \leq x \leq 1$. An analogous argument extends the property to $-1 \leq x \leq 1$.

Related Exercises 31–32 ◀

Other Inverse Trigonometric Functions

The procedures that led to the inverse sine and inverse cosine functions can be used to obtain the other four inverse trigonometric functions. Each of these functions carries a restriction that must be imposed to ensure that an inverse exists.

- The tangent function is one-to-one on $(-\pi/2, \pi/2)$, which becomes the range of $y = \tan^{-1} x$.
- The cotangent function is one-to-one on $(0, \pi)$, which becomes the range of $y = \cot^{-1} x$.
- The secant function is one-to-one on $[0, \pi]$, excluding $x = \pi/2$; this set becomes the range of $y = \sec^{-1} x$.
- The cosecant function is one-to-one on $[-\pi/2, \pi/2]$, excluding $x = 0$; this set becomes the range of $y = \csc^{-1} x$.

The inverse tangent, cotangent, secant, and cosecant are defined as follows.

- Tables, books, and computer algebra systems differ on the definition of the inverses of the secant, cosecant, and cotangent. For example, in some books, $\sec^{-1} x$ is defined to lie in the interval $[-\pi, -\pi/2]$ when $x < 0$.

DEFINITION Other Inverse Trigonometric Functions

$y = \tan^{-1} x$ is the value of y such that $x = \tan y$, where $-\pi/2 < y < \pi/2$.

$y = \cot^{-1} x$ is the value of y such that $x = \cot y$, where $0 < y < \pi$.

The domain of both $\tan^{-1} x$ and $\cot^{-1} x$ is $\{x: -\infty < x < \infty\}$.

$y = \sec^{-1} x$ is the value of y such that $x = \sec y$, where $0 \leq y \leq \pi$, with $y \neq \pi/2$.

$y = \csc^{-1} x$ is the value of y such that $x = \csc y$, where $-\pi/2 \leq y \leq \pi/2$, with $y \neq 0$.

The domain of both $\sec^{-1} x$ and $\csc^{-1} x$ is $\{x: |x| \geq 1\}$.

The graphs of these inverse functions are obtained by reflecting the graphs of the original trigonometric functions about the line $y = x$ (Figures 7.41–7.44). The inverse secant and cosecant are somewhat irregular. The domain of the secant function (Figure 7.43)

Figure 7.41

Figure 7.42

Figure 7.43

Figure 7.44

is restricted to the set $[0, \pi]$, excluding $x = \pi/2$, where the secant has a vertical asymptote. This asymptote splits the range of the secant into two disjoint intervals $(-\infty, -1]$ and $[1, \infty)$, which, in turn, splits the domain of the inverse secant into the same two intervals. A similar situation occurs with the cosecant.

EXAMPLE 4 Working with inverse trigonometric functions Evaluate or simplify the following expressions.

- a. $\tan^{-1}(-1/\sqrt{3})$ b. $\sec^{-1}(-2)$ c. $\sin(\tan^{-1}x)$

SOLUTION

- a. The result of an inverse tangent operation must lie in the interval $(-\pi/2, \pi/2)$. Therefore,

$$\tan^{-1}\left(-\frac{1}{\sqrt{3}}\right) = -\frac{\pi}{6} \quad \text{because} \quad \tan\left(-\frac{\pi}{6}\right) = -\frac{1}{\sqrt{3}}.$$

- b. The result of an inverse secant operation when $x \leq -1$ must lie in the interval $(\pi/2, \pi]$. Therefore,

$$\sec^{-1}(-2) = \frac{2\pi}{3} \quad \text{because} \quad \sec \frac{2\pi}{3} = -2.$$

- c. Figure 7.45 shows a right triangle with the relationship $x = \tan \theta$ or $\theta = \tan^{-1}x$, in the case that $0 \leq \theta < \pi/2$. We see that

$$\sin(\underbrace{\tan^{-1}x}_{\theta}) = \frac{x}{\sqrt{1+x^2}}.$$

The same result follows if $-\pi/2 < \theta < 0$, in which case $x < 0$ and $\sin \theta < 0$.

Related Exercises 34–35, 41 ◀

Figure 7.45

QUICK CHECK 2 Evaluate $\sec^{-1} 1$ and $\tan^{-1} 1$. ◀

Inverse Sine and Its Derivative

Recall that $y = \sin^{-1}x$ is the value of y such that $x = \sin y$, where $-\pi/2 \leq y \leq \pi/2$. The domain of $\sin^{-1}x$ is $\{x: -1 \leq x \leq 1\}$ (Figure 7.46).

Figure 7.46

The derivative of $y = \sin^{-1} x$ follows by differentiating both sides of $x = \sin y$ with respect to x , simplifying, and solving for dy/dx :

$$\begin{aligned} x &= \sin y & y &= \sin^{-1} x \Leftrightarrow x = \sin y \\ \frac{d}{dx}(x) &= \frac{d}{dx}(\sin y) & \text{Differentiate with respect to } x. \\ 1 &= (\cos y) \frac{dy}{dx} & \text{Chain Rule on the right side} \\ \frac{dy}{dx} &= \frac{1}{\cos y}. & \text{Solve for } \frac{dy}{dx}. \end{aligned}$$

The identity $\sin^2 y + \cos^2 y = 1$ is used to express this derivative in terms of x . Solving for $\cos y$ yields

$$\begin{aligned} \cos y &= \pm \sqrt{1 - \underbrace{\sin^2 y}_{x^2}} \quad x = \sin y \Rightarrow x^2 = \sin^2 y \\ &= \pm \sqrt{1 - x^2}. \end{aligned}$$

Because y is restricted to the interval $-\pi/2 \leq y \leq \pi/2$, we have $\cos y \geq 0$. Therefore, we choose the positive branch of the square root, and it follows that

$$\frac{dy}{dx} = \frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1 - x^2}}.$$

This result is consistent with the graph of $f(x) = \sin^{-1} x$ (Figure 7.47).

Figure 7.47

THEOREM 7.11 Derivative of Inverse Sine

$$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1 - x^2}}, \quad \text{for } -1 < x < 1$$

QUICK CHECK 3 Is $f(x) = \sin^{-1} x$ an even or odd function? Is $f'(x)$ an even or odd function? ◀

EXAMPLE 5 Derivatives involving the inverse sine Compute the following derivatives.

- a. $\frac{d}{dx}(\sin^{-1}(x^2 - 1))$ b. $\frac{d}{dx}(\cos(\sin^{-1} x))$

SOLUTION We apply the Chain Rule for both derivatives.

$$\text{a. } \frac{d}{dx}(\sin^{-1}(\underbrace{x^2 - 1}_u)) = \underbrace{\frac{1}{\sqrt{1 - (x^2 - 1)^2}}}_{\substack{\text{derivative of } \sin^{-1} u \\ \text{evaluated at } u = x^2 - 1}} \cdot \underbrace{2x}_{u'(x)} = \frac{2x}{\sqrt{2x^2 - x^4}}$$

$$\text{b. } \frac{d}{dx}(\cos(\underbrace{\sin^{-1} x}_u)) = \underbrace{-\sin(\sin^{-1} x)}_{\substack{\text{the derivative of the} \\ \text{outer function } \cos u \\ \text{evaluated at } u = \sin^{-1} x}} \cdot \underbrace{\frac{1}{\sqrt{1 - x^2}}}_{\substack{\text{the derivative of the} \\ \text{inner function } \sin^{-1} x}} = -\frac{x}{\sqrt{1 - x^2}}$$

► The result in Example 5b could have been obtained by noting that $\cos(\sin^{-1} x) = \sqrt{1 - x^2}$ and differentiating this expression (Exercise 108).

This result is valid for $-1 < x < 1$, where $\sin(\sin^{-1} x) = x$.

Related Exercises 49, 51 ◀

Derivatives of Inverse Tangent and Inverse Secant

The derivatives of the inverse tangent and inverse secant are derived using a method similar to that used for the inverse sine. Once these three derivative results are known, the derivatives of the inverse cosine, cotangent, and cosecant follow immediately.

Inverse Tangent Recall that $y = \tan^{-1} x$ is the value of y such that $x = \tan y$, where $-\pi/2 < y < \pi/2$. The domain of $y = \tan^{-1} x$ is $\{x: -\infty < x < \infty\}$ (Figure 7.48).

Figure 7.48

To find $\frac{dy}{dx}$, we differentiate both sides of $x = \tan y$ with respect to x and simplify:

$$\begin{aligned} x &= \tan y & y &= \tan^{-1} x \Leftrightarrow x = \tan y \\ \frac{d}{dx}(x) &= \frac{d}{dx}(\tan y) & \text{Differentiate with respect to } x. \\ 1 &= \sec^2 y \cdot \frac{dy}{dx} & \text{Chain Rule} \\ \frac{dy}{dx} &= \frac{1}{\sec^2 y}. & \text{Solve for } \frac{dy}{dx}. \end{aligned}$$

To express this derivative in terms of x , we combine the trigonometric identity $\sec^2 y = 1 + \tan^2 y$ with $x = \tan y$ to obtain $\sec^2 y = 1 + x^2$. Substituting this result into the expression for dy/dx , it follows that

$$\frac{dy}{dx} = \frac{d}{dx}(\tan^{-1} x) = \frac{1}{1 + x^2}.$$

The graphs of the inverse tangent and its derivative (Figure 7.49) are informative. Letting $f(x) = \tan^{-1} x$ and $f'(x) = \frac{1}{1+x^2}$, we see that $f'(0) = 1$, which is the maximum value of the derivative; that is, $\tan^{-1} x$ has its maximum slope at $x = 0$. As $x \rightarrow \infty$, $f'(x)$ approaches zero; likewise, as $x \rightarrow -\infty$, $f'(x)$ approaches zero.

Figure 7.49

QUICK CHECK 4 How do the slopes of the lines tangent to the graph of $y = \tan^{-1} x$ behave as $x \rightarrow \infty$? ◀

Inverse Secant Recall that $y = \sec^{-1} x$ is the value of y such that $x = \sec y$, where $0 \leq y \leq \pi$, with $y \neq \pi/2$. The domain of $y = \sec^{-1} x$ is $\{x: |x| \geq 1\}$ (Figure 7.50).

Figure 7.50

The derivative of the inverse secant presents a new twist. Let $y = \sec^{-1} x$, or $x = \sec y$, and then differentiate both sides of $x = \sec y$ with respect to x :

$$1 = \sec y \tan y \frac{dy}{dx}.$$

Solving for $\frac{dy}{dx}$ produces

$$\frac{dy}{dx} = \frac{d}{dx}(\sec^{-1} x) = \frac{1}{\sec y \tan y}.$$

The final step is to express $\sec y \tan y$ in terms of x by using the identity $\sec^2 y = 1 + \tan^2 y$. Solving this equation for $\tan y$, we have

$$\tan y = \pm \sqrt{\underbrace{\sec^2 y}_{x^2} - 1} = \pm \sqrt{x^2 - 1}.$$

Two cases must be examined to resolve the sign on the square root:

- By the definition of $y = \sec^{-1} x$, if $x \geq 1$, then $0 \leq y < \pi/2$ and $\tan y > 0$. In this case, we choose the positive branch and take $\tan y = \sqrt{x^2 - 1}$.
- However, if $x \leq -1$, then $\pi/2 < y \leq \pi$ and $\tan y < 0$. Now we choose the negative branch.

This argument accounts for the $\tan y$ factor in the derivative. For the $\sec y$ factor, we have $\sec y = x$. Therefore, the derivative of the inverse secant is

$$\frac{d}{dx}(\sec^{-1} x) = \begin{cases} \frac{1}{x\sqrt{x^2 - 1}} & \text{if } x > 1 \\ -\frac{1}{x\sqrt{x^2 - 1}} & \text{if } x < -1, \end{cases}$$

which is an awkward result. The absolute value helps here: Recall that $|x| = x$, if $x > 0$, and $|x| = -x$, if $x < 0$. It follows that

$$\frac{d}{dx}(\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2 - 1}}, \text{ for } |x| > 1.$$

We see that the slope of the inverse secant function is always positive, which is consistent with this derivative result (Figure 7.50).

Derivatives of Other Inverse Trigonometric Functions The hard work is complete. The derivative of the inverse cosine results from the identity

$$\cos^{-1} x + \sin^{-1} x = \frac{\pi}{2}.$$

Differentiating both sides of this equation with respect to x , we find that

$$\frac{d}{dx}(\cos^{-1} x) + \underbrace{\frac{d}{dx}(\sin^{-1} x)}_{1/\sqrt{1-x^2}} = \underbrace{\frac{d}{dx}\left(\frac{\pi}{2}\right)}_0.$$

Solving for $\frac{d}{dx}(\cos^{-1} x)$ reveals that the required derivative is

$$\frac{d}{dx}(\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}.$$

In a similar manner, the analogous identities

$$\cot^{-1} x + \tan^{-1} x = \frac{\pi}{2} \quad \text{and} \quad \csc^{-1} x + \sec^{-1} x = \frac{\pi}{2}$$

are used to show that the derivatives of $\cot^{-1} x$ and $\csc^{-1} x$ are the negative of the derivatives of $\tan^{-1} x$ and $\sec^{-1} x$, respectively (Exercise 106).

THEOREM 7.12 Derivatives of Inverse Trigonometric Functions

$$\begin{aligned} \frac{d}{dx}(\sin^{-1} x) &= \frac{1}{\sqrt{1-x^2}} & \frac{d}{dx}(\cos^{-1} x) &= -\frac{1}{\sqrt{1-x^2}}, & \text{for } -1 < x < 1 \\ \frac{d}{dx}(\tan^{-1} x) &= \frac{1}{1+x^2} & \frac{d}{dx}(\cot^{-1} x) &= -\frac{1}{1+x^2}, & \text{for } -\infty < x < \infty \\ \frac{d}{dx}(\sec^{-1} x) &= \frac{1}{|x|\sqrt{x^2-1}} & \frac{d}{dx}(\csc^{-1} x) &= -\frac{1}{|x|\sqrt{x^2-1}}, & \text{for } |x| > 1 \end{aligned}$$

► This identity was proved in Example 3 of this section.

QUICK CHECK 5 Summarize how the derivatives of inverse trigonometric functions are related to the derivatives of the corresponding inverse cofunctions (for example, inverse tangent and inverse cotangent). ◀

EXAMPLE 6 Derivatives of inverse trigonometric functions

- a. Evaluate $f'(2\sqrt{3})$, where $f(x) = x \tan^{-1}(x/2)$.
 b. Find an equation of the line tangent to the graph of $g(x) = \sec^{-1} 2x$ at the point $(1, \pi/3)$.

SOLUTION

$$\begin{aligned} \text{a. } f'(x) &= 1 \cdot \tan^{-1} \frac{x}{2} + x \underbrace{\frac{1}{1 + (x/2)^2} \cdot \frac{1}{2}}_{\frac{d}{dx}(\tan^{-1}(x/2))} && \text{Product Rule and Chain Rule} \\ &= \tan^{-1} \frac{x}{2} + \frac{2x}{4 + x^2} && \text{Simplify.} \end{aligned}$$

We evaluate f' at $x = 2\sqrt{3}$ and note that $\tan^{-1} \sqrt{3} = \pi/3$:

$$f'(2\sqrt{3}) = \tan^{-1} \sqrt{3} + \frac{2(2\sqrt{3})}{4 + (2\sqrt{3})^2} = \frac{\pi}{3} + \frac{\sqrt{3}}{4}.$$

- b. The slope of the tangent line at $(1, \pi/3)$ is $g'(1)$. Using the Chain Rule, we have

$$g'(x) = \frac{d}{dx}(\sec^{-1} 2x) = \frac{2}{|2x|\sqrt{4x^2 - 1}} = \frac{1}{|x|\sqrt{4x^2 - 1}}.$$

It follows that $g'(1) = 1/\sqrt{3}$. An equation of the tangent line is

$$\left(y - \frac{\pi}{3}\right) = \frac{1}{\sqrt{3}}(x - 1) \quad \text{or} \quad y = \frac{1}{\sqrt{3}}x + \frac{\pi}{3} - \frac{1}{\sqrt{3}}.$$

Related Exercises 55, 58 ◀

EXAMPLE 7 Shadows in a ballpark As the sun descends behind the 150-ft grandstand of a baseball stadium, the shadow of the stadium moves across the field (Figure 7.51). Let ℓ be the line segment between the edge of the shadow and the sun, and let θ be the angle of elevation of the sun—the angle between ℓ and the horizontal. The length of the shadow s is the distance between the edge of the shadow and the base of the grandstand.

- a. Express θ as a function of the shadow length s .
 b. Compute $d\theta/ds$ when $s = 200$ ft and explain what this rate of change measures.

SOLUTION

- a. The tangent of θ is

$$\tan \theta = \frac{150}{s},$$

where $s > 0$. Taking the inverse tangent of both sides of this equation, we find that

$$\theta = \tan^{-1} \frac{150}{s}.$$

Figure 7.52 illustrates how the sun's angle of elevation θ approaches $\pi/2$ as the length of the shadow approaches zero ($\theta = \pi/2$ means the sun is overhead). As the shadow length increases, θ decreases and approaches zero.

- b. Using the Chain Rule, we have

$$\begin{aligned} \frac{d\theta}{ds} &= \frac{1}{1 + (150/s)^2} \frac{d}{ds} \left(\frac{150}{s} \right) && \text{Chain Rule; } \frac{d}{du}(\tan^{-1} u) = \frac{1}{1 + u^2} \\ &= \frac{1}{1 + (150/s)^2} \left(-\frac{150}{s^2} \right) && \text{Evaluate the derivative.} \\ &= -\frac{150}{s^2 + 22,500}. && \text{Simplify.} \end{aligned}$$

Figure 7.51

Figure 7.52

Notice that $d\theta/ds$ is negative for all values of s , which means that as shadows lengthen, the angle of elevation decreases (Figure 7.52). At $s = 200$ ft, we have

$$\left. \frac{d\theta}{ds} \right|_{s=200} = -\frac{150}{200^2 + 150^2} = -0.0024 \frac{\text{rad}}{\text{ft}}.$$

When the length of the shadow is $s = 200$ ft, the angle of elevation is changing at a rate of -0.0024 rad/ft, or $-0.138^\circ/\text{ft}$.

Related Exercises 73–74 ◀

QUICK CHECK 6 Example 7 makes the claim that $d\theta/ds = -0.0024$ rad/ft is equivalent to $-0.138^\circ/\text{ft}$. Verify this claim. ◀

Integrals Involving Inverse Trigonometric Functions

It is now a straightforward matter to write the results of Theorem 7.12 in terms of indefinite integrals. Notice that only three (rather than six) new integrals arise in this way. However, they are important integrals that are used frequently in upcoming chapters.

We generalize the integrals using the following observation applied to the inverse sine derivative. Because

$$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}, \quad \text{for } |x| < 1,$$

the Chain Rule gives

$$\frac{d}{dx}\left(\sin^{-1} \frac{x}{a}\right) = \frac{1}{\sqrt{1-(x/a)^2}} \cdot \frac{1}{a} = \frac{1}{\sqrt{a^2-x^2}}, \quad \text{for } |x| < a,$$

where $a > 0$ is a constant. Writing this result as an indefinite integral, we have

$$\int \frac{dx}{\sqrt{a^2-x^2}} = \sin^{-1} \frac{x}{a} + C.$$

A similar calculation with the inverse tangent and inverse secant derivatives gives the following indefinite integrals.

THEOREM 7.13 Integrals Involving Inverse Trigonometric Functions

1. $\int \frac{dx}{\sqrt{a^2-x^2}} = \sin^{-1} \frac{x}{a} + C$
2. $\int \frac{dx}{a^2+x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$
3. $\int \frac{dx}{x\sqrt{x^2-a^2}} = \frac{1}{a} \sec^{-1} \left| \frac{x}{a} \right| + C, a > 0$

EXAMPLE 8 Evaluating integrals Evaluate the following integrals.

$$\text{a. } \int \frac{4}{\sqrt{9-x^2}} dx \qquad \text{b. } \int \frac{dx}{16x^2+1} \qquad \text{c. } \int_{5/\sqrt{3}}^5 \frac{dx}{x\sqrt{4x^2-25}}$$

SOLUTION

a. Setting $a = 3$ in the first result of Theorem 7.13, we have

$$\int \frac{4}{\sqrt{9-x^2}} dx = 4 \int \frac{dx}{\sqrt{3^2-x^2}} = 4 \sin^{-1} \frac{x}{3} + C.$$

b. An algebra step is needed to put this integral in a form that matches Theorem 7.13. We first write

$$\int \frac{dx}{16x^2+1} = \frac{1}{16} \int \frac{dx}{x^2 + \frac{1}{16}} = \frac{1}{16} \int \frac{dx}{x^2 + \left(\frac{1}{4}\right)^2}.$$

Setting $a = \frac{1}{4}$ in part 2 of Theorem 7.13 gives

$$\int \frac{dx}{16x^2 + 1} = \frac{1}{16} \int \frac{dx}{x^2 + (\frac{1}{4})^2} = \frac{1}{16} \cdot 4 \tan^{-1} 4x + C = \frac{1}{4} \tan^{-1} 4x + C.$$

- c. A change of variables puts the integral in the form of the third integral in Theorem 7.13. Letting $u = 2x$, we have

$$\begin{aligned} \int_{5/\sqrt{3}}^5 \frac{dx}{x\sqrt{4x^2 - 25}} &= \int_{10/\sqrt{3}}^{10} \frac{\frac{1}{2} du}{\frac{1}{2} u \sqrt{u^2 - 25}} && u = 2x, du = 2 dx \\ &= \int_{10/\sqrt{3}}^{10} \frac{du}{u \sqrt{u^2 - 25}} && \text{Simplify.} \\ &= \frac{1}{5} \sec^{-1} \frac{u}{5} \Big|_{10/\sqrt{3}}^{10} && \text{Theorem 7.13, } a = 5 \\ &= \frac{1}{5} \left(\sec^{-1} 2 - \sec^{-1} \frac{2}{\sqrt{3}} \right) && \text{Evaluate.} \\ &= \frac{1}{5} \left(\frac{\pi}{3} - \frac{\pi}{6} \right) = \frac{\pi}{30}. && \text{Simplify.} \end{aligned}$$

Related Exercises 77–79 ◀

Figure 7.53

EXAMPLE 9 **Circumference of a circle** Confirm that the circumference of a circle of radius a is $2\pi a$.

SOLUTION The upper half of a circle of radius a centered at $(0, 0)$ is given by the function $f(x) = \sqrt{a^2 - x^2}$, for $|x| \leq a$ (Figure 7.53). So we might consider using the arc length formula on the interval $[-a, a]$ to find the length of a semicircle. However, the circle has vertical tangent lines at $x = \pm a$ and $f'(\pm a)$ is undefined, which prevents us from using the arc length formula. An alternative approach is to use symmetry and avoid the points $x = \pm a$. For example, let's compute the length of one-eighth of the circle on the interval $[0, a/\sqrt{2}]$ (Figure 7.53).

We first determine that $f'(x) = -\frac{x}{\sqrt{a^2 - x^2}}$, which is continuous on $[0, a/\sqrt{2}]$.

The length of one-eighth of the circle is

$$\begin{aligned} \int_0^{a/\sqrt{2}} \sqrt{1 + f'(x)^2} dx &= \int_0^{a/\sqrt{2}} \sqrt{1 + \left(-\frac{x}{\sqrt{a^2 - x^2}} \right)^2} dx \\ &= \int_0^{a/\sqrt{2}} \sqrt{\frac{a^2}{a^2 - x^2}} dx && \text{Simplify.} \\ &= a \int_0^{a/\sqrt{2}} \frac{dx}{\sqrt{a^2 - x^2}} && \text{Simplify; } a > 0 \\ &= a \sin^{-1} \frac{x}{a} \Big|_0^{a/\sqrt{2}} && \text{Integrate.} \\ &= a \left(\sin^{-1} \frac{1}{\sqrt{2}} - 0 \right) && \text{Evaluate.} \\ &= \frac{\pi a}{4}. && \text{Simplify.} \end{aligned}$$

It follows that the circumference of the full circle is $8(\pi a/4) = 2\pi a$ units.

Related Exercises 81, 83 ◀

► The arc length integral for the semicircle on $[-a, a]$ is an example of an *improper integral*, a topic considered in Section 8.9.

SECTION 7.5 EXERCISES

Getting Started

1. Explain why the domain of the sine function must be restricted in order to define its inverse function.
2. Why do values of $\cos^{-1} x$ lie in the interval $[0, \pi]$?
3. Evaluate $\cos^{-1}(\cos(5\pi/4))$.
4. Evaluate $\sin^{-1}(\sin(11\pi/6))$.
5. Is it true that $\tan(\tan^{-1} x) = x$ for all x ? Is it true that $\tan^{-1}(\tan x) = x$ for all x ?
6. Sketch the graphs of $y = \cos x$ and $y = \cos^{-1} x$ on the same set of axes.
7. The function $\tan x$ is undefined at $x = \pm \pi/2$. How does this fact appear in the graph of $y = \tan^{-1} x$?
8. State the domain and range of $\sec^{-1} x$.
9. State the derivative formulas for $\sin^{-1} x$, $\tan^{-1} x$, and $\sec^{-1} x$.
10. What is the slope of the line tangent to the graph of $y = \sin^{-1} x$ at $x = 0$?
11. What is the slope of the line tangent to the graph of $y = \tan^{-1} x$ at $x = -2$?
12. How are the derivatives of $\sin^{-1} x$ and $\cos^{-1} x$ related?
13. Find the slope of the curve $y = \sin^{-1} x$ at $\left(\frac{1}{2}, \frac{\pi}{6}\right)$ without calculating the derivative of $\sin^{-1} x$.
14. Find the slope of the curve $y = \tan^{-1} x$ at $\left(1, \frac{\pi}{4}\right)$ without calculating the derivative of $\tan^{-1} x$.
15. Evaluate $\int \frac{a}{\sqrt{1-x^2}} dx$, where a is a constant.
16. Evaluate $\int_0^{1/2} \frac{dx}{1+4x^2}$ using the substitution $u = 2x$.

Practice Exercises

17–24. Inverse sines and cosines Without using a calculator, evaluate the following expressions, or state that the quantity is undefined.

17. $\sin^{-1} 1$
18. $\cos^{-1}(-1)$
19. $\sin^{-1}(-\frac{1}{2})$
20. $\cos^{-1} 2$
21. $\cos^{-1}(-\frac{1}{2})$
22. $\sin^{-1}(-1)$
23. $\cos(\cos^{-1}(-1))$
24. $\cos^{-1}(\cos(7\pi/6))$

25–30. Right-triangle relationships Draw a right triangle to simplify the given expressions. Assume $x > 0$.

25. $\cos(\sin^{-1} x)$
26. $\cos(\sin^{-1}(x/3))$
27. $\sin(\cos^{-1}(x/2))$
28. $\sin^{-1}(\cos \theta)$, for $0 \leq \theta \leq \pi/2$
29. $\sin(2 \cos^{-1} x)$ (Hint: Use $\sin 2\theta = 2 \sin \theta \cos \theta$.)
30. $\cos(2 \sin^{-1} x)$ (Hint: Use $\cos 2\theta = \cos^2 \theta - \sin^2 \theta$.)

31–32. Identities Prove the following identities.

31. $\cos^{-1} x + \cos^{-1}(-x) = \pi$
32. $\sin^{-1} y + \sin^{-1}(-y) = 0$

33–40. Evaluating inverse trigonometric functions Without using a calculator, evaluate or simplify the following expressions.

33. $\tan^{-1} \sqrt{3}$
34. $\cot^{-1}(-1/\sqrt{3})$
35. $\sec^{-1} 2$
36. $\csc^{-1}(-1)$
37. $\tan^{-1}(\tan(\pi/4))$
38. $\tan^{-1}(\tan(3\pi/4))$
39. $\csc^{-1}(\sec 2)$
40. $\tan(\tan^{-1} 1)$

41–46. Right-triangle relationships Draw a right triangle to simplify the given expressions. Assume $x > 0$.

41. $\cos(\tan^{-1} x)$
42. $\tan(\cos^{-1} x)$
43. $\sec(\tan^{-1} x)$
44. $\sin(\sec^{-1} 3x)$
45. $\sec(\csc^{-1} 2x)$
46. $\tan(\csc^{-1}(x/2))$

47–48. Right-triangle pictures Express θ in terms of x using the inverse sine, inverse tangent, and inverse secant functions.

49–72. Derivatives Evaluate the derivatives of the following functions.

49. $f(x) = \sin^{-1} 2x$
50. $f(x) = x \sin^{-1} x$
51. $f(w) = \cos(\sin^{-1} 2w)$
52. $f(x) = \sin^{-1}(\ln x)$
53. $f(x) = \sin^{-1}(e^{-2x})$
54. $f(x) = \sin^{-1}(e^{\sin x})$
55. $f(y) = \tan^{-1}(2y^2 - 4)$
56. $g(z) = \tan^{-1}(1/z)$
57. $f(z) = \cot^{-1} \sqrt{z}$
58. $f(x) = \sec^{-1} \sqrt{x}$
59. $f(x) = \cos^{-1}(1/x)$
60. $f(t) = (\cos^{-1} t)^2$
61. $f(u) = \csc^{-1}(2u + 1)$
62. $f(t) = \ln(\tan^{-1} t)$
63. $f(y) = \cot^{-1}(1/(y^2 + 1))$
64. $f(w) = \sin(\sec^{-1} 2w)$
65. $f(x) = \sec^{-1}(\ln x)$
66. $f(x) = \tan^{-1}(e^{4x})$
67. $f(x) = \csc^{-1}(\tan e^x)$
68. $f(x) = \sin(\tan^{-1} \ln x)$
69. $f(s) = \cot^{-1}(e^s)$
70. $f(x) = 1/(\tan^{-1}(x^2 + 4))$
71. $f(w) = w^2 - \tan^{-1} w^2$
72. $f(t) = \ln(\sin^{-1} t^2)$

73. Angular size A boat sails directly toward a 150-m skyscraper that stands on the edge of a harbor. The angular size θ of the building is the angle formed by lines from the top and bottom of the building to the observer (see figure).

- a. What is the rate of change of the angular size $d\theta/dx$ when the boat is 500 m from the building?

- b. Graph $d\theta/dx$ as a function of x and determine the point at which the angular size changes most rapidly.

- 74. Angle of elevation** A small plane, moving at 70 m/s, flies horizontally on a line 400 m directly above an observer. Let θ be the angle of elevation of the plane (see figure).

- a. What is the rate of change of the angle of elevation $d\theta/dx$ when the plane is 500 m past the observer?
b. Graph $d\theta/dx$ as a function of x and determine the point at which θ changes most rapidly.

- 75. Towing a boat** A boat is towed toward a dock by a cable attached to a winch that stands 10 ft above the water level (see figure). Let θ be the angle of elevation of the winch, and let ℓ be the length of the cable as the boat is towed toward the dock.

- a. Show that the rate of change of θ with respect to ℓ is

$$\frac{d\theta}{d\ell} = -\frac{10}{\ell\sqrt{\ell^2 - 100}}.$$

- b. Compute $\frac{d\theta}{d\ell}$ when $\ell = 50, 20$, and 11 ft.

- c. Find $\lim_{\ell \rightarrow 10^+} \frac{d\theta}{d\ell}$, and explain what happens as the last foot of cable is reeled in (note that the boat is at the dock when $\ell = 10$).

- d. It is evident from the figure that θ increases as the boat is towed to the dock. Why, then, is $d\theta/d\ell$ negative?

- 76. Hockey problem** A hockey player states on a line that is perpendicular to the goal line (see figure).

- a. Express the angle θ on goal as a function of x .
b. Determine the distance x that maximizes the angle θ .

77–90. Integrals involving inverse trigonometric functions Evaluate the following integrals.

77. $\int \frac{6}{\sqrt{25 - x^2}} dx$

78. $\int \frac{3}{4 + v^2} dv$

79. $\int \frac{dx}{x\sqrt{x^2 - 100}}$

80. $\int \frac{2}{16z^2 + 25} dz$

81. $\int_0^3 \frac{dx}{\sqrt{36 - x^2}}$

82. $\int_2^{2\sqrt{3}} \frac{5}{x^2 + 4} dx$

83. $\int_0^{3/2} \frac{dx}{\sqrt{36 - 4x^2}}$

84. $\int_0^{5/4} \frac{3}{64x^2 + 100} dx$

85. $\int_{-\ln \sqrt{3}}^0 \frac{e^x}{1 + e^{2x}} dx$

86. $\int_1^{\sqrt{e}} \frac{dx}{x\sqrt{1 - \ln^2 x}}$

87. $\int \frac{dy}{y^2 - 4y + 5}$

88. $\int \frac{dx}{(x + 3)\sqrt{x^2 + 6x}}$

89. $\int \frac{e^x}{e^{2x} + 4} dx$

90. $\int \frac{dx}{x^3 + x^{-1}}$

- 91. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. $\frac{\sin^{-1} x}{\cos^{-1} x} = \tan^{-1} x$.

b. $\cos^{-1}(\cos(15\pi/16)) = 15\pi/16$.

c. $\sin^{-1} x = 1/\sin x$.

d. $\frac{d}{dx}(\sin^{-1} x + \cos^{-1} x) = 0$.

e. $\frac{d}{dx}(\tan^{-1} x) = \sec^2 x$.

f. The lines tangent to the graph of $y = \sin^{-1} x$ on the interval $[-1, 1]$ have a minimum slope of 1.

g. The lines tangent to the graph of $y = \sin x$ on the interval $[-\pi/2, \pi/2]$ have a maximum slope of 1.

92–95. One function gives all six Given the following information about one trigonometric function, evaluate the other five functions.

92. $\sin \theta = -\frac{4}{5}$ and $\pi < \theta < 3\pi/2$

93. $\cos \theta = \frac{5}{13}$ and $0 < \theta < \pi/2$

94. $\sec \theta = \frac{5}{3}$ and $3\pi/2 < \theta < 2\pi$

95. $\csc \theta = \frac{13}{12}$ and $0 < \theta < \pi/2$

Explorations and Challenges

96–99. Graphing f and f'

- Graph f with a graphing utility.
- Compute and graph f' .
- Verify that the zeros of f' correspond to points at which f has a horizontal tangent line.

96. $f(x) = (x - 1) \sin^{-1} x$ on $[-1, 1]$

97. $f(x) = (x^2 - 1) \sin^{-1} x$ on $[-1, 1]$

98. $f(x) = (\sec^{-1} x)/x$ on $[1, \infty)$

99. $f(x) = e^{-x} \tan^{-1} x$ on $[0, \infty)$

100. Graphing with inverse trigonometric functions

- Graph the function $f(x) = \frac{\tan^{-1} x}{x^2 + 1}$.
- Compute and graph f' , and then approximate the roots of $f'(x)$.
- Verify that the zeros of f' correspond to points at which f has a horizontal tangent line.

- 101. Angle to a particle (part 1)** A particle travels clockwise on a circular path of diameter D , monitored by a sensor on the circle at point P ; the other endpoint of the diameter on which the sensor lies is Q (see figure). Let θ be the angle between the diameter PQ and the line from the sensor to the particle. Let c be the length of the chord from the particle's position to Q .

- Calculate $\frac{d\theta}{dc}$.
- Evaluate $\frac{d\theta}{dc} \Big|_{c=0}$

- 102. Angle to a particle (part 2)** The figure in Exercise 101 shows the particle traveling away from the sensor, which may have influenced your solution (we expect you used the inverse sine function). Suppose instead that the particle approaches the sensor (see figure). How would this change the solution? Explain the differences in the two answers.

- 103. Tracking a dive** A biologist standing at the bottom of an 80-ft vertical cliff watches a peregrine falcon dive from the top of the cliff at a 45° angle from the horizontal (see figure).

- Express the angle of elevation θ from the biologist to the falcon as a function of the height h of the bird above the ground. (Hint: The vertical distance between the top of the cliff and the falcon is $80 - h$.)
- What is the rate of change of θ with respect to the bird's height when it is 60 ft above the ground?

- 104. Derivative of the inverse sine** Find the derivative of the inverse sine using Theorem 7.3.

- 105. Derivative of the inverse cosine** Find the derivative of the inverse cosine using Theorem 7.3.

- 106. Derivative of $\cot^{-1} x$ and $\csc^{-1} x$** Use a trigonometric identity to show that the derivatives of the inverse cotangent and inverse cosecant differ from the derivatives of the inverse tangent and inverse secant, respectively, by a multiplicative factor of -1 .

- 107–110. Identity proofs** Prove the following identities and give the values of x for which they are true.

107. $\cos(2 \sin^{-1} x) = 1 - 2x^2$

108. $\cos(\sin^{-1} x) = \sqrt{1 - x^2}$

109. $\sin(2 \sin^{-1} x) = 2x\sqrt{1 - x^2}$

110. $\tan(2 \tan^{-1} x) = \frac{2x}{1 - x^2}$

QUICK CHECK ANSWERS

- $\sin^{-1}(\sin 0) = \sin^{-1} 0 = 0$ and $\sin^{-1}(\sin 2\pi) = \sin^{-1} 0 = 0$
- $0, \pi/4$
- $f(x) = \sin^{-1} x$ is odd, while $f'(x) = 1/\sqrt{1 - x^2}$ is even.
- The slopes of the tangent lines approach 0.
- One is the negative of the other.
- Recall that $1^\circ = \pi/180$ rad. So 0.0024 rad/ft is equivalent to $0.138^\circ/\text{ft}$.
- Because $\sin^{-1} x$ and $\cos^{-1} x$ differ by a constant, they are both antiderivatives of $(1 - x^2)^{-1/2}$. A similar argument applies to $\tan^{-1} x$ and $\cot^{-1} x$, and $\sec^{-1} x$ and $\csc^{-1} x$.

7.6 L'Hôpital's Rule and Growth Rates of Functions

We first encountered l'Hôpital's Rule in Section 4.7, where it was applied directly to the indeterminate forms $0/0$ and ∞/∞ . We may now combine properties of the exponential function with l'Hôpital's Rule to evaluate limits with the indeterminate forms that we denote 1^∞ , 0^0 , and ∞^0 . This technique greatly expands our limit-taking capabilities and it offers some surprising results. A valuable outcome of this section is a ranking of functions according to their growth rates as $x \rightarrow \infty$. For example, which function grows faster as $x \rightarrow \infty$, 1.001^x or x^{100} ? Rankings such as this should become part of your mathematical intuition; they are used often in upcoming chapters.

A Brief Review

In Section 4.7, you learned that limits of the indeterminate forms $0/0$ and ∞/∞ may be evaluated by applying l'Hôpital's Rule. Specifically, l'Hôpital's Rule says that under suitable conditions on f and g , if $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0$, or $\lim_{x \rightarrow a} f(x) = \pm \infty$ and $\lim_{x \rightarrow a} g(x) = \pm \infty$, then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)},$$

provided the limit on the right exists (or is $\pm \infty$). The rule also applies if $x \rightarrow a$ is replaced with $x \rightarrow \pm \infty$, $x \rightarrow a^+$, or $x \rightarrow a^-$. Example 1 provides a review of these ideas using the transcendental functions introduced in this chapter. We also review the method used to analyze limits of the form $0 \cdot \infty$.

EXAMPLE 1 L'Hôpital's Rule revisited Evaluate the following limits.

a. $\lim_{x \rightarrow 0} \frac{e^{2x} - 2x - 1}{x \sin x}$ b. $\lim_{x \rightarrow \infty} 3^x (\pi/2 - \tan^{-1} x)$ c. $\lim_{x \rightarrow \infty} \frac{x}{\ln x}$

SOLUTION

a. Evaluating the numerator and denominator of the function at 0, we see that this limit has the indeterminate form $0/0$. Applying l'Hôpital's Rule results in another limit of the form $0/0$, so we use the rule again:

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{e^{2x} - 2x - 1}{x \sin x} &= \lim_{x \rightarrow 0} \frac{2e^{2x} - 2}{\sin x + x \cos x} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow 0} \frac{4e^{2x}}{2 \cos x - x \sin x} && \text{L'Hôpital's Rule again} \\ &= \frac{4}{2} = 2. && \text{Evaluate limit.} \end{aligned}$$

b. Because $\lim_{x \rightarrow \infty} \tan^{-1} x = \frac{\pi}{2}$ (see margin note), the limit form is $0 \cdot \infty$, which may be converted to the form $0/0$ so that l'Hôpital's Rule can be applied:

$$\begin{aligned} \lim_{x \rightarrow \infty} 3^x (\pi/2 - \tan^{-1} x) &= \lim_{x \rightarrow \infty} \frac{\pi/2 - \tan^{-1} x}{3^{-x}} && 3^x = \frac{1}{3^{-x}} \\ &= \lim_{x \rightarrow \infty} \frac{-1/(1+x^2)}{-3^{-x} \ln 3} && \text{L'Hôpital's Rule for } 0/0 \text{ form} \\ &= \lim_{x \rightarrow \infty} \frac{3^x}{(1+x^2) \ln 3}. && \text{Simplify.} \end{aligned}$$

► The fact that $f(x) = \tan x$ has a vertical asymptote at $x = \frac{\pi}{2}$ implies that its inverse $f^{-1}(x) = \tan^{-1} x$ has a horizontal asymptote of $y = \frac{\pi}{2}$, which in turn implies that $\lim_{x \rightarrow \infty} \tan^{-1} x = \frac{\pi}{2}$. A similar argument leads to $\lim_{x \rightarrow -\infty} \tan^{-1} x = -\frac{\pi}{2}$, as shown in the figure.

The new limit is of the form ∞/∞ . Applying l'Hôpital's Rule two more times, we have

$$\lim_{x \rightarrow \infty} \frac{3^x}{(1+x^2) \ln 3} = \lim_{x \rightarrow \infty} \frac{3^x \ln 3}{2x \ln 3} = \lim_{x \rightarrow \infty} \frac{3^x}{2x} = \lim_{x \rightarrow \infty} \frac{3^x \ln 3}{2} = \infty.$$

$\underbrace{\qquad\qquad\qquad}_{\infty/\infty}$
 $\underbrace{\qquad\qquad\qquad}_{\text{l'Hôpital's Rule}}$
 $\underbrace{\qquad\qquad\qquad}_{\text{Simplify; } \infty/\infty}$
 $\underbrace{\qquad\qquad\qquad}_{\text{l'Hôpital's Rule}}$

c. This time we have a limit of the form ∞/∞ , to which we apply l'Hôpital's Rule:

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{x}{\ln x} &= \lim_{x \rightarrow \infty} \frac{1}{1/x} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow \infty} x = \infty. && \text{Simplify and evaluate.} \end{aligned}$$

Related Exercises 7, 14, 20 ◀

Indeterminate Forms 1^∞ , 0^0 , and ∞^0

The indeterminate forms 1^∞ , 0^0 , and ∞^0 all arise in limits of the form $\lim_{x \rightarrow a} f(x)^{g(x)}$. However, l'Hôpital's Rule cannot be applied directly to these indeterminate forms. They must first be expressed in the form $0/0$ or ∞/∞ . Here is how we proceed.

The inverse relationship between $\ln x$ and e^x says that $f^g = e^{g \ln f}$, so we first write

$$\lim_{x \rightarrow a} f(x)^{g(x)} = \lim_{x \rightarrow a} e^{g(x) \ln f(x)}.$$

By the continuity of the exponential function, we switch the order of the limit and the exponential function (Theorem 2.11); therefore,

$$\lim_{x \rightarrow a} f(x)^{g(x)} = \lim_{x \rightarrow a} e^{g(x) \ln f(x)} = e^{\lim_{x \rightarrow a} g(x) \ln f(x)},$$

provided $\lim_{x \rightarrow a} g(x) \ln f(x)$ exists or is $\pm \infty$. Therefore, $\lim_{x \rightarrow a} f(x)^{g(x)}$ is evaluated using the following two steps.

► Notice the following:

For 1^∞ , L has the form $\infty \cdot \ln 1 = \infty \cdot 0$.

For 0^0 , L has the form $0 \cdot \ln 0 = 0 \cdot \infty$.

For ∞^0 , L has the form $0 \cdot \ln \infty = 0 \cdot \infty$.

QUICK CHECK 1 Explain why a limit of the form 0^∞ is not an indeterminate form. ◀

PROCEDURE Indeterminate forms 1^∞ , 0^0 , and ∞^0

Assume $\lim_{x \rightarrow a} f(x)^{g(x)}$ has the indeterminate form 1^∞ , 0^0 , or ∞^0 .

1. Analyze $L = \lim_{x \rightarrow a} g(x) \ln f(x)$. This limit can be put in the form $0/0$ or ∞/∞ , both of which are handled by l'Hôpital's Rule.
2. When L is finite, $\lim_{x \rightarrow a} f(x)^{g(x)} = e^L$. If $L = \infty$ or $-\infty$, then $\lim_{x \rightarrow a} f(x)^{g(x)} = \infty$ or $\lim_{x \rightarrow a} f(x)^{g(x)} = 0$, respectively.

EXAMPLE 2 Indeterminate forms Evaluate the following limits.

a. $\lim_{x \rightarrow 0^+} x^x$ b. $\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x$ c. $\lim_{x \rightarrow 0^+} (\csc x)^x$

SOLUTION

a. This limit has the form 0^0 . Using the given two-step procedure, we note that $x^x = e^{x \ln x}$ and first evaluate

$$L = \lim_{x \rightarrow 0^+} x \ln x.$$

This limit has the form $0 \cdot \infty$, which may be put in the form ∞/∞ so that l'Hôpital's Rule can be applied:

$$\begin{aligned} L &= \lim_{x \rightarrow 0^+} x \ln x = \lim_{x \rightarrow 0^+} \frac{\ln x}{1/x} && x = \frac{1}{1/x} \\ &= \lim_{x \rightarrow 0^+} \frac{1/x}{-1/x^2} && \text{L'Hôpital's Rule for } \infty/\infty \text{ form} \\ &= \lim_{x \rightarrow 0^+} (-x) = 0. && \text{Simplify and evaluate the limit.} \end{aligned}$$

Figure 7.54

- The limit in Example 2b is often given as a definition of e . It is a special case of the more general limit

$$\lim_{x \rightarrow \infty} \left(1 + \frac{a}{x}\right)^x = e^a.$$

See Exercise 67.

Figure 7.55

The second step is to exponentiate the limit:

$$\lim_{x \rightarrow 0^+} x^x = e^L = e^0 = 1.$$

We conclude that $\lim_{x \rightarrow 0^+} x^x = 1$ (Figure 7.54).

- b. This limit has the form 1^∞ . Noting that $(1 + 1/x)^x = e^{x \ln(1 + 1/x)}$, the first step is to evaluate

$$L = \lim_{x \rightarrow \infty} x \ln \left(1 + \frac{1}{x}\right),$$

which has the form $0 \cdot \infty$. Proceeding as in part (a), we have

$$L = \lim_{x \rightarrow \infty} x \ln \left(1 + \frac{1}{x}\right) = \lim_{x \rightarrow \infty} \frac{\ln(1 + 1/x)}{1/x} \quad x = \frac{1}{1/x}$$

$$= \lim_{x \rightarrow \infty} \frac{\frac{1}{1 + 1/x} \cdot \left(-\frac{1}{x^2}\right)}{\left(-\frac{1}{x^2}\right)} \quad \text{L'Hôpital's Rule for } 0/0 \text{ form}$$

$$= \lim_{x \rightarrow \infty} \frac{1}{1 + 1/x} = 1 \quad \text{Simplify and evaluate.}$$

The second step is to exponentiate the limit:

$$\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x = e^L = e^1 = e.$$

The function $y = (1 + 1/x)^x$ (Figure 7.55) has a horizontal asymptote $y = e \approx 2.71828$.

- c. Note that $\lim_{x \rightarrow 0^+} \csc x = \infty$, so the limit has the form ∞^0 . Using the two-step procedure with $(\csc x)^x = e^{x \ln \csc x}$, the first step is to evaluate

$$L = \lim_{x \rightarrow 0^+} x \ln \csc x = \lim_{x \rightarrow 0^+} \frac{\ln \csc x}{x^{-1}},$$

which has the form ∞/∞ . Applying l'Hôpital's Rule, we find that

$$L = \lim_{x \rightarrow 0^+} \frac{\ln \csc x}{x^{-1}} = \lim_{x \rightarrow 0^+} \frac{\frac{1}{\csc x} (-\csc x \cot x)}{-x^{-2}} = \lim_{x \rightarrow 0^+} \frac{\cot x}{x^{-2}}.$$

The resulting limit is another indeterminate form. However, some simplification reveals that

$$L = \lim_{x \rightarrow 0^+} \frac{\cot x}{x^{-2}} = \lim_{x \rightarrow 0^+} \frac{x^2 \cos x}{\sin x} = \underbrace{\lim_{x \rightarrow 0^+} \frac{x}{\sin x}}_1 \cdot \underbrace{\lim_{x \rightarrow 0^+} x}_0 \cdot \underbrace{\lim_{x \rightarrow 0^+} \cos x}_1 = 0.$$

Therefore, $L = 0$ and $\lim_{x \rightarrow 0^+} (\csc x)^x = e^L = e^0 = 1$.

Related Exercises 21, 23–24 ◀

Growth Rates of Functions

An important use of l'Hôpital's Rule is to compare the growth rates of functions. Here are two questions—one practical and one theoretical—that demonstrate the importance of comparative growth rates of functions.

- A particular theory for modeling the spread of an epidemic predicts that the number of infected people t days after the start of the epidemic is given by the function

$$N(t) = 2.5t^2 e^{-0.01t} = 2.5 \frac{t^2}{e^{0.01t}}.$$

Question: In the long run (as $t \rightarrow \infty$), does the epidemic spread or does it die out?

- Models of epidemics produce more complicated functions than the one given here, but they have the same general features.

- The Prime Number Theorem was proved simultaneously (two different proofs) in 1896 by Jacques Hadamard and Charles de la Vallée Poussin, relying on fundamental ideas contributed by Riemann.

- A prime number is an integer $p \geq 2$ that has only two divisors, 1 and itself. The first few prime numbers are 2, 3, 5, 7, and 11. A celebrated theorem states that the number of prime numbers less than x is approximately

$$P(x) = \frac{x}{\ln x}, \quad \text{for large values of } x.$$

Question: According to this function, is the number of prime numbers infinite?

These two questions involve a comparison of two functions. In the first question, if t^2 grows faster than $e^{0.01t}$ as $t \rightarrow \infty$, then $\lim_{t \rightarrow \infty} N(t) = \infty$ and the epidemic grows. If $e^{0.01t}$ grows faster than t^2 as $t \rightarrow \infty$, then $\lim_{t \rightarrow \infty} N(t) = 0$ and the epidemic eventually dies out. We will explain what is meant by *grows faster than* in a moment.

In the second question, the comparison is between x and $\ln x$. In Example 1c, we found that $\lim_{x \rightarrow \infty} P(x) = \infty$; therefore, we conclude that the number of prime numbers is infinite.

Our goal is to obtain a ranking of the following families of functions based on their growth rates:

- Another function with a large growth rate is the factorial function, defined for integers as $f(n) = n! = n(n-1) \cdots 2 \cdot 1$. See Exercise 66.

- mx , where $m > 0$ (represents linear functions)
- x^p , where $p > 0$ (represents polynomials and algebraic functions)
- x^x (sometimes called a *superexponential* or *tower function*)
- $\ln x$ (represents logarithmic functions)
- $\ln^q x$, where $q > 0$ (represents powers of logarithmic functions)
- $x^p \ln x$, where $p > 0$ (a combination of powers and logarithms)
- e^x (represents exponential functions).

QUICK CHECK 2 Before proceeding, use your intuition and rank these classes of functions in order of their growth rates. ◀

We need to be precise about growth rates and what it means for f to grow faster than g as $x \rightarrow \infty$. We work with the following definitions.

DEFINITION Growth Rates of Functions (as $x \rightarrow \infty$)

Suppose f and g are functions with $\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} g(x) = \infty$. Then **f grows faster than g** as $x \rightarrow \infty$ if

$$\lim_{x \rightarrow \infty} \frac{g(x)}{f(x)} = 0 \quad \text{or, equivalently, if} \quad \lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \infty.$$

The functions f and g have **comparable growth rates** if

$$\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = M,$$

where $0 < M < \infty$ (M is positive and finite).

Figure 7.56

The idea of growth rates is illustrated nicely with graphs. Figure 7.56 shows a family of linear functions of the form $y = mx$, where $m > 0$, and powers of x of the form $y = x^p$, where $p > 1$. We see that powers of x grow faster (their curves rise at a greater rate) than the linear functions as $x \rightarrow \infty$.

Figure 7.57

QUICK CHECK 3 Compare the growth rates of $f(x) = x^2$ and $g(x) = x^3$ as $x \rightarrow \infty$. Compare the growth rates of $f(x) = x^2$ and $g(x) = 10x^2$ as $x \rightarrow \infty$. ◀

Figure 7.57 shows that exponential functions of the form $y = b^x$, where $b > 1$, grow faster than powers of x of the form $y = x^p$, where $p > 0$, as $x \rightarrow \infty$ (Example 4).

We now begin a systematic comparison of growth rates. Note that a growth rate limit involves an indeterminate form ∞/∞ , so l'Hôpital's Rule is always in the picture.

EXAMPLE 3 Powers of x vs. powers of $\ln x$ Compare the growth rates as $x \rightarrow \infty$ of the following pairs of functions.

- a. $f(x) = \ln x$ and $g(x) = x^p$, where $p > 0$
 b. $f(x) = \ln^q x$ and $g(x) = x^p$, where $p > 0$ and $q > 0$

SOLUTION

- a. The limit of the ratio of the two functions is

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{\ln x}{x^p} &= \lim_{x \rightarrow \infty} \frac{1/x}{px^{p-1}} && \text{L'Hôpital's Rule} \\ &= \lim_{x \rightarrow \infty} \frac{1}{px^p} && \text{Simplify.} \\ &= 0. && \text{Evaluate the limit.} \end{aligned}$$

We see that any positive power of x grows faster than $\ln x$.

- b. We compare $\ln^q x$ and x^p by observing that

$$\lim_{x \rightarrow \infty} \frac{\ln^q x}{x^p} = \lim_{x \rightarrow \infty} \left(\frac{\ln x}{x^{p/q}} \right)^q = \left(\underbrace{\lim_{x \rightarrow \infty} \frac{\ln x}{x^{p/q}}}_0 \right)^q.$$

By part (a), $\lim_{x \rightarrow \infty} \frac{\ln x}{x^{p/q}} = 0$ (because $p/q > 0$). Therefore, $\lim_{x \rightarrow \infty} \frac{\ln^q x}{x^p} = 0$ (because $q > 0$). We conclude that positive powers of x grow faster than positive powers of $\ln x$.

Related Exercises 36, 38 ◀

EXAMPLE 4 Powers of x vs. exponentials Compare the rates of growth of $f(x) = x^p$ and $g(x) = e^x$ as $x \rightarrow \infty$, where p is a positive real number.

SOLUTION The goal is to evaluate $\lim_{x \rightarrow \infty} \frac{x^p}{e^x}$ for $p > 0$. This comparison is most easily done using Example 3 and a change of variables. We let $x = \ln t$ and note that as $x \rightarrow \infty$, we also have $t \rightarrow \infty$. With this substitution, $x^p = \ln^p t$ and $e^x = e^{\ln t} = t$. Therefore,

$$\lim_{x \rightarrow \infty} \frac{x^p}{e^x} = \lim_{t \rightarrow \infty} \frac{\ln^p t}{t} = 0. \quad \text{Example 3}$$

A similar argument applies when comparing the growth rates of $f(x) = x^p$ and $h(x) = b^x$, for $b > 1$ (Exercise 63). We see that increasing exponential functions grow faster than positive powers of x (Figure 7.57).

Related Exercises 31, 37 ◀

These examples, together with the comparison of exponential functions b^x and the superexponential x^x (Exercise 68), establish a ranking of growth rates.

THEOREM 7.14 Ranking Growth Rates as $x \rightarrow \infty$

Let $f \ll g$ mean that g grows faster than f as $x \rightarrow \infty$. With positive real numbers p, q, r , and s and $b > 1$,

$$\ln^q x \ll x^p \ll x^p \ln^r x \ll x^{p+s} \ll b^x \ll x^x.$$

You should try to build these relative growth rates into your intuition. They are useful in future chapters (Chapter 10 on sequences, in particular), and they can be used to evaluate limits at infinity quickly.

SECTION 7.6 EXERCISES

Getting Started

1. Explain why the form 1^∞ is indeterminate and cannot be evaluated by substitution. Explain how the competing functions behave.
2. Give the two-step method for attacking an indeterminate limit of the form $\lim_{x \rightarrow a} f(x)^{g(x)}$.
3. In terms of limits, what does it mean for f to grow faster than g as $x \rightarrow \infty$?
4. In terms of limits, what does it mean for the rates of growth of f and g to be comparable as $x \rightarrow \infty$?
5. Rank the functions x^3 , $\ln x$, x^x , and 2^x in order of increasing growth rates as $x \rightarrow \infty$.
6. Rank the functions x^{100} , $\ln x^{10}$, x^x , and 10^x in order of increasing growth rates as $x \rightarrow \infty$.

Practice Exercises

7–20. A brief review Evaluate the following limits.

7. $\lim_{x \rightarrow 1} \frac{\ln x}{4x - x^2 - 3}$
8. $\lim_{x \rightarrow 0} \frac{e^x - 1}{x^2 + 3x}$
9. $\lim_{x \rightarrow e} \frac{\ln x - 1}{x - e}$
10. $\lim_{x \rightarrow 1} \frac{4 \tan^{-1} x - \pi}{x - 1}$
11. $\lim_{x \rightarrow 0} \frac{e^x - \sin x - 1}{x^4 + 8x^3 + 12x^2}$
12. $\lim_{x \rightarrow 0} \frac{e^x - x - 1}{5x^2}$
13. $\lim_{x \rightarrow \infty} \frac{\log_2 x}{\log_3 x}$
14. $\lim_{x \rightarrow 0^+} \frac{1 - \ln x}{1 + \ln x}$
15. $\lim_{x \rightarrow \infty} \frac{\ln(3x + 5)}{\ln(7x + 3) + 1}$
16. $\lim_{x \rightarrow \infty} \frac{\ln(3x + 5e^x)}{\ln(7x + 3e^{2x})}$
17. $\lim_{x \rightarrow \infty} \frac{x^2 - \ln(2/x)}{3x^2 + 2x}$
18. $\lim_{x \rightarrow \infty} e^x \cot^{-1} x$
19. $\lim_{x \rightarrow 0^+} (\sin^{-1} x) \cot x$
20. $\lim_{x \rightarrow 1^-} \tan\left(\frac{\pi x}{2}\right) \ln x$

21–30. 1^∞ , 0^0 , ∞^0 forms Evaluate the following limits or explain why they do not exist. Check your results by graphing.

21. $\lim_{x \rightarrow 0} (1 + 2x)^{3/x}$
22. $\lim_{x \rightarrow 0} (1 + 4x)^{3/x}$
23. $\lim_{\theta \rightarrow \pi/2^-} (\tan \theta)^{\cos \theta}$
24. $\lim_{\theta \rightarrow 0^+} (\sin \theta)^{\tan \theta}$
25. $\lim_{x \rightarrow 0^+} (1 + x)^{\cot x}$
26. $\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^{\ln x}$
27. $\lim_{x \rightarrow 0^+} (\tan x)^x$
28. $\lim_{z \rightarrow \infty} \left(1 + \frac{10}{z}\right)^{z^2}$
29. $\lim_{x \rightarrow 0} (x + \cos x)^{1/x}$
30. $\lim_{x \rightarrow 0^+} \left(\frac{1}{3} \cdot 3^x + \frac{2}{3} \cdot 2^x\right)^{1/x}$

31–42. Comparing growth rates Use limit methods to determine which of the two given functions grows faster or state that they have comparable growth rates.

31. x^{10} ; $e^{0.01x}$
32. $x^2 \ln x$; $\ln^2 x$
33. $\ln x^{20}$; $\ln x$
34. $\ln x$; $\ln(\ln x)$
35. 100^x ; x^x
36. $x^2 \ln x$; x^3

37. x^{20} ; 1.00001^x
38. $x^{10} \ln^{10} x$; x^{11}
39. x^x ; $(x/2)^x$
40. $\ln \sqrt{x}$; $\ln^2 x$
41. e^{x^2} ; e^{10x}
42. e^{x^2} ; $x^{x/10}$
43. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.
 - a. $\lim_{x \rightarrow 0^+} x^{1/x}$ is an indeterminate form.
 - b. The number 1 raised to any fixed power is 1. Therefore, because $(1 + x) \rightarrow 1$ as $x \rightarrow 0$, $(1 + x)^{1/x} \rightarrow 1$ as $x \rightarrow 0$.
 - c. The functions $\ln x^{100}$ and $\ln x$ have comparable growth rates as $x \rightarrow \infty$.
 - d. The function e^x grows faster than 2^x as $x \rightarrow \infty$.

44–52. Miscellaneous limits by any means Use analytical methods to evaluate the following limits.

44. $\lim_{x \rightarrow 0^+} x^{1/\ln x}$
45. $\lim_{x \rightarrow 0} \left(\frac{\sin x}{x}\right)^{1/x^2}$
46. $\lim_{x \rightarrow 0^+} (\cot x)^x$
47. $\lim_{x \rightarrow \infty} x^{1/x}$
48. $\lim_{x \rightarrow \infty} \left(\frac{1}{2x}\right)^{3/x}$
49. $\lim_{x \rightarrow 1^+} (\sqrt{x} - 1)^{\sin \pi x}$
50. $\lim_{x \rightarrow 2^+} (\ln(x^2 - 3))^{x^3 - 2x - 4}$
51. $\lim_{x \rightarrow 1^+} \left(\frac{1}{x - 1} - \frac{1}{\ln x}\right)$
52. $\lim_{x \rightarrow 1^-} \left(\frac{x}{x - 1} - \frac{x}{\ln x}\right)$

53. It may take time The ranking of growth rates given in the text applies for $x \rightarrow \infty$. However, these rates may not be evident for small values of x . For example, an exponential grows faster than any power of x . However, for $1 < x < 19,800$, x^2 is greater than $e^{x/1000}$. For the following pairs of functions, estimate the point at which the faster-growing function overtakes the slower-growing function (for the last time).

- a. $\ln^3 x$ and $x^{0.3}$
- b. $2^{x/100}$ and x^3
- c. $x^{x/100}$ and e^x
- d. $\ln^{10} x$ and $e^{x/10}$

54–57. Limits with parameters Evaluate the following limits in terms of the parameters a and b , which are positive real numbers. In each case, graph the function for specific values of the parameters to check your results.

54. $\lim_{x \rightarrow 0} (1 + ax)^{b/x}$
55. $\lim_{x \rightarrow 0^+} (a^x - b^x)^x, a > b > 0$
56. $\lim_{x \rightarrow 0^+} (a^x - b^x)^{1/x}, a > b > 0$
57. $\lim_{x \rightarrow 0} \frac{a^x - b^x}{x}$

58. Avoiding l'Hôpital's Rule Let $L = \lim_{x \rightarrow 0} \frac{x - \sin x}{x^3}$.

- a. Compute L using l'Hôpital's Rule.
- b. Now compute L using the following interesting detour. First use the sine triplication formula $\sin 3x = 3 \sin x - 4 \sin^3 x$ to replace $\sin x$ by $3 \sin(x/3) - 4 \sin^3(x/3)$ in the expression for L .
- c. Let $t = x/3$ and note that as $x \rightarrow 0$, $t \rightarrow 0$. Use $\lim_{t \rightarrow 0} \frac{\sin t}{t} = 1$ to show that $L = \frac{L}{9} + \frac{4}{27}$.
- d. Solve for L and check for agreement with part (a). (Source: *Teaching Mathematics and its Applications*, Fabio Cavallini, 3, 1988)

59. Two methods

- a. The derivative of a function f at a point a is given by $\lim_{h \rightarrow 0} \frac{3^h - 1}{h}$. Find a possible f and a , and evaluate the limit.
- b. Evaluate $\lim_{h \rightarrow 0} \frac{3^h - 1}{h}$ using l'Hôpital's Rule.

60. Two methods

- a. The derivative of a function f at a point a is given by $\lim_{x \rightarrow 0} \frac{e^x - 1}{x}$. Find a possible f and a , and evaluate the limit.
- b. Evaluate $\lim_{x \rightarrow 0} \frac{e^x - 1}{x}$ using l'Hôpital's Rule.

61. Compound interest Suppose you make a deposit of \$ P into a savings account that earns interest at a rate of $100r\%$ per year.

- a. Show that if interest is compounded once per year, then the balance after t years is $B(t) = P(1 + r)^t$.
- b. If interest is compounded m times per year, then the balance after t years is $B(t) = P(1 + r/m)^{mt}$. For example, $m = 12$ corresponds to monthly compounding, and the interest rate for each month is $r/12$. In the limit $m \rightarrow \infty$, the compounding is said to be *continuous*. Show that with continuous compounding, the balance after t years is $B(t) = Pe^{rt}$.

Explorations and Challenges

- 62. Algorithm complexity** The complexity of a computer algorithm is the number of operations or steps the algorithm needs to complete its task assuming there are n pieces of input (for example, the number of steps needed to put n numbers in ascending order). Four algorithms for doing the same task have complexities of A: $n^3/2$, B: $n \log_2 n$, C: $n(\log_2 n)^2$, and D: $\sqrt{n} \log_2 n$. Rank the algorithms in order of increasing efficiency for large values of n . Graph the complexities as they vary with n and comment on your observations.
- 63. Exponential functions and powers** Show that any exponential function b^x , for $b > 1$, grows faster than x^p , for $p > 0$.
- 64. Exponentials with different bases** Show that $f(x) = a^x$ grows faster than $g(x) = b^x$ as $x \rightarrow \infty$ if $1 < b < a$.

- 65. Logs with different bases** Show that $f(x) = \log_a x$ and $g(x) = \log_b x$, where $a > 1$ and $b > 1$, grow at a comparable rate as $x \rightarrow \infty$.

- 66. Factorial growth rate** The factorial function is defined for positive integers as $n! = n(n-1)(n-2) \cdots 3 \cdot 2 \cdot 1$. For example, $5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120$. A valuable result that gives good approximations to $n!$ for large values of n is *Stirling's formula*, $n! \approx \sqrt{2\pi n} n^n e^{-n}$. Use this formula and a calculator to determine where the factorial function appears in the ranking of growth rates given in Theorem 7.14. (See the Guided Project *Stirling's formula and $n!$* .)

- 67. Exponential limit** Prove that $\lim_{x \rightarrow \infty} \left(1 + \frac{a}{x}\right)^x = e^a$, for $a \neq 0$.

- 68. Exponentials vs. super exponentials** Show that x^x grows faster than b^x as $x \rightarrow \infty$ for $b > 1$.

69. Exponential growth rates

- a. For what values of $b > 0$ does b^x grow faster than e^x as $x \rightarrow \infty$?
- b. Compare the growth rates of e^x and e^{ax} as $x \rightarrow \infty$, for $a > 0$.

- 70. A fascinating function** Consider the function $f(x) = (ab^x + (1-a)c^x)^{1/x}$, where a, b , and c are positive real numbers with $0 < a < 1$.
- a. Graph f for several sets of (a, b, c) . Verify that in all cases f is an increasing function with a single inflection point, for all x .
- b. Use analytical methods to determine $\lim_{x \rightarrow 0} f(x)$ in terms of a, b , and c .
- c. Show that $\lim_{x \rightarrow \infty} f(x) = \max\{b, c\}$ and $\lim_{x \rightarrow -\infty} f(x) = \min\{b, c\}$, for any $0 < a < 1$.
- d. Estimate the location of the inflection point of f .

QUICK CHECK ANSWERS

1. The form 0^∞ (for example, $\lim_{x \rightarrow 0^+} x^{1/x}$) is not indeterminate, because as the base goes to zero, raising it to larger and larger powers drives the entire function to zero. 3. x^3 grows faster than x^2 as $x \rightarrow \infty$, whereas x^2 and $10x^2$ have comparable growth rates as $x \rightarrow \infty$. ◀

7.7 Hyperbolic Functions

In this section, we introduce a new family of functions called the *hyperbolic* functions, which are closely related to both trigonometric functions and exponential functions. Hyperbolic functions find widespread use in fluid dynamics, projectile motion, architecture, and electrical engineering, to name just a few areas. Hyperbolic functions are also important in the development of many theoretical results in mathematics.

Relationship Between Trigonometric and Hyperbolic Functions

The trigonometric functions defined in Chapter 1 are based on relationships involving a circle—for this reason, trigonometric functions are also known as *circular* functions. Specifically, $\cos t$ and $\sin t$ are equal to the x - and y -coordinates, respectively, of the point $P(x, y)$ on

the unit circle that corresponds to an angle of t radians (Figure 7.58). We can also regard t as the length of the arc from $(1, 0)$ to the point $P(x, y)$.

Figure 7.58

- Recall that the area of a circular sector of radius r and angle θ is $A = \frac{1}{2}r^2\theta$. With $r = 1$ and $\theta = t$, we have $A = \frac{1}{2}t$, which implies $t = 2A$.

Figure 7.59

There is yet another way to interpret the number t , and it is this third interpretation that links the trigonometric and hyperbolic functions. Observe that t is twice the area of the circular sector in Figure 7.58. The functions $\cos t$ and $\sin t$ are still defined as the x - and y -coordinates of the point P , but now we associate P with a sector whose area is one-half of t .

The *hyperbolic cosine* and *hyperbolic sine* are defined in an analogous fashion using the hyperbola $x^2 - y^2 = 1$ instead of the circle $x^2 + y^2 = 1$. Consider the region bounded by the x -axis, the right branch of the unit hyperbola $x^2 - y^2 = 1$, and a line segment from the origin to a point $P(x, y)$ on the hyperbola (Figure 7.59); let t equal twice the area of this region.

The hyperbolic cosine of t , denoted $\cosh t$, is the x -coordinate of P , and the hyperbolic sine of t , denoted $\sinh t$, is the y -coordinate of P . Expressing x and y in terms of t leads to the standard definitions of the hyperbolic functions. We accomplish this task by writing t , which is an area, as an integral that depends on the coordinates of P . In Exercise 112, we ask you to carry out the calculations to show that

$$x = \cosh t = \frac{e^t + e^{-t}}{2} \quad \text{and} \quad y = \sinh t = \frac{e^t - e^{-t}}{2}.$$

Everything that follows in this section is based on these two definitions.

Definitions, Identities, and Graphs of the Hyperbolic Functions

Once the hyperbolic cosine and hyperbolic sine are defined, the four remaining hyperbolic functions follow in a manner analogous to the trigonometric functions.

- There is no universally accepted pronunciation of the names of the hyperbolic functions. In the United States, *cosh* x (long oh sound) and *sinh* x are common choices for $\cosh x$ and $\sinh x$. The pronunciations *tanch* x , *cotanch* x , *seech* x or *sech* x , and *coseech* x or *cosech* x are used for the other functions. International pronunciations vary as well.

DEFINITION Hyperbolic Functions

Hyperbolic cosine

$$\cosh x = \frac{e^x + e^{-x}}{2}$$

Hyperbolic tangent

$$\tanh x = \frac{\sinh x}{\cosh x} = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

Hyperbolic secant

$$\operatorname{sech} x = \frac{1}{\cosh x} = \frac{2}{e^x + e^{-x}}$$

Hyperbolic sine

$$\sinh x = \frac{e^x - e^{-x}}{2}$$

Hyperbolic cotangent

$$\coth x = \frac{\cosh x}{\sinh x} = \frac{e^x + e^{-x}}{e^x - e^{-x}}$$

Hyperbolic cosecant

$$\operatorname{csch} x = \frac{1}{\sinh x} = \frac{2}{e^x - e^{-x}}$$

The hyperbolic functions satisfy many important identities. Let's begin with the fundamental identity for hyperbolic functions, which is analogous to the familiar trigonometric identity $\cos^2 x + \sin^2 x = 1$:

$$\cosh^2 x - \sinh^2 x = 1.$$

- The fundamental identity for hyperbolic functions can also be understood in terms of the geometric definition of the hyperbolic functions. Because the point $P(\cosh t, \sinh t)$ is on the hyperbola $x^2 - y^2 = 1$, the coordinates of P satisfy the equation of the hyperbola, which leads immediately to

$$\cosh^2 t - \sinh^2 t = 1.$$

This identity is verified by appealing to the definitions:

$$\begin{aligned}\cosh^2 x - \sinh^2 x &= \left(\frac{e^x + e^{-x}}{2} \right)^2 - \left(\frac{e^x - e^{-x}}{2} \right)^2 && \text{Definition of } \cosh x \text{ and } \sinh x \\ &= \frac{e^{2x} + 2 + e^{-2x} - (e^{2x} - 2 + e^{-2x})}{4} && \text{Expand and combine fractions.} \\ &= \frac{4}{4} = 1. && \text{Simplify.}\end{aligned}$$

EXAMPLE 1 Deriving hyperbolic identities

- Use the fundamental identity $\cosh^2 x - \sinh^2 x = 1$ to prove that $1 - \tanh^2 x = \operatorname{sech}^2 x$.
- Derive the identity $\sinh 2x = 2 \sinh x \cosh x$.

SOLUTION

- Dividing both sides of the fundamental identity $\cosh^2 x - \sinh^2 x = 1$ by $\cosh^2 x$ leads to the desired result:

$$\begin{aligned}\cosh^2 x - \sinh^2 x &= 1 && \text{Fundamental identity} \\ \frac{\cosh^2 x}{\cosh^2 x} - \frac{\sinh^2 x}{\cosh^2 x} &= \frac{1}{\cosh^2 x} && \text{Divide both sides by } \cosh^2 x. \\ \underbrace{1}_{\tanh^2 x} - \underbrace{\frac{\sinh^2 x}{\cosh^2 x}}_{\operatorname{sech}^2 x} &= \frac{1}{\cosh^2 x} \\ 1 - \tanh^2 x &= \operatorname{sech}^2 x. && \text{Identify functions.}\end{aligned}$$

- Using the definition of the hyperbolic sine, we have

$$\begin{aligned}\sinh 2x &= \frac{e^{2x} - e^{-2x}}{2} && \text{Definition of } \sinh \\ &= \frac{(e^x - e^{-x})(e^x + e^{-x})}{2} && \text{Factor; difference of perfect squares} \\ &= 2 \sinh x \cosh x. && \text{Identify functions.}\end{aligned}$$

Related Exercises 16–18 ◀

The identities in Example 1 are just two of many useful hyperbolic identities, some of which we list next.

Hyperbolic Identities

$$\begin{array}{ll}\cosh^2 x - \sinh^2 x = 1 & \cosh(-x) = \cosh x \\ 1 - \tanh^2 x = \operatorname{sech}^2 x & \sinh(-x) = -\sinh x \\ \coth^2 x - 1 = \operatorname{csch}^2 x & \tanh(-x) = -\tanh x \\ \cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y \\ \sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y \\ \cosh 2x = \cosh^2 x + \sinh^2 x & \sinh 2x = 2 \sinh x \cosh x \\ \cosh^2 x = \frac{\cosh 2x + 1}{2} & \sinh^2 x = \frac{\cosh 2x - 1}{2}\end{array}$$

Graphs of the hyperbolic functions are relatively easy to produce because they are based on the familiar graphs of e^x and e^{-x} . Recall that $\lim_{x \rightarrow \infty} e^{-x} = 0$ and that $\lim_{x \rightarrow -\infty} e^x = 0$. With

these facts in mind, we see that the graph of $\cosh x$ (Figure 7.60) approaches the graph of $y = \frac{1}{2}e^x$ as $x \rightarrow \infty$ because $\cosh x = \frac{e^x + e^{-x}}{2} \approx \frac{e^x}{2}$ for large values of x .

Figure 7.60

A similar argument shows that as $x \rightarrow -\infty$, $\cosh x$ approaches $y = \frac{1}{2}e^{-x}$. Note also that $\cosh x$ is an even function:

$$\cosh(-x) = \frac{e^{-x} + e^{-(-x)}}{2} = \frac{e^x + e^{-x}}{2} = \cosh x.$$

Finally, $\cosh 0 = \frac{e^0 + e^0}{2} = 1$, so its y -intercept is $(0, 1)$. The behavior of $\sinh x$, an odd function also shown in Figure 7.60, can be explained in much the same way.

The graphs of the other four hyperbolic functions are shown in Figure 7.61. As a consequence of their definitions, we see that the domain of $\cosh x$, $\sinh x$, $\tanh x$, and $\operatorname{sech} x$ is $(-\infty, \infty)$, whereas the domain of $\coth x$ and $\operatorname{csch} x$ is the set of all real numbers excluding 0.

QUICK CHECK 1 Use the definition of the hyperbolic sine to show that $\sinh x$ is an odd function. ◀

QUICK CHECK 2 Explain why the graph of $\tanh x$ has the horizontal asymptotes $y = 1$ and $y = -1$. ◀

Figure 7.61

Derivatives and Integrals of Hyperbolic Functions

Because the hyperbolic functions are defined in terms of e^x and e^{-x} , computing their derivatives is straightforward. The derivatives of the hyperbolic functions are given in Theorem 7.15—reversing these formulas produces corresponding integral formulas.

► The identities, derivative formulas, and integral formulas for the hyperbolic functions are similar to the corresponding formulas for the trigonometric functions, which makes them easy to remember. However, be aware of some subtle differences in the signs associated with these formulas. For instance,

$$\begin{aligned} d/dx(\cos x) &= -\sin x, \\ \text{whereas} \\ d/dx(\cosh x) &= \sinh x. \end{aligned}$$

THEOREM 7.15 Derivative and Integral Formulas

1. $\frac{d}{dx}(\cosh x) = \sinh x \Rightarrow \int \sinh x \, dx = \cosh x + C$
2. $\frac{d}{dx}(\sinh x) = \cosh x \Rightarrow \int \cosh x \, dx = \sinh x + C$
3. $\frac{d}{dx}(\tanh x) = \operatorname{sech}^2 x \Rightarrow \int \operatorname{sech}^2 x \, dx = \tanh x + C$
4. $\frac{d}{dx}(\coth x) = -\operatorname{csch}^2 x \Rightarrow \int \operatorname{csch}^2 x \, dx = -\coth x + C$
5. $\frac{d}{dx}(\operatorname{sech} x) = -\operatorname{sech} x \tanh x \Rightarrow \int \operatorname{sech} x \tanh x \, dx = -\operatorname{sech} x + C$
6. $\frac{d}{dx}(\operatorname{csch} x) = -\operatorname{csch} x \coth x \Rightarrow \int \operatorname{csch} x \coth x \, dx = -\operatorname{csch} x + C$

Proof: Using the definitions of $\cosh x$ and $\sinh x$, we have

$$\begin{aligned} \frac{d}{dx}(\cosh x) &= \frac{d}{dx}\left(\frac{e^x + e^{-x}}{2}\right) = \frac{e^x - e^{-x}}{2} = \sinh x \quad \text{and} \\ \frac{d}{dx}(\sinh x) &= \frac{d}{dx}\left(\frac{e^x - e^{-x}}{2}\right) = \frac{e^x + e^{-x}}{2} = \cosh x. \end{aligned}$$

To prove formula (3), we begin with $\tanh x = \sinh x / \cosh x$ and then apply the Quotient Rule:

$$\begin{aligned} \frac{d}{dx}(\tanh x) &= \frac{d}{dx}\left(\frac{\sinh x}{\cosh x}\right) && \text{Definition of } \tanh x \\ &= \frac{(\cosh x)\cosh x - (\sinh x)\sinh x}{\cosh^2 x} && \text{Quotient Rule} \\ &= \frac{1}{\cosh^2 x} && \cosh^2 x - \sinh^2 x = 1 \\ &= \operatorname{sech}^2 x. && \operatorname{sech} x = 1/\cosh x \end{aligned}$$

The proofs of the remaining derivative formulas are assigned in Exercises 19–21. The integral formulas are a direct consequence of their corresponding derivative formulas. ◀

EXAMPLE 2 Derivatives and integrals of hyperbolic functions Evaluate the following derivatives and integrals.

- a. $\frac{d}{dx}(\operatorname{sech} 3x)$
- b. $\frac{d^2}{dx^2}(\operatorname{sech} 3x)$
- c. $\int \frac{\operatorname{csch}^2 \sqrt{x}}{\sqrt{x}} \, dx$
- d. $\int_0^{\ln 3} \sinh^3 x \cosh x \, dx$

SOLUTION

a. Combining formula (5) of Theorem 7.15 with the Chain Rule gives

$$\frac{d}{dx}(\operatorname{sech} 3x) = -3 \operatorname{sech} 3x \tanh 3x.$$

b. Applying the Product Rule and Chain Rule to the result of part (a), we have

$$\begin{aligned}
 \frac{d^2}{dx^2}(\operatorname{sech} 3x) &= \frac{d}{dx}(-3 \operatorname{sech} 3x \tanh 3x) \\
 &= \underbrace{\frac{d}{dx}(-3 \operatorname{sech} 3x)}_{9 \operatorname{sech} 3x \tanh 3x} \cdot \tanh 3x + (-3 \operatorname{sech} 3x) \cdot \underbrace{\frac{d}{dx}(\tanh 3x)}_{3 \operatorname{sech}^2 3x} && \text{Product Rule} \\
 &= 9 \operatorname{sech} 3x \tanh^2 3x - 9 \operatorname{sech}^3 3x && \text{Chain Rule} \\
 &= 9 \operatorname{sech} 3x (\tanh^2 3x - \operatorname{sech}^2 3x). && \text{Simplify.}
 \end{aligned}$$

c. The integrand suggests the substitution $u = \sqrt{x}$:

$$\begin{aligned}
 \int \frac{\operatorname{csch}^2 \sqrt{x}}{\sqrt{x}} dx &= 2 \int \operatorname{csch}^2 u \, du && \text{Let } u = \sqrt{x}; du = \frac{1}{2\sqrt{x}} dx. \\
 &= -2 \coth u + C && \text{Formula (4), Theorem 7.15} \\
 &= -2 \coth \sqrt{x} + C. && u = \sqrt{x}
 \end{aligned}$$

d. The derivative formula $\frac{d}{dx}(\sinh x) = \cosh x$ suggests the substitution $u = \sinh x$:

$$\int_0^{\ln 3} \sinh^3 x \cosh x \, dx = \int_0^{4/3} u^3 \, du. \quad \text{Let } u = \sinh x; du = \cosh x \, dx.$$

The new limits of integration are determined by the calculations

$$\begin{aligned}
 x = 0 &\Rightarrow u = \sinh 0 = 0 \quad \text{and} \\
 x = \ln 3 &\Rightarrow u = \sinh(\ln 3) = \frac{e^{\ln 3} - e^{-\ln 3}}{2} = \frac{3 - 1/3}{2} = \frac{4}{3}.
 \end{aligned}$$

We now evaluate the integral in the variable u :

$$\begin{aligned}
 \int_0^{4/3} u^3 \, du &= \left. \frac{1}{4} u^4 \right|_0^{4/3} \\
 &= \frac{1}{4} \left(\left(\frac{4}{3} \right)^4 - 0^4 \right) = \frac{64}{81}.
 \end{aligned}$$

QUICK CHECK 3 Find both the derivative and indefinite integral of $f(x) = 4 \cosh 2x$. ◀

Related Exercises 22, 28, 43, 44 ◀

Theorem 7.16 presents integral formulas for the four hyperbolic functions not covered in Theorem 7.15.

THEOREM 7.16 Integrals of Hyperbolic Functions

$$\begin{array}{ll}
 1. \int \tanh x \, dx = \ln \cosh x + C & 2. \int \coth x \, dx = \ln |\sinh x| + C \\
 3. \int \operatorname{sech} x \, dx = \tan^{-1}(\sinh x) + C & 4. \int \operatorname{csch} x \, dx = \ln |\tanh(x/2)| + C
 \end{array}$$

Proof: Formula (1) is derived by first writing $\tanh x$ in terms of $\sinh x$ and $\cosh x$:

$$\begin{aligned}
 \int \tanh x \, dx &= \int \frac{\sinh x}{\cosh x} \, dx && \text{Definition of } \tanh x \\
 &= \int \frac{1}{u} \, du && \text{Let } u = \cosh x; du = \sinh x \, dx. \\
 &= \ln |u| + C && \text{Evaluate integral.} \\
 &= \ln \cosh x + C. && u = \cosh x > 0
 \end{aligned}$$

Formula (2) is derived in a similar fashion (Exercise 60). The more challenging proofs of formulas (3) and (4) are considered in Exercises 107 and 108. ▶

EXAMPLE 3 Integrals involving hyperbolic functions Determine the indefinite integral $\int x \coth x^2 dx$.

SOLUTION The integrand suggests the substitution $u = x^2$:

$$\begin{aligned}\int x \coth x^2 dx &= \frac{1}{2} \int \coth u du && \text{Let } u = x^2; du = 2x dx. \\ &= \frac{1}{2} \ln |\sinh u| + C && \text{Evaluate integral; use Theorem 7.16.} \\ &= \frac{1}{2} \ln(\sinh x^2) + C. && u = x^2; \sinh x^2 \geq 0\end{aligned}$$

QUICK CHECK 4 Determine the indefinite integral $\int \operatorname{csch} 2x dx$. ◀

Related Exercises 45, 58 ◀

Inverse Hyperbolic Functions

At present, we don't have the tools for evaluating an integral such as $\int \frac{dx}{\sqrt{x^2 + 4}}$. By studying inverse hyperbolic functions, we can discover new integration formulas. Inverse hyperbolic functions are also useful for solving equations involving hyperbolic functions.

Figures 7.60 and 7.61 show that the functions $\sinh x$, $\tanh x$, $\coth x$, and $\operatorname{csch} x$ are all one-to-one on their respective domains. This observation implies that each of these functions has a well-defined inverse. However, the function $y = \cosh x$ is not one-to-one on $(-\infty, \infty)$, so its inverse, denoted $y = \cosh^{-1} x$, exists only if we restrict the domain of $\cosh x$. Specifically, when $y = \cosh x$ is restricted to the interval $[0, \infty)$, it is one-to-one, and its inverse is defined as follows:

$$y = \cosh^{-1} x \quad \text{if and only if} \quad x = \cosh y, \text{ for } x \geq 1 \text{ and } 0 \leq y < \infty.$$

Figure 7.62a shows the graph of $y = \cosh^{-1} x$, obtained by reflecting the graph of $y = \cosh x$ on $[0, \infty)$ over the line $y = x$. The definitions and graphs of the other five inverse hyperbolic functions are also shown in Figure 7.62. Notice that the domain of $y = \operatorname{sech} x$ (Figure 7.62d) must be restricted to $[0, \infty)$ to ensure the existence of its inverse.

Figure 7.62

Because hyperbolic functions are defined in terms of exponential functions, we can find explicit formulas for their inverses in terms of logarithms. For example, let's start with the definition of the inverse hyperbolic sine. For all real x and y , we have

$$y = \sinh^{-1} x \iff x = \sinh y.$$

Following the procedure outlined in Section 7.1, we solve

$$x = \sinh y = \frac{e^y - e^{-y}}{2}$$

for y to give a formula for $\sinh^{-1} x$:

$$\begin{aligned} x = \frac{e^y - e^{-y}}{2} &\Rightarrow e^y - 2x - e^{-y} = 0 && \text{Rearrange equation.} \\ &\Rightarrow (e^y)^2 - 2xe^y - 1 = 0. && \text{Multiply by } e^y. \end{aligned}$$

At this stage, we recognize a quadratic equation in e^y and solve for e^y using the quadratic formula, with $a = 1$, $b = -2x$, and $c = -1$:

$$e^y = \frac{2x \pm \sqrt{4x^2 + 4}}{2} = x \pm \sqrt{x^2 + 1} = \underbrace{x + \sqrt{x^2 + 1}}_{\text{choose positive root}}.$$

Because $e^y > 0$ and $\sqrt{x^2 + 1} > x$, the positive root must be chosen. We now solve for y by taking the natural logarithm of both sides:

$$e^y = x + \sqrt{x^2 + 1} \Rightarrow y = \ln(x + \sqrt{x^2 + 1}).$$

Therefore, the formula we seek is $\sinh^{-1} x = \ln(x + \sqrt{x^2 + 1})$.

A similar procedure can be carried out for the other inverse hyperbolic functions (Exercise 110). Theorem 7.17 lists the results of these calculations.

► Most calculators allow for the direct evaluation of the hyperbolic sine, cosine, and tangent, along with their inverses, but are not programmed to evaluate $\operatorname{sech}^{-1} x$, $\operatorname{csch}^{-1} x$, and $\operatorname{coth}^{-1} x$. The formulas in Theorem 7.17 are useful for evaluating these functions on a calculator.

THEOREM 7.17 Inverses of the Hyperbolic Functions Expressed as Logarithms

$$\begin{aligned} \cosh^{-1} x &= \ln(x + \sqrt{x^2 - 1}) \quad (x \geq 1) & \operatorname{sech}^{-1} x &= \cosh^{-1} \frac{1}{x} \quad (0 < x \leq 1) \\ \sinh^{-1} x &= \ln(x + \sqrt{x^2 + 1}) & \operatorname{csch}^{-1} x &= \sinh^{-1} \frac{1}{x} \quad (x \neq 0) \\ \tanh^{-1} x &= \frac{1}{2} \ln \left(\frac{1+x}{1-x} \right) \quad (|x| < 1) & \operatorname{coth}^{-1} x &= \tanh^{-1} \frac{1}{x} \quad (|x| > 1) \end{aligned}$$

Notice that the formulas in Theorem 7.17 for the inverse hyperbolic secant, cosecant, and cotangent are given in terms of the inverses of their corresponding reciprocal functions. Justification for these formulas follows from the definitions of the inverse functions. For example, from the definition of $\operatorname{csch}^{-1} x$, we have

$$y = \operatorname{csch}^{-1} x \iff x = \operatorname{csch} y \iff 1/x = \sinh y.$$

Applying the inverse hyperbolic sine to both sides of $1/x = \sinh y$ yields

$$\sinh^{-1}(1/x) = \underbrace{\sinh^{-1}(\sinh y)}_y \quad \text{or} \quad y = \operatorname{csch}^{-1} x = \sinh^{-1}(1/x).$$

Similar derivations yield the other two formulas.

EXAMPLE 4 Points of intersection Find the points at which the curves $y = \cosh x$ and $y = \frac{5}{3}$ intersect (Figure 7.63).

Figure 7.63

QUICK CHECK 5 Use the results of Example 4 to write an integral for the area of the region bounded by $y = \cosh x$ and $y = \frac{5}{3}$ (Figure 7.63) and then evaluate the integral. ◀

SOLUTION The x -coordinates of the points of intersection satisfy the equation $\cosh x = \frac{5}{3}$, which is solved by applying $\cosh^{-1}$ to both sides of the equation. However, evaluating $\cosh^{-1}(\cosh x)$ requires care—in Exercise 105, you are asked to show that $\cosh^{-1}(\cosh x) = |x|$. With this fact, the points of intersection can be found:

$$\cosh x = \frac{5}{3}$$

Set equations equal to one another.

$$\cosh^{-1}(\cosh x) = \cosh^{-1} \frac{5}{3}$$

Apply $\cosh^{-1}$ to both sides.

$$|x| = \ln \left(\frac{5}{3} + \sqrt{\left(\frac{5}{3} \right)^2 - 1} \right)$$

Simplify; use Theorem 7.17.

$$x = \pm \ln 3.$$

Simplify.

The points of intersection lie on the line $y = \frac{5}{3}$, so the points are $(-\ln 3, \frac{5}{3})$ and $(\ln 3, \frac{5}{3})$.

Related Exercises 61–62 ◀

Derivatives of the Inverse Hyperbolic Functions and Related Integral Formulas

The derivatives of the inverse hyperbolic functions can be computed directly from the logarithmic formulas given in Theorem 7.17. However, it is more efficient to use the definitions in Figure 7.62.

Recall that the inverse hyperbolic sine is defined by

$$y = \sinh^{-1} x \iff x = \sinh y.$$

We differentiate both sides of $x = \sinh y$ with respect to x and solve for dy/dx :

$$x = \sinh y$$

$$y = \sinh^{-1} x \iff x = \sinh y$$

$$1 = (\cosh y) \frac{dy}{dx}$$

Use implicit differentiation.

$$\frac{dy}{dx} = \frac{1}{\cosh y}$$

Solve for dy/dx .

$$\frac{dy}{dx} = \frac{1}{\pm \sqrt{\sinh^2 y + 1}}$$

$$\cosh^2 y - \sinh^2 y = 1$$

$$\frac{dy}{dx} = \frac{1}{\sqrt{x^2 + 1}}$$

$$x = \sinh y$$

In the last step, the positive root is chosen because $\cosh y > 0$ for all y .

The derivatives of the other inverse hyperbolic functions, listed in Theorem 7.18, are derived in a similar way (Exercise 106).

THEOREM 7.18 Derivatives of the Inverse Hyperbolic Functions

$$\frac{d}{dx}(\cosh^{-1} x) = \frac{1}{\sqrt{x^2 - 1}} \quad (x > 1)$$

$$\frac{d}{dx}(\sinh^{-1} x) = \frac{1}{\sqrt{x^2 + 1}}$$

$$\frac{d}{dx}(\tanh^{-1} x) = \frac{1}{1 - x^2} \quad (|x| < 1)$$

$$\frac{d}{dx}(\coth^{-1} x) = \frac{1}{1 - x^2} \quad (|x| > 1)$$

$$\frac{d}{dx}(\operatorname{sech}^{-1} x) = -\frac{1}{x\sqrt{1 - x^2}} \quad (0 < x < 1) \quad \frac{d}{dx}(\operatorname{csch}^{-1} x) = -\frac{1}{|x|\sqrt{1 + x^2}} \quad (x \neq 0)$$

The restrictions associated with the formulas in Theorem 7.18 are a direct consequence of the domains of the inverse functions (Figure 7.62). Note that the derivative of both $\tanh^{-1} x$ and $\coth^{-1} x$ is $1/(1 - x^2)$, although this result is valid on different domains

($|x| < 1$ for $\tanh^{-1} x$ and $|x| > 1$ for $\coth^{-1} x$). These facts have a bearing on formula (3) in the next theorem, which is a reversal of the derivative formulas in Theorem 7.18. Here we list integral results, where a is a positive constant; each formula can be verified by differentiation.

► The integrals in Theorem 7.19 appear again in Chapter 8 in terms of logarithms and with fewer restrictions on the variable of integration.

THEOREM 7.19 Integral Formulas

1. $\int \frac{dx}{\sqrt{x^2 - a^2}} = \cosh^{-1} \frac{x}{a} + C$, for $x > a$
2. $\int \frac{dx}{\sqrt{x^2 + a^2}} = \sinh^{-1} \frac{x}{a} + C$, for all x
3. $\int \frac{dx}{a^2 - x^2} = \begin{cases} \frac{1}{a} \tanh^{-1} \frac{x}{a} + C, & \text{for } |x| < a \\ \frac{1}{a} \coth^{-1} \frac{x}{a} + C, & \text{for } |x| > a \end{cases}$
4. $\int \frac{dx}{x\sqrt{a^2 - x^2}} = -\frac{1}{a} \operatorname{sech}^{-1} \frac{x}{a} + C$, for $0 < x < a$
5. $\int \frac{dx}{x\sqrt{a^2 + x^2}} = -\frac{1}{a} \operatorname{csch}^{-1} \frac{|x|}{a} + C$, for $x \neq 0$

EXAMPLE 5 Derivatives of inverse hyperbolic functions Compute dy/dx for each function.

- a. $y = \tanh^{-1} 3x$ b. $y = x^2 \sinh^{-1} x$

SOLUTION

a. Using the Chain Rule, we have

$$\frac{dy}{dx} = \frac{d}{dx}(\tanh^{-1} 3x) = \frac{1}{1 - (3x)^2} \cdot 3 = \frac{3}{1 - 9x^2}.$$

$$\begin{aligned} \text{b. } \frac{dy}{dx} &= 2x \sinh^{-1} x + x^2 \cdot \frac{1}{\sqrt{x^2 + 1}} && \text{Product Rule; Theorem 7.18} \\ &= x \left(\frac{2\sqrt{x^2 + 1} \cdot \sinh^{-1} x + x}{\sqrt{x^2 + 1}} \right) && \text{Simplify.} \end{aligned}$$

Related Exercises 31, 35 ◀

EXAMPLE 6 Integral computations

a. Compute the area of the region bounded by $y = 1/\sqrt{x^2 + 16}$ over the interval $[0, 3]$.

b. Evaluate $\int_9^{25} \frac{dx}{\sqrt{x}(4 - x)}$.

SOLUTION

a. The region in question is shown in Figure 7.64, and its area is given by $\int_0^3 \frac{dx}{\sqrt{x^2 + 16}}$.

Using formula (2) in Theorem 7.19 with $a = 4$, we have

$$\begin{aligned} \int_0^3 \frac{dx}{\sqrt{x^2 + 16}} &= \sinh^{-1} \frac{x}{4} \Big|_0^3 && \text{Theorem 7.19} \\ &= \sinh^{-1} \frac{3}{4} - \sinh^{-1} 0 && \text{Evaluate.} \\ &= \sinh^{-1} \frac{3}{4}. && \sinh^{-1} 0 = 0 \end{aligned}$$

► The function $3/(1 - 9x^2)$ in the solution to Example 5a is defined for all $x \neq \pm 1/3$. However, the derivative formula $dy/dx = 3/(1 - 9x^2)$ is valid only on $-1/3 < x < 1/3$ because $\tanh^{-1} 3x$ is defined only on $-1/3 < x < 1/3$. The result of computing $\frac{d}{dx}(\coth^{-1} 3x)$ is the same, but valid on $(-\infty, -1/3) \cup (1/3, \infty)$.

Figure 7.64

A calculator gives an approximate result of $\sinh^{-1}(3/4) \approx 0.693$. The exact result can be written in terms of logarithms using Theorem 7.17:

$$\sinh^{-1}(3/4) = \ln(3/4 + \sqrt{(3/4)^2 + 1}) = \ln 2.$$

- b. The integral doesn't match any of the formulas in Theorem 7.19, so we use the substitution $u = \sqrt{x}$:

$$\int_9^{25} \frac{dx}{\sqrt{x}(4-x)} = 2 \int_3^5 \frac{du}{4-u^2}. \quad \text{Let } u = \sqrt{x}; du = \frac{dx}{2\sqrt{x}}.$$

The new integral now matches formula (3), with $a = 2$. We conclude that

$$\begin{aligned} 2 \int_3^5 \frac{du}{4-u^2} &= 2 \cdot \frac{1}{2} \coth^{-1} \frac{u}{2} \Big|_3^5 & \int \frac{dx}{a^2-x^2} &= \frac{1}{a} \coth^{-1} \frac{x}{a} + C \\ &= \coth^{-1} \frac{5}{2} - \coth^{-1} \frac{3}{2}. & \text{Evaluate.} \end{aligned}$$

The antiderivative involving $\coth^{-1} x$ was chosen because the interval of integration ($3 \leq u \leq 5$) satisfies $|u| > a = 2$. Theorem 7.17 is used to express the result in numerical form in case your calculator cannot evaluate $\coth^{-1} x$:

$$\coth^{-1} \frac{5}{2} - \coth^{-1} \frac{3}{2} = \tanh^{-1} \frac{2}{5} - \tanh^{-1} \frac{2}{3} \approx -0.381.$$

QUICK CHECK 6 Evaluate $\int_0^1 \frac{du}{4-u^2}$. ◀

Related Exercises 47, 63 ◀

Figure 7.65

- A Tyrolean traverse is used to pass over difficult terrain, such as a chasm between two cliffs or a raging river. A rope is strung between two anchor points, the climber clips onto the rope and then traverses the gap by pulling on the rope.

Applications of Hyperbolic Functions

This section concludes with a brief look at two applied problems associated with hyperbolic functions. Additional applications are presented in the exercises.

The Catenary When a free-hanging rope or flexible cable supporting only its own weight is attached to two points of equal height, it takes the shape of a curve known as a *catenary*. You can see catenaries in telephone wires, ropes strung across chasms for Tyrolean traverses (Example 7), and spider webs.

The equation for a general catenary is $y = a \cosh(x/a)$, where $a \neq 0$ is a real number. When $a < 0$, the curve is called an inverted catenary, sometimes used in the design of arches. Figure 7.65 illustrates catenaries for several values of a .

EXAMPLE 7 Length of a catenary A climber anchors a rope at two points of equal height, separated by a distance of 100 ft, in order to perform a *Tyrolean traverse*. The rope follows the catenary $f(x) = 200 \cosh(x/200)$ over the interval $[-50, 50]$ (Figure 7.66). Find the length of the unweighted rope between the two anchor points.

Figure 7.66

► Using the principles of vector analysis introduced in Chapter 13, the tension in the rope and the forces acting upon the anchors in Example 7 can be computed. This is crucial information for anyone setting up a Tyrolean traverse; the *sag angle* (Exercise 72) figures into these calculations. Similar calculations are important for catenary lifelines used in construction and for rigging camera shots in Hollywood movies.

SOLUTION Recall from Section 6.5 that the arc length of the curve $y = f(x)$ over the interval $[a, b]$ is $L = \int_a^b \sqrt{1 + f'(x)^2} dx$. Also note that

$$f'(x) = 200 \sinh\left(\frac{x}{200}\right) \cdot \frac{1}{200} = \sinh \frac{x}{200}.$$

Therefore, the length of the rope is

$$\begin{aligned} L &= \int_{-50}^{50} \sqrt{1 + \sinh^2\left(\frac{x}{200}\right)} dx && \text{Arc length formula} \\ &= 2 \int_0^{50} \sqrt{1 + \sinh^2\left(\frac{x}{200}\right)} dx && \text{Use symmetry.} \\ &= 400 \int_0^{1/4} \sqrt{1 + \sinh^2 u} du && \text{Let } u = \frac{x}{200}. \\ &= 400 \int_0^{1/4} \cosh u du && 1 + \sinh^2 u = \cosh^2 u \\ &= 400 \sinh u \Big|_0^{1/4} && \text{Evaluate integral.} \\ &= 400 \left(\sinh \frac{1}{4} - \sinh 0 \right) && \text{Simplify.} \\ &\approx 101 \text{ ft.} && \text{Evaluate.} \end{aligned}$$

Related Exercises 69–70 ◀

Velocity of a Wave To describe the characteristics of a traveling wave, researchers formulate a *wave equation* that reflects the known (or hypothesized) properties of the wave and that often takes the form of a differential equation (Chapter 9). Solving a wave equation produces additional information about the wave, and it turns out that hyperbolic functions may arise naturally in this context.

EXAMPLE 8 Velocity of an ocean wave The velocity v (in meters/second) of an idealized surface wave traveling on the ocean is modeled by the equation

$$v = \sqrt{\frac{g\lambda}{2\pi} \tanh\left(\frac{2\pi d}{\lambda}\right)},$$

where $g = 9.8 \text{ m/s}^2$ is the acceleration due to gravity, λ is the wavelength measured in meters from crest to crest, and d is the depth of the undisturbed water, also measured in meters (Figure 7.67).

Figure 7.67

► In fluid dynamics, *water depth* is often discussed in terms of the depth-to-wavelength ratio d/λ , not the actual depth of the water. Three classifications are generally used:

shallow water: $d/\lambda < 0.05$

intermediate depth: $0.05 < d/\lambda < 0.5$

deep water: $d/\lambda > 0.5$

a. A sea kayaker observes several waves that pass beneath her kayak, and she estimates that $\lambda = 12 \text{ m}$ and $v = 4 \text{ m/s}$. How deep is the water in which she is kayaking?

b. The *deep-water* equation for wave velocity is $v = \sqrt{\frac{g\lambda}{2\pi}}$, which is an approximation to the velocity formula given above. Waves are said to be in deep water if the depth-to-wavelength ratio d/λ is greater than $\frac{1}{2}$. Explain why $v = \sqrt{\frac{g\lambda}{2\pi}}$ is a good approximation when $d/\lambda > \frac{1}{2}$.

SOLUTION

a. We substitute $\lambda = 12$ and $v = 4$ into the velocity equation and solve for d .

$$\begin{aligned} 4 &= \sqrt{\frac{g \cdot 12}{2\pi} \tanh\left(\frac{2\pi d}{12}\right)} \Rightarrow 16 = \frac{6g}{\pi} \tanh\left(\frac{\pi d}{6}\right) && \text{Square both sides.} \\ &\Rightarrow \frac{8\pi}{3g} = \tanh\left(\frac{\pi d}{6}\right) && \text{Multiply by } \frac{\pi}{6g}. \end{aligned}$$

In order to extract d from the argument of $\tanh$, we apply $\tanh^{-1}$ to both sides of the equation and then use the property $\tanh^{-1}(\tanh x) = x$, for all x .

$$\tanh^{-1}\left(\frac{8\pi}{3g}\right) = \tanh^{-1}\left(\tanh\left(\frac{\pi d}{6}\right)\right) \quad \text{Apply } \tanh^{-1} \text{ to both sides.}$$

$$\tanh^{-1}\left(\frac{8\pi}{29.4}\right) = \frac{\pi d}{6} \quad \text{Simplify; } 3g = 29.4.$$

$$d = \frac{6}{\pi} \tanh^{-1}\left(\frac{8\pi}{29.4}\right) \approx 2.4 \text{ m} \quad \text{Solve for } d.$$

Therefore, the kayaker is in water that is about 2.4 m deep.

- b. Recall that $y = \tanh x$ is an increasing function ($dy/dx = \operatorname{sech}^2 x > 0$) whose values approach 1 as $x \rightarrow \infty$ (Figure 7.68). Also notice that when $\frac{d}{\lambda} = \frac{1}{2}$, $\tanh\left(\frac{2\pi d}{\lambda}\right) = \tanh \pi \approx 0.996$, which is nearly equal to 1. These facts imply that whenever $\frac{d}{\lambda} > \frac{1}{2}$, we can replace $\tanh\left(\frac{2\pi d}{\lambda}\right)$ with 1 in the velocity formula, resulting in the deep-water velocity function $v = \sqrt{\frac{g\lambda}{2\pi}}$.

Figure 7.68

QUICK CHECK 7 Explain why longer waves travel faster than shorter waves in deep water. ◀

SECTION 7.7 EXERCISES

Getting Started

- State the definitions of the hyperbolic cosine and hyperbolic sine functions.
- Sketch the graphs of $y = \cosh x$, $y = \sinh x$, and $y = \tanh x$ (include asymptotes), and state whether each function is even, odd, or neither.
- What is the fundamental identity for hyperbolic functions?
- How are the derivative formulas for the hyperbolic functions and the trigonometric functions alike? How are they different?
- Express $\sinh^{-1} x$ in terms of logarithms.
- What is the domain of $\operatorname{sech}^{-1} x$? How is $\operatorname{sech}^{-1} x$ defined in terms of the inverse hyperbolic cosine?
- A calculator has a built-in $\sinh^{-1} x$ function, but no $\operatorname{csch}^{-1} x$ function. How do you evaluate $\operatorname{csch}^{-1} 5$ on such a calculator?
- On what interval is the formula $\frac{d}{dx}(\tanh^{-1} x) = \frac{1}{1-x^2}$ valid?
- When evaluating the definite integral $\int_6^8 \frac{dx}{16-x^2}$, why must you choose the antiderivative $\frac{1}{4} \coth^{-1} \frac{x}{4}$ rather than $\frac{1}{4} \tanh^{-1} \frac{x}{4}$?
- How does the graph of the catenary $y = a \cosh \frac{x}{a}$ change as $a > 0$ increases?

Practice Exercises

11–15. Identities Prove each identity using the definitions of the hyperbolic functions.

$$11. \tanh x = \frac{e^{2x} - 1}{e^{2x} + 1} \quad 12. \tanh(-x) = -\tanh x$$

- $\cosh 2x = \cosh^2 x + \sinh^2 x$ (Hint: Begin with the right side of the equation.)
- $2 \sinh(\ln(\sec x)) = \sin x \tanh x$
- $\cosh x + \sinh x = e^x$
- 16–18. Identities** Use the given identity to prove the related identity.
- Use the fundamental identity $\cosh^2 x - \sinh^2 x = 1$ to prove the identity $\coth^2 x - 1 = \operatorname{csch}^2 x$.
- Use the identity $\cosh 2x = \cosh^2 x + \sinh^2 x$ to prove the identities $\cosh^2 x = \frac{\cosh 2x + 1}{2}$ and $\sinh^2 x = \frac{\cosh 2x - 1}{2}$.
- Use the identity $\cosh(x+y) = \cosh x \cosh y + \sinh x \sinh y$ to prove the identity $\cosh 2x = \cosh^2 x + \sinh^2 x$.

19–21. Derivative formulas Derive the following derivative formulas given that $\frac{d}{dx}(\cosh x) = \sinh x$ and $\frac{d}{dx}(\sinh x) = \cosh x$.

$$19. \frac{d}{dx}(\coth x) = -\operatorname{csch}^2 x \quad 20. \frac{d}{dx}(\operatorname{sech} x) = -\operatorname{sech} x \tanh x$$

$$21. \frac{d}{dx}(\operatorname{csch} x) = -\operatorname{csch} x \coth x$$

22–36. Derivatives Find the derivatives of the following functions.

$$22. f(x) = \sinh 4x \quad 23. f(x) = \cosh^2 x$$

$$24. f(x) = -\sinh^3 4x \quad 25. f(x) = \tanh^2 x$$

$$26. f(x) = \sqrt{\coth 3x} \quad 27. f(x) = \ln \operatorname{sech} 2x$$

$$28. f(x) = x \tanh x \quad 29. f(x) = x^2 \cosh^2 3x$$

$$30. f(x) = \frac{x}{\operatorname{csch} x} \quad 31. f(x) = \cosh^{-1} 4x$$

32. $f(t) = 2 \tanh^{-1} \sqrt{t}$ 33. $f(v) = \sinh^{-1} v^2$
34. $f(x) = \operatorname{csch}^{-1} \frac{2}{x}$ 35. $f(x) = x \sinh^{-1} x - \sqrt{x^2 + 1}$
36. $f(u) = \sinh^{-1}(\tan u)$

37–56. Integrals Evaluate each integral.

37. $\int \cosh 2x \, dx$ 38. $\int \operatorname{sech}^2 w \tanh w \, dw$
39. $\int \frac{\sinh x}{1 + \cosh x} \, dx$ 40. $\int \coth^2 x \operatorname{csch}^2 x \, dx$
41. $\int \tanh^2 x \, dx$ (Hint: Use an identity.)
42. $\int \sinh^2 z \, dz$ (Hint: Use an identity.)
43. $\int_0^1 \cosh^3 3x \sinh 3x \, dx$ 44. $\int_0^4 \frac{\operatorname{sech}^2 \sqrt{x}}{\sqrt{x}} \, dx$
45. $\int_0^{\ln 2} \tanh x \, dx$ 46. $\int_{\ln 2}^{\ln 3} \operatorname{csch} y \, dy$
47. $\int \frac{dx}{8 - x^2}, x > 2\sqrt{2}$ 48. $\int \frac{dx}{\sqrt{x^2 - 16}}, x > 4$
49. $\int \frac{e^x}{36 - e^{2x}} \, dx, x < \ln 6$ 50. $\int \frac{dx}{x\sqrt{16 + x^2}}$
51. $\int \frac{dx}{x\sqrt{4 - x^8}}$ 52. $\int \frac{dx}{x\sqrt{1 + x^4}}$
53. $\int \frac{\cosh z}{\sinh^2 z} \, dz$ 54. $\int \frac{\cos \theta}{9 - \sin^2 \theta} \, d\theta$
55. $\int_{5/12}^{3/4} \frac{\sinh^{-1} x}{\sqrt{x^2 + 1}} \, dx$
56. $\int_{25}^{225} \frac{dx}{\sqrt{x^2 + 25x}}$ (Hint: $\sqrt{x^2 + 25x} = \sqrt{x} \sqrt{x + 25}$.)

57–58. Two ways Evaluate the following integrals two ways.

- a. Simplify the integrand first and then integrate.
- b. Change variables (let $u = \ln x$), integrate, and then simplify your answer. Verify that both methods give the same answer.

57. $\int \frac{\sinh(\ln x)}{x} \, dx$ 58. $\int_1^{\sqrt{3}} \frac{\operatorname{sech}(\ln x)}{x} \, dx$

59. Visual approximation

- a. Use a graphing utility to sketch the graph of $y = \coth x$ and then explain why $\int_5^{10} \coth x \, dx \approx 5$.
- b. Evaluate $\int_5^{10} \coth x \, dx$ analytically and use a calculator to arrive at a decimal approximation to the answer. How large is the error in the approximation in part (a)?

- 60. Integral proof** Prove the formula $\int \coth x \, dx = \ln |\sinh x| + C$ of Theorem 7.16.

61–62. Points of intersection and area

- a. Sketch the graphs of the functions f and g and find the x -coordinate of the points at which they intersect.
- b. Compute the area of the region described.
61. $f(x) = \operatorname{sech} x, g(x) = \tanh x$; the region bounded by the graphs of f, g , and the y -axis

62. $f(x) = \sinh x, g(x) = \tanh x$; the region bounded by the graphs of f, g , and $x = \ln 3$

63–68. Definite integrals Evaluate the following definite integrals. Use Theorem 7.17 to express your answer in terms of logarithms.

63. $\int_1^{e^2} \frac{dx}{x\sqrt{\ln^2 x + 1}}$ 64. $\int_5^{3\sqrt{5}} \frac{dx}{\sqrt{x^2 - 9}}$
65. $\int_{-2}^2 \frac{dt}{t^2 - 9}$ 66. $\int_{1/6}^{1/4} \frac{dt}{t\sqrt{1 - 4t^2}}$
67. $\int_{1/8}^1 \frac{dx}{x\sqrt{1 + x^{2/3}}}$ 68. $\int_{\ln 5}^{\ln 9} \frac{\cosh x}{4 - \sinh^2 x} \, dx$

- 69. Catenary arch** The portion of the curve $y = \frac{17}{15} - \cosh x$ that lies above the x -axis forms a catenary arch. Find the average height of the arch above the x -axis.

- 70. Length of a catenary** Show that the arc length of the catenary $y = \cosh x$ over the interval $[0, a]$ is $L = \sinh a$.

- 71. Power lines** A power line is attached at the same height to two utility poles that are separated by a distance of 100 ft; the power line follows the curve $f(x) = a \cosh \frac{x}{a}$. Use the following steps to find the value of a that produces a sag of 10 ft midway between the poles. Use a coordinate system that places the poles at $x = \pm 50$.

- a. Show that a satisfies the equation $\cosh \frac{50}{a} - 1 = \frac{10}{a}$.

- b. Let $t = \frac{10}{a}$, confirm that the equation in part (a) reduces to $\cosh 5t - 1 = t$, and solve for t using a graphing utility. Report your answer accurate to two decimal places.

- c. Use your answer in part (b) to find a , and then compute the length of the power line.

- 72. Sag angle** Imagine a climber clipping onto the rope described in Example 7 and pulling himself to the rope's midpoint. Because the rope is supporting the weight of the climber, it no longer takes the shape of the catenary $y = 200 \cosh \frac{x}{200}$. Instead, the rope (nearly) forms two sides of an isosceles triangle. Compute the *sag angle* θ illustrated in the figure, assuming the rope does not stretch when weighted. Recall from Example 7 that the length of the rope is 101 ft.

- 73. Wavelength** The velocity of a surface wave on the ocean is given by $v = \sqrt{\frac{g\lambda}{2\pi} \tanh\left(\frac{2\pi d}{\lambda}\right)}$ (Example 8). Use a graphing utility or root finder to approximate the wavelength λ of an ocean wave traveling at $v = 7$ m/s in water that is $d = 10$ m deep.

- 74. Wave velocity** Use Exercise 73 to do the following calculations.

- Find the velocity of a wave where $\lambda = 50$ m and $d = 20$ m.
- Determine the depth of the water if a wave with $\lambda = 15$ m is traveling at $v = 4.5$ m/s.

- 75. Shallow-water velocity equation**

- Confirm that the linear approximation to $f(x) = \tanh x$ at $a = 0$ is $L(x) = x$.
- Recall that the velocity of a surface wave on the ocean is $v = \sqrt{\frac{g\lambda}{2\pi} \tanh\left(\frac{2\pi d}{\lambda}\right)}$. In fluid dynamics, *shallow water* refers to water where the depth-to-wavelength ratio $\frac{d}{\lambda} < 0.05$. Use your answer to part (a) to explain why the approximate shallow-water velocity equation is $v = \sqrt{gd}$.
- Use the shallow-water velocity equation to explain why waves tend to slow down as they approach the shore.

- 76. Tsunamis** A tsunami is an ocean wave often caused by earthquakes on the ocean floor; these waves typically have long wavelengths, ranging from 150 to 1000 km. Imagine a tsunami traveling across the Pacific Ocean, which is the deepest ocean in the world, with an average depth of about 4000 m. Explain why the *shallow-water velocity equation* (Exercise 75) applies to tsunamis even though the actual depth of the water is large. What does the shallow-water equation say about the speed of a tsunami in the Pacific Ocean (use $d = 4000$ m)?

- 77. Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- $\frac{d}{dx}(\sinh(\ln 3)) = \frac{\cosh(\ln 3)}{3}$.
- $\frac{d}{dx}(\sinh x) = \cosh x$ and $\frac{d}{dx}(\cosh x) = -\sinh x$.
- $\ln(1 + \sqrt{2}) = -\ln(-1 + \sqrt{2})$.
- $\int_0^1 \frac{dx}{4 - x^2} = \frac{1}{2} \left(\coth^{-1} \frac{1}{2} - \coth^{-1} 0 \right)$.

- 78. Evaluating hyperbolic functions** Use a calculator to evaluate each expression or state that the value does not exist. Report answers accurate to four decimal places to the right of the decimal point.

- $\coth 4$
- $\tanh^{-1} 2$
- $\operatorname{csch}^{-1} 5$
- $\operatorname{csch} x \Big|_{1/2}^2$
- $\ln \left| \tanh \frac{x}{2} \right| \Big|_1^{10}$
- $\tan^{-1}(\sinh x) \Big|_{-3}^3$
- $\frac{1}{4} \coth^{-1} \frac{x}{4} \Big|_{20}^{36}$

- 79. Evaluating hyperbolic functions** Evaluate each expression without using a calculator or state that the value does not exist. Simplify answers as much as possible.

- $\cosh 0$
- $\tanh 0$
- $\operatorname{csch} 0$
- $\operatorname{sech}(\sinh 0)$

- $\coth(\ln 5)$
- $\sinh(2 \ln 3)$
- $\cosh^2 1$
- $\operatorname{sech}^{-1}(\ln 3)$
- $\cosh^{-1} \frac{17}{8}$
- $\sinh^{-1} \frac{e^2 - 1}{2e}$

- 80. Confirming a graph** The graph of $f(x) = \sinh x$ is shown in Figure 7.60. Use calculus to find the intervals on which f is increasing or decreasing, and to find the intervals on which f is concave up or concave down to confirm that the graph is correct.

- 81. Critical points** Find the critical points of the function $f(x) = \sinh^2 x \cosh x$.

- 82. Critical points**

- Show that the critical points of $f(x) = \frac{\cosh x}{x}$ satisfy $x = \coth x$.
- Use a root finder to approximate the critical points of f .

- 83. Points of inflection** Find the x -coordinate of the point(s) of inflection of $f(x) = \tanh^2 x$.

- 84. Points of inflection** Find the x -coordinate of the point(s) of inflection of $f(x) = \operatorname{sech} x$. Report exact answers in terms of logarithms (use Theorem 7.17).

- 85. Area of region** Find the area of the region bounded by $y = \operatorname{sech} x$, $x = 1$, and the unit circle (see figure).

- 86. Solid of revolution** Compute the volume of the solid of revolution that results when the region in Exercise 85 is revolved about the x -axis.

- 87. L'Hôpital's loophole** Explain why l'Hôpital's Rule fails when applied to the limit $\lim_{x \rightarrow \infty} \frac{\sinh x}{\cosh x}$ and then find the limit another way.

- 88–91. Limits** Use l'Hôpital's Rule to evaluate the following limits.

- $\lim_{x \rightarrow \infty} \frac{1 - \coth x}{1 - \tanh x}$
- $\lim_{x \rightarrow 0} \frac{\tanh^{-1} x}{\tan(\pi x/2)}$
- $\lim_{x \rightarrow 1^-} \frac{\tanh^{-1} x}{\tan(\pi x/2)}$
- $\lim_{x \rightarrow 0^+} (\tanh x)^x$

- 92. Slant asymptote** The linear function $\ell(x) = mx + b$, for finite $m \neq 0$, is a slant asymptote of $f(x)$ if $\lim_{x \rightarrow \infty} (f(x) - \ell(x)) = 0$.

- Use a graphing utility to make a sketch that shows $\ell(x) = x$ is a slant asymptote of $f(x) = x \tanh x$. Does f have any other slant asymptotes?
- Provide an intuitive argument showing that $f(x) = x \tanh x$ behaves like $\ell(x) = x$ as x gets large.
- Prove that $\ell(x) = x$ is a slant asymptote of f by confirming $\lim_{x \rightarrow \infty} (x \tanh x - x) = 0$.

Explorations and Challenges

- 93. Kiln design** Find the volume interior to the inverted catenary kiln (an oven used to fire pottery) shown in the figure.

- 94. Newton's method** Use Newton's method to find all local extreme values of $f(x) = x \operatorname{sech} x$.

- 95. Falling body** When an object falling from rest encounters air resistance proportional to the square of its velocity, the distance it falls (in meters) after t seconds is given by

$$d(t) = \frac{m}{k} \ln \left(\cosh \left(\sqrt{\frac{kg}{m}} t \right) \right), \text{ where } m \text{ is the mass of the object}$$

in kilograms, $g = 9.8 \text{ m/s}^2$ is the acceleration due to gravity, and k is a physical constant.

- A BASE jumper ($m = 75 \text{ kg}$) leaps from a tall cliff and performs a ten-second delay (she free-falls for 10 s and then opens her chute). How far does she fall in 10 s? Assume $k = 0.2$.
 - How long does it take for her to fall the first 100 m? The second 100 m? What is her average velocity over each of these intervals?
- 96. Velocity of falling body** Refer to Exercise 95, which gives the position function for a falling body. Use $m = 75 \text{ kg}$ and $k = 0.2$.
- Confirm that the BASE jumper's velocity t seconds after jumping is $v(t) = d'(t) = \sqrt{\frac{mg}{k}} \tanh \left(\sqrt{\frac{kg}{m}} t \right)$.
 - How fast is the BASE jumper falling ten seconds after jumping?
 - How long does it take for the BASE jumper to reach a speed of 45 m/s (roughly 100 mi/hr)?

- 97. Terminal velocity** Refer to Exercises 95 and 96.

- Compute a jumper's *terminal velocity*, which is defined as

$$\lim_{t \rightarrow \infty} v(t) = \lim_{t \rightarrow \infty} \sqrt{\frac{mg}{k}} \tanh \left(\sqrt{\frac{kg}{m}} t \right).$$

- Find the terminal velocity for the jumper in Exercise 96 ($m = 75 \text{ kg}$ and $k = 0.2$).
- How long does it take any falling object to reach a speed equal to 95% of its terminal velocity? Leave your answer in terms of k , g , and m .
- How tall must a cliff be so that the BASE jumper ($m = 75 \text{ kg}$ and $k = 0.2$) reaches 95% of terminal velocity? Assume the jumper needs at least 300 m at the end of free fall to deploy the chute and land safely.

- 98. Acceleration of a falling body**

- Find the acceleration $a(t) = v'(t)$ of a falling body whose velocity is given in part (a) of Exercise 96.
- Compute $\lim_{t \rightarrow \infty} a(t)$. Explain your answer as it relates to terminal velocity (Exercise 97).

- 99. Differential equations** Hyperbolic functions are useful in solving differential equations (Chapter 9). Show that the functions $y = A \sinh kx$ and $y = B \cosh kx$, where A , B , and k are constants, satisfy the equation $y''(x) - k^2 y(x) = 0$.

- 100. Surface area of a catenoid** When the catenary $y = a \cosh \frac{x}{a}$ is revolved about the x -axis, it sweeps out a surface of revolution called a *catenoid*. Find the area of the surface generated when $y = \cosh x$ on $[-\ln 2, \ln 2]$ is rotated about the x -axis.

- 101–104. Proving identities** Prove the following identities.

101. $\sinh(\cosh^{-1} x) = \sqrt{x^2 - 1}$, for $x \geq 1$

102. $\cosh(\sinh^{-1} x) = \sqrt{x^2 + 1}$, for all x

103. $\cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y$

104. $\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$

- 105. Inverse identity** Show that $\cosh^{-1}(\cosh x) = |x|$ by using the formula $\cosh^{-1} t = \ln(t + \sqrt{t^2 - 1})$ and considering the cases $x \geq 0$ and $x < 0$.

- 106. Theorem 7.18**

- The definition of the inverse hyperbolic cosine is $y = \cosh^{-1} x \Leftrightarrow x = \cosh y$, for $x \geq 1$, $0 \leq y < \infty$. Use implicit differentiation to show that $\frac{d}{dx}(\cosh^{-1} x) = \frac{1}{\sqrt{x^2 - 1}}$.
- Differentiate $\sinh^{-1} x = \ln(x + \sqrt{x^2 + 1})$ to show that $\frac{d}{dx}(\sinh^{-1} x) = \frac{1}{\sqrt{x^2 + 1}}$.

- 107. Many formulas** There are several ways to express the indefinite integral of $\operatorname{sech} x$.

- Show that $\int \operatorname{sech} x \, dx = \tan^{-1}(\sinh x) + C$ (Theorem 7.16). (Hint: Write $\operatorname{sech} x = \frac{1}{\cosh x} = \frac{\cosh x}{\cosh^2 x} = \frac{\cosh x}{1 + \sinh^2 x}$ and then make a change of variables.)
- Show that $\int \operatorname{sech} x \, dx = \sin^{-1}(\tanh x) + C$. (Hint: Show that $\operatorname{sech} x = \frac{\operatorname{sech}^2 x}{\sqrt{1 - \tanh^2 x}}$ and then make a change of variables.)
- Verify that $\int \operatorname{sech} x \, dx = 2 \tan^{-1} e^x + C$ by proving $\frac{d}{dx}(2 \tan^{-1} e^x) = \operatorname{sech} x$.

- 108. Integral formula** Carry out the following steps to derive the

formula $\int \operatorname{csch} x \, dx = \ln \left| \tanh \frac{x}{2} \right| + C$ (Theorem 7.16).

- Change variables with the substitution $u = \frac{x}{2}$ to show that $\int \operatorname{csch} x \, dx = \int \frac{2 \, du}{\sinh 2u}$.
- Use the identity for $\sinh 2u$ to show that $\frac{2}{\sinh 2u} = \frac{\operatorname{sech}^2 u}{\tanh u}$.
- Change variables again to determine $\int \frac{\operatorname{sech}^2 u}{\tanh u} \, du$, and then express your answer in terms of x .

- 109. Arc length** Use the result of Exercise 108 to find the arc length of the curve $f(x) = \ln \left| \tanh \frac{x}{2} \right|$ on $[\ln 2, \ln 8]$.

110. Inverse hyperbolic tangent Recall that the inverse hyperbolic tangent is defined as $y = \tanh^{-1} x \Leftrightarrow x = \tanh y$, for $-1 < x < 1$ and all real y . Solve $x = \tanh y$ for y to express the formula for $\tanh^{-1} x$ in terms of logarithms.

111. Integral family Use the substitution $u = x^r$ to show that

$$\int \frac{dx}{x\sqrt{1-x^{2r}}} = -\frac{1}{r} \operatorname{sech}^{-1} x^r + C, \text{ for } r > 0 \text{ and } 0 < x < 1.$$

112. Definitions of hyperbolic sine and cosine Complete the following steps to prove that when the x - and y -coordinates of a point on the hyperbola $x^2 - y^2 = 1$ are defined as $\cosh t$ and $\sinh t$, respectively, where t is twice the area of the shaded region in the figure, x and y can be expressed as

$$x = \cosh t = \frac{e^t + e^{-t}}{2} \quad \text{and} \quad y = \sinh t = \frac{e^t - e^{-t}}{2}.$$

a. Explain why twice the area of the shaded region is given by

$$\begin{aligned} t &= 2 \cdot \left(\frac{1}{2}xy - \int_1^x \sqrt{z^2 - 1} \, dz \right) \\ &= x\sqrt{x^2 - 1} - 2 \int_1^x \sqrt{z^2 - 1} \, dz. \end{aligned}$$

b. In Chapter 8, the formula for the integral in part (a) is derived:

$$\int \sqrt{z^2 - 1} \, dz = \frac{z}{2} \sqrt{z^2 - 1} - \frac{1}{2} \ln|z + \sqrt{z^2 - 1}| + C.$$

Evaluate this integral on the interval $[1, x]$, explain why the absolute value can be dropped, and combine the result with part (a) to show that

$$t = \ln(x + \sqrt{x^2 - 1}).$$

c. Solve the final equation from part (b) for x to show that

$$x = \frac{e^t + e^{-t}}{2}.$$

d. Use the fact that $y = \sqrt{x^2 - 1}$, in combination with part (c), to show that $y = \frac{e^t - e^{-t}}{2}$.

QUICK CHECK ANSWERS

1. $\sinh(-x) = \frac{e^{-x} - e^{-(-x)}}{2} = -\frac{e^x - e^{-x}}{2} = -\sinh x$

2. Because $\tanh x = \frac{e^x - e^{-x}}{e^x + e^{-x}}$ and $\lim_{x \rightarrow \infty} e^{-x} = 0$,

$\tanh x \approx \frac{e^x}{e^x} = 1$ for large x , which implies that $y = 1$ is a horizontal asymptote. A similar argument shows that $\tanh x \rightarrow -1$ as $x \rightarrow -\infty$, which means that $y = -1$ is also a horizontal asymptote. 3. $\frac{d}{dx}(4 \cosh 2x) = 8 \sinh 2x$;

$\int 4 \cosh 2x \, dx = 2 \sinh 2x + C$ 4. $\frac{1}{2} \ln |\tanh x| + C$

5. Area $= 2 \int_0^{\ln 3} \left(\frac{5}{3} - \cosh x \right) dx$
 $= \frac{2}{3} (5 \ln 3 - 4) \approx 0.995$

6. $\int_0^1 \frac{du}{4 - u^2} = \frac{1}{2} \tanh^{-1} \frac{1}{2} \approx 0.275$ 7. The deep-water velocity formula is $v = \sqrt{\frac{g\lambda}{2\pi}}$, which is an increasing function of the wavelength λ . Therefore, larger values of λ correspond to faster waves. ◀

CHAPTER 7 REVIEW EXERCISES

1. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. If $f(x) = 2/x$, then $f^{-1}(x) = 2/x$.

b. $\ln xy = (\ln x)(\ln y)$.

c. The slope of a line tangent to $f(x) = e^x$ is never 0.

d. The function $y = Ae^{0.1t}$ increases by 10% when t increases by one unit.

e. $\frac{d}{dx}(b^x) = b^x$ for exactly one positive value of b .

f. $\lim_{x \rightarrow 0^+} \sin x^{\ln x}$ is an indeterminate form.

g. The domain of $\tan^{-1} x$ is $\{x: |x| < \pi/2\}$.

h. $\pi^{3x} = e^{\pi \ln 3x}$

i. $\sinh(\ln x) = \frac{x^2 - 1}{2x}$, for $x > 0$.

2–3. Properties of logarithms and exponentials Use properties of logarithms and exponentials, not a calculator, for the following exercises.

2. Solve the equation $48 = 6e^{4k}$ for k .

3. Solve the equation $\log_{10} x^2 + 3 \log_{10} x = \log_{10} 32$ for x . Does the answer depend on the base of the log in the equation?

- 4. Graphs of logarithmic and exponential functions** The figure shows the graphs of $y = 2^x$, $y = 3^{-x}$, and $y = -\ln x$. Match each curve with the correct function.

5–6. Existence of inverses Determine the largest intervals on which the following functions have an inverse.

5. $f(x) = x^3 - 3x^2$ 6. $g(t) = 2 \sin(t/3)$

7–8. Finding inverses Find the inverse on the specified interval and express it in the form $y = f^{-1}(x)$. Then graph f and f^{-1} .

7. $f(x) = x^2 - 4x + 5$, for $x \geq 2$

8. $f(x) = 1/x^2$, for $x > 0$

9–14. Finding inverse functions Find the inverse $f^{-1}(x)$ of each function (on the given interval, if specified).

9. $f(x) = \frac{5 - 2x}{3}$

10. $f(x) = \ln(x^2 + 1)$, for $x \geq 0$

11. $f(x) = 10^{-2x}$

12. $f(x) = \log_{10} 4x$

13. $f(x) = e^x/(e^x + 2)$

14. $f(x) = x/(x - 2)$, for $x > 2$

15–17. Derivative of the inverse at a point Consider the following functions. In each case, without finding the inverse, evaluate the derivative of the inverse at the given point.

15. $f(x) = \cos x$, $0 \leq x \leq \pi$, at $f(\pi/4)$

16. $f(x) = 1/(x + 1)$, $x > -1$, at $f(0)$

17. $f(x) = \sqrt{x^3 + x} - 1$ at $y = 3$

18. A function and its inverse function The function $f(x) = \frac{x}{x + 1}$

is one-to-one for $x > -1$ and has an inverse on that interval.

a. Graph f , for $x > -1$.

b. Find the inverse function f^{-1} corresponding to the function graphed in part (a). Graph f^{-1} on the same set of axes as in part (a).

c. Evaluate the derivative of f^{-1} at the point $(\frac{1}{2}, 1)$.

d. Sketch the tangent lines on the graphs of f and f^{-1} at $(1, \frac{1}{2})$ and $(\frac{1}{2}, 1)$, respectively.

19–22. Derivatives of inverse functions Consider the following functions (on the given interval, if specified). Find the inverse function, express it as a function of x , and find the derivative of the inverse function.

19. $f(x) = 6 - 3x$

20. $f(x) = 3^{2x} - 1$

21. $f(x) = \sqrt{4x - 1}$

22. $f(x) = x^2 + 2$, $x \leq 0$

23. Derivative of the inverse in two ways Let $f(x) = \sin x$, $f^{-1}(x) = \sin^{-1} x$, and $(x_0, y_0) = (\pi/4, 1/\sqrt{2})$.

a. Evaluate $(f^{-1})'(1/\sqrt{2})$ using Theorem 7.3.

b. Evaluate $(f^{-1})'(1/\sqrt{2})$ directly by differentiating f^{-1} . Check for agreement with part (a).

24–40. Evaluating derivatives Evaluate and simplify the following derivatives.

24. $\frac{d}{dx}(xe^{-10x})$

25. $\frac{d}{dx}(x \ln^2 x)$

26. $\frac{d}{dw}(e^{-w} \ln w)$

27. $\frac{d}{dx}(2^{x^2-x})$

28. $\frac{d}{dx}(\log_3(x + 8))$

29. $\frac{d}{dx}\left(\sin^{-1} \frac{1}{x}\right)$

30. $\frac{d}{dx}(x^{\sin 5x})$

31. $\frac{d}{dx}(\cosh t \sinh t)$

32. $\frac{d}{dx}\left(\frac{\sinh x}{1 + \sinh x}\right)$

33. $\frac{d}{dx}(\sin^{-1} e^x)$

34. $\frac{d}{dt}(\sinh^{-1} \sqrt{t})$

35. $f'(1)$ when $f(x) = x^{1/x}$

36. $f'(1)$ when $f(x) = \tan^{-1}(4x^2)$

37. $\frac{d}{dx}(x \sec^{-1} x) \Big|_{x=\frac{2}{\sqrt{3}}}$

38. $\frac{d}{dx}(\tan^{-1} e^{-x}) \Big|_{x=0}$

39. $\frac{d}{dx}(x^2 \sinh x)$

40. $\frac{d}{dx}(\cosh x^2)$

41–46. Inverse sines and cosines Evaluate or simplify the following expressions.

41. $\cos^{-1} \frac{\sqrt{3}}{2}$

42. $\cos^{-1}(-\frac{\sqrt{3}}{2})$

43. $\sin^{-1}(\sin(-\frac{5\pi}{6}))$

44. $\cos^{-1}(\cos \frac{5\pi}{4})$

45. $\sin(\sin^{-1} x)$

46. $\cos^{-1}(\sin 3\pi)$

47. Right triangles Given that $\theta = \sin^{-1} \frac{12}{13}$, evaluate $\cos \theta$, $\tan \theta$, $\cot \theta$, $\sec \theta$, and $\csc \theta$.

48–53. Right-triangle relationships Draw a right triangle to simplify the given expression. Assume $x > 0$ and $0 \leq \theta \leq \pi/2$.

48. $\tan(\sec^{-1}(x/2))$

49. $\cot^{-1}(\tan \theta)$

50. $\csc^{-1}(\sec \theta)$

51. $\sin^{-1} x + \sin^{-1}(-x)$

52. $\sec(\csc^{-1} 3x)$

53. $\cot(\sin^{-1}(2x - 1))$

54–67. Integrals Evaluate the following integrals.

54. $\int \frac{e^x}{4e^x + 6} dx$

55. $\int \frac{e^8 dx}{e^2 x \ln x}$

56. $\int_1^{410^{\sqrt{x}}} \frac{dx}{\sqrt{x}}$

57. $\int \frac{x + 4}{x^2 + 8x + 25} dx$

58. $\int \frac{dx}{\sqrt{49 - 4x^2}}$

59. $\int \frac{3}{2x^2 + 1} dx$

60. $\int \frac{dt}{2t\sqrt{t^2 - 4}}$

61. $\int_{-1}^{2\sqrt{3}-1} \frac{dx}{x^2 + 2x + 5}$

62. $\int \frac{(\ln \ln x)^4}{x \ln x} dx$

63. $\int_{-2/\sqrt{3}}^{2/\sqrt{3}} \frac{dx}{\sqrt{16 - 9x^2}}$

$$64. \int_{\ln 2}^{\ln 3} \coth s \, ds \qquad 65. \int \frac{dx}{\sqrt{x^2 - 9}}, x > 3$$

$$66. \int \frac{e^x}{\sqrt{e^{2x} + 4}} dx \qquad 67. \int_0^1 \frac{x^2}{9 - x^6} dx$$

68–69. Arc length Find the length of the following curves.

$$68. y = \ln(x - \sqrt{x^2 - 1}), \text{ for } 1 \leq x \leq \sqrt{2}$$

$$69. y = 3 \ln x - \frac{x^2}{24}, \text{ for } 1 \leq x \leq 6$$

70–72. Volume problems Compute the volume of the following solids of revolution.

70. The region bounded by the curve $y = e^{-x^2}$ and the x -axis on the interval $[0, \sqrt{\ln 3}]$ is revolved about the y -axis.

71. The region bounded by the curve $y = \frac{2}{1 + x^2}$ and the x -axis on the interval $[0, 4]$ is revolved about the y -axis.

72. The region bounded by the curve $y = (4 - x^2)^{-1/4}$ and the x -axis on the interval $[0, 1]$ is revolved about the x -axis.

T 73. An exponential bike ride Tom and Sue took a bike ride, both starting at the same time and position. Tom started riding at 20 mi/hr, and his velocity decreased according to the function $v(t) = 20e^{-2t}$, for $t \geq 0$. Sue started riding at 15 mi/hr, and her velocity decreased according to the function $u(t) = 15e^{-t}$, for $t \geq 0$.

- Find and graph the position functions of Tom and Sue.
- Find the times at which the riders had the same position at the same time.
- Who ultimately took the lead and remained in the lead?

74. Population growth The population of a large city grows exponentially with a current population of 1.3 million and a predicted population of 1.45 million 10 years from now.

- Use an exponential model to estimate the population in 20 years. Assume the annual growth rate is constant.
- Find the doubling time of the population.

75. Caffeine An adult consumes an espresso containing 75 mg of caffeine. If the caffeine has a half-life of 5.5 hours, when will the amount of caffeine in her bloodstream equal 30 mg?

76. Two cups of coffee A college student consumed two cups of coffee, each containing 80 mg of caffeine, 90 minutes apart. Suppose that just before he consumed his second cup of coffee, 65 mg of caffeine was still in his system from the first cup of coffee. How much caffeine remains in his system 7 hours after he drank his first cup of coffee?

77. Moore's Law In 1965, Gordon Moore observed that the number of transistors that could be placed on an integrated circuit was approximately doubling each year, and he predicted that this trend would continue for another decade. In 1975, Moore revised the doubling time to every two years, and this prediction became known as *Moore's Law*.

- In 1979, Intel introduced the Intel 8088 processor; each of its integrated circuits contained 29,000 transistors. Use Moore's revised doubling time to find a function $y(t)$ that approximates the number of transistors on an integrated circuit t years after 1979.

b. In 2000, the Pentium 4 integrated circuit was introduced; it contained 42 million transistors. Compare this value to the value obtained using the function found in part (a).

78. Radioactive decay The mass of radioactive material in a sample has decreased by 30% since the decay began. Assuming a half-life of 1500 years, how long ago did the decay begin?

79. Population growth Growing from an initial population of 150,000 at a constant annual growth rate of 4%/yr, how long will it take a city to reach a population of 1 million?

80. Savings account A savings account advertises an annual percentage yield (APY) of 5.4%, which means that the balance in the account increases at an annual growth rate of 5.4%/yr.

- Find the balance in the account for $t \geq 0$ with an initial deposit of \$1500, assuming the APY remains fixed and no additional deposits or withdrawals are made.
- What is the doubling time of the balance?
- After how many years does the balance reach \$5000?

81–82. Curve sketching Use the graphing techniques of Section 4.4 to graph the following functions on their domains. Identify local extreme points, inflection points, concavity, and end behavior. Use a graphing utility only to check your work.

$$81. f(x) = e^x(x^2 - x) \qquad 82. f(x) = \ln x - \ln^2 x$$

T 83. Arc length Find the length of the curve $y = \ln x$ between $x = 1$ and $x = b > 1$ given that

$$\int \frac{\sqrt{x^2 + a^2}}{x} dx = \sqrt{x^2 + a^2} - a \ln \left(\frac{a + \sqrt{x^2 + a^2}}{x} \right) + C.$$

Use any means to approximate the value of b for which the curve has length 2.

84–89. Limits Evaluate the following limits.

$$84. \lim_{x \rightarrow 0} \frac{e^{-2x} - 1 + 2x}{x^2}$$

$$85. \lim_{x \rightarrow \pi/2^-} (\sin x)^{\tan x}$$

$$86. \lim_{x \rightarrow \infty} \frac{\ln^3 x}{\sqrt{x}}$$

$$87. \lim_{x \rightarrow \infty} \ln \left(\frac{x+1}{x-1} \right)$$

$$88. \lim_{x \rightarrow \infty} \left(\frac{2}{\pi} \tan^{-1} x \right)^x$$

$$89. \lim_{x \rightarrow \infty} \left(1 - \frac{3}{x} \right)^x$$

90–97. Comparing growth rates Determine which of the two functions grows faster or state that they have comparable growth rates.

$$90. x^{100} \text{ and } 1.1^x$$

$$91. x^{1/2} \text{ and } x^{1/3}$$

$$92. \ln x \text{ and } \log_{10} x$$

$$93. \sqrt{x} \text{ and } \ln^{10} x$$

$$94. 10x \text{ and } \ln x^2$$

$$95. e^x \text{ and } 3^x$$

$$96. \sqrt{x^6 + 10} \text{ and } x^3$$

$$97. 2^x \text{ and } 4^{x/2}$$

98. Logs of logs Compare the growth rates of $\ln x$, $\ln(\ln x)$, and $\ln(\ln(\ln x))$.

T 99. Two limits with exponentials Evaluate $\lim_{x \rightarrow 0^+} \frac{x}{\sqrt{1 - e^{-x^2}}}$ and $\lim_{x \rightarrow 0^+} \frac{x^2}{1 - e^{-x^2}}$, and confirm your result by graphing.

100. Geometric mean Prove that $\lim_{r \rightarrow 0} \left(\frac{a^r + b^r + c^r}{3} \right)^{1/r} = \sqrt[3]{abc}$, where a , b , and c are positive real numbers.

101. Towers of exponents The functions

$$f(x) = (x^x)^x \quad \text{and} \quad g(x) = x^{(x^x)}$$

are different functions. For example, $f(3) = 19,683$ and $g(3) \approx 7.6 \times 10^{12}$. Determine whether $\lim_{x \rightarrow 0^+} f(x)$ and $\lim_{x \rightarrow 0^+} g(x)$ are indeterminate forms and evaluate the limits.

T 102. A family of super-exponential functions Let $f(x) = (a + x)^x$, where $a > 0$.

- What is the domain of f (in terms of a)?
- Describe the end behavior of f (near the left boundary of its domain and as $x \rightarrow \infty$).
- Compute f' . Then graph f and f' for $a = 0.5, 1, 2$, and 3 .
- Show that f has a single local minimum at the point z that satisfies $(z + a) \ln(z + a) + z = 0$.
- Describe how z (found in part (d)) varies as a increases. Describe how $f(z)$ varies as a increases.

103. Limits for e Consider the function $g(x) = (1 + 1/x)^{x+a}$.

Show that if $0 \leq a < \frac{1}{2}$, then $g(x) \rightarrow e$ from *below* as $x \rightarrow \infty$; if $\frac{1}{2} \leq a < 1$, then $g(x) \rightarrow e$ from *above* as $x \rightarrow \infty$.

104. Arc length of family of exponential functions

- Show that the arc length integral for the function

$$f(x) = Ae^{ax} + \frac{1}{4Aa^2} e^{-ax}, \quad \text{where } a > 0 \text{ and } A > 0, \text{ may be integrated using methods you already know.}$$

- Verify that the arc length of the curve $y = f(x)$ on the interval $[0, \ln 2]$ is

$$A(2^a - 1) - \frac{1}{4a^2 A} (2^{-a} - 1).$$

T 105. Log-normal probability distribution A commonly used distribution in probability and statistics is the log-normal distribution. (If the logarithm of a variable has a normal distribution, then the variable itself has a log-normal distribution.) The distribution function is

$$f(x) = \frac{1}{x\sigma\sqrt{2\pi}} e^{-\ln^2 x / (2\sigma^2)}, \quad \text{for } x > 0,$$

where $\ln x$ has zero mean and standard deviation $\sigma > 0$.

- Graph f for $\sigma = \frac{1}{2}, 1$, and 2 . Based on your graphs, does $\lim_{x \rightarrow 0^+} f(x)$ appear to exist?
- Evaluate $\lim_{x \rightarrow 0^+} f(x)$. (Hint: Let $x = e^y$.)
- Show that f has a single local maximum at $x^* = e^{-\sigma^2}$.
- Evaluate $f(x^*)$ and express the result as a function of σ .
- For what value of $\sigma > 0$ in part (d) does $f(x^*)$ have a minimum?

T 106. A rush hour function The function $f(t) = \sin(e^{a \cos t}) + 1$ is a periodic function with the property that the number of local extrema on the interval $[0, 2\pi]$ is determined by the parameter $a > 0$. For some values of a , the function could be used to model traffic flow (two rush hours per day) or ocean tides (two low tides and two high tides per day).

- Graph f on the interval $[0, 2\pi]$ for $a = 0.3, 1.3$, and 1.7 . Confirm that in these cases, f has one, three, and five local extrema on $(0, 2\pi)$, respectively.
- Prove that the period of f is 2π , for all $a > 0$.
- Prove that f has extreme values at $t = 0, \pi$, and 2π , for all $a > 0$.

- Prove that if $0 < a < \ln(\pi/2)$, then f has one local minimum on $(0, 2\pi)$.
- Prove that if $\ln(\pi/2) < a < \ln(3\pi/2)$, then f has one local minimum and two local maxima on $(0, 2\pi)$.
- Prove that if $a > \ln(3\pi/2)$, then f has at least five local extreme points on $(0, 2\pi)$.

107. Viewing angles An auditorium with a flat floor has a large screen on one wall. The lower edge of the screen is 3 ft above eye level and the upper edge of the screen is 10 ft above eye level (see figure).

- Express θ as a function of x .
- Maximize the function in part (a) to determine how far you should stand from the screen to maximize your viewing angle θ .

T 108. Blood testing Suppose that a blood test for a disease must be given to a population of N people, where N is large. At most, N individual blood tests must be done. The following strategy reduces the number of tests. Suppose 100 people are selected from the population and their blood samples are pooled. One test determines whether any of the 100 people test positive. If the test is positive, those 100 people are tested individually, making 101 tests necessary. However, if the pooled sample tests negative, then 100 people have been tested with one test. This procedure is then repeated. Probability theory shows that if the group size is x (for example, $x = 100$, as described here), then the average number of blood tests required to test N people is $N(1 - q^x + 1/x)$, where q is the probability that any one person tests negative. What group size x minimizes the average number of tests in the case that $N = 10,000$ and $q = 0.95$? Assume that x is a nonnegative real number.**T 109. Bungee jumper** A woman attached to a bungee cord jumps from a bridge that is 30 m above a river. Her height in meters above the river t seconds after the jump is $y(t) = 15(1 + e^{-t} \cos t)$, for $t \geq 0$.

- Determine her velocity at $t = 1$ and $t = 3$.
- Use a graphing utility to determine when she is moving downward and when she is moving upward during the first 10 s.
- Use a graphing utility to estimate the maximum upward velocity.

T 110. Cell population The population of a culture of cells after t days is

$$\text{approximated by the function } P(t) = \frac{1600}{1 + 7e^{-0.02t}}, \quad \text{for } t \geq 0.$$

- Graph the population function.
- What is the average growth rate during the first 10 days?
- Looking at the graph, when does the growth rate appear to be a maximum?

- d. Differentiate the population function to determine the growth rate function $P'(t)$.
- e. Graph the growth rate. When is it a maximum and what is the population at the time that the growth rate is a maximum?

111. Derivatives of hyperbolic functions Compute the following derivatives.

a. $\frac{d^6}{dx^6}(\cosh x)$ b. $\frac{d}{dx}(x \operatorname{sech} x)$

112. Area of region Find the area of the region bounded by the curves $f(x) = 8 \operatorname{sech}^2 x$ and $g(x) = \cosh x$.

113. Linear approximation Find the linear approximation to $f(x) = \cosh x$ at $a = \ln 3$ and then use it to approximate the value of $\cosh 1$.

114. Limit Evaluate $\lim_{x \rightarrow \infty} (\tanh x)^x$.

Chapter 7 Guided Projects

Applications of the material in this chapter and related topics can be found in the following Guided Projects. For additional information, see the Preface.

- Means and tangent lines
- Inverse sine from geometry
- Optimizing fuel use
- Enzyme kinetics
- Oscillators
- Pharmacokinetics—drug metabolism
- Acid, noise, and earthquakes
- Landing an airliner
- Hyperbolic functions
- Atmospheric CO_2

- 8.2 Integration by Parts
- 8.3 Trigonometric Integrals
- 8.4 Trigonometric Substitutions
- 8.5 Partial Fractions
- 8.6 Integration Strategies
- 8.7 Other Methods of Integration
- 8.8 Numerical Integration
- 8.9 Improper Integrals

Chapter Preview In this chapter, we return to integration methods and present a variety of new strategies that supplement the substitution (or change of variables) method. The new techniques introduced here are integration by parts, trigonometric substitution, and partial fractions. Taken altogether, these *analytical methods* (pencil-and-paper methods) greatly enlarge the collection of integrals that we can evaluate. Nevertheless, it is important to recognize that these methods are limited because many integrals do not yield to them. For this reason, we also introduce table-based methods, which are used to evaluate many indefinite integrals, and computer-based methods for approximating definite integrals. The discussion then turns to integrals that have either infinite integrands or infinite intervals of integration. These integrals, called *improper integrals*, offer surprising results and have many practical applications.

8.1 Basic Approaches

Before plunging into new integration techniques, we devote this section to two practical goals. The first is to review what you learned about the substitution method in Section 5.5. The other is to introduce several basic simplifying procedures that are worth keeping in mind when evaluating integrals.

Table 8.1 includes the basic integration formulas presented earlier in the text. To this list we add four standard trigonometric integrals (formulas 14–17), which are derived in Examples 1 and 2 using substitution.

► Table 8.1 is similar to Table 4.9 in Section 4.9. It is a subset of the table of integrals at the back of the text.

Table 8.1 Basic Integration Formulas

1. $\int k \, dx = kx + C, k \text{ real}$	2. $\int x^p \, dx = \frac{x^{p+1}}{p+1} + C, p \neq -1 \text{ real}$	3. $\int \cos ax \, dx = \frac{1}{a} \sin ax + C$
4. $\int \sin ax \, dx = -\frac{1}{a} \cos ax + C$	5. $\int \sec^2 ax \, dx = \frac{1}{a} \tan ax + C$	6. $\int \csc^2 ax \, dx = -\frac{1}{a} \cot ax + C$
7. $\int \sec ax \tan ax \, dx = \frac{1}{a} \sec ax + C$	8. $\int \csc ax \cot ax \, dx = -\frac{1}{a} \csc ax + C$	9. $\int e^{ax} \, dx = \frac{1}{a} e^{ax} + C$
10. $\int \frac{dx}{x} = \ln x + C$	11. $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$	12. $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{a} + C, a > 0$
13. $\int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{a} \sec^{-1} \left \frac{x}{a} \right + C, a > 0$	14. $\int \tan ax \, dx = \frac{1}{a} \ln \sec ax + C$	15. $\int \cot ax \, dx = \frac{1}{a} \ln \sin ax + C$
16. $\int \sec ax \, dx = \frac{1}{a} \ln \sec ax + \tan ax + C$	17. $\int \csc ax \, dx = -\frac{1}{a} \ln \csc ax + \cot ax + C$	

In Section 4.9, we introduced formulas for $\int \cos x \, dx$ and $\int \sin x \, dx$ and then derived more general results listed in Table 5.6 of Section 5.5. Missing from that table of integrals are formulas for the antiderivatives of $\tan x$, $\cot x$, $\sec x$, and $\csc x$. Examples 1 and 2 (and their related exercises) fill in these holes.

EXAMPLE 1 Substitution review Derive integral formula 14 in Table 8.1:

$$\int \tan ax \, dx = \frac{1}{a} \ln |\sec ax| + C.$$

SOLUTION We begin with a simpler form of the integral, $\int \tan x \, dx$, and express $\tan x$ in terms of $\sin x$ and $\cos x$ to prepare for a standard substitution:

$$\begin{aligned} \int \tan x \, dx &= \int \frac{\sin x}{\cos x} dx \\ &= -\int \frac{1}{u} du && u = \cos x; du = -\sin x \, dx \\ &= -\ln |u| + C = -\ln |\cos x| + C. \end{aligned}$$

Using the properties of logarithms, the integral can also be written

$$\begin{aligned} \int \tan x \, dx &= -\ln |\cos x| + C = -\ln |1/\sec x| + C \\ &= -(\ln 1 - \ln |\sec x|) = \ln |\sec x| + C. \end{aligned}$$

QUICK CHECK 1 What change of variable would you use for the integral

$$\int \frac{\sec^2 x}{\tan^3 x} dx? \blacktriangleleft$$

With this result in hand, the more general formula given in Table 8.1 is easily derived by using the substitution $u = ax$. The derivation of formula 15 in Table 8.1 is similar (Exercise 66).

Related Exercise 66 

EXAMPLE 2 Multiplication by 1 Derive integral formula 16 in Table 8.1:

$$\int \sec ax \, dx = \frac{1}{a} \ln |\sec ax + \tan ax| + C.$$

SOLUTION As in Example 1, it is easier to begin with a simpler form of the integral, $\int \sec x \, dx$. The key to evaluating this integral is admittedly not obvious, and the trick works only on special integrals. The idea is to multiply the integrand by 1, but the challenge is finding the appropriate representation of 1. In this case, we use

$$1 = \frac{\sec x + \tan x}{\sec x + \tan x}.$$

The integral is evaluated as follows:

$$\begin{aligned} \int \sec x \, dx &= \int \sec x \cdot \underbrace{\frac{\sec x + \tan x}{\sec x + \tan x}}_1 dx && \text{Multiply integrand by 1.} \\ &= \int \frac{\sec^2 x + \sec x \tan x}{\sec x + \tan x} dx && \text{Expand numerator.} \\ &= \int \frac{du}{u} && u = \sec x + \tan x; du = (\sec^2 x + \sec x \tan x) dx \\ &= \ln |u| + C && \text{Integrate.} \\ &= \ln |\sec x + \tan x| + C. && u = \sec x + \tan x \end{aligned}$$

Using the substitution $u = ax$ with $\int \sec ax \, dx$ leads to the more general result in Table 8.1. The derivation of formula 17 in Table 8.1 employs the same technique used here (Exercise 67).

Related Exercise 67 

EXAMPLE 3 Subtle substitution Evaluate $\int \frac{dx}{e^x + e^{-x}}$.

SOLUTION In this case, we see nothing in Table 8.1 that resembles the given integral. In a spirit of trial and error, we try the technique used in Example 2 and multiply the numerator and denominator of the integrand by e^x :

$$\int \frac{dx}{e^x + e^{-x}} = \int \frac{e^x}{e^{2x} + 1} dx. \quad e^x \cdot e^x = e^{2x}$$

This form of the integrand suggests the substitution $u = e^x$, which implies that $du = e^x dx$. Making these substitutions, the integral becomes

$$\begin{aligned} \int \frac{e^x}{e^{2x} + 1} dx &= \int \frac{du}{u^2 + 1} && \text{Substitute } u = e^x, du = e^x dx. \\ &= \tan^{-1} u + C && \text{Table 8.1} \\ &= \tan^{-1} e^x + C. && u = e^x \end{aligned}$$

Related Exercises 45–46 ◀

EXAMPLE 4 Split up fractions Evaluate $\int \frac{\cos x + \sin^3 x}{\sec x} dx$.

SOLUTION Don't overlook the opportunity to split a fraction into two or more fractions. In this case, the integrand is simplified in a useful way:

$$\begin{aligned} \int \frac{\cos x + \sin^3 x}{\sec x} dx &= \int \frac{\cos x}{\sec x} dx + \int \frac{\sin^3 x}{\sec x} dx && \text{Split fraction.} \\ &= \int \cos^2 x dx + \int \sin^3 x \cos x dx. && \sec x = \frac{1}{\cos x} \end{aligned}$$

The first of the resulting integrals is evaluated using a half-angle formula (Example 5 of Section 5.5). In the second integral, the substitution $u = \sin x$ is used:

$$\begin{aligned} \int \frac{\cos x + \sin^3 x}{\sec x} dx &= \int \cos^2 x dx + \int \sin^3 x \cos x dx \\ &= \int \frac{1 + \cos 2x}{2} dx + \int \sin^3 x \cos x dx && \text{Half-angle formula} \\ &= \frac{1}{2} \int dx + \frac{1}{2} \int \cos 2x dx + \int u^3 du && u = \sin x, du = \cos x dx \\ &= \frac{x}{2} + \frac{1}{4} \sin 2x + \frac{1}{4} \sin^4 x + C. && \text{Evaluate integrals.} \end{aligned}$$

Related Exercises 22, 25 ◀

EXAMPLE 5 Division with rational functions Evaluate $\int \frac{x^2 + 2x - 1}{x + 4} dx$.

SOLUTION When integrating rational functions (polynomials in the numerator and denominator), check to see whether the function is *improper* (the degree of the numerator is greater than or equal to the degree of the denominator). In this example, we have an improper rational function, and long division is used to simplify it. The integration is done as follows:

$$\begin{aligned} \int \frac{x^2 + 2x - 1}{x + 4} dx &= \int (x - 2) dx + \int \frac{7}{x + 4} dx && \text{Long division} \\ &= \frac{x^2}{2} - 2x + 7 \ln |x + 4| + C. && \text{Evaluate integrals.} \end{aligned}$$

Related Exercises 34–35 ◀

► Half-angle formulas

$$\cos^2 x = \frac{1 + \cos 2x}{2}$$

$$\sin^2 x = \frac{1 - \cos 2x}{2}$$

QUICK CHECK 2 Explain how to simplify the integrand of $\int \frac{x^3 + \sqrt{x}}{x^{3/2}} dx$ before integrating. ◀

$$\begin{array}{r} x - 2 \\ x + 4 \overline{) x^2 + 2x - 1} \\ \underline{x^2 + 4x} \\ -2x - 1 \\ \underline{-2x - 8} \\ 7 \end{array}$$

QUICK CHECK 3 Explain how to simplify the integrand of $\int \frac{x+1}{x-1} dx$ before integrating. ◀

EXAMPLE 6 Complete the square Evaluate $\int \frac{dx}{\sqrt{-x^2 - 8x - 7}}$.

SOLUTION We don't see an integral in Table 8.1 that looks like the given integral, so some preliminary work is needed. In this case, the key is to complete the square on the polynomial in the denominator. We find that

$$\begin{aligned} -x^2 - 8x - 7 &= -(x^2 + 8x + 7) \\ &= -(x^2 + 8x + \underbrace{16}_{\text{add and subtract 16}} + 7) && \text{Complete the square.} \\ &= -((x + 4)^2 - 9) && \text{Factor and combine terms.} \\ &= 9 - (x + 4)^2. && \text{Rearrange terms.} \end{aligned}$$

After a change of variables, the integral is recognizable:

$$\begin{aligned} \int \frac{dx}{\sqrt{-x^2 - 8x - 7}} &= \int \frac{dx}{\sqrt{9 - (x + 4)^2}} && \text{Complete the square.} \\ &= \int \frac{du}{\sqrt{9 - u^2}} && u = x + 4, du = dx \\ &= \sin^{-1} \frac{u}{3} + C && \text{Table 8.1} \\ &= \sin^{-1} \left(\frac{x + 4}{3} \right) + C. && \text{Replace } u \text{ with } x + 4. \end{aligned}$$

Related Exercises 31, 37 ◀

QUICK CHECK 4 Express $x^2 + 6x + 16$ in terms of a perfect square. ◀

The techniques illustrated in this section are designed to transform or simplify an integrand before you apply a specific method. In fact, these ideas may help you recognize the best method to use. Keep them in mind as you learn new integration methods and improve your integration skills.

SECTION 8.1 EXERCISES

Getting Started

- What change of variables would you use for the integral $\int (4 - 7x)^{-6} dx$?
- Evaluate $\int (\sec x + 1)^2 dx$. (Hint: Expand $(\sec x + 1)^2$ first.)
- What trigonometric identity is useful in evaluating $\int \sin^2 x dx$?
- Let $f(x) = \frac{4x^3 + x^2 + 4x + 2}{x^2 + 1}$. Use long division to show that $f(x) = 4x + 1 + \frac{1}{x^2 + 1}$ and use this result to evaluate $\int f(x) dx$.
- Describe a first step in integrating $\int \frac{10}{x^2 - 4x - 9} dx$.
- Evaluate $\int \frac{2x + 1}{x^2 + 1} dx$ using the following steps.
 - Fill in the blanks: By splitting the integrand into two fractions, we have $\int \frac{2x + 1}{x^2 + 1} dx = \int \underline{\hspace{1cm}} dx + \int \underline{\hspace{1cm}} dx$.
 - Evaluate the two integrals on the right side of the equation in part (a).

Practice Exercises

7–64. Integration review Evaluate the following integrals.

- $\int \frac{dx}{(3 - 5x)^4}$
- $\int (9x - 2)^{-3} dx$
- $\int_0^{3\pi/8} \sin \left(2x - \frac{\pi}{4} \right) dx$
- $\int e^{3-4x} dx$
- $\int \frac{\ln 2x}{x} dx$
- $\int_{-5}^0 \frac{dx}{\sqrt{4 - x}}$
- $\int \frac{e^x}{e^x + 1} dx$
- $\int_0^1 x 3^{x^2+1} dx$
- $\int_1^{e^2} \frac{\ln^2(x^2)}{x} dx$
- $\int_0^1 \frac{t^2}{1 + t^6} dt$
- $\int_1^2 s(s - 1)^9 ds$
- $\int_3^7 (t - 6)\sqrt{t - 3} dt$
- $\int \frac{(\ln w - 1)^7 \ln w}{w} dw$
- $\int e^x(1 + e^x)^9(1 - e^x) dx$
- $\int \frac{x + 2}{x^2 + 4} dx$
- $\int \frac{\sin x + 1}{\cos x} dx$

23. $\int e^x \csc(3e^x + 4) dx$

24. $\int_0^9 \frac{x^{5/2} - x^{1/2}}{x^{3/2}} dx$

25. $\int_0^{\pi/4} \frac{\sec \theta + \csc \theta}{\sec \theta \csc \theta} d\theta$

26. $\int \frac{4 + e^{-2x}}{e^{3x}} dx$

27. $\int \frac{2 - 3x}{\sqrt{1 - x^2}} dx$

28. $\int \frac{3x + 1}{\sqrt{4 - x^2}} dx$

29. $\int_{\pi/4}^{\pi/2} \sqrt{1 + \cot^2 x} dx$

30. $\int_{e^{\pi/4}}^{e^{\pi/3}} \frac{\cot(\ln x)}{x} dx$

31. $\int \frac{dx}{x^2 - 2x + 10}$

32. $\int_0^2 \frac{x}{x^2 + 4x + 8} dx$

33. $\int \frac{x^3 + 2x^2 + 5x + 3}{x^2 + x + 2} dx$

34. $\int_2^4 \frac{x^2 + 2}{x - 1} dx$

35. $\int_0^1 \frac{t^4 + t^3 + t^2 + t + 1}{t^2 + 1} dt$

36. $\int \frac{t^3 - 2}{t + 1} dt$

37. $\int \frac{d\theta}{\sqrt{27 - 6\theta - \theta^2}}$

38. $\int \frac{x}{x^4 + 2x^2 + 1} dx$

39. $\int \frac{d\theta}{1 + \sin \theta}$

40. $\int \frac{1 - x}{1 - \sqrt{x}} dx$

41. $\int \frac{dx}{\sec x - 1}$

42. $\int \frac{d\theta}{1 - \csc \theta}$

43. $\int \frac{\cosh 3x}{1 + \sinh 3x} dx$

44. $\int_0^{\sqrt{3}} \frac{6x^3}{\sqrt{x^2 + 1}} dx$

45. $\int \frac{e^x}{e^x - 2e^{-x}} dx$

46. $\int \frac{e^{2z}}{e^{2z} - 4e^{-z}} dz$

47. $\int \frac{dx}{x^{-1} + 1}$

48. $\int \frac{dy}{y^{-1} + y^{-3}}$

49. $\int \sqrt{9 + \sqrt{t + 1}} dt$

50. $\int_4^9 \frac{dx}{1 - \sqrt{x}}$

51. $\int_{-1}^0 \frac{x}{x^2 + 2x + 2} dx$

52. $\int_{\pi/6}^{\pi/2} \frac{dy}{\sin y}$

53. $\int e^x \sec(e^x + 1) dx$

54. $\int_0^1 \sqrt{1 + \sqrt{x}} dx$

55. $\int \sin x \sin 2x dx$

56. $\int_0^{\pi/2} \sqrt{1 + \cos 2x} dx$

57. $\int \frac{dx}{x^{1/2} + x^{3/2}}$

58. $\int_0^1 \frac{dp}{4 - \sqrt{p}}$

59. $\int \frac{x - 2}{x^2 + 6x + 13} dx$

60. $\int_0^{\pi/4} 3\sqrt{1 + \sin 2x} dx$

61. $\int \frac{e^x}{e^{2x} + 2e^x + 1} dx$

62. $\int \frac{-x^5 - x^4 - 2x^3 + 4x + 3}{x^2 + x + 1} dx$

63. $\int_1^3 \frac{2}{x^2 + 2x + 1} dx$

64. $\int_0^2 \frac{2}{s^3 + 3s^2 + 3s + 1} ds$

65. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. $\int \frac{3}{x^2 + 4} dx = \int \frac{3}{x^2} dx + \int \frac{3}{4} dx.$

b. Long division simplifies the evaluation of the integral

$$\int \frac{x^3 + 2}{3x^4 + x} dx.$$

c. $\int \frac{1}{\sin x + 1} dx = \ln|\sin x + 1| + C.$

d. $\int \frac{dx}{e^x} = \ln e^x + C.$

66–67. Integrals of $\cot x$ and $\csc x$

66. Use a change of variables to prove that $\int \cot x dx = \ln|\sin x| + C.$ (Hint: See Example 1.)

67. Prove that $\int \csc x dx = -\ln|\csc x + \cot x| + C.$ (Hint: See Example 2.)

68. Different methods

a. Evaluate $\int \cot x \csc^2 x dx$ using the substitution $u = \cot x.$

b. Evaluate $\int \cot x \csc^2 x dx$ using the substitution $u = \csc x.$

c. Reconcile the results in parts (a) and (b).

69. Different substitutions

a. Evaluate $\int \tan x \sec^2 x dx$ using the substitution $u = \tan x.$

b. Evaluate $\int \tan x \sec^2 x dx$ using the substitution $u = \sec x.$

c. Reconcile the results in parts (a) and (b).

70. **Different methods** Let $I = \int \frac{x + 2}{x + 4} dx.$

a. Evaluate I after first performing long division on the integrand.

b. Evaluate I without performing long division on the integrand.

c. Reconcile the results in parts (a) and (b).

71. **Different methods** Let $I = \int \frac{x^2}{x + 1} dx.$

a. Evaluate I using the substitution $u = x + 1.$

b. Evaluate I after first performing long division on the integrand.

c. Reconcile the results in parts (a) and (b).

72. **Area of a region between curves** Find the area of the entire region bounded by the curves $y = \frac{x^3}{x^2 + 1}$ and $y = \frac{8x}{x^2 + 1}.$

73. **Area of a region between curves** Find the area of the region bounded by the curves $y = \frac{x^2}{x^3 - 3x}$ and $y = \frac{1}{x^3 - 3x}$ on the interval $[2, 4].$

74. **Volume of a solid** Consider the region R bounded by the graph of $f(x) = \frac{1}{x + 2}$ and the x -axis on the interval $[0, 3].$ Find the volume of the solid formed when R is revolved about the y -axis.

75. **Volume of a solid** Consider the region R bounded by the graph of $f(x) = \sqrt{x^2 + 1}$ and the x -axis on the interval $[0, 2].$ Find the volume of the solid formed when R is revolved about the y -axis.

Explorations and Challenges

76. Different substitutions

a. Show that $\int \frac{dx}{\sqrt{x - x^2}} = \sin^{-1}(2x - 1) + C$ using either

$$u = 2x - 1 \text{ or } u = x - \frac{1}{2}.$$

b. Show that $\int \frac{dx}{\sqrt{x-x^2}} = 2 \sin^{-1} \sqrt{x} + C$ using $u = \sqrt{x}$.

c. Prove the identity $2 \sin^{-1} \sqrt{x} - \sin^{-1}(2x-1) = \frac{\pi}{2}$.

77. **Surface area** Let $f(x) = \sqrt{x+1}$. Find the area of the surface generated when the region bounded by the graph of f and the x -axis on the interval $[0, 1]$ is revolved about the x -axis.

78. **Surface area** Find the area of the surface generated when the region bounded by the graph of $y = e^x + \frac{1}{4}e^{-x}$ and the x -axis on the interval $[0, \ln 2]$ is revolved about the x -axis.

79. **Arc length** Find the length of the curve $y = x^{5/4}$ on the interval $[0, 1]$. (Hint: Write the arc length integral and let

$$u^2 = 1 + \left(\frac{5}{4}\right)^2 \sqrt{x}.$$

80. **Skydiving** A skydiver in free fall subject to gravitational acceleration and air resistance has a velocity given by $v(t) = v_T \left(\frac{e^{at} - 1}{e^{at} + 1} \right)$, where v_T is the terminal velocity and $a > 0$ is a physical constant. Find the distance that the skydiver falls after t seconds, which is $d(t) = \int_0^t v(y) dy$.

QUICK CHECK ANSWERS

1. Let $u = \tan x$.
2. Write the integrand as $x^{3/2} + x^{-1}$.
3. Use long division to write the integrand as $1 + \frac{2}{x-1}$.
4. $(x+3)^2 + 7$ ◀

8.2 Integration by Parts

The Substitution Rule (Section 5.5) emerges when we reverse the Chain Rule for derivatives. In this section, we use a similar strategy and reverse the Product Rule for derivatives. The result is an integration technique called *integration by parts*. To illustrate the importance of integration by parts, consider the indefinite integrals

$$\int e^x dx = e^x + C \quad \text{and} \quad \int x e^x dx.$$

The first integral is an elementary integral that we have already encountered. The second integral is only slightly different—and yet, the appearance of the product $x e^x$ in the integrand makes this integral (at the moment) impossible to evaluate. Integration by parts is ideally suited for evaluating integrals of *products* of functions.

Integration by Parts for Indefinite Integrals

Given two differentiable functions u and v , the Product Rule states that

$$\frac{d}{dx}(u(x)v(x)) = u'(x)v(x) + u(x)v'(x).$$

By integrating both sides, we can write this rule in terms of an indefinite integral:

$$u(x)v(x) = \int (u'(x)v(x) + u(x)v'(x)) dx.$$

Rearranging this expression in the form

$$\int \underbrace{u(x)v'(x)}_{dv} dx = u(x)v(x) - \int \underbrace{v(x)u'(x)}_{du} dx$$

leads to the basic relationship for *integration by parts*. It is expressed compactly by noting that $du = u'(x) dx$ and $dv = v'(x) dx$. Suppressing the independent variable x , we have

$$\int u dv = uv - \int v du.$$

The integral $\int u dv$ is viewed as the given integral, and we use integration by parts to express it in terms of a new integral $\int v du$. The technique is successful if the new integral can be evaluated.

Integration by Parts

Suppose u and v are differentiable functions. Then

$$\int u dv = uv - \int v du.$$

- The integration by parts calculation may be done without including the constant of integration—as long as it is included in the final result.

- The arrows in the table show how to combine factors in the integration by parts formula. The first arrow indicates the product uv ; the second arrow indicates the integrand $v \, du$.

EXAMPLE 1 Integration by parts Evaluate $\int x e^x \, dx$.

SOLUTION The presence of *products* in the integrand often suggests integration by parts. We split the product $x e^x$ into two factors, one of which must be identified as u and the other as dv (the latter always includes the differential dx). Powers of x are *often* good choices for u . The choice for dv should be easy to integrate. In this case, the choices $u = x$ and $dv = e^x \, dx$ are advisable. It follows that $du = dx$. The relationship $dv = e^x \, dx$ means that v is an antiderivative of e^x , which implies $v = e^x$. A table is helpful for organizing these calculations.

Functions in original integral	$u = x$	$dv = e^x \, dx$
Functions in new integral	$du = dx$	$v = e^x$

The integration by parts rule is now applied:

$$\int \underbrace{x}_u \underbrace{e^x \, dx}_{dv} = \underbrace{x}_u \underbrace{e^x}_v - \int \underbrace{e^x}_v \underbrace{dx}_{du}$$

The original integral $\int x e^x \, dx$ has been replaced with the integral of e^x , which is easier to evaluate: $\int e^x \, dx = e^x + C$. The entire procedure looks like this:

$$\begin{aligned} \int x e^x \, dx &= x e^x - \int e^x \, dx && \text{Integration by parts} \\ &= x e^x - e^x + C. && \text{Evaluate the new integral.} \end{aligned}$$

Related Exercises 11–12 ◀

- To make the table, first write the functions in the original integral:

$$u = \underline{\hspace{1cm}}, \, dv = \underline{\hspace{1cm}}.$$

Then find the functions in the new integral by differentiating u and integrating dv :

$$du = \underline{\hspace{1cm}}, \, v = \underline{\hspace{1cm}}.$$

EXAMPLE 2 Integration by parts Evaluate $\int x \sin x \, dx$.

SOLUTION Remembering that powers of x are often a good choice for u , we form the following table.

$u = x$	$dv = \sin x \, dx$
$du = dx$	$v = -\cos x$

Applying integration by parts, we have

$$\begin{aligned} \int \underbrace{x}_u \underbrace{\sin x \, dx}_{dv} &= \underbrace{x}_u \underbrace{(-\cos x)}_v - \int \underbrace{(-\cos x)}_v \underbrace{dx}_{du} && \text{Integration by parts} \\ &= -x \cos x + \sin x + C. && \text{Evaluate } \int \cos x \, dx = \sin x. \end{aligned}$$

Related Exercises 10, 16 ◀

QUICK CHECK 1 What are the best choices for u and dv in evaluating $\int x \cos x \, dx$? ◀

In general, integration by parts works when we can easily integrate the choice for dv and when the new integral is easier to evaluate than the original. Integration by parts is often used for integrals of the form $\int x^n f(x) \, dx$, where n is a positive integer. Such integrals generally require the repeated use of integration by parts, as shown in the following example.

EXAMPLE 3 Repeated use of integration by parts

- Evaluate $\int x^2 e^x \, dx$.
- How would you evaluate $\int x^n e^x \, dx$, where n is a positive integer?

SOLUTION

- The factor x^2 is a good choice for u , leaving $dv = e^x \, dx$. We then have

$$\int \underbrace{x^2}_u \underbrace{e^x \, dx}_{dv} = \underbrace{x^2}_u \underbrace{e^x}_v - \int \underbrace{e^x}_v \underbrace{2x \, dx}_{du}$$

$u = x^2$	$dv = e^x \, dx$
$du = 2x \, dx$	$v = e^x$

Notice that the new integral on the right side is simpler than the original integral because the power of x has been reduced by one. In fact, the new integral was evaluated in Example 1. Therefore, after using integration by parts twice, we have

$$\begin{aligned}\int x^2 e^x dx &= x^2 e^x - 2 \int x e^x dx && \text{Integration by parts} \\ &= x^2 e^x - 2(x e^x - e^x) + C && \text{Result of Example 1} \\ &= e^x (x^2 - 2x + 2) + C. && \text{Simplify.}\end{aligned}$$

$u = x^n$	$dv = e^x dx$
$du = nx^{n-1} dx$	$v = e^x$

- An integral identity in which the power of a variable is reduced is called a **reduction formula**. Other examples of reduction formulas are explored in Exercises 50–53.

b. We now let $u = x^n$ and $dv = e^x dx$. The integration takes the form

$$\int x^n e^x dx = x^n e^x - n \int x^{n-1} e^x dx.$$

We see that integration by parts reduces the power of the variable in the integrand. The integral in part (a) with $n = 2$ requires two uses of integration by parts. You can probably anticipate that evaluating the integral $\int x^n e^x dx$ requires n applications of integration by parts to reach the integral $\int e^x dx$, which is easily evaluated.

Related Exercises 24–25 ◀

EXAMPLE 4 Repeated use of integration by parts Evaluate $\int e^{2x} \sin x dx$.

SOLUTION The integrand consists of a product, which suggests integration by parts. In this case, there is no obvious choice for u and dv , so let's try the following choices.

$u = e^{2x}$	$dv = \sin x dx$
$du = 2e^{2x} dx$	$v = -\cos x$

- In Example 4, we could also use $u = \sin x$ and $dv = e^{2x} dx$. In general, some trial and error may be required when using integration by parts. Effective choices come with practice.

The integral then becomes

$$\int e^{2x} \sin x dx = -e^{2x} \cos x + 2 \int e^{2x} \cos x dx. \quad (1)$$

- When using integration by parts, the acronym LIPET may help. If the integrand is the product of two or more functions, choose u to be the first function type that appears in the list
Logarithmic, Inverse trigonometric,
Polynomial, Exponential, Trigonometric.

The original integral has been expressed in terms of a new integral, $\int e^{2x} \cos x dx$, which is no easier to evaluate than the original integral. It is tempting to start over with a new choice of u and dv , but a little persistence pays off. Suppose we evaluate $\int e^{2x} \cos x dx$ using integration by parts with the following choices.

$u = e^{2x}$	$dv = \cos x dx$
$du = 2e^{2x} dx$	$v = \sin x$

Integrating by parts, we have

$$\int e^{2x} \cos x dx = e^{2x} \sin x - 2 \int e^{2x} \sin x dx. \quad (2)$$

Now observe that equation (2) contains the original integral, $\int e^{2x} \sin x dx$. Substituting the result of equation (2) into equation (1), we find that

$$\begin{aligned}\int e^{2x} \sin x dx &= -e^{2x} \cos x + 2 \int e^{2x} \cos x dx \\ &= -e^{2x} \cos x + 2(e^{2x} \sin x - 2 \int e^{2x} \sin x dx) && \text{Substitute for } \int e^{2x} \cos x dx. \\ &= -e^{2x} \cos x + 2e^{2x} \sin x - 4 \int e^{2x} \sin x dx. && \text{Simplify.}\end{aligned}$$

- To solve for $\int e^{2x} \sin x dx$ in the equation $\int e^{2x} \sin x dx = -e^{2x} \cos x + 2e^{2x} \sin x - 4 \int e^{2x} \sin x dx$, add $4 \int e^{2x} \sin x dx$ to both sides of the equation and then divide both sides by 5.

Now it is a matter of solving for $\int e^{2x} \sin x dx$ and including the constant of integration:

$$\int e^{2x} \sin x dx = \frac{1}{5} e^{2x} (2 \sin x - \cos x) + C.$$

Related Exercises 27–28 ◀

Integration by Parts for Definite Integrals

Integration by parts with definite integrals presents two options. You can use the method outlined in Examples 1–4 to find an antiderivative and then evaluate it at the upper and lower limits of integration. Alternatively, the limits of integration can be incorporated directly into the integration by parts process. With the second approach, integration by parts for definite integrals has the following form.

- Integration by parts for definite integrals still has the form

$$\int u \, dv = uv - \int v \, du.$$

However, both definite integrals must be written with respect to x .

Integration by Parts for Definite Integrals

Let u and v be differentiable. Then

$$\int_a^b u(x)v'(x) \, dx = u(x)v(x) \Big|_a^b - \int_a^b v(x)u'(x) \, dx.$$

EXAMPLE 5 A definite integral Evaluate $\int_1^2 \ln x \, dx$.

SOLUTION This example is instructive because the integrand does not appear to be a product. The key is to view the integrand as the product $(\ln x)(1 \, dx)$. Then the following choices are plausible.

$u = \ln x$	$dv = dx$
$du = \frac{1}{x} dx$	$v = x$

Using integration by parts, we have

$$\begin{aligned} \int_1^2 \underbrace{\ln x}_u \underbrace{dx}_{dv} &= \left(\underbrace{(\ln x)}_u \underbrace{x}_v \right) \Big|_1^2 - \int_1^2 \underbrace{x}_{\cancel{v}} \underbrace{\frac{1}{x}}_{du} dx && \text{Integration by parts} \\ &= (x \ln x - x) \Big|_1^2 && \text{Integrate and simplify.} \\ &= (2 \ln 2 - 2) - (0 - 1) && \text{Evaluate.} \\ &= 2 \ln 2 - 1 \approx 0.386. && \text{Simplify.} \end{aligned}$$

Related Exercises 33–34 ◀

In Example 5, we evaluated a definite integral of $\ln x$. The corresponding indefinite integral can be added to our list of integration formulas.

Integral of $\ln x$

$$\int \ln x \, dx = x \ln x - x + C$$

QUICK CHECK 2 Verify by differentiation that $\int \ln x \, dx = x \ln x - x + C$. ◀

Figure 8.1

We now apply integration by parts to a familiar geometry problem.

EXAMPLE 6 Solids of revolution Let R be the region bounded by $y = \ln x$, the x -axis, and the line $x = e$ (Figure 8.1). Find the volume of the solid that is generated when the region R is revolved about the x -axis.

SOLUTION Revolving R about the x -axis generates a solid whose volume is computed with the disk method (Section 6.3). Its volume is

$$V = \int_1^e \pi (\ln x)^2 \, dx.$$

- Recall that if $f(x) \geq 0$ on $[a, b]$ and the region bounded by the graph of f and the x -axis on $[a, b]$ is revolved about the x -axis, then the volume of the solid generated is $V = \int_a^b \pi f(x)^2 dx$.

We integrate by parts with the following assignments.

$u = (\ln x)^2$	$dv = dx$
$du = \frac{2 \ln x}{x} dx$	$v = x$

The integration is carried out as follows, using the indefinite integral of $\ln x$ just given:

$$\begin{aligned}
 V &= \int_1^e \pi (\ln x)^2 dx && \text{Disk method} \\
 &= \pi \left(\underbrace{(\ln x)^2}_u \underbrace{x}_v \Big|_1^e - \int_1^e \underbrace{x \frac{2 \ln x}{x}}_{du} dx \right) && \text{Integration by parts} \\
 &= \pi \left(x(\ln x)^2 \Big|_1^e - 2 \int_1^e \ln x dx \right) && \text{Simplify.} \\
 &= \pi \left(x(\ln x)^2 \Big|_1^e - 2(x \ln x - x) \Big|_1^e \right) && \int \ln x dx = x \ln x - x + C \\
 &= \pi(e(\ln e)^2 - 2e \ln e + 2e - 2) && \text{Evaluate and simplify.} \\
 &= \pi(e - 2) \approx 2.257. && \text{Simplify.}
 \end{aligned}$$

43. The region bounded by $f(x) = e^{-x}$, $x = \ln 2$, and the coordinate axes is revolved about the y -axis.
44. The region bounded by $f(x) = \sin x$ and the x -axis on $[0, \pi]$ is revolved about the y -axis.
45. The region bounded by $g(x) = \sqrt{\ln x}$ and the x -axis on $[1, e]$ is revolved about the x -axis.
46. The region bounded by $f(x) = e^{-x}$ and the x -axis on $[0, \ln 2]$ is revolved about the line $x = \ln 2$.
47. The region bounded by $f(x) = x \ln x$ and the x -axis on $[1, e^2]$ is revolved about the x -axis.
48. **Integral of $\sec^3 x$** Use integration by parts to show that

$$\int \sec^3 x \, dx = \frac{1}{2} \sec x \tan x + \frac{1}{2} \int \sec x \, dx.$$

49. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- a. $\int uv' \, dx = \left(\int u \, dx \right) \left(\int v' \, dx \right).$
- b. $\int uv' \, dx = uv - \int vu' \, dx.$
- c. $\int v \, du = uv - \int u \, dv.$

50–53. Reduction formulas Use integration by parts to derive the following reduction formulas.

50. $\int x^n e^{ax} \, dx = \frac{x^n e^{ax}}{a} - \frac{n}{a} \int x^{n-1} e^{ax} \, dx, \text{ for } a \neq 0$
51. $\int x^n \cos ax \, dx = \frac{x^n \sin ax}{a} - \frac{n}{a} \int x^{n-1} \sin ax \, dx, \text{ for } a \neq 0$
52. $\int x^n \sin ax \, dx = -\frac{x^n \cos ax}{a} + \frac{n}{a} \int x^{n-1} \cos ax \, dx, \text{ for } a \neq 0$
53. $\int \ln^n x \, dx = x \ln^n x - n \int \ln^{n-1} x \, dx$

54–57. Applying reduction formulas Use the reduction formulas in Exercises 50–53 to evaluate the following integrals.

54. $\int x^2 e^{3x} \, dx$
55. $\int x^2 \cos 5x \, dx$
56. $\int x^3 \sin x \, dx$
57. $\int_1^e \ln^3 x \, dx$

58. **Two methods** Evaluate $\int_0^{\pi/3} \sin x \ln(\cos x) \, dx$ in the following two ways.

- a. Use integration by parts. b. Use substitution.

59. Two methods

- a. Evaluate $\int \frac{x}{\sqrt{x+1}} \, dx$ using integration by parts.
- b. Evaluate $\int \frac{x}{\sqrt{x+1}} \, dx$ using substitution.
- c. Verify that your answers to parts (a) and (b) are consistent.

60. Two methods

- a. Evaluate $\int x \ln x^2 \, dx$ using the substitution $u = x^2$ and evaluating $\int \ln u \, du$.
- b. Evaluate $\int x \ln x^2 \, dx$ using integration by parts.
- c. Verify that your answers to parts (a) and (b) are consistent.

61. **Logarithm base b** Prove that $\int \log_b x \, dx = \frac{1}{\ln b} (x \ln x - x) + C$.
62. **Two integration methods** Evaluate $\int \sin x \cos x \, dx$ using integration by parts. Then evaluate the integral using a substitution. Reconcile your answers.
63. **Combining two integration methods** Evaluate $\int \cos \sqrt{x} \, dx$ using a substitution followed by integration by parts.
64. **Combining two integration methods** Evaluate $\int_0^{\pi^2/4} \sin \sqrt{x} \, dx$ using a substitution followed by integration by parts.
65. **An identity** Show that if f has continuous derivatives on $[a, b]$ and $f'(a) = f'(b) = 0$, then

$$\int_a^b x f''(x) \, dx = f(a) - f(b).$$

66. **Integrating derivatives** Use integration by parts to show that if f' is continuous on $[a, b]$, then

$$\int_a^b f(x) f'(x) \, dx = \frac{1}{2} (f(b)^2 - f(a)^2).$$

67. **Function defined as an integral** Find the arc length of the function $f(x) = \int_e^x \sqrt{\ln^2 t - 1} \, dt$ on $[e, e^3]$.

68. **Log integrals** Use integration by parts to show that for $m \neq -1$,

$$\int x^m \ln x \, dx = \frac{x^{m+1}}{m+1} \left(\ln x - \frac{1}{m+1} \right) + C$$

and for $m = -1$,

$$\int \frac{\ln x}{x} \, dx = \frac{1}{2} \ln^2 x + C.$$

69. **Comparing volumes** Let R be the region bounded by $y = \sin x$ and the x -axis on the interval $[0, \pi]$. Which is greater, the volume of the solid generated when R is revolved about the x -axis or the volume of the solid generated when R is revolved about the y -axis?

70. A useful integral

- a. Use integration by parts to show that if f' is continuous, then

$$\int x f'(x) \, dx = x f(x) - \int f(x) \, dx.$$

- b. Use part (a) to evaluate $\int x e^{3x} \, dx$.

71. **Solid of revolution** Find the volume of the solid generated when the region bounded by $y = \cos x$ and the x -axis on the interval $[0, \pi/2]$ is revolved about the y -axis.

Explorations and Challenges

72. **Between the sine and inverse sine** Find the area of the region bounded by the curves $y = \sin x$ and $y = \sin^{-1} x$ on the interval $[0, 1/2]$.

73. **Two useful exponential integrals** Use integration by parts to derive the following formulas for real numbers a and b .

$$\int e^{ax} \sin bx \, dx = \frac{e^{ax}(a \sin bx - b \cos bx)}{a^2 + b^2} + C$$

$$\int e^{ax} \cos bx \, dx = \frac{e^{ax}(a \cos bx + b \sin bx)}{a^2 + b^2} + C$$

74. Integrating inverse functions Assume f has an inverse on its domain.

a. Let $y = f^{-1}(x)$ and show that

$$\int f^{-1}(x) dx = \int y f'(y) dy.$$

b. Use part (a) to show that

$$\int f^{-1}(x) dx = y f(y) - \int f(y) dy.$$

c. Use the result of part (b) to evaluate $\int \ln x dx$ (express the result in terms of x).

d. Use the result of part (b) to evaluate $\int \sin^{-1} x dx$.

e. Use the result of part (b) to evaluate $\int \tan^{-1} x dx$.

75. Oscillator displacements Suppose a mass on a spring that is slowed by friction has the position function $s(t) = e^{-t} \sin t$.

a. Graph the position function. At what times does the oscillator pass through the position $s = 0$?

b. Find the average value of the position on the interval $[0, \pi]$.

c. Generalize part (b) and find the average value of the position on the interval $[n\pi, (n+1)\pi]$, for $n = 0, 1, 2, \dots$.

d. Let a_n be the absolute value of the average position on the interval $[n\pi, (n+1)\pi]$, for $n = 0, 1, 2, \dots$. Describe the pattern in the numbers $a_0, a_1, a_2, \dots$.

76. Find the error Suppose you evaluate $\int \frac{dx}{x}$ using integration by parts. With $u = 1/x$ and $dv = dx$, you find that $du = -1/x^2 dx$, $v = x$, and

$$\int \frac{dx}{x} = \left(\frac{1}{x}\right)x - \int x\left(-\frac{1}{x^2}\right) dx = 1 + \int \frac{dx}{x}.$$

You conclude that $0 = 1$. Explain the problem with the calculation.

77. Tabular integration Consider the integral $\int f(x)g(x) dx$, where f can be differentiated repeatedly and g can be integrated repeatedly. Let G_k represent the result of calculating k indefinite integrals of g , where the constants of integration are omitted.

a. Show that integration by parts, when applied to $\int f(x)g(x) dx$ with the choices $u = f(x)$ and $dv = g(x) dx$, leads to $\int f(x)g(x) dx = f(x)G_1(x) - \int f'(x)G_1(x) dx$. This formula can be remembered by utilizing the following table, where a right arrow represents a product of functions on the right side of the integration by parts formula, and a left arrow represents the *integral* of a product of functions (also appearing on the right side of the formula). Explain the significance of the signs associated with the arrows.

f and its derivatives	g and its integrals
$f(x)$	$g(x)$
$f'(x)$	$G_1(x)$

b. Perform integration by parts again on $\int f'(x)G_1(x) dx$ (from part (a)) with the choices $u = f'(x)$ and $dv = G_1(x) dx$ to show that $\int f(x)g(x) dx = f(x)G_1(x) - f'(x)G_2(x) + \int f''(x)G_2(x) dx$. Explain the connection between this integral formula and the following table, paying close attention to the signs attached to the arrows.

f and its derivatives	g and its integrals
$f(x)$	$g(x)$
$f'(x)$	$G_1(x)$
$f''(x)$	$G_2(x)$

- c. Continue the pattern established in parts (a) and (b) and integrate by parts a third time. Write the integral formula that results from three applications of integration by parts, and construct the associated *tabular integration* table (include signs of the arrows).
- d. The tabular integration table from part (c) is easily extended to allow for as many steps as necessary in the process of integration by parts. Evaluate $\int x^2 e^{x/2} dx$ by constructing an appropriate table, and explain why the process terminates after four rows of the table have been filled in.
- e. Use tabular integration to evaluate $\int x^3 \cos x dx$. How many rows of the table are necessary? Why?
- f. Explain why tabular integration is particularly suited to integrals of the form $\int p_n(x)g(x) dx$, where p_n is a polynomial of degree $n > 0$ (and where, as before, we assume g is easily integrated as many times as necessary).

78. Practice with tabular integration Evaluate the following integrals using tabular integration (refer to Exercise 77).

- a. $\int x^4 e^x dx$
- b. $\int 7xe^{3x} dx$
- c. $\int_{-1}^0 2x^2 \sqrt{x+1} dx$
- d. $\int (x^3 - 2x) \sin 2x dx$
- e. $\int \frac{2x^2 - 3x}{(x-1)^3} dx$
- f. $\int \frac{x^2 + 3x + 4}{\sqrt[3]{2x+1}} dx$
- g. Why doesn't tabular integration work well when applied to $\int \frac{x}{\sqrt{1-x^2}} dx$? Evaluate this integral using a different method.

79. Tabular integration extended Refer to Exercise 77.

- a. The following table shows the method of tabular integration applied to $\int e^x \cos x dx$. Use the table to express $\int e^x \cos x dx$ in terms of the sum of functions and an indefinite integral.

f and its derivatives	g and its integrals
e^x	$\cos x$
e^x	$\sin x$
e^x	$-\cos x$

- b. Solve the equation in part (a) for $\int e^x \cos x dx$.
- c. Evaluate $\int e^{-2x} \sin 3x dx$ by applying the idea from parts (a) and (b).

80. An identity Show that if f and g have continuous second derivatives and $f(0) = f(1) = g(0) = g(1) = 0$, then

$$\int_0^1 f''(x)g(x) dx = \int_0^1 f(x)g''(x) dx.$$

81. Possible and impossible integrals Let $I_n = \int x^n e^{-x^2} dx$, where n is a nonnegative integer.

- a. $I_0 = \int e^{-x^2} dx$ cannot be expressed in terms of elementary functions. Evaluate I_1 .
- b. Use integration by parts to evaluate I_3 .

- c. Use integration by parts and the result of part (b) to evaluate I_5 .
- d. Show that, in general, if n is odd, then $I_n = -\frac{1}{2}e^{-x^2}p_{n-1}(x)$, where p_{n-1} is a polynomial of degree $n - 1$.
- e. Argue that if n is even, then I_n cannot be expressed in terms of elementary functions.

82. A family of exponentials The curves $y = xe^{-ax}$ are shown in the figure for $a = 1, 2$, and 3 .

- a. Find the area of the region bounded by $y = xe^{-x}$ and the x -axis on the interval $[0, 4]$.
- b. Find the area of the region bounded by $y = xe^{-ax}$ and the x -axis on the interval $[0, 4]$, where $a > 0$.
- c. Find the area of the region bounded by $y = xe^{-ax}$ and the x -axis on the interval $[0, b]$. Because this area depends on a and b , we call it $A(a, b)$.
- d. Use part (c) to show that $A(1, \ln b) = 4A\left(2, \frac{\ln b}{2}\right)$.
- e. Does this pattern continue? Is it true that $A(1, \ln b) = a^2A(a, (\ln b)/a)$?

QUICK CHECK ANSWERS

1. Let $u = x$ and $dv = \cos x \, dx$.
2. $\frac{d}{dx}(x \ln x - x + C) = \ln x$
3. Integration by parts must be applied five times. ◀

8.3 Trigonometric Integrals

At the moment, our inventory of integrals involving trigonometric functions is rather limited. For example, we can integrate the basic trigonometric functions found in Table 8.1, but have not yet encountered integrals such as $\int \cos^5 x \, dx$ and $\int \cos^2 x \sin^4 x \, dx$. The goal of this section is to develop techniques for evaluating integrals involving powers of trigonometric functions. These techniques are indispensable when we encounter *trigonometric substitutions* in the next section.

Integrating Powers of $\sin x$ or $\cos x$

Two strategies are used when evaluating integrals of the form $\int \sin^m x \, dx$ or $\int \cos^n x \, dx$, where m and n are positive integers. Both strategies use trigonometric identities to recast the integrand, as shown in the first example.

EXAMPLE 1 Powers of sine or cosine Evaluate the following integrals.

a. $\int \cos^5 x \, dx$ b. $\int \sin^4 x \, dx$

SOLUTION

- a. Integrals involving odd powers of $\cos x$ (or $\sin x$) are most easily evaluated by splitting off a single factor of $\cos x$ (or $\sin x$). In this case, we rewrite $\cos^5 x$ as $\cos^4 x \cdot \cos x$. Notice that $\cos^4 x$ can be written in terms of $\sin x$ using the identity $\cos^2 x = 1 - \sin^2 x$. The result is an integrand that readily yields to the substitution $u = \sin x$:

$$\begin{aligned}
 \int \cos^5 x \, dx &= \int \cos^4 x \cos x \, dx && \text{Split off } \cos x. \\
 &= \int (1 - \sin^2 x)^2 \cos x \, dx && \text{Pythagorean identity} \\
 &= \int (1 - u^2)^2 du && \text{Let } u = \sin x; du = \cos x \, dx. \\
 &= \int (1 - 2u^2 + u^4) du && \text{Expand.} \\
 &= u - \frac{2}{3}u^3 + \frac{1}{5}u^5 + C && \text{Integrate.} \\
 &= \sin x - \frac{2}{3}\sin^3 x + \frac{1}{5}\sin^5 x + C. && \text{Replace } u \text{ with } \sin x.
 \end{aligned}$$

► Some of the techniques described in this section also work for negative powers of trigonometric functions.

► Pythagorean identities:

$$\begin{aligned}
 \cos^2 x + \sin^2 x &= 1 \\
 1 + \tan^2 x &= \sec^2 x \\
 \cot^2 x + 1 &= \csc^2 x
 \end{aligned}$$

► The half-angle formulas for $\sin^2 x$ and $\cos^2 x$ are easily confused. Use the phrase “sine is minus” to remember that a minus sign is associated with the half-angle formula for $\sin^2 x$, whereas a positive sign is used for $\cos^2 x$.

b. With even positive powers of $\sin x$ or $\cos x$, we use the half-angle formulas

$$\sin^2 x = \frac{1 - \cos 2x}{2} \quad \text{and} \quad \cos^2 x = \frac{1 + \cos 2x}{2}$$

to reduce the powers in the integrand:

$$\begin{aligned} \int \sin^4 x \, dx &= \int \left(\underbrace{\frac{1 - \cos 2x}{2}}_{\sin^2 x} \right)^2 dx && \text{Half-angle formula} \\ &= \frac{1}{4} \int (1 - 2 \cos 2x + \cos^2 2x) \, dx. && \text{Expand the integrand.} \end{aligned}$$

Using the half-angle formula for $\cos^2 2x$, the evaluation may be completed:

$$\begin{aligned} \int \sin^4 x \, dx &= \frac{1}{4} \int \left(1 - 2 \cos 2x + \underbrace{\frac{1 + \cos 4x}{2}}_{\cos^2 2x} \right) dx && \text{Half-angle formula} \\ &= \frac{1}{4} \int \left(\frac{3}{2} - 2 \cos 2x + \frac{1}{2} \cos 4x \right) dx && \text{Simplify.} \\ &= \frac{3x}{8} - \frac{1}{4} \sin 2x + \frac{1}{32} \sin 4x + C. && \text{Evaluate the integrals.} \end{aligned}$$

Related Exercises 9–11 ◀

QUICK CHECK 1 Evaluate $\int \sin^3 x \, dx$ by splitting off a factor of $\sin x$, rewriting $\sin^2 x$ in terms of $\cos x$, and using an appropriate u -substitution. ◀

Integrating Products of Powers of $\sin x$ and $\cos x$

We now consider integrals of the form $\int \sin^m x \cos^n x \, dx$. If m is an odd, positive integer, we split off a factor of $\sin x$ and write the remaining even power of $\sin x$ in terms of cosine functions. This step prepares the integrand for the substitution $u = \cos x$, and the resulting integral is readily evaluated. A similar strategy is used when n is an odd, positive integer.

If both m and n are even positive integers, the half-angle formulas are used to transform the integrand into a polynomial in $\cos 2x$, each of whose terms can be integrated, as shown in Example 2.

EXAMPLE 2 **Products of sine and cosine** Evaluate the following integrals.

a. $\int \sin^4 x \cos^2 x \, dx$ b. $\int \sin^3 x \cos^{-2} x \, dx$

SOLUTION

a. When both powers are even positive integers, the half-angle formulas are used:

$$\begin{aligned} \int \sin^4 x \cos^2 x \, dx &= \int \left(\underbrace{\frac{1 - \cos 2x}{2}}_{\sin^2 x} \right)^2 \left(\underbrace{\frac{1 + \cos 2x}{2}}_{\cos^2 x} \right) dx && \text{Half-angle formulas} \\ &= \frac{1}{8} \int (1 - \cos 2x - \cos^2 2x + \cos^3 2x) \, dx. && \text{Expand.} \end{aligned}$$

The third term in the integrand is rewritten with a half-angle formula. For the last term, a factor of $\cos 2x$ is split off, and the resulting even power of $\cos 2x$ is written in terms of $\sin 2x$ to prepare for a u -substitution:

$$\begin{aligned} \int \sin^4 x \cos^2 x \, dx &= \\ &= \frac{1}{8} \int \left(1 - \cos 2x - \underbrace{\frac{1 + \cos 4x}{2}}_{\cos^2 2x} \right) dx + \frac{1}{8} \int \underbrace{(1 - \sin^2 2x)}_{\cos^2 2x} \cdot \cos 2x \, dx. \end{aligned}$$

Finally, the integrals are evaluated, using the substitution $u = \sin 2x$ for the second integral. After simplification, we find that

$$\int \sin^4 x \cos^2 x \, dx = \frac{1}{16} x - \frac{1}{64} \sin 4x - \frac{1}{48} \sin^3 2x + C.$$

b. When at least one power is odd and positive, the following approach works:

$$\begin{aligned}
 \int \sin^3 x \cos^{-2} x \, dx &= \int \sin^2 x \cos^{-2} x \cdot \sin x \, dx && \text{Split off } \sin x. \\
 &= \int (1 - \cos^2 x) \cos^{-2} x \cdot \sin x \, dx && \text{Pythagorean identity} \\
 &= -\int (1 - u^2) u^{-2} \, du && u = \cos x; \, du = -\sin x \, dx \\
 &= \int (1 - u^{-2}) \, du = u + \frac{1}{u} + C && \text{Evaluate the integral.} \\
 &= \cos x + \sec x + C. && \text{Replace } u \text{ with } \cos x.
 \end{aligned}$$

Related Exercises 15–17 ◀

QUICK CHECK 2 What strategy would you use to evaluate $\int \sin^3 x \cos^3 x \, dx$? ◀

Table 8.2 summarizes the techniques used to evaluate integrals of the form $\int \sin^m x \cos^n x \, dx$.

Table 8.2

$\int \sin^m x \cos^n x \, dx$	Strategy
m odd and positive, n real	Split off $\sin x$, rewrite the resulting even power of $\sin x$ in terms of $\cos x$, and then use $u = \cos x$.
n odd and positive, m real	Split off $\cos x$, rewrite the resulting even power of $\cos x$ in terms of $\sin x$, and then use $u = \sin x$.
m and n both even, nonnegative integers	Use half-angle formulas to transform the integrand into a polynomial in $\cos 2x$, and apply the preceding strategies once again to powers of $\cos 2x$ greater than 1.

► If both m and n are odd, you may split off $\sin x$ or $\cos x$, though in practice, one choice may be more efficient than the other.

Reduction Formulas

Evaluating an integral such as $\int \sin^8 x \, dx$ using the method of Example 1b is tedious, at best. For this reason, *reduction formulas* have been developed to ease the workload. A reduction formula equates an integral involving a power of a function with another integral in which the power is reduced; several reduction formulas were encountered in Exercises 50–53 of Section 8.2. Here are some frequently used reduction formulas for trigonometric integrals.

Reduction Formulas

Assume n is a positive integer.

- $\int \sin^n x \, dx = -\frac{\sin^{n-1} x \cos x}{n} + \frac{n-1}{n} \int \sin^{n-2} x \, dx$
- $\int \cos^n x \, dx = \frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n} \int \cos^{n-2} x \, dx$
- $\int \tan^n x \, dx = \frac{\tan^{n-1} x}{n-1} - \int \tan^{n-2} x \, dx, \quad n \neq 1$
- $\int \sec^n x \, dx = \frac{\sec^{n-2} x \tan x}{n-1} + \frac{n-2}{n-1} \int \sec^{n-2} x \, dx, \quad n \neq 1$

Formulas 1, 3, and 4 are derived in Exercises 72–74. The derivation of formula 2 is similar to that of formula 1.

EXAMPLE 3 Powers of $\tan x$ Evaluate $\int \tan^4 x \, dx$.

SOLUTION Reduction formula 3 gives

$$\begin{aligned}\int \tan^4 x \, dx &= \frac{1}{3} \tan^3 x - \underbrace{\int \tan^2 x \, dx}_{\text{use (3) again}} \\ &= \frac{1}{3} \tan^3 x - (\tan x - \underbrace{\int \tan^0 x \, dx}_{=1}) \\ &= \frac{1}{3} \tan^3 x - \tan x + x + C.\end{aligned}$$

An alternative solution uses the identity $\tan^2 x = \sec^2 x - 1$:

$$\begin{aligned}\int \tan^4 x \, dx &= \int \tan^2 x \underbrace{(\sec^2 x - 1)}_{\tan^2 x} dx \\ &= \int \tan^2 x \sec^2 x \, dx - \int \tan^2 x \, dx.\end{aligned}$$

The substitution $u = \tan x$, $du = \sec^2 x \, dx$ is used in the first integral, and the identity $\tan^2 x = \sec^2 x - 1$ is used again in the second integral:

$$\begin{aligned}\int \tan^4 x \, dx &= \int \underbrace{\tan^2 x}_{u^2} \underbrace{\sec^2 x \, dx}_{du} - \int \tan^2 x \, dx \\ &= \int u^2 \, du - \int (\sec^2 x - 1) \, dx && \text{Substitution and identity} \\ &= \frac{u^3}{3} - \tan x + x + C && \text{Evaluate integrals.} \\ &= \frac{1}{3} \tan^3 x - \tan x + x + C. && u = \tan x\end{aligned}$$

Related Exercises 30–31 ◀

Note that for odd powers of $\tan x$ and $\sec x$, the use of reduction formula 3 or 4 will eventually lead to $\int \tan x \, dx$ or $\int \sec x \, dx$. Table 8.1 in Section 8.1 gives these integrals, along with the integrals of $\cot x$ and $\csc x$.

Integrating Products of Powers of $\tan x$ and $\sec x$

Integrals of the form $\int \tan^m x \sec^n x \, dx$ are evaluated using methods analogous to those used for $\int \sin^m x \cos^n x \, dx$. For example, if n is an even positive integer, we split off a factor of $\sec^2 x$ and write the remaining even power of $\sec x$ in terms of $\tan x$. This step prepares the integral for the substitution $u = \tan x$. If m is odd and positive, we split off a factor of $\sec x \tan x$ (the derivative of $\sec x$), which prepares the integral for the substitution $u = \sec x$. If m is even and n is odd, the integrand is expressed as a polynomial in $\sec x$, each of whose terms is handled by a reduction formula. Example 4 illustrates these techniques.

EXAMPLE 4 Products of $\tan x$ and $\sec x$ Evaluate the following integrals.

a. $\int \tan^3 x \sec^4 x \, dx$ **b.** $\int \tan^2 x \sec x \, dx$

SOLUTION

a. With an even power of $\sec x$, we split off a factor of $\sec^2 x$ and prepare the integral for the substitution $u = \tan x$:

$$\begin{aligned}\int \tan^3 x \sec^4 x \, dx &= \int \tan^3 x \sec^2 x \cdot \sec^2 x \, dx \\ &= \int \tan^3 x (\tan^2 x + 1) \cdot \sec^2 x \, dx && \sec^2 x = \tan^2 x + 1 \\ &= \int u^3 (u^2 + 1) \, du && u = \tan x; \, du = \sec^2 x \, dx \\ &= \frac{1}{6} \tan^6 x + \frac{1}{4} \tan^4 x + C. && \text{Evaluate; } u = \tan x.\end{aligned}$$

- In Example 4a, the two methods produce results that look different but are equivalent. This is common when evaluating trigonometric integrals. For instance, evaluate $\int \sin^4 x \, dx$ using reduction formula 1, and compare your answer to

$$\frac{3x}{8} - \frac{1}{4} \sin 2x + \frac{1}{32} \sin 4x + C,$$

the solution found in Example 1b.

Because the integrand also has an odd power of $\tan x$, an alternative solution is to split off a factor of $\sec x \tan x$ and prepare the integral for the substitution $u = \sec x$:

$$\begin{aligned} \int \tan^3 x \sec^4 x \, dx &= \int \underbrace{\tan^2 x}_{\sec^2 x - 1} \sec^3 x \cdot \sec x \tan x \, dx \\ &= \int (\sec^2 x - 1) \sec^3 x \cdot \sec x \tan x \, dx \\ &= \int (u^2 - 1) u^3 \, du && u = \sec x; \\ &&& du = \sec x \tan x \, dx \\ &= \frac{1}{6} \sec^6 x - \frac{1}{4} \sec^4 x + C. && \text{Evaluate; } u = \sec x. \end{aligned}$$

The apparent difference in the two solutions given here is reconciled by using the identity $1 + \tan^2 x = \sec^2 x$ to transform the second result into the first, the only difference being an additive constant, which is part of C .

- b. In this case, we write the even power of $\tan x$ in terms of $\sec x$:

$$\begin{aligned} \int \tan^2 x \sec x \, dx &= \int (\sec^2 x - 1) \sec x \, dx && \tan^2 x = \sec^2 x - 1 \\ &= \int \sec^3 x \, dx - \int \sec x \, dx && \text{Expand.} \\ &= \underbrace{\frac{1}{2} \sec x \tan x + \frac{1}{2} \int \sec x \, dx}_{\text{reduction formula 4}} - \int \sec x \, dx && \text{Use reduction formula.} \\ &= \frac{1}{2} \sec x \tan x - \frac{1}{2} \ln |\sec x + \tan x| + C. && \text{Add secant integrals; use Table 8.1 in Section 8.1.} \end{aligned}$$

Related Exercises 33–35 ◀

Table 8.3 summarizes the methods used to integrate $\int \tan^m x \sec^n x \, dx$. Analogous techniques are used for $\int \cot^m x \csc^n x \, dx$.

Table 8.3

$\int \tan^m x \sec^n x \, dx$	Strategy
n even and positive, m real	Split off $\sec^2 x$, rewrite the remaining even power of $\sec x$ in terms of $\tan x$, and use $u = \tan x$.
m odd and positive, n real	Split off $\sec x \tan x$, rewrite the remaining even power of $\tan x$ in terms of $\sec x$, and use $u = \sec x$.
m even and positive, n odd and positive	Rewrite the even power of $\tan x$ in terms of $\sec x$ to produce a polynomial in $\sec x$; apply reduction formula 4 to each term.

63. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- a. If m is a positive integer, then $\int_0^{\pi} \cos^{2m+1} x dx = 0$.
- b. If m is a positive integer, then $\int_0^{\pi} \sin^m x dx = 0$.
64. **Sine football** Find the volume of the solid generated when the region bounded by $y = \sin x$ and the x -axis on the interval $[0, \pi]$ is revolved about the x -axis.
65. **Volume** Find the volume of the solid generated when the region bounded by $y = \sin^2 x \cos^{3/2} x$ and the x -axis on the interval $[0, \pi/2]$ is revolved about the x -axis.
66. **Particle position** A particle moves along a line with a velocity (in m/s) given by $v(t) = \sec^4 \frac{\pi t}{12}$, for $0 \leq t \leq 5$, where t is measured in seconds. Determine the position function $s(t)$, for $0 \leq t \leq 5$. Assume $s(0) = 0$.

67–70. Integrals of the form $\int \sin mx \cos nx dx$ Use the following three identities to evaluate the given integrals.

$$\sin mx \sin nx = \frac{1}{2} (\cos((m-n)x) - \cos((m+n)x))$$

$$\sin mx \cos nx = \frac{1}{2} (\sin((m-n)x) + \sin((m+n)x))$$

$$\cos mx \cos nx = \frac{1}{2} (\cos((m-n)x) + \cos((m+n)x))$$

67. $\int \sin 3x \cos 7x dx$
68. $\int \sin 5x \sin 7x dx$
69. $\int \sin 3x \sin 2x dx$
70. $\int \cos x \cos 2x dx$

Explorations and Challenges

71. Prove the following **orthogonality relations** (which are used to generate *Fourier series*). Assume m and n are integers with $m \neq n$.
- a. $\int_0^{\pi} \sin mx \sin nx dx = 0$
- b. $\int_0^{\pi} \cos mx \cos nx dx = 0$
- c. $\int_0^{\pi} \sin mx \cos nx dx = 0$, for $|m+n|$ even
72. **A sine reduction formula** Use integration by parts to obtain the reduction formula for positive integers n :
- $$\int \sin^n x dx = -\sin^{n-1} x \cos x + (n-1) \int \sin^{n-2} x \cos^2 x dx.$$
- Then use an identity to obtain the reduction formula
- $$\int \sin^n x dx = -\frac{\sin^{n-1} x \cos x}{n} + \frac{n-1}{n} \int \sin^{n-2} x dx.$$
- Use this reduction formula to evaluate $\int \sin^6 x dx$.
73. **A tangent reduction formula** Prove that for positive integers $n \neq 1$,
- $$\int \tan^n x dx = \frac{\tan^{n-1} x}{n-1} - \int \tan^{n-2} x dx.$$
- Use the formula to evaluate $\int_0^{\pi/4} \tan^3 x dx$.
74. **A secant reduction formula** Prove that for positive integers $n \neq 1$,
- $$\int \sec^n x dx = \frac{\sec^{n-2} x \tan x}{n-1} + \frac{n-2}{n-1} \int \sec^{n-2} x dx.$$
- (Hint: Integrate by parts with $u = \sec^{n-2} x$ and $dv = \sec^2 x dx$.)

75. Exploring powers of sine and cosine

- Graph the functions $f_1(x) = \sin^2 x$ and $f_2(x) = \sin^2 2x$ on the interval $[0, \pi]$. Find the area under these curves on $[0, \pi]$.
- Graph a few more of the functions $f_n(x) = \sin^2 nx$ on the interval $[0, \pi]$, where n is a positive integer. Find the area under these curves on $[0, \pi]$. Comment on your observations.
- Prove that $\int_0^\pi \sin^2 nx \, dx$ has the same value for all positive integers n .
- Does the conclusion of part (c) hold if sine is replaced by cosine?

- Repeat parts (a), (b), and (c) with $\sin^2 x$ replaced by $\sin^4 x$. Comment on your observations.

QUICK CHECK ANSWERS

- $\frac{1}{3} \cos^3 x - \cos x + C$
- Write $\int \sin^3 x \cos^3 x \, dx = \int \sin^2 x \cos^3 x \sin x \, dx = \int (1 - \cos^2 x) \cos^3 x \sin x \, dx$. Then use the substitution $u = \cos x$. Or begin by writing $\int \sin^3 x \cos^3 x \, dx = \int \sin^3 x \cos^2 x \cos x \, dx$. ◀

8.4 Trigonometric Substitutions

In Example 3 of Section 6.5, we wrote the arc length integral for the segment of the parabola $y = x^2$ on the interval $[0, 2]$ as

$$\int_0^2 \sqrt{1 + 4x^2} \, dx = \int_0^2 2 \sqrt{\frac{1}{4} + x^2} \, dx.$$

At the time, we did not have the analytical methods needed to evaluate this integral. The difficulty with $\int_0^2 \sqrt{1 + 4x^2} \, dx$ is that the square root of a sum (or difference) of two squares is not easily simplified. On the other hand, the square root of a product of two squares is easily simplified: $\sqrt{A^2 B^2} = |AB|$. If we could somehow replace $1 + 4x^2$ with a product of squares, this integral might be easier to evaluate. The goal of this section is to introduce techniques that transform sums of squares $a^2 + x^2$ (and the difference of squares $a^2 - x^2$ and $x^2 - a^2$) into products of squares.

Integrals similar to the arc length integral for the parabola arise in many different situations. For example, electrostatic, magnetic, and gravitational forces obey an inverse square law (their strength is proportional to $1/r^2$, where r is a distance). Computing these force fields in two dimensions leads to integrals such as $\int \frac{dx}{\sqrt{x^2 + a^2}}$ or $\int \frac{dx}{(x^2 + a^2)^{3/2}}$.

It turns out that integrals containing the terms $a^2 \pm x^2$ or $x^2 - a^2$, where a is a constant, can be simplified using somewhat unexpected substitutions involving trigonometric functions. The new integrals produced by these substitutions are often trigonometric integrals of the variety studied in the preceding section.

Integrals Involving $a^2 - x^2$

Suppose you are faced with an integral whose integrand contains the term $a^2 - x^2$, where a is a positive constant. Observe what happens when x is replaced with $a \sin \theta$:

$$\begin{aligned} a^2 - x^2 &= a^2 - (a \sin \theta)^2 && \text{Replace } x \text{ with } a \sin \theta. \\ &= a^2 - a^2 \sin^2 \theta && \text{Simplify.} \\ &= a^2 (1 - \sin^2 \theta) && \text{Factor.} \\ &= a^2 \cos^2 \theta. && 1 - \sin^2 \theta = \cos^2 \theta \end{aligned}$$

This calculation shows that the change of variables $x = a \sin \theta$ turns the difference $a^2 - x^2$ into the product $a^2 \cos^2 \theta$. The resulting integral—now with respect to θ —is often easier to evaluate than the original integral. The details of this procedure are spelled out in the following examples.

EXAMPLE 1 Area of a circle Verify that the area of a circle of radius a is πa^2 .

SOLUTION The function $f(x) = \sqrt{a^2 - x^2}$ describes the upper half of a circle centered at the origin with radius a (Figure 8.2). The region under this curve on the interval $[0, a]$ is a quarter-circle. Therefore, the area of the full circle is $4 \int_0^a \sqrt{a^2 - x^2} \, dx$.

► To understand how a difference of squares is rewritten as a product of squares, think of the Pythagorean Theorem: $a^2 + b^2 = c^2$. A rearrangement of this theorem leads to the standard substitution for integrals involving the difference of squares $a^2 - x^2$. The term $\sqrt{a^2 - x^2}$ is the length of one side of a right triangle whose hypotenuse has length a and whose other side has length x . Labeling one acute angle θ , we see that the substitution $x = a \sin \theta$ transforms $a^2 - x^2$ into $a^2 \cos^2 \theta$.

$$x = a \sin \theta$$

QUICK CHECK 1 Use a substitution of the form $x = a \sin \theta$ to transform $9 - x^2$ into a product. ◀

Figure 8.2

Figure 8.3

- The key identities for integrating $\sin^2 \theta$ and $\cos^2 \theta$ are

$$\sin^2 \theta = \frac{1 - \cos 2\theta}{2} \quad \text{and} \quad \cos^2 \theta = \frac{1 + \cos 2\theta}{2}.$$

Because the integrand contains the expression $a^2 - x^2$, we use the trigonometric substitution $x = a \sin \theta$, which can also be written $\theta = \sin^{-1}(x/a)$. This substitution is well defined only when the angle θ is restricted to the interval $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$, which is the range of $\sin^{-1}(x/a)$ (Figure 8.3). As with all substitutions, the differential associated with the substitution must be computed:

$$x = a \sin \theta \quad \text{implies that} \quad dx = a \cos \theta \, d\theta.$$

Notice that the new variable θ plays the role of an angle. Replacing x with $a \sin \theta$ in the integrand, we have

$$\begin{aligned} \sqrt{a^2 - x^2} &= \sqrt{a^2 - (a \sin \theta)^2} && \text{Replace } x \text{ with } a \sin \theta. \\ &= \sqrt{a^2 (1 - \sin^2 \theta)} && \text{Factor.} \\ &= \sqrt{a^2 \cos^2 \theta} && 1 - \sin^2 \theta = \cos^2 \theta \\ &= |a \cos \theta| && \sqrt{x^2} = |x| \\ &= a \cos \theta. && a > 0, \cos \theta \geq 0, \text{ for } -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2} \end{aligned}$$

We also change the limits of integration: When $x = 0$, $\theta = \sin^{-1} 0 = 0$; when $x = a$, $\theta = \sin^{-1}(a/a) = \sin^{-1} 1 = \pi/2$. Making these substitutions, we evaluate the integral as follows:

$$\begin{aligned} 4 \int_0^a \sqrt{a^2 - x^2} \, dx &= 4 \int_0^{\pi/2} \underbrace{a \cos \theta}_{\text{integrand simplified}} \cdot \underbrace{a \cos \theta \, d\theta}_{dx} && x = a \sin \theta, dx = a \cos \theta \, d\theta \\ &= 4a^2 \int_0^{\pi/2} \cos^2 \theta \, d\theta && \text{Simplify.} \\ &= 4a^2 \left(\frac{\theta}{2} + \frac{\sin 2\theta}{4} \right) \bigg|_0^{\pi/2} && \cos^2 \theta = \frac{1 + \cos 2\theta}{2} \\ &= 4a^2 \left(\left(\frac{\pi}{4} + 0 \right) - (0 + 0) \right) = \pi a^2. && \text{Simplify.} \end{aligned}$$

A similar calculation (Exercise 58) gives the area of an ellipse.

Related Exercises 7, 9 ◀

EXAMPLE 2 Sine substitution Evaluate $\int \frac{dx}{(16 - x^2)^{3/2}}$.

SOLUTION The factor $16 - x^2$ has the form $a^2 - x^2$ with $a = 4$, so we use the substitution $x = 4 \sin \theta$. It follows that $dx = 4 \cos \theta \, d\theta$. We now simplify $(16 - x^2)^{3/2}$:

$$\begin{aligned} (16 - x^2)^{3/2} &= (16 - (4 \sin \theta)^2)^{3/2} && \text{Substitute } x = 4 \sin \theta. \\ &= (16 (1 - \sin^2 \theta))^{3/2} && \text{Factor.} \\ &= (16 \cos^2 \theta)^{3/2} && 1 - \sin^2 \theta = \cos^2 \theta \\ &= 64 \cos^3 \theta. && \text{Simplify.} \end{aligned}$$

Replacing the factors $(16 - x^2)^{3/2}$ and dx of the original integral with appropriate expressions in θ , we have

$$\begin{aligned} \int \frac{\overbrace{4 \cos \theta \, d\theta}^{dx}}{\underbrace{(16 - x^2)^{3/2}}_{64 \cos^3 \theta}} &= \int \frac{4 \cos \theta}{64 \cos^3 \theta} \, d\theta \\ &= \frac{1}{16} \int \frac{d\theta}{\cos^2 \theta} \\ &= \frac{1}{16} \int \sec^2 \theta \, d\theta && \text{Simplify.} \\ &= \frac{1}{16} \tan \theta + C. && \text{Evaluate the integral.} \end{aligned}$$

Figure 8.4

The final step is to express this result in terms of x . In many integrals, this step is most easily done with a reference triangle showing the relationship between x and θ . **Figure 8.4** shows a right triangle with an angle θ and with the sides labeled such that $x = 4 \sin \theta$ (or $\sin \theta = x/4$). Using this triangle, we see that $\tan \theta = \frac{x}{\sqrt{16 - x^2}}$, which implies that

$$\int \frac{dx}{(16 - x^2)^{3/2}} = \frac{1}{16} \tan \theta + C = \frac{x}{16\sqrt{16 - x^2}} + C.$$

Related Exercises 8, 11 ◀

Integrals Involving $a^2 + x^2$ or $x^2 - a^2$

The additional trigonometric substitutions involving tangent and secant use a procedure similar to that used for the sine substitution. **Figure 8.5** and Table 8.4 summarize the three basic trigonometric substitutions for real numbers $a > 0$.

Figure 8.5

Table 8.4

The Integral Contains . . .	Corresponding Substitution	Useful Identity
$a^2 - x^2$	$x = a \sin \theta, -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}, \text{ for } x \leq a$	$a^2 - a^2 \sin^2 \theta = a^2 \cos^2 \theta$
$a^2 + x^2$	$x = a \tan \theta, -\frac{\pi}{2} < \theta < \frac{\pi}{2}$	$a^2 + a^2 \tan^2 \theta = a^2 \sec^2 \theta$
$x^2 - a^2$	$x = a \sec \theta, \begin{cases} 0 \leq \theta < \frac{\pi}{2}, \text{ for } x \geq a \\ \frac{\pi}{2} < \theta \leq \pi, \text{ for } x \leq -a \end{cases}$	$a^2 \sec^2 \theta - a^2 = a^2 \tan^2 \theta$

Figure 8.6

In order for the tangent substitution $x = a \tan \theta$ to be well defined, the angle θ must be restricted to the interval $-\pi/2 < \theta < \pi/2$, which is the range of $\tan^{-1}(x/a)$ (**Figure 8.6**). On this interval, $\sec \theta > 0$ and with $a > 0$, it is valid to write

$$\sqrt{a^2 + x^2} = \sqrt{a^2 + (a \tan \theta)^2} = \sqrt{a^2 (1 + \tan^2 \theta)} = a \sec \theta.$$

With the secant substitution, there is a technicality. As discussed in Section 1.4, $\theta = \sec^{-1}(x/a)$ is defined for $x \geq a$, in which case $0 \leq \theta < \pi/2$, and for $x \leq -a$, in which case $\pi/2 < \theta \leq \pi$ (**Figure 8.7**). These restrictions on θ must be treated carefully when simplifying integrands with a factor of $\sqrt{x^2 - a^2}$. Because $\tan \theta$ is positive in the first quadrant but negative in the second, we have

$$\sqrt{x^2 - a^2} = \sqrt{a^2 (\sec^2 \theta - 1)} = |a \tan \theta| = \begin{cases} a \tan \theta & \text{if } 0 \leq \theta < \frac{\pi}{2} \\ -a \tan \theta & \text{if } \frac{\pi}{2} < \theta \leq \pi. \end{cases}$$

Figure 8.7

QUICK CHECK 2 Suggest a trigonometric substitution for each integral, and then write the new integral that results after carrying out the substitution.

a. $\int \frac{x^2}{\sqrt{x^2 + 9}} dx$

b. $\int \frac{3}{\sqrt{x^2 - 16}} dx, x > 4 \blacktriangleleft$

► Because we are evaluating a definite integral in Example 3, we could change the limits of integration to $\theta = 0$ and $\theta = \tan^{-1} 4$. However, $\tan^{-1} 4$ is not a standard angle, so it is easier to express the antiderivative in terms of x and use the original limits of integration.

Figure 8.8

When evaluating a definite integral, you should check the limits of integration to see which of these two cases applies. For indefinite integrals, a piecewise formula is often needed, unless a restriction on the variable is given in the problem (see Exercises 79–80).

EXAMPLE 3 Arc length of a parabola Evaluate $\int_0^2 \sqrt{1 + 4x^2} dx$, the arc length of the segment of the parabola $y = x^2$ on $[0, 2]$.

SOLUTION Removing a factor of 4 from the square root, we have

$$\int_0^2 \sqrt{1 + 4x^2} dx = 2 \int_0^2 \sqrt{\frac{1}{4} + x^2} dx = 2 \int_0^2 \sqrt{\left(\frac{1}{2}\right)^2 + x^2} dx.$$

The integrand contains the expression $a^2 + x^2$, with $a = \frac{1}{2}$, which suggests the substitution $x = \frac{1}{2} \tan \theta$. It follows that $dx = \frac{1}{2} \sec^2 \theta d\theta$, and

$$\sqrt{\left(\frac{1}{2}\right)^2 + x^2} = \sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{1}{2} \tan \theta\right)^2} = \frac{1}{2} \sqrt{1 + \tan^2 \theta} = \frac{1}{2} \sec \theta.$$

Setting aside the limits of integration for the moment, we compute the antiderivative:

$$\begin{aligned} 2 \int \sqrt{\left(\frac{1}{2}\right)^2 + x^2} dx &= 2 \int \frac{1}{2} \sec \theta \underbrace{\frac{1}{2} \sec^2 \theta d\theta}_{dx} && x = \frac{1}{2} \tan \theta, \\ &= \frac{1}{2} \int \sec^3 \theta d\theta && dx = \frac{1}{2} \sec^2 \theta d\theta \\ &= \frac{1}{4} (\sec \theta \tan \theta + \ln |\sec \theta + \tan \theta|) + C. && \text{Simplify.} \end{aligned}$$

Reduction formula 4, Section 8.3

Using a reference triangle (Figure 8.8), we express the antiderivative in terms of the original variable x and evaluate the definite integral:

$$\begin{aligned} 2 \int_0^2 \sqrt{\left(\frac{1}{2}\right)^2 + x^2} dx &= \frac{1}{4} \left(\underbrace{\sqrt{1 + 4x^2}}_{\sec \theta} \underbrace{2x}_{\tan \theta} + \ln \left| \underbrace{\sqrt{1 + 4x^2}}_{\sec \theta} + \underbrace{2x}_{\tan \theta} \right| \right) \bigg|_0^2 \\ &= \frac{1}{4} (4\sqrt{17} + \ln(\sqrt{17} + 4)) \approx 4.65. \end{aligned}$$

Related Exercises 41, 77 ◀

QUICK CHECK 3 The integral $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$ is given in Section 7.5. Verify this result with the appropriate trigonometric substitution. ◀

EXAMPLE 4 Another tangent substitution Evaluate $\int \frac{dx}{(1 + x^2)^2}$.

SOLUTION The factor $1 + x^2$ suggests the substitution $x = \tan \theta$. It follows that $\theta = \tan^{-1} x$, $dx = \sec^2 \theta d\theta$, and

$$(1 + x^2)^2 = \underbrace{(1 + \tan^2 \theta)^2}_{\sec^2 \theta} = \sec^4 \theta.$$

Substituting these factors leads to

$$\begin{aligned} \int \frac{dx}{(1 + x^2)^2} &= \int \frac{\sec^2 \theta}{\sec^4 \theta} d\theta && x = \tan \theta, dx = \sec^2 \theta d\theta \\ &= \int \cos^2 \theta d\theta && \text{Simplify.} \\ &= \frac{\theta}{2} + \frac{\sin 2\theta}{4} + C. && \text{Integrate } \cos^2 \theta = \frac{1 + \cos 2\theta}{2}. \end{aligned}$$

Figure 8.9

The final step is to return to the original variable x . The first term $\theta/2$ is replaced with $\frac{1}{2} \tan^{-1} x$. The second term involving $\sin 2\theta$ requires the identity $\sin 2\theta = 2 \sin \theta \cos \theta$. The reference triangle (Figure 8.9) tells us that

$$\frac{1}{4} \sin 2\theta = \frac{1}{2} \sin \theta \cos \theta = \frac{1}{2} \cdot \frac{x}{\sqrt{1+x^2}} \cdot \frac{1}{\sqrt{1+x^2}} = \frac{x}{2(1+x^2)}.$$

The integration can now be completed:

$$\begin{aligned} \int \frac{dx}{(1+x^2)^2} &= \frac{\theta}{2} + \frac{\sin 2\theta}{4} + C \\ &= \frac{1}{2} \tan^{-1} x + \frac{x}{2(1+x^2)} + C. \end{aligned}$$

Related Exercises 28–29 ◀

EXAMPLE 5 Multiple approaches Evaluate the integral $\int \frac{dx}{\sqrt{x^2 + 4}}$.

SOLUTION Our goal is to show that several different methods lead to the same end.

Solution 1: The term $x^2 + 4$ suggests the substitution $x = 2 \tan \theta$, which implies that $dx = 2 \sec^2 \theta d\theta$ and

$$\sqrt{x^2 + 4} = \sqrt{4 \tan^2 \theta + 4} = \sqrt{4(\tan^2 \theta + 1)} = 2 \sqrt{\sec^2 \theta} = 2 \sec \theta.$$

Making these substitutions, the integral becomes

$$\int \frac{dx}{\sqrt{x^2 + 4}} = \int \frac{2 \sec^2 \theta}{2 \sec \theta} d\theta = \int \sec \theta d\theta = \ln |\sec \theta + \tan \theta| + C.$$

To express the indefinite integral in terms of x , notice that with $x = 2 \tan \theta$, we have

$$\tan \theta = \frac{x}{2} \quad \text{and} \quad \sec \theta = \sqrt{\tan^2 \theta + 1} = \frac{1}{2} \sqrt{x^2 + 4}.$$

Therefore,

$$\begin{aligned} \int \frac{dx}{\sqrt{x^2 + 4}} &= \ln |\sec \theta + \tan \theta| + C \\ &= \ln \left| \frac{1}{2} \sqrt{x^2 + 4} + \frac{x}{2} \right| + C && \text{Substitute for } \sec \theta \text{ and } \tan \theta. \\ &= \ln \left(\frac{1}{2} (\sqrt{x^2 + 4} + x) \right) + C && \text{Factor; } \sqrt{x^2 + 4} + x > 0. \\ &= \ln \frac{1}{2} + \ln(\sqrt{x^2 + 4} + x) + C && \ln ab = \ln a + \ln b \\ &= \ln(\sqrt{x^2 + 4} + x) + C. && \text{Absorb constant in } C. \end{aligned}$$

Solution 2: Using Theorem 7.19 of Section 7.7, we see that

$$\int \frac{dx}{\sqrt{x^2 + 4}} = \sinh^{-1} \frac{x}{2} + C.$$

By Theorem 7.17 of Section 7.7, we also know that

$$\sinh^{-1} \frac{x}{2} = \ln \left(\frac{x}{2} + \sqrt{\left(\frac{x}{2} \right)^2 + 1} \right) = \ln \left(\frac{1}{2} (\sqrt{x^2 + 4} + x) \right),$$

which leads to the same result as in Solution 1.

Solution 3: Yet another approach is to use the substitution $x = 2 \sinh t$, which implies that $dx = 2 \cosh t dt$ and

$$\sqrt{x^2 + 4} = \sqrt{4 \sinh^2 t + 4} = \sqrt{4(\sinh^2 t + 1)} = 2 \sqrt{\cosh^2 t} = 2 \cosh t.$$

The original integral now becomes

$$\int \frac{dx}{\sqrt{x^2 + 4}} = \int \frac{2 \cosh t}{2 \cosh t} dt = \int dt = t + C.$$

Because $x = 2 \sinh t$, we have $t = \sinh^{-1} \frac{x}{2}$, which, by Theorem 7.17, leads to the result found in Solution 2.

This example shows that some integrals may be evaluated by more than one method. With practice, you will learn to identify the best method for a given integral.

Related Exercises 44, 49 ◀

- Recall that to complete the square with $x^2 + bx + c$, you add and subtract $(b/2)^2$ to and from the expression, and then factor to form a perfect square. You could also make the single substitution $x + 2 = 3 \sec \theta$ in Example 6.

- The substitution $u = 3 \sec \theta$ can be rewritten as $\theta = \sec^{-1}(u/3)$. Because $u \geq 3$ in the integral $\int_3^6 \frac{\sqrt{u^2 - 9}}{u} du$, we have $0 \leq \theta < \frac{\pi}{2}$.

EXAMPLE 6 A secant substitution Evaluate $\int_1^4 \frac{\sqrt{x^2 + 4x - 5}}{x + 2} dx$.

SOLUTION This example illustrates a useful preliminary step first encountered in Section 8.1. The integrand does not contain any of the patterns in Table 8.4 that suggest a trigonometric substitution. Completing the square does, however, lead to one of those patterns. Noting that $x^2 + 4x - 5 = (x + 2)^2 - 9$, we change variables with $u = x + 2$ and write the integral as

$$\begin{aligned} \int_1^4 \frac{\sqrt{x^2 + 4x - 5}}{x + 2} dx &= \int_1^4 \frac{\sqrt{(x + 2)^2 - 9}}{x + 2} dx && \text{Complete the square.} \\ &= \int_3^6 \frac{\sqrt{u^2 - 9}}{u} du. && \begin{array}{l} u = x + 2, du = dx \\ \text{Change limits of integration.} \end{array} \end{aligned}$$

This new integral calls for the secant substitution $u = 3 \sec \theta$ (where $0 \leq \theta < \pi/2$), which implies that $du = 3 \sec \theta \tan \theta d\theta$ and $\sqrt{u^2 - 9} = 3 \tan \theta$. We also change the limits of integration: When $u = 3$, $\theta = 0$, and when $u = 6$, $\theta = \pi/3$. The complete integration can now be done:

$$\begin{aligned} \int_1^4 \frac{\sqrt{x^2 + 4x - 5}}{x + 2} dx &= \int_3^6 \frac{\sqrt{u^2 - 9}}{u} du && u = x + 2, du = dx \\ &= \int_0^{\pi/3} \frac{3 \tan \theta}{3 \sec \theta} 3 \sec \theta \tan \theta d\theta && u = 3 \sec \theta, du = 3 \sec \theta \tan \theta d\theta \\ &= 3 \int_0^{\pi/3} \tan^2 \theta d\theta && \text{Simplify.} \\ &= 3 \int_0^{\pi/3} (\sec^2 \theta - 1) d\theta && \tan^2 \theta = \sec^2 \theta - 1 \\ &= 3 (\tan \theta - \theta) \Big|_0^{\pi/3} && \text{Evaluate the integral.} \\ &= 3\sqrt{3} - \pi. && \text{Simplify.} \end{aligned}$$

45. $\int \frac{x^3}{(81-x^2)^2} dx$
47. $\int_{4/\sqrt{3}}^4 \frac{dx}{x^2(x^2-4)}$
49. $\int_0^{1/\sqrt{3}} \sqrt{x^2+1} dx$
51. $\int \frac{x^2}{\sqrt{4+x^2}} dx$

52. $\int \frac{\sqrt{4x^2-1}}{x^2} dx, x > \frac{1}{2}$

53. $\int \frac{\sqrt{9x^2-25}}{x^3} dx, x > \frac{5}{3}$

54. $\int \frac{y^4}{1+y^2} dy$

55. $\int \frac{dx}{x^3\sqrt{x^2-100}}, x > 10$

56. $\int \frac{x^3}{(x^2-16)^{3/2}} dx, x < -4$

57. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

a. If $x = 4 \tan \theta$, then $\csc \theta = 4/x$.

b. The integral $\int_1^2 \sqrt{1-x^2} dx$ does not have a finite real value.

c. The integral $\int_1^2 \sqrt{x^2-1} dx$ does not have a finite real value.

d. The integral $\int \frac{dx}{x^2+4x+9}$ cannot be evaluated using a trigonometric substitution.

58. **Area of an ellipse** The upper half of the ellipse centered at the origin with axes of length $2a$ and $2b$ is described by $y = \frac{b}{a} \sqrt{a^2 - x^2}$ (see figure). Find the area of the ellipse in terms of a and b .

59. **Area of a segment of a circle** Use two approaches to show that the area of a cap (or segment) of a circle of radius r subtended by an angle θ (see figure) is given by

$$A_{\text{seg}} = \frac{1}{2} r^2 (\theta - \sin \theta).$$

a. Find the area using geometry (no calculus).

b. Find the area using calculus.

60–69. **Completing the square** Evaluate the following integrals.

60. $\int \frac{dx}{x^2-6x+34}$

61. $\int \frac{dx}{\sqrt{3-2x-x^2}}$

62. $\int \frac{du}{2u^2-12u+36}$

63. $\int \frac{dx}{x^2+6x+18}$

64. $\int \frac{x^2-2x+1}{\sqrt{x^2-2x+10}} dx$

65. $\int_{1/2}^{(\sqrt{2}+3)/(2\sqrt{2})} \frac{dx}{8x^2-8x+11}$

$$66. \int_1^4 \frac{dt}{t^2 - 2t + 10}$$

$$67. \int \frac{x^2 - 8x + 16}{(9 + 8x - x^2)^{3/2}} dx$$

$$68. \int \frac{dx}{\sqrt{(x-1)(3-x)}}$$

$$69. \int_{2+\sqrt{2}}^4 \frac{dx}{\sqrt{(x-1)(x-3)}}$$

70–74. Using the integral of $\sec^3 u$ By reduction formula 4 in Section 8.3,

$$\int \sec^3 u \, du = \frac{1}{2}(\sec u \tan u + \ln |\sec u + \tan u|) + C.$$

Graph the following functions and find the area under the curve on the given interval.

$$70. f(x) = (4 + x^2)^{1/2}, [0, 2] \quad 71. f(x) = (9 - x^2)^{-2}, \left[0, \frac{3}{2}\right]$$

$$72. f(x) = (x^2 - 25)^{1/2}, [5, 10]$$

$$73. f(x) = \sqrt{x^2 - 9}/x, [3, 6]$$

$$74. f(x) = \frac{1}{x\sqrt{x^2 - 36}}, \left[\frac{12}{\sqrt{3}}, 12\right]$$

$$75. \text{ Find the area of the region bounded by the curve } f(x) = (16 + x^2)^{-3/2} \text{ and the } x\text{-axis on the interval } [0, 3].$$

Explorations and Challenges

76. Area and volume Consider the function $f(x) = (9 + x^2)^{-1/2}$ and the region R on the interval $[0, 4]$ (see figure).

- Find the area of R .
- Find the volume of the solid generated when R is revolved about the x -axis.
- Find the volume of the solid generated when R is revolved about the y -axis.

77. Arc length of a parabola Find the length of the curve $y = ax^2$ from $x = 0$ to $x = 10$, where $a > 0$ is a real number.

78. Computing areas On the interval $[0, 2]$, the graphs of $f(x) = x^2/3$ and $g(x) = x^2(9 - x^2)^{-1/2}$ have similar shapes.

- Find the area of the region bounded by the graph of f and the x -axis on the interval $[0, 2]$.
- Find the area of the region bounded by the graph of g and the x -axis on the interval $[0, 2]$.
- Which region has greater area?

79–80. Care with the secant substitution Recall that the substitution $x = a \sec \theta$ implies either $x \geq a$ (in which case $0 \leq \theta < \pi/2$ and $\tan \theta \geq 0$) or $x \leq -a$ (in which case $\pi/2 < \theta \leq \pi$ and $\tan \theta \leq 0$).

$$79. \text{ Show that } \int \frac{dx}{x\sqrt{x^2 - 1}} = \begin{cases} \sec^{-1} x + C & \text{if } x > 1 \\ -\sec^{-1} x + C & \text{if } x < -1. \end{cases}$$

80. Evaluate for $\int \frac{\sqrt{x^2 - 1}}{x^3} dx$, for $x > 1$ and for $x < -1$.

81. Electric field due to a line of charge A total charge of Q is distributed uniformly on a line segment of length $2L$ along the y -axis (see figure). The x -component of the electric field at a point $(a, 0)$ is given by

$$E_x(a) = \frac{kQa}{2L} \int_{-L}^L \frac{dy}{(a^2 + y^2)^{3/2}},$$

where k is a physical constant and $a > 0$.

$$\text{a. Confirm that } E_x(a) = \frac{kQ}{a\sqrt{a^2 + L^2}}.$$

b. Letting $\rho = Q/2L$ be the charge density on the line segment, show that if $L \rightarrow \infty$, then $E_x(a) = 2k\rho/a$.

(See the Guided Project *Electric field integrals* for a derivation of this and other similar integrals.)

82. Magnetic field due to current in a straight wire A long straight wire of length $2L$ on the y -axis carries a current I . According to the Biot-Savart Law, the magnitude of the magnetic field due to the current at a point $(a, 0)$ is given by

$$B(a) = \frac{\mu_0 I}{4\pi} \int_{-L}^L \frac{\sin \theta}{r^2} dy,$$

where μ_0 is a physical constant, $a > 0$, and θ , r , and y are related as shown in the figure.

a. Show that the magnitude of the magnetic field at $(a, 0)$ is

$$B(a) = \frac{\mu_0 I L}{2\pi a \sqrt{a^2 + L^2}}.$$

b. What is the magnitude of the magnetic field at $(a, 0)$ due to an infinitely long wire ($L \rightarrow \infty$)?

83. Visual proof Let $F(x) = \int_0^x \sqrt{a^2 - t^2} \, dt$. The figure shows that $F(x) = \text{area of sector } OAB + \text{area of triangle } OBC$.

a. Use the figure to prove that

$$F(x) = \frac{a^2 \sin^{-1}(x/a)}{2} + \frac{x\sqrt{a^2 - x^2}}{2}.$$

b. Conclude that

$$\int \sqrt{a^2 - x^2} dx = \frac{a^2 \sin^{-1}(x/a)}{2} + \frac{x\sqrt{a^2 - x^2}}{2} + C.$$

(Source: *The College Mathematics Journal*, 34, 3, May 2003)

- 84. Maximum path length of a projectile** (Adapted from Putnam Exam 1940) A projectile is launched from the ground with an initial speed V at an angle θ from the horizontal. Assume the x -axis is the horizontal ground and y is the height above the ground. Neglecting air resistance and letting g be the acceleration due to gravity, it can be shown that the trajectory of the projectile is given by

$$y = -\frac{1}{2} kx^2 + y_{\max}, \quad \text{where } k = \frac{g}{(V \cos \theta)^2}$$

$$\text{and } y_{\max} = \frac{(V \sin \theta)^2}{2g}$$

- Note that the high point of the trajectory occurs at $(0, y_{\max})$. If the projectile is on the ground at $(-a, 0)$ and $(a, 0)$, what is a ?
 - Show that the length of the trajectory (arc length) is $2 \int_0^a \sqrt{1 + k^2 x^2} dx$.
 - Evaluate the arc length integral and express your result in terms of V , g , and θ .
 - For a fixed value of V and g , show that the launch angle θ that maximizes the length of the trajectory satisfies $(\sin \theta) \ln(\sec \theta + \tan \theta) = 1$.
 - Use a graphing utility to approximate the optimal launch angle.
- 85. Fastest descent time** The cycloid is the curve traced by a point on the rim of a rolling wheel. Imagine a wire shaped like an inverted cycloid (see figure). A bead sliding down this wire without

friction has some remarkable properties. Among all wire shapes, the cycloid is the shape that produces the fastest descent time (see the Guided Project *The amazing cycloid* for more about the *brachistochrone property*). It can be shown that the descent time between any two points $0 \leq a < b \leq \pi$ on the curve is

$$\text{descent time} = \int_a^b \sqrt{\frac{1 - \cos t}{g(\cos a - \cos t)}} dt,$$

where g is the acceleration due to gravity, $t = 0$ corresponds to the top of the wire, and $t = \pi$ corresponds to the lowest point on the wire.

- Find the descent time on the interval $[a, b]$ by making the substitution $u = \cos t$.
- Show that when $b = \pi$, the descent time is the same for all values of a ; that is, the descent time to the bottom of the wire is the same for all starting points.

- 86. Clever substitution** Evaluate $\int \frac{dx}{1 + \sin x + \cos x}$ using the substitution $x = 2 \tan^{-1} \theta$. The identities $\sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2}$ and $\cos x = \cos^2 \frac{x}{2} - \sin^2 \frac{x}{2}$ are helpful.

QUICK CHECK ANSWERS

- Use $x = 3 \sin \theta$ to obtain $9 \cos^2 \theta$.
- (a) Use $x = 3 \tan \theta$; $\int 9 \tan^2 \theta \sec \theta d\theta$. (b) Use $x = 4 \sec \theta$; $\int 3 \sec \theta d\theta$.
- Let $x = a \tan \theta$, so that $dx = a \sec^2 \theta d\theta$. The new integral is $\int \frac{a \sec^2 \theta d\theta}{a^2(1 + \tan^2 \theta)} = \frac{1}{a} \int d\theta = \frac{1}{a} \theta + C = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$. ◀

8.5 Partial Fractions

Later in this chapter, we will see that finding the velocity of a skydiver requires evaluating an integral of the form $\int \frac{dv}{a - bv^2}$ and finding the population of a species that is limited in size involves an integral of the form $\int \frac{dP}{aP(1 - bP)}$, where a and b are constants in both cases. These integrals have the common feature that their integrands are rational functions. Similar integrals result from modeling mechanical and electrical networks. The goal of this section is to introduce the *method of partial fractions* for integrating rational functions. When combined with standard and trigonometric substitutions (Section 8.4), this method allows us (in principle) to integrate any rational function.

► Recall that a rational function has the form p/q , where p and q are polynomials.

Method of Partial Fractions

Given a function such as

$$f(x) = \frac{1}{x-2} + \frac{2}{x+4},$$

it is a straightforward task to find a common denominator and write the equivalent expression

$$f(x) = \frac{(x+4) + 2(x-2)}{(x-2)(x+4)} = \frac{3x}{(x-2)(x+4)} = \frac{3x}{x^2 + 2x - 8}.$$

The purpose of partial fractions is to reverse this process. Given a rational function that is difficult to integrate, the method of partial fractions produces an equivalent function that is much easier to integrate.

QUICK CHECK 1 Find an antiderivative of $f(x) = \frac{1}{x-2} + \frac{2}{x+4}$. ◀

Rational function	method of partial fractions	Partial fraction decomposition
$\frac{3x}{x^2 + 2x - 8}$	$\longrightarrow$	$\frac{1}{x-2} + \frac{2}{x+4}$
Difficult to integrate		Easy to integrate
$\int \frac{3x}{x^2 + 2x - 8} dx$		$\int \left(\frac{1}{x-2} + \frac{2}{x+4} \right) dx$

The Key Idea Working with the same function, $f(x) = \frac{3x}{(x-2)(x+4)}$, our objective is to write it in the form

$$\frac{A}{x-2} + \frac{B}{x+4},$$

where A and B are constants to be determined. This expression is called the **partial fraction decomposition** of the original function; in this case, it has two terms, one for each factor in the denominator of the original function.

The constants A and B are determined using the condition that the original function f and its partial fraction decomposition must be equal for all values of x in the domain of f ; that is,

$$\frac{3x}{(x-2)(x+4)} = \frac{A}{x-2} + \frac{B}{x+4}. \quad (1)$$

Multiplying both sides of equation (1) by $(x-2)(x+4)$ gives

$$3x = A(x+4) + B(x-2).$$

Collecting like powers of x results in

$$3x = (A+B)x + (4A-2B). \quad (2)$$

If equation (2) is to hold for all values of x , then

- the coefficients of x^1 on both sides of the equation must be equal, and
- the coefficients of x^0 (that is, the constants) on both sides of the equation must be equal.

$$3x + 0 = \underbrace{(A+B)}_{\text{coeff of } x^1}x + \underbrace{(4A-2B)}_{\text{coeff of } x^0}$$

These observations lead to two equations for A and B .

$$\text{Equate coefficients of } x^1: \quad 3 = A + B$$

$$\text{Equate coefficients of } x^0: \quad 0 = 4A - 2B$$

The first equation says that $A = 3 - B$. Substituting $A = 3 - B$ into the second equation gives the equation $0 = 4(3 - B) - 2B$. Solving for B , we find that $6B = 12$, or $B = 2$. The value of A now follows; we have $A = 3 - B = 1$.

► Notice that the numerator of the original rational function does not affect the form of the partial fraction decomposition. The constants A and B are called *undetermined coefficients*.

► This step requires that $x \neq 2$ and $x \neq -4$; both values are outside the domain of f .

Substituting these values of A and B into equation (1), the partial fraction decomposition is

$$\frac{3x}{(x-2)(x+4)} = \frac{1}{x-2} + \frac{2}{x+4}.$$

- Like an ordinary fraction, a rational function is said to be in **reduced form** if the numerator and denominator have no common factors, and it is said to be **proper** if the degree of the numerator is less than the degree of the denominator.

- For the sake of simplicity, the factors of the denominator q in Step 1 are written with a leading coefficient of 1. The same procedure may be applied to factors whose leading coefficients are not equal to 1 as long as no factor is a constant multiple of any other factor. For example, $(x+2)(2x+4) = 2(x+2)^2$ should be recognized as a repeated linear factor (p. 550), not two simple linear factors. See Example 2.

QUICK CHECK 2 If the denominator of a reduced proper rational function is $(x-1)(x+5)(x-10)$, what is the general form of its partial fraction decomposition? ◀

Simple Linear Factors

The previous calculation illustrates the method of partial fractions with **simple linear factors**, meaning the denominator of the original function consists only of linear factors of the form $(x-r)$, which appear to the first power and no higher power. Here is the general procedure for this case.

PROCEDURE Partial Fractions with Simple Linear Factors

Suppose $f(x) = p(x)/q(x)$, where p and q are polynomials with no common factors and with the degree of p less than the degree of q . Assume q is the product of simple linear factors. The partial fraction decomposition is obtained as follows.

Step 1. Factor the denominator q in the form $(x-r_1)(x-r_2)\cdots(x-r_n)$, where $r_1, \dots, r_n$ are distinct real numbers.

Step 2. Partial fraction decomposition Form the partial fraction decomposition by writing

$$\frac{p(x)}{q(x)} = \frac{A_1}{(x-r_1)} + \frac{A_2}{(x-r_2)} + \cdots + \frac{A_n}{(x-r_n)}.$$

Step 3. Clear denominators Multiply both sides of the equation in Step 2 by $q(x) = (x-r_1)(x-r_2)\cdots(x-r_n)$, which produces conditions for $A_1, \dots, A_n$.

Step 4. Solve for coefficients Equate like powers of x in Step 3 to solve for the undetermined coefficients $A_1, \dots, A_n$.

EXAMPLE 1 Integrating with partial fractions

a. Find the partial fraction decomposition for $f(x) = \frac{3x^2 + 7x - 2}{x^3 - x^2 - 2x}$.

b. Evaluate $\int f(x) dx$.

SOLUTION

a. The partial fraction decomposition is done in four steps.

Step 1: Factoring the denominator, we find that

$$x^3 - x^2 - 2x = x(x+1)(x-2),$$

in which only simple linear factors appear.

Step 2: The partial fraction decomposition has one term for each factor in the denominator:

$$\frac{3x^2 + 7x - 2}{x(x+1)(x-2)} = \frac{A}{x} + \frac{B}{x+1} + \frac{C}{x-2}. \quad (3)$$

The goal is to find the undetermined coefficients A , B , and C .

Step 3: We multiply both sides of equation (3) by $x(x+1)(x-2)$:

$$\begin{aligned} 3x^2 + 7x - 2 &= A(x+1)(x-2) + Bx(x-2) + Cx(x+1) \\ &= (A+B+C)x^2 + (-A-2B+C)x - 2A. \end{aligned}$$

- You can call the undetermined coefficients $A_1, A_2, A_3, \dots$ or $A, B, C, \dots$. The latter choice avoids subscripts.

Step 4: We now equate coefficients of x^2 , x^1 , and x^0 on both sides of the equation in Step 3.

$$\text{Equate coefficients of } x^2: \quad A + B + C = 3$$

$$\text{Equate coefficients of } x^1: \quad -A - 2B + C = 7$$

$$\text{Equate coefficients of } x^0: \quad -2A = -2$$

The third equation implies that $A = 1$, which is substituted into the first two equations to give

$$B + C = 2 \quad \text{and} \quad -2B + C = 8.$$

Solving for B and C , we conclude that $A = 1$, $B = -2$, and $C = 4$. Substituting the values of A , B , and C into equation (3), the partial fraction decomposition is

$$f(x) = \frac{1}{x} - \frac{2}{x+1} + \frac{4}{x-2}.$$

b. Integration is now straightforward:

$$\begin{aligned} \int \frac{3x^2 + 7x - 2}{x^3 - x^2 - 2x} dx &= \int \left(\frac{1}{x} - \frac{2}{x+1} + \frac{4}{x-2} \right) dx && \text{Partial fractions} \\ &= \ln |x| - 2 \ln |x+1| + 4 \ln |x-2| + K && \text{Integrate; arbitrary constant } K. \\ &= \ln \frac{|x|(x-2)^4}{(x+1)^2} + K. && \text{Properties of logarithms} \end{aligned}$$

Related Exercises 30, 35 ◀

A Shortcut (Convenient Values) Solving for more than three unknown coefficients in a partial fraction decomposition may be difficult. In the case of simple linear factors, a shortcut saves work. In Example 1, Step 3 led to the equation

$$3x^2 + 7x - 2 = A(x+1)(x-2) + Bx(x-2) + Cx(x+1).$$

Because this equation holds for *all* values of x , it must hold for any particular value of x . By choosing values of x judiciously, it is easy to solve for A , B , and C . For example, setting $x = 0$ in this equation results in $-2 = -2A$, or $A = 1$. Setting $x = -1$ results in $-6 = 3B$, or $B = -2$, and setting $x = 2$ results in $24 = 6C$, or $C = 4$. In each case, we choose a value of x that eliminates all but one term on the right side of the equation.

EXAMPLE 2 Using the shortcut

a. Find the partial fraction decomposition for $f(x) = \frac{9x^2 + 2x - 1}{(x-1)(2x^2 + 7x - 4)}$.

b. Evaluate $\int_2^{14} f(x) dx$.

SOLUTION

a. We use four steps to obtain the partial fraction decomposition.

Step 1: Factoring the denominator of f results in $(x-1)(2x-1)(x+4)$, so the integrand has three simple linear factors.

Step 2: We form the partial fraction decomposition with one term for each factor in the denominator:

$$\frac{9x^2 + 2x - 1}{(x-1)(2x-1)(x+4)} = \frac{A}{x-1} + \frac{B}{2x-1} + \frac{C}{x+4}. \quad (4)$$

The goal is to find the undetermined coefficients A , B , and C .

Step 3: We now multiply both sides of equation (4) by $(x-1)(2x-1)(x+4)$:

$$9x^2 + 2x - 1 = A(2x-1)(x+4) + B(x-1)(x+4) + C(x-1)(2x-1). \quad (5)$$

► In cases other than simple linear factors, the shortcut can be used to determine some, but not all the coefficients, which reduces the work required to find the remaining coefficients. A modified shortcut can be utilized to find all the coefficients; see the margin note next to Example 3.

Step 4: The shortcut is now used to determine A , B , and C . Substituting $x = 1$, $1/2$, and -4 in equation (5) allows us to solve directly for the coefficients:

$$\text{Letting } x = 1 \Rightarrow 10 = 5A + 0 \cdot B + 0 \cdot C \Rightarrow A = 2;$$

$$\text{Letting } x = 1/2 \Rightarrow 9/4 = 0 \cdot A - 9B/4 + 0 \cdot C \Rightarrow B = -1;$$

$$\text{Letting } x = -4 \Rightarrow 135 = 0 \cdot A + 0 \cdot B + 45C \Rightarrow C = 3.$$

Substituting the values of A , B , and C into equation (4) gives the partial fraction decomposition

$$f(x) = \frac{2}{x-1} - \frac{1}{2x-1} + \frac{3}{x+4}.$$

b. We now carry out the integration.

$$\begin{aligned} \int_2^{14} f(x) dx &= \int_2^{14} \left(\frac{2}{x-1} - \frac{1}{2x-1} + \frac{3}{x+4} \right) dx && \text{Partial fractions} \\ &= \left(2 \ln |x-1| - \frac{1}{2} \ln |2x-1| + 3 \ln |x+4| \right) \Big|_2^{14} && \text{Integrate;} \\ &= 2 \ln 13 - \frac{1}{2} \ln 27 + 3 \ln 18 - \left(2 \ln 1 - \frac{1}{2} \ln 3 + 3 \ln 6 \right) && u = 2x-1, \\ &= \ln 13^2 + \underbrace{\ln 18^3 - \ln 6^3}_{\ln 27} - \frac{1}{2} (\underbrace{\ln 27 - \ln 3}_{\ln 3}) && du = 2dx. \\ &= \ln 1521 \approx 7.327 && \text{Evaluate.} \end{aligned}$$

Log properties

Simplify.

Related Exercises 27–28 ◀

Repeated Linear Factors

► *Simple* means the factor is raised to the first power; *repeated* means the factor is raised to an integer power greater than 1.

The preceding discussion relies on the assumption that the denominator of the rational function can be factored into simple linear factors of the form $(x - r)$. But what about denominators such as $x^2(x - 3)$ or $(x + 2)^2(x - 4)^3$, in which linear factors are raised to integer powers greater than 1? In these cases we have *repeated linear factors*, and a modification to the previous procedure must be made.

Here is the modification: Suppose the factor $(x - r)^m$ appears in the denominator, where $m > 1$ is an integer. Then there must be a partial fraction for each power of $(x - r)$ up to and including the m th power. For example, if $x^2(x - 3)^4$ appears in the denominator, then the partial fraction decomposition includes the terms

$$\frac{A}{x} + \frac{B}{x^2} + \frac{C}{(x-3)} + \frac{D}{(x-3)^2} + \frac{E}{(x-3)^3} + \frac{F}{(x-3)^4}.$$

The rest of the partial fraction procedure remains the same, although the amount of work increases as the number of coefficients increases.

PROCEDURE Partial Fractions for Repeated Linear Factors

Suppose the repeated linear factor $(x - r)^m$ appears in the denominator of a proper rational function in reduced form. The partial fraction decomposition has a partial fraction for each power of $(x - r)$ up to and including the m th power; that is, the partial fraction decomposition contains the sum

$$\frac{A_1}{(x-r)} + \frac{A_2}{(x-r)^2} + \frac{A_3}{(x-r)^3} + \cdots + \frac{A_m}{(x-r)^m},$$

where $A_1, \dots, A_m$ are constants to be determined.

EXAMPLE 3 Integrating with repeated linear factors Evaluate $\int f(x) dx$, where

$$f(x) = \frac{5x^2 - 3x + 2}{x^3 - 2x^2}.$$

► Think of x^2 as the repeated linear factor $(x - 0)^2$.

SOLUTION The denominator factors as $x^3 - 2x^2 = x^2(x - 2)$, so it has one simple linear factor $(x - 2)$ and one repeated linear factor x^2 . The partial fraction decomposition has the form

$$\frac{5x^2 - 3x + 2}{x^2(x - 2)} = \frac{A}{x} + \frac{B}{x^2} + \frac{C}{(x - 2)}.$$

Multiplying both sides of the partial fraction decomposition by $x^2(x - 2)$, we find

$$\begin{aligned} 5x^2 - 3x + 2 &= Ax(x - 2) + B(x - 2) + Cx^2 \\ &= (A + C)x^2 + (-2A + B)x - 2B. \end{aligned}$$

The coefficients A , B , and C are determined by equating the coefficients of x^2 , x^1 , and x^0 .

$$\begin{aligned} \text{Equate coefficients of } x^2: & \quad A + C = 5 \\ \text{Equate coefficients of } x^1: & \quad -2A + B = -3 \\ \text{Equate coefficients of } x^0: & \quad -2B = 2 \end{aligned}$$

Solving these three equations in three unknowns results in the solution $A = 1$, $B = -1$, and $C = 4$. When A , B , and C are substituted, the partial fraction decomposition is

$$f(x) = \frac{1}{x} - \frac{1}{x^2} + \frac{4}{x - 2}.$$

Integration is now straightforward:

$$\begin{aligned} \int \frac{5x^2 - 3x + 2}{x^3 - 2x^2} dx &= \int \left(\frac{1}{x} - \frac{1}{x^2} + \frac{4}{x - 2} \right) dx && \text{Partial fractions} \\ &= \ln |x| + \frac{1}{x} + 4 \ln |x - 2| + K && \text{Integrate; arbitrary constant } K. \\ &= \frac{1}{x} + \ln (|x|(x - 2)^4) + K. && \text{Properties of logarithms} \end{aligned}$$

Related Exercises 40–41 ◀

► The shortcut can be used to obtain two of the three coefficients easily. Choosing $x = 0$ allows B to be determined. Choosing $x = 2$ determines C . To find A , any other value of x may be substituted.

QUICK CHECK 3 State the form of the partial fraction decomposition of the reduced proper rational function $p(x)/q(x)$ if $q(x) = x^2(x - 3)^2(x - 1)$. ◀

Irreducible Quadratic Factors

By the Fundamental Theorem of Algebra, we know that a polynomial with real-valued coefficients can be written as the product of linear factors of the form $x - r$ and *irreducible quadratic factors* of the form $ax^2 + bx + c$, where r , a , b , and c are real numbers. By irreducible, we mean that $ax^2 + bx + c$ cannot be factored over the real numbers. For example, the polynomial

$$x^9 + 4x^8 + 6x^7 + 34x^6 + 64x^5 - 84x^4 - 287x^3 - 500x^2 - 354x - 180$$

factors as

$$\underbrace{(x - 2)}_{\text{linear factor}} \underbrace{(x + 3)^2}_{\text{repeated linear factor}} \underbrace{(x^2 - 2x + 10)}_{\text{irreducible quadratic factor}} \underbrace{(x^2 + x + 1)^2}_{\text{repeated irreducible quadratic factor}}.$$

In this factored form, we see linear factors (simple and repeated) and irreducible quadratic factors (simple and repeated).

With irreducible quadratic factors, two cases must be considered: simple and repeated factors. Simple quadratic factors are examined in the following examples, and repeated quadratic factors (which generally involve long computations) are explored in the exercises.

► The quadratic $ax^2 + bx + c$ has no real roots and cannot be factored over the real numbers if $b^2 - 4ac < 0$.

PROCEDURE Partial Fractions with Simple Irreducible Quadratic Factors

Suppose a simple irreducible factor $ax^2 + bx + c$ appears in the denominator of a proper rational function in reduced form. The partial fraction decomposition contains a term of the form

$$\frac{Ax + B}{ax^2 + bx + c},$$

where A and B are unknown coefficients to be determined.

EXAMPLE 4 Setting up partial fractions Give the appropriate form of the partial fraction decomposition for the following functions.

a. $\frac{x^2 + 1}{x^4 - 4x^3 - 32x^2}$ b. $\frac{10}{(x - 2)^2(x^2 + 2x + 2)}$

SOLUTION

- a. The denominator factors as $x^2(x^2 - 4x - 32) = x^2(x - 8)(x + 4)$. Therefore, x is a repeated linear factor, and $(x - 8)$ and $(x + 4)$ are simple linear factors. The required form of the decomposition is

$$\frac{A}{x} + \frac{B}{x^2} + \frac{C}{x - 8} + \frac{D}{x + 4}.$$

We see that the factor $x^2 - 4x - 32$ is quadratic, but it can be factored as $(x - 8)(x + 4)$, so it is not irreducible.

- b. The denominator is already fully factored. The quadratic factor $x^2 + 2x + 2$ cannot be factored using real numbers; therefore, it is irreducible. The form of the decomposition is

$$\frac{A}{x - 2} + \frac{B}{(x - 2)^2} + \frac{Cx + D}{x^2 + 2x + 2}.$$

Related Exercises 8, 10 ◀

EXAMPLE 5 Integrating with quadratic factors Evaluate

$$\int \frac{7x^2 - 13x + 13}{(x - 2)(x^2 - 2x + 3)} dx.$$

SOLUTION Note that the quadratic factor is irreducible. The appropriate form of the partial fraction decomposition is

$$\frac{7x^2 - 13x + 13}{(x - 2)(x^2 - 2x + 3)} = \frac{A}{x - 2} + \frac{Bx + C}{x^2 - 2x + 3}.$$

Multiplying both sides of this equation by $(x - 2)(x^2 - 2x + 3)$ leads to

$$\begin{aligned} 7x^2 - 13x + 13 &= A(x^2 - 2x + 3) + (Bx + C)(x - 2) \\ &= (A + B)x^2 + (-2A - 2B + C)x + (3A - 2C). \end{aligned}$$

Equating coefficients of equal powers of x results in the equations

$$A + B = 7, \quad -2A - 2B + C = -13, \quad \text{and} \quad 3A - 2C = 13.$$

Solving this system of equations gives $A = 5$, $B = 2$, and $C = 1$; therefore, the original integral can be written as

$$\int \frac{7x^2 - 13x + 13}{(x - 2)(x^2 - 2x + 3)} dx = \int \frac{5}{x - 2} dx + \int \frac{2x + 1}{x^2 - 2x + 3} dx.$$

► In Example 4b, the factor $(x - 2)^2$ cannot be treated as an irreducible quadratic factor; it is a repeated linear factor.

Let's work on the second (more difficult) integral. The substitution $u = x^2 - 2x + 3$ would work if $du = (2x - 2) dx$ appeared in the numerator. For this reason, we write the numerator as $2x + 1 = (2x - 2) + 3$ and split the integral:

$$\int \frac{2x + 1}{x^2 - 2x + 3} dx = \int \frac{2x - 2}{x^2 - 2x + 3} dx + \int \frac{3}{x^2 - 2x + 3} dx.$$

Assembling all the pieces, we have

$$\begin{aligned} & \int \frac{7x^2 - 13x + 13}{(x - 2)(x^2 - 2x + 3)} dx \\ &= \int \frac{5}{x - 2} dx + \int \frac{2x - 2}{\underbrace{x^2 - 2x + 3}_{\text{let } u = x^2 - 2x + 3}} dx + \int \frac{3}{\underbrace{x^2 - 2x + 3}_{(x - 1)^2 + 2}} dx && \text{Complete the square in the third integral.} \\ &= 5 \ln |x - 2| + \ln |x^2 - 2x + 3| + \frac{3}{\sqrt{2}} \tan^{-1} \left(\frac{x - 1}{\sqrt{2}} \right) + K && \text{Integrate.} \\ &= \ln |(x - 2)^5 (x^2 - 2x + 3)| + \frac{3}{\sqrt{2}} \tan^{-1} \left(\frac{x - 1}{\sqrt{2}} \right) + K. && \text{Property of logarithms} \end{aligned}$$

To evaluate the last integral $\int \frac{3}{x^2 - 2x + 3} dx$, we completed the square in the denominator and used the substitution $u = x - 1$ to produce $3 \int \frac{du}{u^2 + 2}$, which is a standard form.

Related Exercises 53, 55 ◀

Long Division The preceding discussion of partial fraction decomposition assumes $f(x) = p(x)/q(x)$ is a proper rational function. If this is not the case and we are faced with an improper rational function f , we divide the denominator into the numerator and express f in two parts. One part will be a polynomial, and the other will be a proper rational function. For example, given the function

$$f(x) = \frac{2x^3 + 11x^2 + 28x + 33}{x^2 - x - 6},$$

we perform long division.

$$\begin{array}{r} 2x + 13 \\ x^2 - x - 6 \overline{) 2x^3 + 11x^2 + 28x + 33} \\ \underline{2x^3 - 2x^2 - 12x} \\ 13x^2 + 40x + 33 \\ \underline{13x^2 - 13x - 78} \\ 53x + 111 \end{array}$$

It follows that

$$f(x) = \underbrace{2x + 13}_{\substack{\text{polynomial;} \\ \text{easy to} \\ \text{integrate}}} + \frac{53x + 111}{x^2 - x - 6}.$$

apply partial fraction decomposition

The first piece is easily integrated, and the second piece now qualifies for the methods described in this section.

QUICK CHECK 4 What is the result of simplifying $\frac{x}{x + 1}$ by long division? ◀

SUMMARY Partial Fraction Decompositions

Let $f(x) = p(x)/q(x)$ be a proper rational function in reduced form. Assume the denominator q has been factored completely over the real numbers and m is a positive integer.

- 1. Simple linear factor** A factor $x - r$ in the denominator requires the partial

$$\text{fraction } \frac{A}{x - r}.$$

- 2. Repeated linear factor** A factor $(x - r)^m$ with $m > 1$ in the denominator requires the partial fractions

$$\frac{A_1}{(x - r)} + \frac{A_2}{(x - r)^2} + \frac{A_3}{(x - r)^3} + \cdots + \frac{A_m}{(x - r)^m}.$$

- 3. Simple irreducible quadratic factor** An irreducible factor $ax^2 + bx + c$ in the denominator requires the partial fraction

$$\frac{Ax + B}{ax^2 + bx + c}.$$

- 4. Repeated irreducible quadratic factor** (See Exercises 61–64.) An irreducible factor $(ax^2 + bx + c)^m$ with $m > 1$ in the denominator requires the partial fractions

$$\frac{A_1x + B_1}{ax^2 + bx + c} + \frac{A_2x + B_2}{(ax^2 + bx + c)^2} + \cdots + \frac{A_mx + B_m}{(ax^2 + bx + c)^m}.$$

SECTION 8.5 EXERCISES**Getting Started**

- What kinds of functions can be integrated using partial fraction decomposition?
- Give an example of each of the following.
 - A simple linear factor
 - A repeated linear factor
 - A simple irreducible quadratic factor
 - A repeated irreducible quadratic factor
- What term(s) should appear in the partial fraction decomposition of a proper rational function with each of the following?
 - A factor of $x - 3$ in the denominator
 - A factor of $(x - 4)^3$ in the denominator
 - A factor of $x^2 + 2x + 6$ in the denominator
- What is the first step in integrating $\frac{x^2 + 2x - 3}{x + 1}$?

5–16. Set up the appropriate form of the partial fraction decomposition for the following expressions. Do not find the values of the unknown constants.

5. $\frac{4x}{x^2 - 9x + 20}$

6. $\frac{4x + 1}{4x^2 - 1}$

7. $\frac{x + 3}{(x - 5)^2}$

8. $\frac{2}{x^3 - 2x^2 + x}$

9. $\frac{4}{x^5 - 5x^3 + 4x}$

10. $\frac{20x}{(x - 1)^2(x^2 + 1)}$

11. $\frac{1}{x(x^2 + 1)}$

12. $\frac{2x^2 + 3}{(x^2 - 8x + 16)(x^2 + 3x + 4)}$

13. $\frac{x^4 + 12x^2}{(x - 2)^2(x^2 + x + 2)^2}$

14. $\frac{6x^4 - 4x^3 + 15x^2 - 5x + 7}{(x - 2)(2x^2 + 3)^2}$

15. $\frac{x}{(x^4 - 16)^2}$

16. $\frac{x^2 + 2x + 6}{x^3(x^2 + x + 1)^2}$

Practice Exercises

17–22. Give the partial fraction decomposition for the following expressions.

17. $\frac{5x - 7}{x^2 - 3x + 2}$

18. $\frac{11x - 10}{x^2 - x}$

19. $\frac{6}{x^2 - 2x - 8}$

20. $\frac{x^2 - 4x + 11}{(x - 3)(x - 1)(x + 1)}$

21. $\frac{2x^2 + 5x + 6}{x^2 + 3x + 2}$ (Hint: Use long division first.)

22. $\frac{x^4 + 2x^3 + x}{x^2 - 1}$

23–64. Integration Evaluate the following integrals.

23. $\int \frac{3}{(x - 1)(x + 2)} dx$

24. $\int \frac{8}{(x - 2)(x + 6)} dx$

25. $\int \frac{6}{x^2 - 1} dx$

26. $\int_0^1 \frac{dt}{t^2 - 9}$

27. $\int \frac{8x - 5}{3x^2 - 5x + 2} dx$
29. $\int_{-1}^2 \frac{5x}{x^2 - x - 6} dx$
31. $\int \frac{6x^2}{x^4 - 5x^2 + 4} dx$
33. $\int \frac{3x^2 + 4x - 6}{x^2 - 3x + 2} dx$
35. $\int \frac{x^2 + 12x - 4}{x^3 - 4x} dx$
37. $\int \frac{dx}{x^4 - 10x^2 + 9}$
39. $\int \frac{81}{x^3 - 9x^2} dx$
41. $\int_{-1}^1 \frac{x}{(x + 3)^2} dx$
43. $\int \frac{2}{x^3 + x^2} dx$
45. $\int \frac{x - 5}{x^2(x + 1)} dx$
47. $\int \frac{x^3 - 10x^2 + 27x}{x^2 - 10x + 25} dx$
49. $\int \frac{x^2 - 4}{x^3 - 2x^2 + x} dx$
51. $\int \frac{x^2 + x + 2}{(x + 1)(x^2 + 1)} dx$
53. $\int \frac{2x^2 + 5x + 5}{(x + 1)(x^2 + 2x + 2)} dx$
55. $\int \frac{20x}{(x - 1)(x^2 + 4x + 5)} dx$
57. $\int \frac{x^3 + 5x}{(x^2 + 3)^2} dx$
59. $\int \frac{x^3 + 6x^2 + 12x + 6}{(x^2 + 6x + 10)^2} dx$
61. $\int \frac{2}{x(x^2 + 1)^2} dx$
63. $\int \frac{9x^2 + x + 21}{(3x^2 + 7)^2} dx$
28. $\int_1^2 \frac{7x - 2}{3x^2 - 2x} dx$
30. $\int \frac{21x^2}{x^3 - x^2 - 12x} dx$
32. $\int \frac{4x - 2}{x^3 - x} dx$
34. $\int \frac{2z^3 + z^2 - 6z + 7}{z^2 + z - 6} dz$
36. $\int \frac{z^2 + 20z - 15}{z^3 + 4z^2 - 5z} dz$
38. $\int_0^5 \frac{2}{x^2 - 4x - 32} dx$
40. $\int \frac{16x^2}{(x - 6)(x + 2)^2} dx$
42. $\int \frac{dx}{x^3 - 2x^2 - 4x + 8}$
44. $\int_1^2 \frac{2}{t^3(t + 1)} dt$
46. $\int \frac{x^2}{(x - 2)^3} dx$
48. $\int \frac{x^3 + 2}{x^3 - 2x^2 + x} dx$
50. $\int \frac{8(x^2 + 4)}{x(x^2 + 8)} dx$
52. $\int \frac{x^2 + 3x + 2}{x(x^2 + 2x + 2)} dx$
54. $\int \frac{z + 1}{z(z^2 + 4)} dz$
56. $\int \frac{2x + 1}{x^2 + 4} dx$
58. $\int \frac{x^4 + 1}{x^3 + 9x} dx$
60. $\int \frac{dy}{(y^2 + 1)(y^2 + 2)}$
62. $\int \frac{dx}{(x + 1)(x^2 + 2x + 2)^2}$
64. $\int \frac{9x^5 + 6x^3}{(3x^2 + 1)^3} dx$

65. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- a. To evaluate $\int \frac{4x^6}{x^4 + 3x^2} dx$, the first step is to find the partial fraction decomposition of the integrand.
- b. The easiest way to evaluate $\int \frac{6x + 1}{3x^2 + x} dx$ is with a partial fraction decomposition of the integrand.

- c. The rational function $f(x) = \frac{1}{x^2 - 13x + 42}$ has an irreducible quadratic denominator.
- d. The rational function $f(x) = \frac{1}{x^2 - 13x + 43}$ has an irreducible quadratic denominator.

66–68. Areas of regions Find the area of the following regions.

66. The region bounded by the curve $y = \frac{x - x^2}{(x + 1)(x^2 + 1)}$ and the x -axis from $x = 0$ to $x = 1$
67. The region bounded by the curve $y = \frac{10}{x^2 - 2x - 24}$, the x -axis, and the lines $x = -2$ and $x = 2$
68. The region in the first quadrant bounded by the curves $y = \frac{3x^2 + 2x + 1}{x(x^2 + x + 1)}$, $y = \frac{2}{x}$, and $x = 2$

69–72. Volumes of solids Find the volume of the following solids.

69. The region bounded by $y = \frac{x}{x + 1}$, the x -axis, and $x = 4$ is revolved about the x -axis.
70. The region bounded by $y = \frac{1}{x^2(x^2 + 2)^2}$, $y = 0$, $x = 1$, and $x = 2$ is revolved about the y -axis.
71. The region bounded by $y = \frac{1}{\sqrt{x(3 - x)}}$, $y = 0$, $x = 1$, and $x = 2$ is revolved about the x -axis.
72. The region bounded by $y = \frac{3x^2 + 25}{x^2(x^2 + 25)}$, $y = 0$, $x = 5$, and $x = 10$ is revolved about the y -axis.
73. **Two methods** Evaluate $\int \frac{dx}{x^2 - 1}$, for $x > 1$, in two ways: using partial fractions and a trigonometric substitution. Reconcile your two answers.

74–75. Finding constants with a computer algebra system Give the appropriate form of the partial fraction decomposition of the expression, and then use a computer algebra system to find the unknown constants.

74. $\frac{3x^2 + 2x + 1}{(x + 1)^3(x^2 + x + 1)^2}$ 75. $\frac{x^4 + 3x^2 + 1}{x(x^2 + 1)^2(x^2 + x + 4)^2}$

76–83. Preliminary steps The following integrals require a preliminary step such as a change of variables before using the method of partial fractions. Evaluate these integrals.

76. $\int \frac{\cos \theta}{(\sin^3 \theta - 4 \sin \theta)} d\theta$ 77. $\int \frac{e^x}{(e^x - 1)(e^x + 2)} dx$
78. $\int \frac{dy}{y(\sqrt{a} - \sqrt{y})}$, $a > 0$ (Hint: Let $u = \sqrt{y}$.)
79. $\int \frac{\sec t}{1 + \sin t} dt$
80. $\int \sqrt{e^x + 1} dx$ (Hint: Let $u = \sqrt{e^x + 1}$.)
81. $\int \frac{(e^{3x} + e^{2x} + e^x)}{(e^{2x} + 1)^2} dx$ 82. $\int \frac{dx}{x\sqrt{1 + 2x}}$

83. $\int \frac{dx}{1 + e^x}$

84. **What's wrong?** Why are there no constants A and B satisfying

$$\frac{x^2}{(x-4)(x+5)} = \frac{A}{x-4} + \frac{B}{x+5}?$$

85. **Another form of $\int \sec x \, dx$**

a. Verify the identity $\sec x = \frac{\cos x}{1 - \sin^2 x}$.

b. Use the identity in part (a) to verify that

$$\int \sec x \, dx = \frac{1}{2} \ln \left| \frac{1 + \sin x}{1 - \sin x} \right| + C.$$

(Source: *The College Mathematics Journal*, 32, 5, Nov 2001)

Explorations and Challenges

86. **Partial fractions from an integral** A computer algebra system was used to obtain the following result.

$$\begin{aligned} \int \frac{2x^4 + 14x^3 + 14x^2 + 51x + 19}{x^5 + x^4 + 3x^3 + 3x^2 - 4x - 4} dx \\ = 5 \ln(x-1) - 3 \ln(x+1) - \frac{3}{x+1} + \frac{1}{2} \tan^{-1} \frac{x}{2} + C \end{aligned}$$

Use this fact to find the partial fraction decomposition of the integrand on the left side of the equation.

87–92. *An integrand with trigonometric functions in the numerator and denominator can often be converted to a rational function using the substitution $u = \tan(x/2)$ or, equivalently, $x = 2 \tan^{-1} u$. The following relations are used in making this change of variables.*

$$A: dx = \frac{2}{1+u^2} du \quad B: \sin x = \frac{2u}{1+u^2} \quad C: \cos x = \frac{1-u^2}{1+u^2}$$

87. Verify relation A by differentiating $x = 2 \tan^{-1} u$. Verify relations B and C using a right-triangle diagram and the double-angle formulas

$$\sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2} \quad \text{and} \quad \cos x = 2 \cos^2 \frac{x}{2} - 1.$$

88. Evaluate $\int \frac{dx}{2 + \cos x}$. 89. Evaluate $\int \frac{dx}{1 - \cos x}$.

90. Evaluate $\int \frac{dx}{1 + \sin x + \cos x}$.

91. Evaluate $\int_0^{\pi/2} \frac{d\theta}{\cos \theta + \sin \theta}$. 92. Evaluate $\int_0^{\pi/3} \frac{\sin \theta}{1 - \sin \theta} d\theta$.

93. **Three start-ups** Three cars, A, B, and C, start from rest and accelerate along a line according to the following velocity functions:

$$v_A(t) = \frac{88t}{t+1}, \quad v_B(t) = \frac{88t^2}{(t+1)^2}, \quad \text{and} \quad v_C(t) = \frac{88t^2}{t^2+1}.$$

- Which car travels farthest on the interval $0 \leq t \leq 1$?
- Which car travels farthest on the interval $0 \leq t \leq 5$?
- Find the position functions for each car assuming each car starts at the origin.
- Which car ultimately gains the lead and remains in front?

94. **Skydiving** A skydiver has a downward velocity given by

$$v(t) = V_T \left(\frac{1 - e^{-2gt/V_T}}{1 + e^{-2gt/V_T}} \right),$$

where $t = 0$ is the instant the skydiver starts falling, $g = 9.8 \, \text{m/s}^2$ is the acceleration due to gravity, and V_T is the terminal velocity of the skydiver.

- Evaluate $v(0)$ and $\lim_{t \rightarrow \infty} v(t)$ and interpret these results.
- Graph the velocity function.
- Verify by integration that the position function is given by

$$s(t) = V_T t + \frac{V_T^2}{g} \ln \left(\frac{1 + e^{-2gt/V_T}}{2} \right),$$

where $s'(t) = v(t)$ and $s(0) = 0$.

d. Graph the position function.

(See the Guided Project *Terminal velocity* for more details on free fall and terminal velocity.)

95. **$\pi < 22/7$** One of the earliest approximations to π is $22/7$. Verify that $0 < \int_0^1 \frac{x^4(1-x)^4}{1+x^2} dx = \frac{22}{7} - \pi$. Why can you conclude that $\pi < 22/7$?
96. **Challenge** Show that with the change of variables $u = \sqrt{\tan x}$, the integral $\int \sqrt{\tan x} \, dx$ can be converted to an integral amenable to partial fractions. Evaluate $\int_0^{\pi/4} \sqrt{\tan x} \, dx$.

QUICK CHECK ANSWERS

- $\ln|x-2| + 2 \ln|x+4| = \ln|(x-2)(x+4)^2|$
- $A/(x-1) + B/(x+5) + C/(x-10)$
- $A/x + B/x^2 + C/(x-3) + D/(x-3)^2 + E/(x-1)$
- $1 - \frac{1}{x+1} \leftarrow$

8.6 Integration Strategies

In the previous five sections, we introduced various methods for evaluating integrals, though always in the context of learning a specific technique of integration. For instance, in Section 8.3, we focused on integrals involving trigonometric functions. In this section, the chief goal is to illustrate how to attack a generic integration problem when the appropriate method is not obvious.

Integration Strategies

As a starting point, we assume you know all the integrals listed in Table 8.1 at the beginning of this chapter, and that you are familiar with the reduction formulas presented in

Sections 8.2 and 8.3. Your instructor may also require that you know the formulas presented in Section 7.7 that involve hyperbolic functions.

We noted in Section 5.5 that computing the derivative of a (differentiable) function usually requires only the proper application of the derivative rules from Chapter 3. Finding the antiderivative of a function is, generally speaking, more difficult. In what follows, we offer a collection of strategies to use when confronted with an unfamiliar integral, illustrated with brief examples.

Rewrite the integrand Several techniques can be used to transform an integrand. We can split up fractions, use long division or trigonometric identities, complete the square in an integrand that includes a quadratic function, perform algebraic manipulations (such as multiplying numerator and denominator by the same expression), and cancel common factors.

EXAMPLE 1 Rewrite the integrand Evaluate $\int \frac{\sin x + 1}{\cos^2 x} dx$.

SOLUTION Split the fraction and use trigonometric identities to rewrite the integral as the sum of two integrals:

$$\int \frac{\sin x + 1}{\cos^2 x} dx = \int \left(\frac{1}{\cos x} \cdot \frac{\sin x}{\cos x} + \frac{1}{\cos^2 x} \right) dx = \int \sec x \tan x dx + \int \sec^2 x dx.$$

Both integrals on the right are now easily integrated using Table 8.1.

Related Exercises 4, 11 ◀

QUICK CHECK 1 Use Table 8.1 (p. 520) to complete the process of evaluating $\int \frac{\sin x + 1}{\cos^2 x} dx$ given in Example 1. ◀

Try substitution As a general rule, if an integrand contains the function $f(x)$ and its derivative $f'(x)$, the substitution $u = f(x)$ often results in an easier integral. For instance,

$\int \frac{\sin(1/x)}{x^2} dx$ suggests the substitution $u = 1/x$ because $\frac{du}{dx} = -\frac{1}{x^2}$ appears in the integrand (up to a constant multiplicative factor). When attempting to evaluate an integral using the substitution method, it is important to understand that there is no list of “rules” one must follow—any substitution is fair game. On occasion, a creative substitution does the trick.

QUICK CHECK 2 Use the substitution $u = \frac{1}{x}$ to evaluate $\int \frac{\sin(1/x)}{x^2} dx$. ◀

EXAMPLE 2 Substitution after rewriting the integrand Evaluate $\int \frac{x^2}{\sqrt{4 - x^6}} dx$.

SOLUTION Expressing the denominator of the integrand as $\sqrt{4 - (x^3)^2}$ looks promising, particularly because a constant multiple of the derivative of x^3 appears in the numerator. Therefore, we try the substitution $u = x^3$:

$$\int \frac{x^2}{\sqrt{4 - x^6}} dx = \int \frac{x^2}{\sqrt{4 - (x^3)^2}} dx = \frac{1}{3} \int \frac{du}{\sqrt{4 - u^2}}. \quad \text{Let } u = x^3; du = 3x^2 dx.$$

Observe that $\int \frac{du}{\sqrt{4 - u^2}}$ is a standard integral, found in Table 8.1.

Related Exercises 14, 43 ◀

QUICK CHECK 3 Complete the evaluation of $\int \frac{x^2}{\sqrt{4 - x^6}} dx$ in Example 2; make sure to express your answer in terms of x . ◀

Recognize a common pattern present in the integrand Here we list certain patterns to look for in the integrand and the associated integration techniques.

1. Integrating the product of two functions often calls for integration by parts (Section 8.2), particularly if the factors of the product are a polynomial and a transcendental function (a logarithmic, exponential, trigonometric, or inverse trigonometric function). In some cases, integration by parts is successful when the integrand is a single function (for example, $\int \ln x dx$ or $\int \sin^{-1} x dx$).
2. Powers and products of $\sin x$ and $\cos x$, $\tan x$ and $\sec x$, or $\cot x$ and $\csc x$ are integrated using identities, reduction formulas, or the substitutions given in Tables 8.2 and 8.3 of Section 8.3.

3. Integrals containing the expression $a^2 - x^2$, $a^2 + x^2$, or $x^2 - a^2$ may yield to trigonometric substitution. Use the substitutions given in Table 8.4 of Section 8.4 to tackle such integrals, but don't overlook a simpler solution. For example, $\int \frac{x}{1-x^2} dx$ is most easily evaluated using the substitution $u = 1 - x^2$ rather than $x = \sin \theta$.
4. Use partial fraction decomposition (Section 8.5) to integrate rational functions. Remember to first cancel common factors and to apply long division if the rational function is not proper.

EXAMPLE 3 Identify a strategy Suggest a technique of integration for each of the following integrals based on patterns in the integrand.

a. $\int \frac{4 - 3x^2}{x(x^2 - 4)} dx$ b. $\int x e^{\sqrt{1+x^2}} dx$ c. $\int \ln(1 + x^2) dx$

SOLUTION

- a. The integrand is a rational function whose denominator factors easily, so partial fraction decomposition is an obvious choice. However, it is worth considering other options that may save time. Expanding the denominator, we recognize the integral admits an almost perfect u -substitution:

$$\int \frac{4 - 3x^2}{x(x^2 - 4)} dx = \int \frac{4 - 3x^2}{x^3 - 4x} dx. \quad \begin{array}{l} \text{Let } u = x^3 - 4x; du = (3x^2 - 4) dx, \\ \text{or } -du = (4 - 3x^2) dx. \end{array}$$

This substitution leads to $-\int \frac{du}{u}$, which is a standard integral.

- b. The integrand suggests several techniques. The substitution $u = 1 + x^2$ looks promising given that $du/dx = 2x$ appears in the integrand (up to a constant multiple). This choice leads to $\frac{1}{2} \int e^{\sqrt{u}} du$, which requires a crafty substitution followed by integration by parts.

Given that the integrand is a product of two functions, we might try integration by parts as a first step. We leave it to the reader to conclude that this path is not fruitful.

Finally, the presence of $1 + x^2$ in the integrand suggests the substitution $x = \tan \theta$. This choice leads to

$$\begin{aligned} \int x e^{\sqrt{1+x^2}} dx &= \int \tan \theta \cdot e^{\sqrt{1+\tan^2 \theta}} \sec^2 \theta d\theta && x = \tan \theta, dx = \sec^2 \theta d\theta \\ &= \int \sec \theta \cdot e^{\sec \theta} \sec \theta \tan \theta d\theta && \text{Rewrite the integrand to prepare for a substitution.} \\ &= \int u e^u du. && \text{Let } u = \sec \theta; du = \sec \theta \tan \theta d\theta. \end{aligned}$$

We encountered the last integral in Example 1 of Section 8.2 and evaluated it using integration by parts.

- c. Because $1 + x^2$ is present in the integrand, we could try the substitution $x = \tan \theta$, which yields $\int \ln(\sec^2 \theta) \sec^2 \theta d\theta$. Using integration by parts on this new integral eventually leads to the answer, but it is more efficient to use integration by parts from the beginning. We try the following choices for u and dv .

$u = \ln(1 + x^2)$	$dv = dx$
$du = \frac{2x}{1 + x^2} dx$	$v = x$

The integral then becomes

$$\int \ln(1 + x^2) dx = x \ln(1 + x^2) - 2 \int \frac{x^2}{1 + x^2} dx,$$

and the new integral is handled with long division followed by routine integration.

Related Exercises 55, 70, 96 ◀

► The substitution $u = \sqrt{1 + x^2}$ is yet another option for the integral in Example 3b; this choice leads immediately (though not transparently) to $\int u e^u du$. It takes a lot of practice to find creative solutions such as this one.

The integrals in Example 3 bring to light two important concepts. First, recognize that more than one technique may work for a given integral. In practice, one method is usually more efficient than the others, so be ready to try another method if your first choice does not work. Second, to determine which choice is best, you may need to carry out the first few steps of several techniques in order to recognize the best approach.

Be persistent Be prepared to experience dead ends when attempting to evaluate an integral. Look again at the integral given in Example 1. Instead of splitting the fraction, suppose we used the identity $\cos^2 x = 1 - \sin^2 x$:

$$\int \frac{\sin x + 1}{\cos^2 x} dx = \int \frac{\sin x + 1}{1 - \sin^2 x} dx = \int \frac{\sin x + 1}{(1 + \sin x)(1 - \sin x)} dx = \int \frac{1}{1 - \sin x} dx.$$

No error has been committed in the previous calculation, but the final integral is not easily integrated in its present form. In situations such as this one, start again using a different approach.

EXAMPLE 4 Integration by parts? Evaluate $\int xe^{\sqrt{x}} dx$.

SOLUTION The integrand is the product of a power of x and a transcendental function; integrals of this form often yield to integration by parts. We try the following choices for u and dv .

$u = e^{\sqrt{x}}$	$dv = x dx$
$du = \frac{e^{\sqrt{x}}}{2\sqrt{x}} dx$	$v = \frac{x^2}{2}$

The integral then becomes

$$\int xe^{\sqrt{x}} dx = \frac{x^2 e^{\sqrt{x}}}{2} - \frac{1}{4} \int x^{3/2} e^{\sqrt{x}} dx.$$

► The integral that results in Example 4 when applying integration by parts, $\int x^{3/2} e^{\sqrt{x}} dx$, can be evaluated. For instance, the substitution $u = e^{\sqrt{x}}$ leads to $2 \int \ln^4 u du$, and the substitution $u = \sqrt{x}$ leads to $2 \int u^4 e^u du$, both of which can be handled by reduction formulas given in the exercise set of Section 8.2. However, the second solution, using the substitution $u = \sqrt{x}$, is more efficient.

The new integral appears to be more difficult than the original. Because integration by parts was not successful, we return to the original integral. Let's try the substitution $u = \sqrt{x}$, which implies that $du = \frac{1}{2\sqrt{x}} dx$. At this point, there are two paths we might follow.

Option 1: Our substitution would succeed if $2\sqrt{x}$ appeared in the denominator of the integrand. Using the technique of multiplication by 1, we multiply the numerator and denominator of the integrand by $2\sqrt{x}$ to prepare for the substitution:

$$\begin{aligned} \int xe^{\sqrt{x}} dx &= \int \frac{2\sqrt{x} \cdot xe^{\sqrt{x}}}{2\sqrt{x}} dx && \text{Multiply by 1.} \\ &= 2 \int u^3 e^u du. && u = \sqrt{x}; du = \frac{dx}{2\sqrt{x}}; \sqrt{x} \cdot x = (\sqrt{x})^3 = u^3 \end{aligned}$$

Option 2: Because $u = \sqrt{x}$, we have $x = u^2$, which implies that $dx = 2u du$. Making these substitutions in the integral leads to

$$\begin{aligned} \int xe^{\sqrt{x}} dx &= \int u^2 e^u \cdot 2u du && u = \sqrt{x}; x = u^2; dx = 2u du \\ &= 2 \int u^3 e^u du. && \text{Simplify.} \end{aligned}$$

In both cases we arrive at the same integral, $2 \int u^3 e^u du$, which is handled by applying repeated integration by parts (see tabular integration, Exercises 77–79, Section 8.2) or by using a reduction formula (Exercise 50, Section 8.2).

Related Exercise 98 ◀

Multiple techniques More than one technique may be necessary for complicated integrals. We conclude this section with a full evaluation of an integral that requires several techniques of integration.

EXAMPLE 5 Multiple techniques needed Find the area of the surface of revolution that results when the curve $f(x) = e^x$ on $[0, \ln 2]$ is revolved about the x -axis.

SOLUTION Recall from Section 6.6 that the integral $\int_a^b 2\pi f(x) \sqrt{1 + f'(x)^2} dx$ gives the area of the surface generated when $y = f(x)$ on $[a, b]$ is revolved about the x -axis. Because $f'(x) = e^x$, the area of the surface is

$$\int_0^{\ln 2} 2\pi e^x \sqrt{1 + (e^x)^2} dx.$$

The presence of e^x and its derivative in the integrand suggests the substitution $u = e^x$:

$$\int_0^{\ln 2} 2\pi e^x \sqrt{1 + (e^x)^2} dx = 2\pi \int_1^2 \sqrt{1 + u^2} du \quad \begin{array}{l} u = e^x; du = e^x dx \\ x = 0 \Rightarrow u = 1; x = \ln 2 \Rightarrow u = 2 \end{array}$$

The new integrand contains $1 + u^2$, so we try the trigonometric substitution $u = \tan \theta$. Setting the definite integral aside for the moment, we first focus on evaluating the indefinite integral:

$$\begin{aligned} 2\pi \int \sqrt{1 + u^2} du &= 2\pi \int \sqrt{1 + \tan^2 \theta} \sec^2 \theta d\theta && \text{Let } u = \tan \theta; du = \sec^2 \theta d\theta. \\ &= 2\pi \int \sec^3 \theta d\theta. && 1 + \tan^2 \theta = \sec^2 \theta \end{aligned}$$

To complete the solution, we rely on the secant reduction formula from Section 8.3 and return to the variable u :

$$\begin{aligned} 2\pi \int \sec^3 \theta d\theta &= 2\pi \left(\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \int \sec \theta d\theta \right) && \text{Secant reduction formula} \\ &= \pi (\sec \theta \tan \theta + \ln |\sec \theta + \tan \theta|) + C && \text{Evaluate } \int \sec \theta d\theta. \\ &= \pi (u \sqrt{1 + u^2} + \ln |u + \sqrt{1 + u^2}|) + C. && \tan \theta = u; \sec \theta = \sqrt{1 + u^2} \end{aligned}$$

Evaluating the antiderivative using limits of integration from the integral in u gives the area of the surface:

$$\begin{aligned} \text{Area} &= \pi \left(u \sqrt{1 + u^2} + \ln(u + \sqrt{1 + u^2}) \right) \Big|_1^2 \\ &= \pi \left(2\sqrt{5} - \sqrt{2} + \ln \frac{2 + \sqrt{5}}{1 + \sqrt{2}} \right) \approx 11.37. \end{aligned}$$

Related Exercise 87 ◀

SECTION 8.6 EXERCISES

Getting Started

1–6. Choosing an integration strategy Identify a technique of integration for evaluating the following integrals. If necessary, explain how to first simplify the integrand before applying the suggested technique of integration. You do not need to evaluate the integrals.

- $\int 4x \sin 5x dx$
- $\int (1 + \tan x) \sec^2 x dx$
- $\int \frac{x^3}{\sqrt{64 - x^2}} dx$
- $\int \frac{\tan^2 x + 1}{\tan x} dx$
- $\int \frac{5x^2 + 18x + 20}{(2x + 3)(x^2 + 4x + 8)} dx$
- $\int \frac{\cos^5 x \sin^4 x}{1 - \sin^2 x} dx$

Practice Exercises

7–84. Evaluate the following integrals.

- $\int_0^{\pi/2} \frac{\sin \theta}{1 + \cos^2 \theta} d\theta$
- $\int \cos^2 10x dx$
- $\int_4^6 \frac{dx}{\sqrt{8x - x^2}}$
- $\int \sin^9 x \cos^3 x dx$
- $\int_0^{\pi/4} (\sec x - \cos x)^2 dx$
- $\int \frac{e^x}{\sqrt{1 - e^{2x}}} dx$
- $\int \frac{dx}{e^x \sqrt{1 - e^{2x}}}$
- $\int \frac{x^{-2} + x^{-3}}{x^{-1} + 16x^{-3}} dx$
- $\int_1^4 \frac{2\sqrt{x}}{\sqrt{x}} dx$
- $\int \frac{dx}{x^4 - 1}$

17. $\int_1^2 w^3 e^{w^2} dw$
18. $\int_5^6 x(x-5)^{10} dx$
19. $\int_0^{\pi/2} \sin^7 x dx$
20. $\int_1^3 \frac{dt}{\sqrt{t}(t+1)}$
21. $\int x^9 \ln 3x dx$
22. $\int \frac{dx}{(x-a)(x-b)}, a \neq b$
23. $\int \frac{\sin x}{\cos^2 x + \cos x} dx$
24. $\int \frac{3w^5 + 2w^4 - 12w^3 - 12w - 32}{w^3 - 4w} dw$
25. $\int \frac{dx}{x\sqrt{1-x^2}}$
26. $\int_{1/e}^1 \frac{dx}{x(\ln^2 x + 2 \ln x + 2)}$
27. $\int \sin^4 \frac{x}{2} dx$
28. $\int \frac{3x^2 + 2x + 3}{x^4 + 2x^2 + 1} dx$
29. $\int \frac{2 \cos x + \cot x}{1 + \sin x} dx$
30. $\int_{5/2}^{5\sqrt{3}/2} \frac{dv}{v^2 \sqrt{25 - v^2}}$
31. $\int \sqrt{36 - 9x^2} dx$
32. $\int \frac{dx}{\sqrt{36x^2 - 25}}, x > 5/6$
33. $\int \frac{e^x}{a^2 + e^{2x}} dx, a \neq 0$
34. $\int_0^{\pi/9} \frac{\sin 3x}{\cos 3x + 1} dx$
35. $\int_0^{\pi/4} (\tan^2 \theta + \tan \theta + 1) \sec^2 \theta d\theta$
36. $\int x 10^x dx$
37. $\int_0^{\pi/6} \frac{dx}{1 - \sin 2x}$
38. $\int_{\pi/6}^{\pi/2} \cos x \ln(\sin x) dx$
39. $\int \sin x \ln(\sin x) dx$
40. $\int \sin 2x \ln(\sin x) dx$
41. $\int \cot^{3/2} x \csc^4 x dx$
42. $\int_0^{1/2} \frac{\sin^{-1} x}{\sqrt{1-x^2}} dx$
43. $\int \frac{x^9}{\sqrt{1-x^{20}}} dx$
44. $\int \frac{dx}{x^3 - x^2}$
45. $\int_0^{\ln 2} \frac{1}{(1 + e^x)^2} dx$
46. $\int \frac{dx}{e^{2x} + 1}$
47. $\int \frac{2x^3 + x^2 - 2x - 4}{x^2 - x - 2} dx$
48. $\int \frac{\sqrt{16 - x^2}}{x^2} dx$
49. $\int \tan^3 x \sec^9 x dx$
50. $\int \tan^7 x \sec^4 x dx$
51. $\int_0^{\pi/3} \tan x \sec^{7/4} x dx$
52. $\int t^2 e^{3t} dt$
53. $\int e^x \cot^3 e^x dx$
54. $\int \frac{2x^2 + 3x + 26}{(x-2)(x^2 + 16)} dx$
55. $\int \frac{3x^2 + 3x + 1}{x^3 + x} dx$
56. $\int_{\pi}^{3\pi/2} \sin 2x e^{\sin^2 x} dx$
57. $\int \sin \sqrt{x} dx$
58. $\int w^2 \tan^{-1} w dw$
59. $\int \frac{dx}{x^4 + x^2}$
60. $\int_0^{\pi/2} e^{-3x} \cos x dx$
61. $\int_0^{\sqrt{2}/2} e^{\sin^{-1} x} dx$
62. $\int_0^{\pi/2} \sqrt{1 + \cos \theta} d\theta$
63. $\int x^a \ln x dx, a \neq -1$
64. $\int \frac{\ln ax}{x} dx, a \neq 0$
65. $\int_0^{1/6} \frac{dx}{\sqrt{1 - 9x^2}}$
66. $\int \frac{x}{\sqrt{1 - 9x^2}} dx$
67. $\int \frac{x^2}{\sqrt{1 - 9x^2}} dx$
68. $\int \frac{e^x}{e^{2x} + 2e^x + 17} dx$
69. $\int \frac{dx}{1 - x^2 + \sqrt{1 - x^2}}$
70. $\int \ln(x^2 + a^2) dx, a \neq 0$
71. $\int \frac{1 - \cos x}{1 + \cos x} dx$
72. $\int x^2 \sinh x dx$
73. $\int_9^{16} \sqrt{1 + \sqrt{x}} dx$
74. $\int \frac{e^{3x}}{e^x - 1} dx$
75. $\int_1^3 \frac{\tan^{-1} \sqrt{x}}{x^{1/2} + x^{3/2}} dx$
76. $\int \frac{x}{x^2 + 6x + 18} dx$
77. $\int \cos^{-1} x dx$
78. $\int (\cos^{-1} x)^2 dx$
79. $\int \frac{\sin^{-1} x}{x^2} dx$
80. $\int_{-2}^{-1} \sqrt{-4x - x^2} dx$
81. $\int \frac{x^4 + 2x^3 + 5x^2 + 2x + 1}{x^5 + 2x^3 + x} dx$
82. $\int \frac{dx}{1 + \tan x}$
83. $\int e^x \sin^{998}(e^x) \cos^3(e^x) dx$
84. $\int \frac{\tan \theta + \tan^3 \theta}{(1 + \tan \theta)^{50}} d\theta$
85. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
 - a. More than one integration method can be used to evaluate $\int \frac{dx}{1 - x^2}$.
 - b. Using the substitution $u = \sqrt[3]{x}$ in $\int \sin \sqrt[3]{x} dx$ leads to $\int 3u^2 \sin u du$.
 - c. The most efficient way to evaluate $\int \tan 3x \sec^2 3x dx$ is to first rewrite the integrand in terms of $\sin 3x$ and $\cos 3x$.
 - d. Using the substitution $u = \tan x$ in $\int \frac{\tan^2 x}{\tan x - 1} dx$ leads to $\int \frac{u^2}{u - 1} du$.
86. **Area** Find the area of the region bounded by the curves $y = \frac{x}{x^2 - 2x + 2}$, $y = \frac{2}{x^2 - 2x + 2}$, and $x = 0$.
87. **Surface area** Find the area of the surface generated when the curve $f(x) = \sin x$ on $[0, \pi/2]$ is revolved about the x -axis.

- 88. Volume** Find the volume of the solid obtained by revolving the region bounded by the curve $y = \frac{x}{\sqrt{4-x^2}}$ on $[0, 1]$ about the y -axis.
- 89. Volume** Find the volume of the solid obtained by revolving the region bounded by the curve $y = \frac{1}{1-\sin x}$ on $[0, \pi/4]$ about the x -axis.
- 90. Work** Let R be the region in the first quadrant bounded by the curve $y = \sqrt{x^4 - 4}$, and the lines $y = 0$ and $y = 2$. Suppose a tank that is full of water has the shape of a solid of revolution obtained by revolving region R about the y -axis. How much work is required to pump all the water to the top of the tank? Assume x and y are in meters.
- 91. Work** Let R be the region in the first quadrant bounded by the curve $y = \sec^{-1} x$ and the line $y = \pi/3$. Suppose a tank that is full of water has the shape of a solid of revolution obtained by revolving region R about the y -axis. How much work is required to pump all the water to the top of the tank? Assume x and y are in meters.

Explorations and Challenges

92–98. Evaluate the following integrals.

- 92.** $\int_1^{\sqrt[3]{2}} y^8 e^{y^3} dy$ **93.** $\int \frac{68}{e^{2x} + 2e^x + 17} dx$
- 94.** $\int \frac{dt}{t^3 + 1}$ **95.** $\int \frac{dx}{1 - \tan^2 x}$
- 96.** $\int e^{\sqrt[3]{x}} dx$ **97.** $\int \tan^{-1} \sqrt[3]{x} dx$
- 98.** $\int e^{\sqrt{\sin x}} \cos x dx$
- 99. Surface area** Find the area of the surface generated when the curve $f(x) = \tan x$ on $[0, \pi/4]$ is revolved about the x -axis.

QUICK CHECK ANSWERS

1. $\sec x + \tan x + C$ 2. $\cos(1/x) + C$
 3. $\frac{1}{3} \sin^{-1} \frac{x^3}{2} + C \blacktriangleleft$

8.7 Other Methods of Integration

The integration methods studied so far—various substitutions, integration by parts, and partial fractions—are examples of *analytical methods*; they are done with pencil and paper, and they give exact results. While many important integrals can be evaluated with analytical methods, many more integrals lie beyond their reach. For example, the following integrals cannot be evaluated in terms of familiar functions:

$$\int e^{x^2} dx, \quad \int \sin x^2 dx, \quad \int \frac{\sin x}{x} dx, \quad \int \frac{e^{-x}}{x} dx, \quad \text{and} \quad \int \ln(\ln x) dx.$$

The next two sections survey alternative strategies for evaluating integrals when standard analytical methods do not work. These strategies fall into three categories.

Figure 8.10

1. Tables of integrals The endpapers of this text contain a table of many standard integrals. Because these integrals were evaluated analytically, using tables is considered an analytical method. Tables of integrals also contain reduction formulas like those discussed in Sections 8.2 and 8.3.

2. Symbolic methods Computer algebra systems have sophisticated algorithms to evaluate difficult integrals. Many definite and indefinite integrals can be evaluated exactly using these symbolic methods.

3. Numerical methods The value of a definite integral can be approximated accurately using numerical methods introduced in the next section. *Numerical* means that these methods compute numbers rather than manipulate symbols. Computers and calculators often have built-in functions to carry out numerical calculations.

Figure 8.10 is a chart of the various integration strategies and how they are related.

Using Tables of Integrals

Given a specific integral, you *may* be able to find the identical integral in a table of integrals. More often, some preliminary work is needed to convert the given integral into one that appears in a table. Most tables give only indefinite integrals, although some tables include special definite integrals. The following examples illustrate various ways in which tables of integrals are used.

► A short table of integrals is found at the end of the text. Longer tables of integrals are found online and in venerable collections such as the *CRC Mathematical Tables* and *Handbook of Mathematical Functions*, by Abramowitz and Stegun.

► Letting $u^2 = 2x - 9$, we have $u \, du = dx$ and $x = \frac{1}{2}(u^2 + 9)$. Therefore,

$$\int \frac{dx}{x\sqrt{2x-9}} = 2 \int \frac{du}{u^2 + 9}.$$

EXAMPLE 1 Using tables of integrals Evaluate the integral $\int \frac{dx}{x\sqrt{2x-9}}$.

SOLUTION It is worth noting that this integral may be evaluated with the change of variables $u^2 = 2x - 9$. Alternatively, a table of integrals includes the integral

$$\int \frac{dx}{x\sqrt{ax-b}} = \frac{2}{\sqrt{b}} \tan^{-1} \sqrt{\frac{ax-b}{b}} + C, \quad \text{where } b > 0,$$

which matches the given integral. Letting $a = 2$ and $b = 9$, we find that

$$\int \frac{dx}{x\sqrt{2x-9}} = \frac{2}{\sqrt{9}} \tan^{-1} \sqrt{\frac{2x-9}{9}} + C = \frac{2}{3} \tan^{-1} \frac{\sqrt{2x-9}}{3} + C.$$

Related Exercises 9–10 ◀

EXAMPLE 2 Preliminary work Evaluate $\int \sqrt{x^2 + 6x} \, dx$.

SOLUTION Most tables of integrals do not include this integral. The nearest integral you are likely to find is $\int \sqrt{x^2 \pm a^2} \, dx$. The given integral can be put into this form by completing the square and using a substitution:

$$x^2 + 6x = x^2 + 6x + 9 - 9 = (x + 3)^2 - 9.$$

With the change of variables $u = x + 3$, the evaluation appears as follows:

$$\begin{aligned} \int \sqrt{x^2 + 6x} \, dx &= \int \sqrt{(x + 3)^2 - 9} \, dx && \text{Complete the square.} \\ &= \int \sqrt{u^2 - 9} \, du && u = x + 3, \, du = dx \\ &= \frac{u}{2} \sqrt{u^2 - 9} - \frac{9}{2} \ln|u + \sqrt{u^2 - 9}| + C && \text{Table of integrals} \\ &= \frac{x + 3}{2} \sqrt{(x + 3)^2 - 9} - \frac{9}{2} \ln|x + 3 + \sqrt{(x + 3)^2 - 9}| + C && \text{Replace } u \text{ with } x + 3. \\ &= \frac{x + 3}{2} \sqrt{x^2 + 6x} - \frac{9}{2} \ln|x + 3 + \sqrt{x^2 + 6x}| + C. && \text{Simplify.} \end{aligned}$$

Related Exercises 31–33 ◀

Figure 8.11

QUICK CHECK 1 Use the result of Example 3 to evaluate

$$\int_0^{\pi/2} \frac{dx}{1 + \sin x}. \quad \blacktriangleleft$$

EXAMPLE 3 Using tables of integrals for area Find the area of the region bounded by the curve $y = \frac{1}{1 + \sin x}$ and the x -axis between $x = 0$ and $x = \pi$.

SOLUTION The region in question (Figure 8.11) lies entirely above the x -axis, so its area is $\int_0^\pi \frac{dx}{1 + \sin x}$. A matching integral in a table of integrals is

$$\int \frac{dx}{1 + \sin ax} = -\frac{1}{a} \tan \left(\frac{\pi}{4} - \frac{ax}{2} \right) + C.$$

Evaluating the definite integral with $a = 1$, we have

$$\int_0^\pi \frac{dx}{1 + \sin x} = -\tan \left(\frac{\pi}{4} - \frac{x}{2} \right) \Big|_0^\pi = -\tan \left(-\frac{\pi}{4} \right) - \left(-\tan \frac{\pi}{4} \right) = 2.$$

Related Exercises 45–46 ◀

Symbolic Methods

Computer algebra systems evaluate many integrals exactly using symbolic methods, and they approximate many definite integrals using numerical methods. Different software packages may produce different results for the same indefinite integral, but ultimately, they must agree. The discussion that follows does not rely on one particular computer algebra system. Rather, it illustrates results from different systems and shows some of the idiosyncrasies of using a computer algebra system.

QUICK CHECK 2 Using one computer algebra system, it was found that $\int \sin x \cos x \, dx = \frac{1}{2} \sin^2 x + C$; using another computer algebra system, it was found that $\int \sin x \cos x \, dx = -\frac{1}{2} \cos^2 x + C$. Reconcile the two answers. ◀

- Some computer algebra systems do not include the constant of integration after evaluating an indefinite integral. But it should always be included when reporting a result.

- Recall that the *hyperbolic tangent* is defined as

$$\tanh x = \frac{e^x - e^{-x}}{e^x + e^{-x}}.$$

Its inverse is the *inverse hyperbolic tangent*, written $\tanh^{-1} x$.

- Some computer algebra systems use $\log x$ for $\ln x$.

EXAMPLE 4 Apparent discrepancies Evaluate $\int \frac{dx}{\sqrt{e^x + 1}}$ using tables and a computer algebra system.

SOLUTION Using one particular computer algebra system, we find that

$$\int \frac{dx}{\sqrt{e^x + 1}} = -2 \tanh^{-1} \sqrt{e^x + 1} + C,$$

where $\tanh^{-1}$ is the *inverse hyperbolic tangent* function (Section 7.7). However, we can obtain a result in terms of more familiar functions by first using the substitution $u = e^x$, which implies that $du = e^x dx$ or $dx = du/e^x = du/u$. The integral becomes

$$\int \frac{dx}{\sqrt{e^x + 1}} = \int \frac{du}{u\sqrt{u + 1}}.$$

Using a computer algebra system again, we obtain

$$\begin{aligned} \int \frac{dx}{\sqrt{e^x + 1}} &= \int \frac{du}{u\sqrt{u + 1}} = \ln(\sqrt{1 + u} - 1) - \ln(\sqrt{1 + u} + 1) \\ &= \ln(\sqrt{1 + e^x} - 1) - \ln(\sqrt{1 + e^x} + 1). \end{aligned}$$

A table of integrals leads to a third equivalent form of the integral:

$$\begin{aligned} \int \frac{dx}{\sqrt{e^x + 1}} &= \int \frac{du}{u\sqrt{u + 1}} = \ln\left(\frac{\sqrt{u + 1} - 1}{\sqrt{u + 1} + 1}\right) + C \\ &= \ln\left(\frac{\sqrt{e^x + 1} - 1}{\sqrt{e^x + 1} + 1}\right) + C. \end{aligned}$$

Often the difference between two results is a few steps of algebra or a trigonometric identity. In this case, the final two results are reconciled using logarithm properties. This example illustrates that some computer algebra systems do not include constants of integration and may omit absolute values when logarithms appear. It is important for the user to determine whether integration constants and absolute values are needed.

Related Exercises 49–50 ◀

QUICK CHECK 3 Using partial fractions, we know that $\int \frac{dx}{x(x + 1)} = \ln \left| \frac{x}{x + 1} \right| + C$.

Using a computer algebra system, we find that $\int \frac{dx}{x(x + 1)} = \ln x - \ln(x + 1)$. What is wrong with the result from the computer algebra system? ◀

EXAMPLE 5 Symbolic versus numerical integration Use a computer algebra system to evaluate $\int_0^1 \sin x^2 dx$.

SOLUTION Sometimes a computer algebra system gives the exact value of an integral in terms of an unfamiliar function, or it may not be able to evaluate the integral exactly. For example, one particular computer algebra system returns the result

$$\int_0^1 \sin x^2 dx = \sqrt{\frac{\pi}{2}} S\left(\sqrt{\frac{2}{\pi}}\right),$$

where S is known as the *Fresnel integral function* ($S(x) = \int_0^x \sin\left(\frac{\pi t^2}{2}\right) dt$). However, if the computer algebra system is instructed to approximate the integral, the result is

$$\int_0^1 \sin x^2 dx \approx 0.3102683017,$$

which is an excellent approximation.

Getting Started

- Give some examples of analytical methods for evaluating integrals.
- Does a computer algebra system give an exact result for an indefinite integral? Explain.
- Why might an integral found in a table differ from the same integral evaluated by a computer algebra system?
- Is a reduction formula an analytical method or a numerical method? Explain.
- Evaluate $\int e^x \cos^3(e^x) dx$ using tables after performing the substitution $u = e^x$.
- Evaluate $\int \cos x \sqrt{100 - \sin^2 x} dx$ using tables after performing the substitution $u = \sin x$.

Practice Exercises

7–40. Table look-up integrals Use a table of integrals to evaluate the following indefinite integrals. Some of the integrals require preliminary work, such as completing the square or changing variables, before they can be found in a table.

- | | |
|---|--|
| 7. $\int \cos^{-1} x dx$ | 8. $\int \sin 3x \cos 2x dx$ |
| 9. $\int \frac{dx}{\sqrt{x^2 + 16}}$ | 10. $\int \frac{dx}{\sqrt{x^2 - 25}}$ |
| 11. $\int \frac{3u}{2u + 7} du$ | 12. $\int \frac{dy}{y(2y + 9)}$ |
| 13. $\int \frac{dx}{1 - \cos 4x}$ | 14. $\int \frac{dx}{x\sqrt{81 - x^2}}$ |
| 15. $\int \frac{x}{\sqrt{4x + 1}} dx$ | 16. $\int t\sqrt{4t + 12} dt$ |
| 17. $\int \frac{dx}{\sqrt{9x^2 - 100}}, x > \frac{10}{3}$ | 18. $\int \frac{dx}{225 - 16x^2}$ |

- | | |
|--|---|
| 19. $\int \frac{e^x}{\sqrt{e^{2x} + 4}} dx$ | 20. $\int \frac{\sqrt{\ln^2 x + 4}}{x} dx$ |
| 21. $\int \frac{\cos x}{\sin^2 x + 2 \sin x} dx$ | 22. $\int \frac{\cos^{-1} \sqrt{x}}{\sqrt{x}} dx$ |
| 23. $\int \frac{(\ln x) \sin^{-1}(\ln x)}{x} dx$ | 24. $\int \frac{dt}{\sqrt{1 + 4e^t}}$ |
| 25. $\int \frac{dx}{(16 + 9x^2)^{3/2}}$ | 26. $\int \sqrt{4x^2 - 9} dx, x > \frac{3}{2}$ |
| 27. $\int \frac{dx}{x\sqrt{144 - x^2}}$ | 28. $\int \frac{dv}{v(v^2 + 8)}$ |
| 29. $\int \ln^2 x dx$ | 30. $\int x^2 e^{5x} dx$ |
| 31. $\int \sqrt{x^2 + 10x} dx, x > 0$ | 32. $\int \sqrt{x^2 - 8x} dx, x > 8$ |
| 33. $\int \frac{dx}{x^2 + 2x + 10}$ | 34. $\int \sqrt{x^2 - 4x + 8} dx$ |
| 35. $\int \frac{dx}{x(x^{10} + 1)}$ | 36. $\int \frac{dt}{t(t^8 - 256)}$ |
| 37. $\int \frac{dx}{\sqrt{x^2 - 6x}}, x > 6$ | 38. $\int \frac{dx}{\sqrt{x^2 + 10x}}, x > 0$ |
| 39. $\int \frac{\tan^{-1} x^3}{x^4} dx$ | 40. $\int \frac{e^{3t}}{\sqrt{4 + e^{2t}}} dt$ |

41–48. Geometry problems Use a table of integrals to solve the following problems.

- Find the length of the curve $y = \frac{x^2}{4}$ on the interval $[0, 8]$.
- Find the length of the curve $y = x^{3/2} + 8$ on the interval $[0, 2]$.
- Find the length of the curve $y = e^x$ on the interval $[0, \ln 2]$.

44. The region bounded by the graph of $y = x^2\sqrt{\ln x}$ and the x -axis on the interval $[1, e]$ is revolved about the x -axis. What is the volume of the solid that is formed?
45. The region bounded by the graph of $y = 1/\sqrt{x+4}$ and the x -axis on the interval $[0, 12]$ is revolved about the y -axis. What is the volume of the solid that is formed?
46. Find the area of the region bounded by the graph of $y = \frac{1}{\sqrt{x^2 - 2x + 2}}$ and the x -axis between $x = 0$ and $x = 3$.
47. The region bounded by the graphs of $y = \pi/2$, $y = \sin^{-1} x$, and the y -axis is revolved about the y -axis. What is the volume of the solid that is formed?
48. The graphs of $f(x) = \frac{2}{x^2 + 1}$ and $g(x) = \frac{7}{4\sqrt{x^2 + 1}}$ are shown in the figure. Which is greater, the average value of f or the average value of g on the interval $[-1, 1]$?

49–63. Integrating with a CAS Use a computer algebra system to evaluate the following integrals. Find both an exact result and an approximate result for each definite integral. Assume a is a positive real number.

49. $\int \frac{x}{\sqrt{2x+3}} dx$ 50. $\int \sqrt{4x^2 + 36} dx$
51. $\int \tan^2 3x dx$ 52. $\int_0^{\pi/2} \cos^6 x dx$
53. $\int_0^4 (9 + x^2)^{3/2} dx$ 54. $\int (a^2 - t^2)^{-2} dt$
55. $\int \frac{(x^2 - a^2)^{3/2}}{x} dx$ 56. $\int \frac{dx}{x(a^2 - x^2)^2}$
57. $\int_0^{\pi/2} \frac{dt}{1 + \tan^2 t}$ 58. $\int_0^{2\pi} \frac{dt}{(4 + 2 \sin t)^2}$
59. $\int (a^2 - x^2)^{3/2} dx$ 60. $\int (y^2 + a^2)^{-5/2} dy$
61. $\int_0^1 (\ln x) \ln(1+x) dx$ 62. $\int_0^1 x^{31} e^{x^2} dx$
63. $\int_1^2 \frac{x^{19}}{\sqrt{x^4 - 1}} dx$
64. Using a computer algebra system, it was determined that $\int x(x+1)^8 dx = \frac{x^{10}}{10} + \frac{8x^9}{9} + \frac{7x^8}{2} + 8x^7 + \frac{35x^6}{3} + \frac{56x^5}{5} + 7x^4 + \frac{8x^3}{3} + \frac{x^2}{2} + C$. Use integration by substitution to evaluate $\int x(x+1)^8 dx$.

65–68. Reduction formulas Use the reduction formulas in a table of integrals to evaluate the following integrals.

65. $\int x^3 e^{2x} dx$ 66. $\int p^2 e^{-3p} dp$
67. $\int \tan^4 3y dy$ 68. $\int \sec^4 4t dt$

69–70. Using a computer algebra system Use a computer algebra system to solve the following problems.

69. Find the exact area of the region bounded by the curves $y = \sqrt{x + \sqrt{x}}$ and $y = \frac{2}{\sqrt{1 + \sqrt{x}}}$ in the first quadrant.
70. Find the approximate area of the surface generated when the curve $y = 1 + \sin x + \cos x$, for $0 \leq x \leq \pi$, is revolved about the x -axis.

71–74. Deriving formulas Evaluate the following integrals. Assume a and b are real numbers and n is a positive integer.

71. $\int \frac{x}{ax + b} dx$ (Hint: Let $u = ax + b$.)
72. $\int \frac{x}{\sqrt{ax + b}} dx$ (Hint: Let $u^2 = ax + b$.)
73. $\int x(ax + b)^n dx$ (Hint: Let $u = ax + b$.)
74. $\int x^n \sin^{-1} x dx$ (Hint: Try integration by parts.)

75. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. It is possible for a computer algebra system to give the result $\int \frac{dx}{x(x-1)} = \ln(x-1) - \ln x$ and a table of integrals to give the result $\int \frac{dx}{x(x-1)} = \ln \left| \frac{x-1}{x} \right| + C$.
- b. A computer algebra system working in symbolic mode could give the result $\int_0^1 x^8 dx = \frac{1}{9}$, and a computer algebra system working in approximate (numerical) mode could give the result $\int_0^1 x^8 dx = 0.11111111$.

Explorations and Challenges

76. Apparent discrepancy Three different computer algebra systems give the following results:

$$\int \frac{dx}{x\sqrt{x^4 - 1}} = \frac{1}{2} \cos^{-1} \sqrt{x^{-4}} = \frac{1}{2} \cos^{-1} x^{-2} = \frac{1}{2} \tan^{-1} \sqrt{x^4 - 1}.$$

Explain how all three can be correct.

77. Reconciling results Using one computer algebra system, it was found that $\int \frac{dx}{1 + \sin x} = \frac{\sin x - 1}{\cos x}$, and using another computer algebra system, it was found that $\int \frac{dx}{1 + \sin x} = \frac{2 \sin(x/2)}{\cos(x/2) + \sin(x/2)}$. Reconcile the two answers.

78. Apparent discrepancy Resolve the apparent discrepancy between $\int \frac{dx}{x(x-1)(x+2)} = \frac{1}{6} \ln \frac{(x-1)^2 |x+2|}{|x|^3} + C$ and $\int \frac{dx}{x(x-1)(x+2)} = \frac{\ln|x-1|}{3} + \frac{\ln|x+2|}{6} - \frac{\ln|x|}{2} + C$.

79–82. Double table look-up The following integrals may require more than one table look-up. Evaluate the integrals using a table of integrals, and then check your answer with a computer algebra system.

79. $\int x \sin^{-1} 2x \, dx$

80. $\int 4x \cos^{-1} 10x \, dx$

81. $\int \frac{\tan^{-1} x}{x^2} \, dx$

82. $\int \frac{\sin^{-1} ax}{x^2} \, dx, a > 0$

83. Evaluating an integral without the Fundamental Theorem of Calculus Evaluate $\int_0^{\pi/4} \ln(1 + \tan x) \, dx$ using the following steps.

a. If f is integrable on $[0, b]$, use substitution to show that

$$\int_0^b f(x) \, dx = \int_0^{b/2} (f(x) + f(b-x)) \, dx.$$

b. Use part (a) and the identity $\tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta}$ to evaluate $\int_0^{\pi/4} \ln(1 + \tan x) \, dx$.

(Source: *The College Mathematics Journal*, 33, 4, Sep 2004)

84. Two integration approaches Evaluate $\int \cos(\ln x) \, dx$ two different ways:

a. Use tables after first using the substitution $u = \ln x$.

b. Use integration by parts twice to verify your answer to part (a).

85. Period of a pendulum Consider a pendulum of length L meters that swings under the influence of gravity alone. Suppose the pendulum starts swinging with an initial displacement of θ_0 radians (see figure). The period (time to complete one full cycle) is given by

$$T = \frac{4}{\omega} \int_0^{\pi/2} \frac{d\varphi}{\sqrt{1 - k^2 \sin^2 \varphi}},$$

where $\omega^2 = \frac{g}{L}$, $g = 9.8 \, \text{m/s}^2$ is the acceleration due to gravity, and $k^2 = \sin^2 \frac{\theta_0}{2}$. Assume $L = 9.8 \, \text{m}$, which means $\omega = 1 \, \text{s}^{-1}$.

a. Use a computer algebra system to find the period of the pendulum for $\theta_0 = 0.1, 0.2, \dots, 0.9, 1.0$ rad.

b. For small values of θ_0 , the period should be approximately 2π s. For what values of θ_0 are your computed values within 10% of 2π (relative error less than 0.1)?

86. Arc length of a parabola Let $L(c)$ be the length of the parabola $f(x) = x^2$ from $x = 0$ to $x = c$, where $c \geq 0$ is a constant.

a. Find an expression for L .

b. Is L concave up or concave down on $[0, \infty)$?

c. Show that as c becomes large and positive, the arc length function increases as c^2 ; that is, $L(c) \approx kc^2$, where k is a constant.

87. Powers of sine and cosine It can be shown that

$$\int_0^{\pi/2} \sin^n x \, dx = \int_0^{\pi/2} \cos^n x \, dx = \begin{cases} \frac{1 \cdot 3 \cdot 5 \cdots (n-1)}{2 \cdot 4 \cdot 6 \cdots n} \cdot \frac{\pi}{2} & \text{if } n \geq 2 \text{ is an even integer} \\ \frac{2 \cdot 4 \cdot 6 \cdots (n-1)}{3 \cdot 5 \cdot 7 \cdots n} & \text{if } n \geq 3 \text{ is an odd integer.} \end{cases}$$

a. Use a computer algebra system to confirm this result for $n = 2, 3, 4$, and 5.

b. Evaluate the integrals with $n = 10$ and confirm the result.

c. Using graphing and/or symbolic computation, determine whether the values of the integrals increase or decrease as n increases.

88. A remarkable integral It is a fact that $\int_0^{\pi/2} \frac{dx}{1 + \tan^m x} = \frac{\pi}{4}$, for all real numbers m .

a. Graph the integrand for $m = -2, -3/2, -1, -1/2, 0, 1/2, 1, 3/2$, and 2, and explain geometrically how the area under the curve on the interval $[0, \pi/2]$ remains constant as m varies.

b. Use a computer algebra system to confirm that the integral is constant for all m .

QUICK CHECK ANSWERS

1. 1 2. Because $\sin^2 x = 1 - \cos^2 x$, the two results differ by a constant, which can be absorbed in the arbitrary constant C .

3. The second result agrees with the first for $x > 0$ after using $\ln a - \ln b = \ln(a/b)$. The second result should have absolute values and an arbitrary constant. ◀

8.8 Numerical Integration

Situations arise in which the analytical methods we have developed so far cannot be used to evaluate a definite integral. For example, an integrand may not have an obvious antiderivative (such as $\cos x^2$ and $1/\ln x$), or perhaps the value of the integrand is known only at a finite set of points, which makes finding an antiderivative impossible.

When analytical methods fail, we often turn to *numerical methods*, which are typically done on a calculator or computer. These methods do not produce exact values of definite integrals, but they provide approximations that are generally quite accurate. Many calculators, software packages, and computer algebra systems have built-in numerical integration methods. In this section, we explore some of these methods.

Absolute and Relative Error

Because numerical methods do not typically produce exact results, we should be concerned about the accuracy of approximations, which leads to the ideas of *absolute* and *relative error*.

DEFINITION Absolute and Relative Error

Suppose c is a computed numerical solution to a problem having an exact solution x . There are two common measures of the error in c as an approximation to x :

$$\text{absolute error} = |c - x|$$

and

$$\text{relative error} = \frac{|c - x|}{|x|} \quad (\text{if } x \neq 0).$$

► Because the exact solution is usually not known, the goal in practice is to estimate the maximum size of the error.

EXAMPLE 1 Absolute and relative error The ancient Greeks used $\frac{22}{7}$ to approximate the value of π . Determine the absolute and relative error in this approximation to π .

SOLUTION Letting $c = \frac{22}{7}$ be the approximate value of $x = \pi$, we find that

$$\text{absolute error} = \left| \frac{22}{7} - \pi \right| \approx 0.00126$$

and

$$\text{relative error} = \frac{|22/7 - \pi|}{|\pi|} \approx 0.000402 \approx 0.04\%.$$

Related Exercises 11–14 ◀

Midpoint Rule

Many numerical integration methods are based on the ideas that underlie Riemann sums; these methods approximate the net area of regions bounded by curves. A typical problem is shown in Figure 8.12, where we see a function f defined on an interval $[a, b]$. The goal is to

Figure 8.12

approximate the value of $\int_a^b f(x) dx$. As with Riemann sums, we first partition the interval $[a, b]$ into n subintervals of equal length $\Delta x = (b - a)/n$. This partition establishes $n + 1$ grid points

$$x_0 = a, \quad x_1 = a + \Delta x, \quad x_2 = a + 2\Delta x, \dots, \quad x_k = a + k\Delta x, \dots, \quad x_n = b.$$

The k th subinterval is $[x_{k-1}, x_k]$, for $k = 1, 2, \dots, n$.

The Midpoint Rule approximates the region under the curve using rectangles. The bases of the rectangles have width Δx . The height of the k th rectangle is $f(m_k)$, where $m_k = (x_{k-1} + x_k)/2$ is the midpoint of the k th subinterval (Figure 8.12). Therefore, the net area of the k th rectangle is $f(m_k)\Delta x$.

Let $M(n)$ be the Midpoint Rule approximation to the integral using n rectangles. Summing the net areas of the rectangles, we have

- If $f(m_k) < 0$ for some k , then the net area of the corresponding rectangle is negative, which makes a negative contribution to the approximation (Section 5.2).

$$\begin{aligned} \int_a^b f(x) dx &\approx M(n) \\ &= f(m_1)\Delta x + f(m_2)\Delta x + \cdots + f(m_n)\Delta x \\ &= \sum_{k=1}^n f\left(\frac{x_{k-1} + x_k}{2}\right)\Delta x. \end{aligned}$$

Just as with Riemann sums, the Midpoint Rule approximations to $\int_a^b f(x) dx$ generally improve as n increases.

- The Midpoint Rule is a midpoint Riemann sum, introduced in Section 5.1.

QUICK CHECK 1 To apply the Midpoint Rule on the interval $[3, 11]$ with $n = 4$, at what points must the integrand be evaluated? ◀

DEFINITION Midpoint Rule

Suppose f is defined and integrable on $[a, b]$. The **Midpoint Rule approximation** to $\int_a^b f(x) dx$ using n equally spaced subintervals on $[a, b]$ is

$$\begin{aligned} M(n) &= f(m_1)\Delta x + f(m_2)\Delta x + \cdots + f(m_n)\Delta x \\ &= \sum_{k=1}^n f\left(\frac{x_{k-1} + x_k}{2}\right)\Delta x, \end{aligned}$$

where $\Delta x = (b - a)/n$, $x_0 = a$, $x_k = a + k\Delta x$, and $m_k = (x_{k-1} + x_k)/2$ is the midpoint of $[x_{k-1}, x_k]$, for $k = 1, \dots, n$.

Figure 8.13

EXAMPLE 2 Applying the Midpoint Rule Approximate $\int_2^4 x^2 dx$ using the Midpoint Rule with $n = 4$ and $n = 8$ subintervals.

SOLUTION With $a = 2$, $b = 4$, and $n = 4$ subintervals, the length of each subinterval is $\Delta x = (b - a)/n = 2/4 = 0.5$. The grid points are

$$x_0 = 2, \quad x_1 = 2.5, \quad x_2 = 3, \quad x_3 = 3.5, \quad \text{and} \quad x_4 = 4.$$

The integrand must be evaluated at the midpoints (Figure 8.13)

$$m_1 = 2.25, \quad m_2 = 2.75, \quad m_3 = 3.25, \quad \text{and} \quad m_4 = 3.75.$$

With $f(x) = x^2$ and $n = 4$, the Midpoint Rule approximation is

$$\begin{aligned} M(4) &= f(m_1)\Delta x + f(m_2)\Delta x + f(m_3)\Delta x + f(m_4)\Delta x \\ &= (m_1^2 + m_2^2 + m_3^2 + m_4^2)\Delta x \\ &= (2.25^2 + 2.75^2 + 3.25^2 + 3.75^2) \cdot 0.5 \\ &= 18.625. \end{aligned}$$

The exact area of the region is $\frac{56}{3}$, so this Midpoint Rule approximation has an absolute error of

$$|18.625 - 56/3| \approx 0.0417$$

and a relative error of

$$\left| \frac{18.625 - 56/3}{56/3} \right| \approx 0.00223 = 0.223\%.$$

Using $n = 8$ subintervals, the midpoint approximation is

$$M(8) = \sum_{k=1}^8 f(m_k) \Delta x = 18.65625,$$

which has an absolute error of about 0.0104 and a relative error of about 0.0558%. We see that increasing n and using more rectangles decreases the error in the approximations.

Related Exercises 15–16 ◀

The Trapezoid Rule

Another numerical method for estimating $\int_a^b f(x) dx$ is the Trapezoid Rule, which uses the same partition of the interval $[a, b]$ described for the Midpoint Rule. Instead of approximating the region under the curve by rectangles, the Trapezoid Rule uses (what else?) trapezoids. The bases of the trapezoids have length Δx . The sides of the k th trapezoid have lengths $f(x_{k-1})$ and $f(x_k)$, for $k = 1, 2, \dots, n$ (Figure 8.14). Therefore, the net area of the k th trapezoid is $\frac{f(x_{k-1}) + f(x_k)}{2} \Delta x$.

$$\text{Trapezoid Rule: } \int_a^b f(x) dx \approx \left(\frac{1}{2}f(x_0) + f(x_1) + \dots + f(x_{n-1}) + \frac{1}{2}f(x_n) \right) \Delta x$$

Figure 8.14

Letting $T(n)$ be the Trapezoid Rule approximation to the integral using n subintervals, we have

$$\begin{aligned} \int_a^b f(x) dx &\approx T(n) \\ &= \underbrace{\frac{f(x_0) + f(x_1)}{2} \Delta x}_{\text{area of first trapezoid}} + \underbrace{\frac{f(x_1) + f(x_2)}{2} \Delta x}_{\text{area of second trapezoid}} + \dots + \underbrace{\frac{f(x_{n-1}) + f(x_n)}{2} \Delta x}_{\text{area of } n\text{th trapezoid}} \\ &= \left(\frac{f(x_0)}{2} + \underbrace{\frac{f(x_1)}{2} + \frac{f(x_1)}{2}}_{f(x_1)} + \dots + \underbrace{\frac{f(x_{n-1})}{2} + \frac{f(x_{n-1})}{2}}_{f(x_{n-1})} + \frac{f(x_n)}{2} \right) \Delta x \\ &= \left(\frac{f(x_0)}{2} + \underbrace{f(x_1) + \dots + f(x_{n-1})}_{\sum_{k=1}^{n-1} f(x_k)} + \frac{f(x_n)}{2} \right) \Delta x. \end{aligned}$$

As with the Midpoint Rule, the Trapezoid Rule approximations generally improve as n increases.

► This derivation of the Trapezoid Rule assumes f is nonnegative on $[a, b]$. However, the same argument can be used if f is negative on all or part of $[a, b]$. In fact, the argument illustrates how negative contributions to the net area arise when f is negative.

QUICK CHECK 2 Does the Trapezoid Rule underestimate or overestimate the value of $\int_0^4 x^2 dx$? ◀

DEFINITION Trapezoid Rule

Suppose f is defined and integrable on $[a, b]$. The **Trapezoid Rule approximation** to $\int_a^b f(x) dx$ using n equally spaced subintervals on $[a, b]$ is

$$T(n) = \left(\frac{1}{2} f(x_0) + \sum_{k=1}^{n-1} f(x_k) + \frac{1}{2} f(x_n) \right) \Delta x,$$

where $\Delta x = (b - a)/n$ and $x_k = a + k\Delta x$, for $k = 0, 1, \dots, n$.

Figure 8.15

EXAMPLE 3 Applying the Trapezoid Rule Approximate $\int_2^4 x^2 dx$ using the Trapezoid Rule with $n = 4$ subintervals.

SOLUTION As in Example 2, the grid points are

$$x_0 = 2, \quad x_1 = 2.5, \quad x_2 = 3, \quad x_3 = 3.5, \quad \text{and} \quad x_4 = 4.$$

With $f(x) = x^2$ and $n = 4$, the Trapezoid Rule approximation is

$$\begin{aligned} T(4) &= \frac{1}{2} f(x_0) \Delta x + f(x_1) \Delta x + f(x_2) \Delta x + f(x_3) \Delta x + \frac{1}{2} f(x_4) \Delta x \\ &= \left(\frac{1}{2} x_0^2 + x_1^2 + x_2^2 + x_3^2 + \frac{1}{2} x_4^2 \right) \Delta x \\ &= \left(\frac{1}{2} \cdot 2^2 + 2.5^2 + 3^2 + 3.5^2 + \frac{1}{2} \cdot 4^2 \right) \cdot 0.5 \\ &= 18.75. \end{aligned}$$

Figure 8.15 shows the approximation with $n = 4$ trapezoids. The exact area of the region is $56/3$, so the Trapezoid Rule approximation has an absolute error of about 0.0833 and a relative error of approximately 0.00446, or 0.446%. Increasing n decreases this error.

Related Exercises 19–20 ◀

EXAMPLE 4 Errors in the Midpoint and Trapezoid Rules Given that

$$\int_0^1 x e^{-x} dx = 1 - 2e^{-1},$$

find the absolute errors in the Midpoint Rule and Trapezoid Rule approximations to the integral with $n = 4, 8, 16, 32, 64$, and 128 subintervals.

SOLUTION Because the exact value of the integral is known (which does *not* happen in practice), we can compute the error in various approximations. For example, if $n = 16$, then

$$\Delta x = \frac{1}{16} \quad \text{and} \quad x_k = \frac{k}{16}, \quad \text{for } k = 0, 1, \dots, n.$$

Using sigma notation and a calculator, we have

$$M(16) = \sum_{k=1}^{16} f\left(\frac{\overbrace{(k-1)}^{x_{k-1}} + \overbrace{k}^{x_k}}{2}\right) \frac{\overbrace{1}^{\Delta x}}{16} = \sum_{k=1}^{16} f\left(\frac{2k-1}{32}\right) \frac{1}{16} \approx 0.26440383609318$$

and

$$T(16) = \left(\frac{1}{2} f(\underbrace{0}_{x_0=a}) + \sum_{k=1}^{15} f(\underbrace{k/16}_{x_k}) + \frac{1}{2} f(\underbrace{1}_{x_{16}=b}) \right) \frac{1}{16} \approx 0.26391564480235.$$

The absolute error in the Midpoint Rule approximation with $n = 16$ is $|M(16) - (1 - 2e^{-1})| \approx 0.000163$. The absolute error in the Trapezoid Rule approximation with $n = 16$ is $|T(16) - (1 - 2e^{-1})| \approx 0.000325$.

The Midpoint Rule and Trapezoid Rule approximations to the integral, together with the associated absolute errors, are shown in Table 8.5 for various values of n . Notice that as n increases, the errors in both methods decrease, as expected. With $n = 128$ subintervals, the approximations $M(128)$ and $T(128)$ agree to four decimal places. Based on these approximations, a good approximation to the integral is 0.2642. The way in which the errors decrease is also worth noting. If you look carefully at both error columns in Table 8.5, you will see that each time n is doubled (or Δx is halved), the error decreases by a factor of approximately 4.

QUICK CHECK 3 Compute the approximate factor by which the error decreases in Table 8.5 between $T(16)$ and $T(32)$, and between $T(32)$ and $T(64)$. ◀

Related Exercises 31–32 ◀

We now apply the Midpoint and Trapezoid Rules to a problem with real data.

EXAMPLE 5 World oil production Table 8.6 and Figure 8.16 show data for the rate of world crude oil production (in billions of barrels/yr) over a 16-year period. If the rate of oil production is given by the (assumed to be integrable) function R , then the total amount of oil produced in billions of barrels over the time period $a \leq t \leq b$ is $Q = \int_a^b R(t) dt$ (Section 6.1). Use the Midpoint and Trapezoid Rules to approximate the total oil produced between 1995 and 2011.

SOLUTION For convenience, let $t = 0$ represent 1995 and $t = 16$ represent 2011. We let $R(t)$ be the rate of oil production in the year corresponding to t (for example, $R(6) = 25.2$ is the rate in 2001). The goal is to approximate $Q = \int_0^{16} R(t) dt$. If we use $n = 4$ subintervals, then $\Delta t = 4$ yr. The resulting Midpoint and Trapezoid Rule approximations (in billions of barrels) are

$$\begin{aligned} Q &\approx M(4) = (R(2) + R(6) + R(10) + R(14))\Delta t \\ &= (23.0 + 25.2 + 25.9 + 26.4)4 \\ &= 402.0 \end{aligned}$$

and

$$\begin{aligned} Q &\approx T(4) = \left(\frac{1}{2}R(0) + R(4) + R(8) + R(12) + \frac{1}{2}R(16) \right)\Delta t \\ &= \left(\frac{1}{2} \cdot 21.9 + 24.5 + 24.5 + 27.0 + \frac{1}{2} \cdot 27.0 \right) 4 \\ &= 401.8. \end{aligned}$$

The two methods give reasonable agreement. Using $n = 8$ subintervals, with $\Delta t = 2$ yr, similar calculations give the approximations

$$Q \approx M(8) = 399.8 \quad \text{and} \quad Q \approx T(8) = 401.9.$$

The given data do not allow us to compute the next Midpoint Rule approximation $M(16)$. However, we can compute the next Trapezoid Rule approximation $T(16)$, and here is a good way to do it. If $T(n)$ and $M(n)$ are known, then the next Trapezoid Rule approximation is (Exercise 76)

$$T(2n) = \frac{T(n) + M(n)}{2}.$$

Using this identity, we find that

$$T(16) = \frac{T(8) + M(8)}{2} = \frac{401.9 + 399.8}{2} \approx 400.9.$$

Based on these calculations, the best approximation to the total oil produced between 1995 and 2011 is 400.9 billion barrels.

Related Exercises 37–40 ◀

The Midpoint and Trapezoid Rules, as well as left and right Riemann sums, can be applied to problems in which data are given on a nonuniform grid (that is, the lengths of the subintervals vary). In the case of the Trapezoid Rule, the net areas of the approximating trapezoids must be computed individually and then summed, as shown in the next example.

EXAMPLE 6 Net change in sea level Table 8.7 lists rates of change $s'(t)$ in global sea level $s(t)$ in various years from 1995 ($t = 0$) to 2011 ($t = 16$), with rates of change reported in mm/yr.

Table 8.7

t (years from 1995)	0 (1995)	3 (1998)	5 (2000)	7 (2002)	8 (2003)	12 (2007)	14 (2009)	16 (2011)
$s'(t)$ (mm/yr)	0.51	5.19	4.39	2.21	5.24	0.63	4.19	2.38

(Source: Collecte Localisation Satellites/Centre national d'études spatiales/Legos)

► The rate of change in sea level varies from one location on Earth to the next; sea level also varies seasonally and is influenced by ocean currents. The data in Table 8.7 reflect approximate rates of change at the beginning of each year listed, averaged over the entire globe.

- Assuming s' is continuous on $[0, 16]$, explain how a definite integral can be used to find the net change in sea level from 1995 to 2011; then write the definite integral.
- Use the data in Table 8.7 and generalize the Trapezoid Rule to estimate the value of the integral from part (a).

SOLUTION

- The net change in any quantity Q over the interval $[a, b]$ is $Q(b) - Q(a)$ (Section 6.1). When the rate of change Q' is known, the net change in Q is found by integrating Q' over the same interval; that is,

$$\text{net change in } Q = Q(b) - Q(a) = \int_a^b Q'(t) \, dt. \quad \text{Fundamental Theorem}$$

Therefore, the net change in sea level from 1995 to 2011 is $\int_0^{16} s'(t) \, dt$.

- The values from Table 8.7 are plotted in **Figure 8.17**, accompanied by seven trapezoids whose area approximates $\int_0^{16} s'(t) \, dt$. Notice that the grid points (the t -values in Table 8.7) do not form a regular partition of the interval $[0, 16]$. Therefore, we must generalize the standard Trapezoid Rule and compute the area of each trapezoid separately.

Figure 8.17

Focusing on the first trapezoid over the subinterval $[0, 3]$, we find that its area is

$$\underbrace{\text{area of first trapezoid}}_{A = \frac{1}{2}(b_1 + b_2)h} = \frac{1}{2} \cdot \underbrace{(s'(0) + s'(3))}_{\substack{\text{measured in mm/yr} \\ \text{yr}}} \cdot \underbrace{3}_{\text{yr}} = \frac{1}{2} \cdot (0.51 + 5.19) \cdot 3 = 8.55.$$

Because s' is measured in mm/yr and t is measured in yr, the area of this trapezoid (8.55) is interpreted as the approximate net change in sea level from 1995 to 1998, measured in mm. As we add new trapezoid areas to the ongoing sum that approximates $\int_0^{16} s'(t) dt$, the changes in sea level accumulate, resulting in the total change in sea level on $[0, 16]$. The sum of the areas of all seven trapezoids is

$$\begin{aligned} & \underbrace{\frac{1}{2}(s'(0) + s'(3)) \cdot 3}_{\text{first trapezoid}} + \underbrace{\frac{1}{2}(s'(3) + s'(5)) \cdot 2}_{\text{second trapezoid} \dots} + \frac{1}{2}(s'(5) + s'(7)) \cdot 2 + \frac{1}{2}(s'(7) + s'(8)) \cdot 1 \\ & + \frac{1}{2}(s'(8) + s'(12)) \cdot 4 + \frac{1}{2}(s'(12) + s'(14)) \cdot 2 + \underbrace{\frac{1}{2}(s'(14) + s'(16)) \cdot 2}_{\dots \text{last trapezoid}} = 51.585. \end{aligned}$$

We conclude that an estimate of the rise in sea level from 1995 to 2011 is 51.585 mm.

Related Exercises 41, 43 ◀

Simpson's Rule

An improvement over the Midpoint Rule and the Trapezoid Rule results when the graph of f is approximated with curves rather than line segments. Returning to the partition of the interval $[a, b]$ used by the Midpoint and Trapezoid Rules, suppose we work with three neighboring points on the curve $y = f(x)$, say $(x_0, f(x_0))$, $(x_1, f(x_1))$, and $(x_2, f(x_2))$. These three points determine a parabola, and it is easy to find the net area bounded by a parabola on the interval $[x_0, x_2]$. When this idea is applied to every group of three consecutive points along the interval of integration, the result is *Simpson's Rule* (Figure 8.18). Our immediate goal is to determine a formula for this rule.

Figure 8.18

To ease the computation involved in deriving Simpson's Rule, we consider an interval $[-h, h]$ symmetric about the origin with grid points $-h, 0$, and h , where $h = \Delta x$; we label the corresponding points on the graph of f as $(-h, y_0)$, $(0, y_1)$, and (h, y_2) (Figure 8.19).

Figure 8.19

If these points are to lie on the parabola $p(x) = Ax^2 + Bx + C$, they must satisfy the following conditions:

$$\begin{aligned} p(-h) &= A(-h)^2 + B(-h) + C = y_0, & \text{or } Ah^2 - Bh + C &= y_0; \\ p(0) &= A(0)^2 + B(0) + C = y_1, & \text{or } C &= y_1; \text{ and} \\ p(h) &= A(h)^2 + B(h) + C = y_2, & \text{or } Ah^2 + Bh + C &= y_2. \end{aligned}$$

Solving this system of equations for A , B , and C yields

$$A = \frac{y_0 - 2y_1 + y_2}{2h^2}, \quad B = \frac{y_2 - y_0}{2h}, \quad \text{and } C = y_1.$$

Therefore, the net area bounded by the parabola is given by

- Recall that if $f(x)$ is an even function and $g(x)$ is odd, then

$$\int_{-h}^h f(x) dx = 2 \int_0^h f(x) dx \quad \text{and} \quad \int_{-h}^h g(x) dx = 0.$$

- In the event that the three points $(-h, y_0)$, $(0, y_1)$, and (h, y_2) are collinear, there is no parabola that passes through all the points. However, it can be shown that the net area bounded by the line segment through these points is also given by $\frac{h}{3}(y_0 + 4y_1 + y_2)$.

$$\begin{aligned} \int_{-h}^h \left(\underbrace{\frac{y_0 - 2y_1 + y_2}{2h^2} x^2}_A + \underbrace{\frac{y_2 - y_0}{2h} x}_{\substack{\text{odd function} \\ B}} + \underbrace{y_1}_C \right) dx &= 2 \int_0^h \left(\frac{y_0 - 2y_1 + y_2}{2h^2} x^2 + y_1 \right) dx && \text{Use symmetry.} \\ &= 2 \left(\frac{y_0 - 2y_1 + y_2}{6h^2} x^3 + y_1 x \right) \Big|_0^h && \text{Integrate.} \\ &= 2 \left(\frac{(y_0 - 2y_1 + y_2)h}{6} + y_1 h \right) && \text{Evaluate.} \\ &= \frac{h}{3}(y_0 + 4y_1 + y_2). && \text{Simplify.} \end{aligned}$$

Notice that a horizontal shift of the parabola shown in Figure 8.19 does not change its associated net area, which implies that the net area bounded by the parabola on $[x_0, x_2]$ shown in Figure 8.18 is also given by

$$\frac{h}{3}(y_0 + 4y_1 + y_2), \quad \text{or} \quad (f(x_0) + 4f(x_1) + f(x_2)) \frac{\Delta x}{3}.$$

Similarly, the net area bounded by the parabola on the interval $[x_2, x_4]$ is

$$(f(x_2) + 4f(x_3) + f(x_4)) \frac{\Delta x}{3}.$$

When we sum the net area of all such parabolas, we arrive at an approximation to the net area bounded by the graph of f on $[a, b]$. With n subintervals, Simpson's Rule is denoted $S(n)$ and is given by

$$\begin{aligned} S(n) &= \underbrace{(f(x_0) + 4f(x_1) + f(x_2)) \frac{\Delta x}{3}}_{\text{net area bounded by first parabola}} + \underbrace{(f(x_2) + 4f(x_3) + f(x_4)) \frac{\Delta x}{3}}_{\text{net area bounded by second parabola}} + \cdots \\ &\quad + \underbrace{(f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)) \frac{\Delta x}{3}}_{\text{net area bounded by } n\text{th parabola}} \\ &= (f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + \cdots + 2f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)) \frac{\Delta x}{3}. \end{aligned}$$

Notice that apart from the first and last terms, the coefficients alternate between 4 and 2; to apply this rule, n must be an even integer.

DEFINITION Simpson's Rule

Suppose f is defined and integrable on $[a, b]$ and $n \geq 2$ is an even integer. The **Simpson's Rule approximation** to $\int_a^b f(x) dx$ using n equally spaced subintervals on $[a, b]$ is

$$S(n) = (f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + \cdots + 4f(x_{n-1}) + f(x_n)) \frac{\Delta x}{3},$$

where n is an even integer, $\Delta x = (b - a)/n$, and $x_k = a + k\Delta x$, for $k = 0, 1, \dots, n$.

EXAMPLE 7 Applying Simpson's Rule Approximate $\int_{\pi/2}^{5\pi/2} \frac{\sin x}{x} dx$ using Simpson's Rule with $n = 4$ subintervals.

SOLUTION We have $\Delta x = \frac{5\pi/2 - \pi/2}{4} = \pi/2$, and therefore the grid points are

$$x_0 = \pi/2, \quad x_1 = \pi, \quad x_2 = 3\pi/2, \quad x_3 = 2\pi, \quad \text{and} \quad x_4 = 5\pi/2.$$

With $f(x) = \frac{\sin x}{x}$ and $n = 4$, the approximation given by Simpson's Rule is

$$\begin{aligned} S(4) &= (f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + f(x_4)) \frac{\pi/2}{3} \\ &= \left(\frac{\sin x_0}{x_0} + \frac{4 \sin x_1}{x_1} + \frac{2 \sin x_2}{x_2} + \frac{4 \sin x_3}{x_3} + \frac{\sin x_4}{x_4} \right) \frac{\pi}{6} \\ &= \left(\frac{1}{\pi/2} + \frac{4(0)}{\pi} + \frac{2(-1)}{3\pi/2} + \frac{4(0)}{2\pi} + \frac{1}{5\pi/2} \right) \frac{\pi}{6} \\ &= \left(\frac{2}{\pi} - \frac{4}{3\pi} + \frac{2}{5\pi} \right) \frac{\pi}{6} \\ &= \frac{8}{45} \approx 0.178. \end{aligned}$$

Figure 8.20

QUICK CHECK 4 Write the Simpson's Rule formula for $\int_0^3 g(x) dx$ with $n = 6$ subintervals. ◀

Figure 8.20 shows the approximation with two parabolas. To perform error analysis on our approximation, we need to look ahead to Theorem 8.1 (p. 577); this theorem involves finding an upper bound of $|f^{(4)}(x)|$ on the interval $[\frac{\pi}{2}, \frac{5\pi}{2}]$.

Related Exercises 23, 26 ◀

You can use the formula for Simpson's Rule, but here is an easier way. If you already have the Trapezoid Rule approximations $T(n)$ and $T(2n)$, the next Simpson's Rule approximation follows immediately with a simple calculation (Exercise 78):

$$S(2n) = \frac{4T(2n) - T(n)}{3}.$$

EXAMPLE 8 Errors in the Trapezoid Rule and Simpson's Rule Given that $\int_0^1 xe^{-x} dx = 1 - 2e^{-1}$, find the absolute errors in the Trapezoid Rule and Simpson's Rule approximations to the integral with $n = 8, 16, 32, 64$, and 128 subintervals.

SOLUTION Because the shortcut formula for Simpson's Rule is based on values generated by the Trapezoid Rule, it is best to calculate the Trapezoid Rule approximations first. The second column of Table 8.8 shows the Trapezoid Rule approximations computed in Example 4. Having a column of Trapezoid Rule approximations, we can readily find the corresponding Simpson's Rule approximations. For example, if $n = 4$, we have

$$S(8) = \frac{4T(8) - T(4)}{3} \approx 0.26423805546593.$$

The table also shows the absolute errors in the approximations. The Simpson's Rule errors decrease more rapidly than the Trapezoid Rule errors. By careful inspection, you will see that the Simpson's Rule errors decrease with a clear pattern: Each time n is doubled (or Δx is halved), the errors decrease by a factor of approximately 16, which makes Simpson's Rule a more accurate method.

Table 8.8

QUICK CHECK 5 Compute the approximate factor by which the error decreases in Table 8.8 between $S(16)$ and $S(32)$ and between $S(32)$ and $S(64)$. ◀

Related Exercises 45–48 ◀

Errors in Numerical Integration

A detailed analysis of the errors in the three methods we have discussed goes beyond the scope of the text. We state without proof the standard error theorems for the methods and note that Examples 2, 3, 4, and 8 are consistent with these results.

► Because $\Delta x = \frac{b-a}{n}$, the error bounds in Theorem 8.1 can also be written as

$$\begin{aligned} E_M &\leq \frac{k(b-a)^3}{24n^2}, \\ E_T &\leq \frac{k(b-a)^3}{12n^2}, \text{ and} \\ E_S &\leq \frac{K(b-a)^5}{180n^4}. \end{aligned}$$

THEOREM 8.1 Errors in Numerical Integration

Assume f'' is continuous on the interval $[a, b]$ and k is a real number such that $|f''(x)| \leq k$, for all x in $[a, b]$. The absolute errors in approximating the integral $\int_a^b f(x) dx$ by the Midpoint Rule and Trapezoid Rule with n subintervals satisfy the inequalities

$$E_M \leq \frac{k(b-a)}{24} (\Delta x)^2 \quad \text{and} \quad E_T \leq \frac{k(b-a)}{12} (\Delta x)^2,$$

respectively, where $\Delta x = (b-a)/n$.

Assume $f^{(4)}$ is continuous on the interval $[a, b]$ and K is a real number such that $|f^{(4)}(x)| \leq K$ on $[a, b]$. The absolute error in approximating the integral $\int_a^b f(x) dx$ by Simpson's Rule with n subintervals satisfies the inequality

$$E_S \leq \frac{K(b-a)}{180} (\Delta x)^4.$$

QUICK CHECK 6 In Example 7, we used Simpson's Rule with $n = 4$ to find that

$\int_{\pi/2}^{5\pi/2} \frac{\sin x}{x} dx \approx 0.178$. Use Theorem 8.1 to find an upper bound on E_S , the absolute error in this approximation, given that $|f^{(4)}(x)| \leq 0.2$ on $[\frac{\pi}{2}, \frac{5\pi}{2}]$. ◀

The absolute errors associated with the Midpoint Rule and Trapezoid Rule are proportional to $(\Delta x)^2$. So if Δx is reduced by a factor of 2, the errors decrease roughly by a factor of 4, as shown in Example 4. Simpson's Rule is a more accurate method; its error is proportional to $(\Delta x)^4$, which means that if Δx is reduced by a factor of 2, the errors decrease roughly by a factor of 16, as shown in Example 8. Computing both the Trapezoid Rule and Simpson's Rule together, as shown in Example 8, is a powerful method that produces accurate approximations with relatively little work.

SECTION 8.8 EXERCISES

Getting Started

1. If the interval $[4, 18]$ is partitioned into $n = 28$ subintervals of equal length, what is Δx ?
2. Explain geometrically how the Midpoint Rule is used to approximate a definite integral.
3. Explain geometrically how the Trapezoid Rule is used to approximate a definite integral.
4. If the Midpoint Rule is used on the interval $[-1, 11]$ with $n = 3$ subintervals, at what x -coordinates is the integrand evaluated?

5–8. Compute the following estimates of $\int_0^8 f(x) dx$ using the graph in the figure.

5. $M(4)$
6. $T(4)$
7. $S(4)$
8. $S(8)$
9. If the Trapezoid Rule is used on the interval $[-1, 9]$ with $n = 5$ subintervals, at what x -coordinates is the integrand evaluated?
10. Suppose two Trapezoidal Rule approximations of $\int_a^b f(x) dx$ are $T(2) = 6$ and $T(4) = 5.1$. Find the Simpson's Rule approximation $S(4)$.

11–14. Compute the absolute and relative errors in using c to approximate x .

11. $x = \pi$; $c = 3.14$
12. $x = \sqrt{2}$; $c = 1.414$
13. $x = e$; $c = 2.72$
14. $x = e$; $c = 2.718$

Practice Exercises

15–18. **Midpoint Rule approximations** Find the indicated Midpoint Rule approximations to the following integrals.

15. $\int_2^{10} 2x^2 dx$ using $n = 1, 2$, and 4 subintervals
16. $\int_1^9 x^3 dx$ using $n = 1, 2$, and 4 subintervals
17. $\int_0^1 \sin \pi x dx$ using $n = 6$ subintervals
18. $\int_0^1 e^{-x} dx$ using $n = 8$ subintervals

19–22. **Trapezoid Rule approximations** Find the indicated Trapezoid Rule approximations to the following integrals.

19. $\int_2^{10} 2x^2 dx$ using $n = 2, 4$, and 8 subintervals
20. $\int_1^9 x^3 dx$ using $n = 2, 4$, and 8 subintervals
21. $\int_0^1 \sin \pi x dx$ using $n = 6$ subintervals

22. $\int_0^1 e^{-x} dx$ using $n = 8$ subintervals

23–26. **Simpson's Rule approximations** Find the indicated Simpson's Rule approximations to the following integrals.

23. $\int_0^\pi \sqrt{\sin x} dx$ using $n = 4$ and $n = 6$ subintervals
24. $\int_4^8 \sqrt{x} dx$ using $n = 4$ and $n = 8$ subintervals
25. $\int_{-2}^3 e^{-x^2} dx$ using $n = 10$ subintervals
26. $\int_2^4 \cos \sqrt{x} dx$ using $n = 8$ subintervals

27. **Midpoint Rule, Trapezoid Rule, and relative error** Find the Midpoint and Trapezoid Rule approximations to $\int_0^1 \sin \pi x dx$ using $n = 25$ subintervals. Compute the relative error of each approximation.

28. **Midpoint Rule, Trapezoid Rule, and relative error** Find the Midpoint and Trapezoid Rule approximations to $\int_0^1 e^{-x} dx$ using $n = 50$ subintervals. Compute the relative error of each approximation.

29–34. **Comparing the Midpoint and Trapezoid Rules** Apply the Midpoint and Trapezoid Rules to the following integrals. Make a table similar to Table 8.5 showing the approximations and errors for $n = 4, 8, 16$, and 32. The exact values of the integrals are given for computing the error.

29. $\int_1^5 (3x^2 - 2x) dx = 100$
30. $\int_{-2}^6 \left(\frac{x^3}{16} - x \right) dx = 4$
31. $\int_0^{\pi/4} 3 \sin 2x dx = \frac{3}{2}$
32. $\int_1^e \ln x dx = 1$
33. $\int_0^\pi \sin x \cos 3x dx = 0$
34. $\int_0^8 e^{-2x} dx = \frac{1 - e^{-16}}{2}$

35–36. **River flow rates** The following figure shows the discharge rate $r(t)$ of the Snoqualmie River near Carnation, Washington, starting on a February day when the air temperature was rising. The variable t is the number of hours after midnight, $r(t)$ is given in millions of cubic feet per hour, and $\int_0^{24} r(t) dt$ equals the total amount of water that flows by the town of Carnation over a 24-hour period. Estimate $\int_0^{24} r(t) dt$ using the Trapezoidal Rule and Simpson's Rule with the following values of n .

35. $n = 4$

36. $n = 6$

- T 37–40. Temperature data** Hourly temperature data for Boulder, Colorado; San Francisco, California; Nantucket, Massachusetts; and Duluth, Minnesota, over a 12-hr period on the same day of January are shown in the figure. Assume these data are taken from a continuous temperature function $T(t)$. The average temperature (in °F) over the 12-hr period is $\bar{T} = \frac{1}{12} \int_0^{12} T(t) dt$.

t	0	1	2	3	4	5	6	7	8	9	10	11	12
B	47	50	46	45	48	52	54	61	62	63	63	59	55
SF	41	44	46	48	52	53	53	53	51	51	49	47	47
N	35	34	34	36	36	37	37	36	35	35	34	33	32
D	9	11	11	12	14	15	17	19	20	22	24	24	25

37. Find an accurate approximation to the average temperature over the 12-hr period for Boulder. State your method.
38. Find an accurate approximation to the average temperature over the 12-hr period for San Francisco. State your method.
39. Find an accurate approximation to the average temperature over the 12-hr period for Nantucket. State your method.
40. Find an accurate approximation to the average temperature over the 12-hr period for Duluth. State your method.
- 41–44. Nonuniform grids** Use the indicated methods to solve the following problems with nonuniform grids.
41. A curling iron is plugged into an outlet at time $t = 0$. Its temperature T in degrees Fahrenheit, assumed to be a continuous function that is strictly increasing and concave down on $0 \leq t \leq 120$, is given at various times (in seconds) in the table.

t (seconds)	0	20	45	60	90	110	120
$T(t)$ (°F)	70	130	200	239	311	355	375

- a. Approximate $\frac{1}{120} \int_0^{120} T(t) dt$ in three ways: using a left Riemann sum, a right Riemann sum, and the Trapezoid Rule. Interpret the value of $\frac{1}{120} \int_0^{120} T(t) dt$ in the context of this problem.
